The "integrated care" theory is accordance with the concept of the sustainable development and basic connotation and it is a kind of deep reform to the traditional care methods. It doesn't only adjust the institutional frame of the past care, but also reforms the service concept (Hill, 2007; Du Peng, etc., 2014). Integrated care is a kind of social supporting method that focuses on the sustainable development of resources and stresses performance and harmonious development with the society, which will integrate the rural endowment resources at present to the maximum and save the social resources and play the role of endowment at the same time. Integrated care has the caring advantages of systematisms and sustainability, which has important enlightened significance to lessen the contradiction between the rural population aging and sustainable development.

3 Integrated Care System for the Rural Elderly and Its Functions

3.1 The integration of the rural care system for the elderly

At the beginning of the 21th century, "integrated care" drew attentions in western countries gradually and formed social policy. Integrated care is the integration of different care resources, so that the individual in the fragmentation of care become healthy and happy, the management and organization of integrated care take place at the same time. At present "integrated care" has formed two kinds of main integrated mechanisms: The first one is "institutional integration" mode, which is focusing on the coordination of the institutional layer of care under the promotion of the government policy to perfect and develop the new "institutional" work network and integrate the original care resources to enhance the accessibility of service. Countries in Europe, especially Northern European mainly apply this mode. The second one is "community integration" mode, namely "community care" as the basic unit, which is deploying care resources such as states and institutions to supply constant social services with high

quality. Countries such as British, America, Japan and Singapore are representatives of this mode, which is also a mode that our country can learn from.

Most definitions of “integrated care” describe it as connecting the management and organization that is input, supplied and serviced together to improve the quality and efficiency of service (Kodner&Spreeuwenberg, 2002). So, “integrated care” refers to: (1) Provide healthy and social service by a single organization; (2) Supply healthy and social service unitedly by several organizations(commonly); (3) Connect the primary and the secondary health care; (4) Connect cares of different layers in a single department, such as service of spiritual health; (5) Connect prevention and treatment service (Robertson, 2011). “Integrated care” usually classifies from the two dimensions of integrated direction and integrated function (Hawkes, 2009).

In the direction of integration, the integrated care system for the rural elderly can be divided into “vertical integration” and “horizontal integration”. The “Vertical integration” refers to the integration of the primary endowment system and the secondary endowment system. The primary endowment system refers to commercial endowment resources and non-commercial endowment resources. The secondary endowment system includes specific endowment methods and services such as commercial endowment institution, commercial endowment service, government endowment institution, home-based endowment institution, etc. The “Horizontal integration” refers to the integration of the function of the integrated care system for the rural elderly, which mainly includes supplying living care, health care and psychological supporting to the rural old people. When classified from the dimension of functional integration, the rural aging integrated care can also be divided into “functional integration”, “organizational integration” as well as “professional integration”. Among which, the “professional integration” refers to the coordination work, contact or strategic alliance among experts of aging care or between different government institutions and social organizations.

The important feature of the “integrated care” is comprehensiveness, and it stresses the maximum utilization of the social resources and absorbs rural endowment forces and coordinates and manage through social organization at the same time. In addition, it stresses the management of the performance in the integrated care system. The performance management refers to evaluate and supervise the quality.

3.2 Component elements of the integrated care system for the rural elderly

In the view of the sustainable development, the integrated care system is constituted by institutional endowment resources and non-institutional endowment resources, commercial endowment resources and non-commercial endowment resources by the sustainable principle and integrated direction. It can be divided into the primary endowment system and the secondary endowment system so as to build the integrated care system for the rural elderly focusing on the family endowment and government backstop (as is shown in figure 1). While integrating the endowment resources, it cultivates the home-based endowment system in rural area and the marketing element of commercial endowment, which are coordinated through the community and social organization.

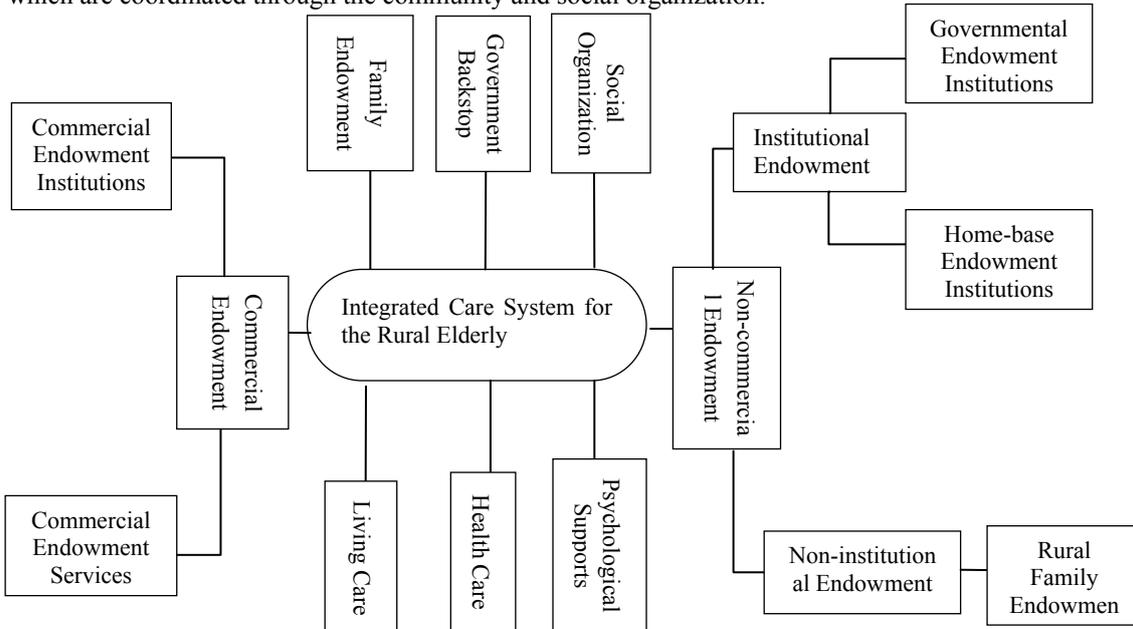

Figure 1 Structure of the Integrated Care System for the Rural Elderly

The commercial endowment resources include the commercial endowment institutions and commercial endowment services. The commercial endowment institution refers to the institutions such as the nursing homes and sanitariums that implement the system of check-in after payment. In other words, the elderly themselves, their children or the units supply an endowment institution with a certain expenses and the endowment institutions supply services such as life care, spiritual consolation to the elderly that check in. The commercial endowment services build endowment communities that are designed especially for the elderly to meet the more and more diversified endowment requirements with high layer for the elderly to provide professional medical service, health care service, entertainment service, psychological service, etc.

Non-commercial endowment resources include institutional and non-institutional endowment. The institutional endowment resources include governmental endowment institutions and home-based endowment institutions. The governmental endowment institutions are the social welfare institutions that are built by the government, which refer to the endowment service institutions that deal with registered procedure in the registration authority organ of the public institutions and they have the nature of the state welfare. The home-based endowment service refers to a kind of service form that the society supplies for the elderly that live at home. It sets solving the routine living difficulties as the primary content and is the supplementary when the home-based endowment service capacity is sufficient. Non-institutional endowment resources mainly refer to the rural family endowment. The family endowment is the most primary and the longest endowment mode in Chinese village. The rural family endowment takes root in the agricultural economy and its substance is being built on the genetic connection and guaranteed by the accumulation of the individual labor benefit. It implements “regurgitation-feeding type” support that is exchanged inside the family.

Besides the subjects that provide the service in the integrated care system, there are also the subjects of coordination and management—community and the social organization. Chinese integrated care system for the rural elderly should adopt the “community mode” according to the actual condition of Chinese rural area. Although Chinese rural communities are autonomous organizations, they still have a certain administrative function, they can better gather the social force. At the same time, there are certain rural autonomy committees in the rural society, such as the elderly associations, the rural public welfare organizations and rural social work institutions that develop newly. Through the government, the community as a unit, the rural associations, public welfare organizations and social work institutions can be integrated to establish regulatory agencies in order to performance evaluation, supervision and coordination functions. The evaluation refers to select the service providers and evaluate the effectiveness of services according to the individual and family status; Supervision refers to supervise the delivery process condition, promptly response when find the malfunction of delivery; Coordination is defined that the service subjects coordinate to meet the needs of the elderly in the rural and keep collaboration and partnership.

3.3 The functions of the integrated care system for the rural elderly

The functions of the integrated care system for the rural elderly mainly perform in three aspects: Firstly, it provides living care for the elderly. In accordance with the principles of sustainability and avoid overlapping and waste of social resources, should be evaluated through a case, the family unit, considering the elderly in rural areas and the actual situation of the traditional culture, give priority to the family endowment. If it is found through evaluation that the functions of family endowment is lost, it should be filled up through institutional home care system. As to the few alone elderly people, it should play more function through the nursing home with the nature of the government subsidy.

Secondly, it provides health care for the elderly, such as periodic physical examinations, supplying household medicines, visiting medical services, routine massage health cares, etc. Health care for the elderly should fully absorb the experience of the United States and other countries, and set the community as a unit to carry out classification management. Through the assessment of community, the number to the elderly in the community and aging state, health care is divided into different levels, which is equipped with different health care resources, as much as possible to achieve the maximization of resource utilization, avoid waste of resources equalization and care not.

Thirdly, it provides psychological supports for the elderly. The psychological supports mainly refer to supply psychological consultancy, lessen emotional barrier and alarm the suicidal tendency, etc. At present, urban communities in our country has built follow-up visit system of the family health and the state is enlarging the investment of healthy in countryside, especially the investment to the left-behind elderly people in the rural. Pay attention to care the left-behind elderly people and oldest-old people of the rural through integrated care system to find out the psychological problem timely.

4 Process and Mechanism of the Integrated Care System for the Rural Elderly

4.1 The process of the integrated care system for the rural elderly

The integrated care system for the rural elderly has characteristics such as comprehensiveness, sociality and publicity, which needs coordination of many sides, integration of resources and building a set of scientific work system to help to straighten out the work relationship so as to guarantee the implementation of the service work. The prominent feature of the integrated care system is the maximum utilization of the social resources, and the maximum playing of the function of endowment at the same time so as to realize the optimization of Pareto.

According to the life cycle of the public goods, the integrated care service includes the service subject and the supply object as well as the demand and so on. Their relationship is reflected in: through the integration of the relevant family, communities and institutions to organize, it provides a full range, the whole process, the whole time of service for the rural elderly. Based on the life cycle of public goods, service cycle can be divided into the service supply section, the service object link section and the service demand satisfaction section. Their relationship model is illustrated in Figure 2. The section of service supply mainly corresponds to the different works of service subject, while the section of the connection of the service objective mainly corresponds to the interaction relationship between the service subject and the service objective and the section of the identification of the service requirement mainly corresponds to the satisfaction condition of requirements after the service objective receiving the service delivery.

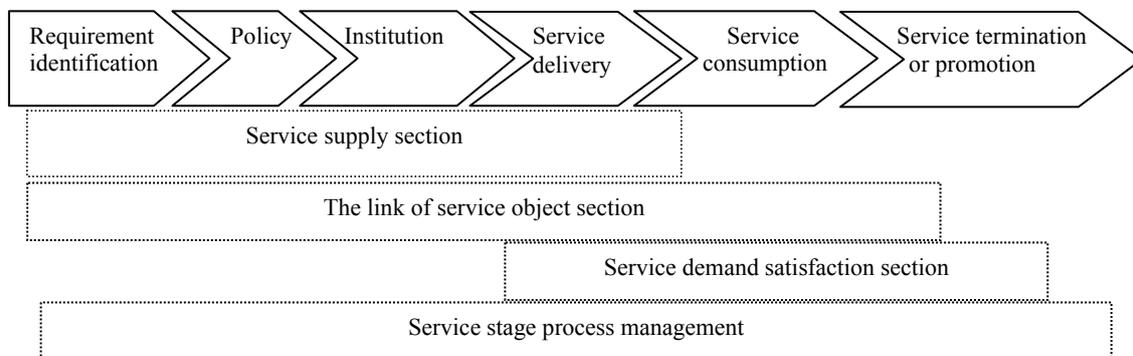

Figure 2 Service Process of the Rural Aging Integrated Care

The figure 2 indicates that the rural elderly integrated care is the mechanism of the whole process management, integrated care can be divided into three stages: pre service, intermediate service and late service. Pre service is needed to integrate the service preparation, including the establishment of public policy and decision-making bodies and the supply of the main screening and establishment, demand identification, etc.; Intermediate service refers to the service output, service delivery and service product consumption, including funds, publicity, service object identification and service use, etc.; Late service refers to the service demand, the end of service supply, referral or upgrade, etc.

4.2 The mechanism of the integrated care system for the rural elderly

The mechanism of the integrated care system can be summarized as follows: the division of labor, the clear object, the comprehensive security and the performance evaluation. Mainly reflected in the following four points:

4.2.1 Cohesion and referral between the primary service system and the secondary service system

The system of the rural elderly integrated care can be divided into the primary service system and the secondary service system. The integrated care system for the rural elderly is embedded into the rural government and the society, which stresses the government backstop and the governance concept of the participation of the whole society.

Under the sustainable principle and according to the actual condition of the rural society in China, the primary service system of the integrated care system for the rural elderly should mainly include rural family, home-based endowment and the institutional nursing home opened by the government. In the current village, family endowment is still a major social force. They play an important economic supporting role and also play functions that other social forces do not have to the life care and psychological support of the elderly. Under the effect of the aging of population and the urbanization, the functions of the family endowment are declining obviously, so it should be intervened institutionally.

The family that is lack of the functions of family endowment should meet the needs of life care through home-based endowment. And the few old people without children should be supported by the institutional nursing homes that are opened by the government.

The secondary service system mainly includes the governmental health system, the public social organizations and commercial institutions. The government health system mainly supplies follow-up visiting service of family health and the intervening service of psychological problems. The public social organizations mainly develop the rural social service projects through the social work organized and developed by the charity institutions and the government, and the commercial institutions mainly supply services such as commercial institutional endowment services and insurance and the commercial institutions mainly meet the requirements of the endowment in many layers.

The primary service system and the secondary service system are evaluated and supervised by the supervision organs of the community endowment and the social organizations. The corresponding service system should be matched aiming at the differences of individual cases of the elderly in community. In the event of service delivery barriers, timely referral.

4.2.2 Screening and determination of the service objective

In the work system of the rural elderly integrated care, firstly departments that are responsible for the organizational decision-making and the business guidance determine the targeted area and population of integrated care, then each responsible department of the village and the subsidiary department in the work system implement further screening and determine the service objective. Before making a decision, the demand of the service object is evaluated in advance. The successful “integrated care” should gather people who are cared, that are the service objectives (Berehtold & Peytremann Bridevau, 2011). The objective of the integrated care should be clear and the gathering should abide by the philosophy of holism and focusing on customers, including all of the targeted area and population (cover and access of geography and population), and promote the participation of service objectives.

4.2.3 Comprehensiveness of the service system

One of the important features of “integrated care” is comprehensiveness. The comprehensiveness performs in the comprehensiveness of the subjects of the service supply as well as the diversification of the service content. The integrated care system for the rural elderly includes the primary service system and the secondary service system, and the subjects of supplying mainly come from family, community, social organizations and commercial institutions, etc. In order to provide comprehensive services for the service objects, the rural elderly care system is based on the pre evaluation of the demand of the service object. In addition, the functions of service system are also diversified, including living care, health care and psychological support, etc.

4.2.4 Evaluation of the performance of the scientific supervision

The sustainable principle requires the maximum utilization of the social resources, so it needs the evaluation system of performance that is supervised scientifically to evaluate and supervise the quality of the rural aging integration care, scan the effect of different care models to the usage of endowment resources with the method of “cost-benefit”, measure the performance of the care from the perspective of stakeholder to give a certain stimulation to the caregiver with practical effect.

5 Conclusions

In the view of the sustainable development and combining the sustainable development theory and the integrated care theory, this paper sets the current situation of the rural aging in China as the background and puts forward to apply comprehensively the social resources, integrate the institutional endowment resources and non-institutional endowment resources, commercial endowment resources and non-commercial endowment resources in rural aging system, build the integrated care system for the rural elderly based on the family endowment and government backstop, including the primary endowment system and the secondary endowment system.

The rural population aging in China cannot be simply attributed to the population policy and the age structure in rural area, it is still related with factors such as the rural economic level, cultural educational degree, etc. Alleviating the problem of rural aging cannot simply rely on a hand or a resource, but the comprehensive use of social resources, integrate social resources, realize the maximization of the use of social resources, and maximize the function of providing for the aged, multi-party coordination, integration of resources, to establish a set of scientific and integrated care system working mechanism. Although a set of theoretical system is put forward in this paper, which still needs to be tested practically.

The rural population aging forms huge challenges to the rural environment and economic development in China. Only making the best use of the circumstances, promoting the building of the comprehensive, social and public integrated care system for the rural elderly and the integration of the rural social resources can ensure the social sustainable development in China.

An Evolution Model Applied to Ecological Building Materials Industry

Xu Xiaoxiao, Wei Long

School of Economic, Wuhan University of Technology, Wuhan, P.R.China, 430070

(E-mail: prodigal3@163.com, longwei@whut.edu.cn)

Abstract: Ecology and evolution models are widened application rather than the traditional ecology field is current megatrend, especially in ecological industry which dynamics evolution process is similar to biological population. In this article a modified patches model was discussed to applied the ecological industry region. We summarize patches model sand discussed what improvements of models have been proposed thus bring the cross elasticity prototype structure in a part of them. The modified model will be discussed optimal solution of model reasonable dynamic development direction for the ecological industry. And with real data obtained from statistical review and numerical simulations which show how parameters affect the models. Our purpose is figure out the modified patches models could support in several other areas, especially in prospective ecological building materials industry.

Key words: Ecological industry; Patches model; Stability; Substituting capacity

1 Introduction

Dynamical evolution systems in ecology often within the structure habitat patches which individuals reproduce and disperse. A vast amount of literature is devoted to Nonlinear analysis of ecological dynamic patches model which has been is firmly related with the development of mathematicians and other natural sciences, related theory and application, interdisciplinary attention. Ecological dynamic model was used to analyze practical ecological community, application and development , according to the actual demand in the relevant discipline as well as in particular ecological building materials.

At this stage with the wide application of computer technology, ecology in both macroscopic and microscopic direction made big progress. Nurmi and Parvinen (2008) and (2011) studied evolution of specialization under metapopulational conditions. Wilson and Yoshimura (1994) and Abrams (2006) showed that both flexible patches choice of the generalists and temporal variability in the relative profit abilities of the different. Governed by local extinction and colonization implies some migration between patches where populations are composed of a large number of subpopulations in patches, but many individuals spend almost their life in single patch, the state of the system in one patch is exactly the same as the state in all other patches at any given time. However, the interaction between a patch and population has not been sufficiently investigated. It has often been demonstrated that a number of patches can promote coexistence of species competing for single patch (Hastings 1980). Such coexistence frequently depends on the existence of a competition, where inferior competitors have larger colonization rates (Tilman 1994) However, situations in which species are able to use more fractions of patches have been little mentioned.

In this paper, we focus on analysis on the important role of interaction between a patch and population for the sustainable growth tendency of ecological industry. Amount of literature have not involved in the field of industry evolution, resource specialization in mixed patches instead that requires rather strict conditions in those models. Butwe discussed the dynamic development tendency of ecological building materials industry as a case, and keepings steady path, by built integrated model using a patches prototype structure as part of them. The suitable measures for optimal solution of model will be discussed and with real data obtained from statistical review and numerical simulations which show how they affect the models.

2 Integrated Models Description

A variety of complexity industry evolution can be describing the process of economic and biological dynamic progress, which exchange resource, energy and information between the external environment and industry system that affect proceeding of the evolution.

In two species industry system, the evolution tendency of the industries population is either a population trend to extinction the other trend to boom period in the progress, or two industries population to achieve some kind of coexistence.

We propose building materials industry systems including two species, ecological building materials industry population and general building materials industry population. Ecological building materials is emerging industry population, which from obtain legal status to high-level degree of organization is detailed and complicated process, thus draw into the patches model to integrated models, which including patches dynamic progress and populations who rely on patches dynamic, so it is a nonlinear dynamic model.

2.1 The evolution model

Mathematical method to establish the nonlinear dynamic model particularly patches model which can be used to make inferences from a complete set of competing models most notably in mechanism of ecology analysis. Such as the cellular automata model considering the spatial distribution of the patch and the population dynamics but difficult to express with mathematical form, and the classical patches model like the Levins model (1969, 1970) which has been frequently used to conduct a comprehensive quantitative description in specific production rates of some products for each individual case. Thus, Compare the reaction diffusion equations as described in the real world of material movement mathematical form, because it's given species in the ecosystem of its uneven characteristics of distribution, those newly patches are always allowing local populations of different sizes with different colonization and extinction rates. The simplified patches the order of species extinction and the population dynamics notational simplicity (Hanski's ,1985, Hastings,1991):

$$\begin{aligned} \frac{dD_j}{dt} &= f(D_j) - \sum_{i=1}^n a_{ij}b_{ij}(D_j)N_{ij} \\ \frac{dN_{ij}}{dt} &= c_{ij}a_{ij}b_{ij}(D_j)N_{ij} - d_iN_{ij} - \sigma_iN_{ij}N_{ji} - \varepsilon_iN_{ij} + \frac{1}{m}\sigma_j\sum_{j=1}^m N_{ij} \end{aligned} \tag{1}$$

2.2 Simplified model of ecological building materials industry

Obviously this initial model apply to dynamics processes on ecological industry appears to be deficient such as patches resource heterogeneity on spatial or temporal scales and acquisition capacity of species. Admitting that, simplified model is possible adapted to be more general scope, especially designing and optimizing in the construction industry which is assumed a single-patch for building materials industry system, but the system is not consumed resources and energy of construction industry. Distinct from the initial model, considerations the patch potentially influences are necessary to model; hence models are defined as follows:

$$\begin{aligned} \frac{dN_i}{dt} &= N_i \left(a_i b_i [f(B)] - \sigma_{ij} N_i - d_i \right) \\ f(B) &= rB \left[1 - \frac{B}{k} \right] \end{aligned} \tag{2}$$

B = Density of building industry resources a_i = The diffusion rate of building material industry N_i = The population density of building materials industry $f(B)$ = The growth of the construction industry function, $b_i[f(B)]$ = Ability to capture industry resources construction of the building materials industry i , d_i = termination rates of Industry i , σ_{ij} = transfer rate of Industry i to industry j , k = Density parameter s

k = resources loading capacity of Construction industry

We assume that the building materials industry system made up of two populations that ecological building materials industry and general building materials industry that constitute an organic synthesis in building materials industry system, with construction industry as its single patch. For the model, we make the assumptions by: Function $f(B)$ and $B(t)$ is continuously differentiable.

2.3 The processes of steady state

Just two populations in building materials industry system, the persistence evolution is expected to the equilibrium gradually moving to steady state, regardless of dynamic path to choose. Construction industry that is assumed to be set by Logistic growth model(Eqs 2.1) , Logistic model show that the evolution of the population within a limited space is nonlinear, population presents the s-shaped growth over time, the curve of model is adopted $s=1$, (r denotes the natural growth rate of

the population), therefore building industry B, ecological building materials industry N1, N2 common building materials industry, the relations between and among can be expressed by the following equations:

$$\frac{dN_i}{dt} = N_i (a_i b_i [f(B)] - \sigma_{ij} N_j - d_i) \quad i = 1, 2 \quad N_i(0) > 0 \quad (3)$$

At a static equilibrium the model is: dX/dt equal to 0, and in the N1, N2 phase space distribution has the following solutions:

$$\begin{aligned} N_1^e &= \frac{1}{\sigma_{12}} (a_1 b_1 [f(B)] - d_1) \\ N_2^e &= \frac{1}{\sigma_{21}} (a_2 b_2 [f(B)] - d_2) \end{aligned} \quad (4)$$

Both Ecological building materials and general building materials within the development process of construction industry, the system will have 4 kinds of possible combination of equilibrium:

$$E(N_1, N_2) = \begin{bmatrix} 0 & 0 \\ \frac{1}{\delta_{12}} (a_1 b_1 [f(B)] - d_1) & 0 \\ 0 & \frac{1}{\delta_{21}} (a_2 b_2 [f(B)] - d_2) \\ \frac{1}{\delta_{12}} (a_1 b_1 [f(B)] - d_1) & \frac{1}{\delta_{21}} (a_2 b_2 [f(B)] - d_2) \end{bmatrix} \quad (5)$$

four equilibrium state : C1 (0,0) C2 (N1,0) C3 (0,N2) C4 : $(\frac{1}{\delta_{12}} (a_1 b_1 [f(B)] - d_1), \frac{1}{\delta_{21}} (a_2 b_2 [f(B)] - d_2))$

The above four equilibrium state to calculate these jacobian matrixes,

$$J_1 = \begin{bmatrix} a_1 b_1 [f(B)] & 0 \\ 0 & a_2 b_2 [f(B)] \end{bmatrix} \quad J_2 = \begin{bmatrix} -a_1 b_1 [f(B)] + d_1 & 0 \\ 0 & 0 \end{bmatrix} \quad J_3 = \begin{bmatrix} 0 & 0 \\ 0 & -a_2 b_2 [f(B)] + d_2 \end{bmatrix} \quad J_4 = \begin{bmatrix} -a_1 b_1 [f(B)] + d_1 & 0 \\ 0 & -a_2 b_2 [f(B)] + d_2 \end{bmatrix}$$

respectively calculate characteristic root: $|\lambda E - J_i| = 0$

Equilibrium state C1(0,0): $a_1 > 0, b_1 > 0, [f(B)] > 0$ System has a positive characteristic root, C1 is not stable state, therefore, the construction industry system and building materials industries will not appear in C1(0,0)

Equilibrium state C2(N1,0), when $a_1 b_1 [f(B)] < d_1$ System has a positive characteristic root, therefore, C2 is not stable state; when $a_1 b_1 [f(B)] > d_1$, and evolved into the C2, system gradually stable in the C2 (N1, 0) In the competition for the resources of construction industry patches, ecological building materials population gradually incline to maximum capacity N1, and general building materials species will become extinct, building industry patches and building materials industry systems will asymptotically stable at C2 (N1, 0).

Equilibrium state C3 (0, N2), when $a_2 b_2 [f(B)] < d_2$, The system is instability; when $a_2 b_2 [f(B)] > d_2$, The system gradually stable in the C3, In the competition for the resources of construction industry patches, general building materials population gradually incline to maximum capacity N2, and ecological building materials species will become extinct, building industry patches and building materials industry systems will asymptotically stable at C3(0,N2).

According to the Routh-Hurwitz theorem, the characteristic equation for C4(N1,N2): $\lambda^2 + \{a_1 b_1 [f(B)] + a_2 b_2 [f(B)] - d_1 - d_2\} \lambda + a_1 b_1 [f(B)] \times a_2 b_2 [f(B)] - a_2 b_2 [f(B)] \times d_1 - a_1 b_1 [f(B)] \times d_2 + d_1 \times d_2 = 0$
 when $a_1 b_1 [f(B)] + a_2 b_2 [f(B)] - d_1 - d_2 < 0$, or $a_1 b_1 [f(B)] \times a_2 b_2 [f(B)] - a_2 b_2 [f(B)] \times d_1 - a_1 b_1 [f(B)] \times d_2 + d_1 \times d_2 < 0$ system is not stable state; hen $a_1 b_1 [f(B)] + a_2 b_2 [f(B)] - d_1 - d_2 > 0$, and $a_1 b_1 [f(B)] \times a_2 b_2 [f(B)] - a_2 b_2 [f(B)] \times d_1 - a_1 b_1 [f(B)] \times d_2 + d_1 \times d_2 > 0$

$\times d_1 - a_1 b_1 [f(B)] \times d_2 + d_1 \times d_2 > 0$ system gradually stable in the C4, In the competition for the resources of construction industry patch, ecological building materials population gradually incline to maximum capacity N2, and general building materials species also gradually incline to its own maximum capacity, therefore systems can achieve a stable coexistence between the two sides at C4, building industry patches and building materials industry systems will asymptotically stable at

$$C4 : \left(\frac{1}{\delta_{12}} (a_1 b_1 [f(B)] - d_1) \right) \frac{1}{\delta_{21}} (a_2 b_2 [f(B)] - d_2) .$$

There is only a single population system is easy to reach the stable state building materials industry, and always maintain a stable state. But consider patches species biodiversity, ecology is more emphasis on equilibrium C4 (N1, and N2), Related research has focused on a single patch, or population co-evolution on patches, and a series of empirical or theoretical interpretation.

Similar to the ecological evolution process, two building materials industry in the equilibrium under the construction industry, but in the course of the evolution of ecological industry more important alternative equilibrium C2(N1,0).

3 The Significance of Patch Reaction Function

For Analysis the $b_i[f(B)]$, even if the form of this function uncertainty we can estimate related parameters value in the model according to mass of data arrangement from the statistical yearbook data of China. the data processing is used from building materials enterprise gaining environmental protection labelling certification (Fig1):

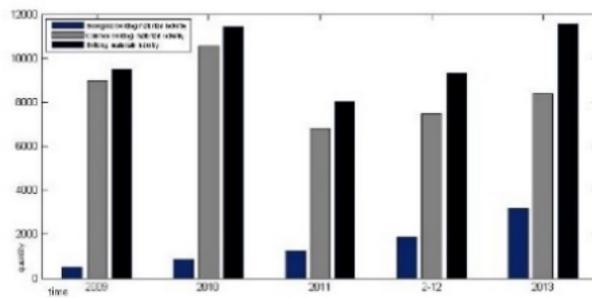

Figure 1 Quantity of Ecological Building Materials Enterprise

Figure 1 shows the evolution of the model parameters, set k and r for: $k = 1, r = 0.103$, parts of the model parameters were estimated: $a_i = 0.284, d_i = 0.074, \sigma_{ij} = 0.031$, to find effect function we assume that the different function values: $b_i[f(B)]_{F1} = 4, b_i[f(B)]_{F2} = 5, b_i[f(B)]_{F3} = 6, b_i[f(B)]_{F4} = 9$ simulation the certain period of evolution. Then, adjustments the original value of N_i , we have got Four species common evolution development initial period (Fig2).

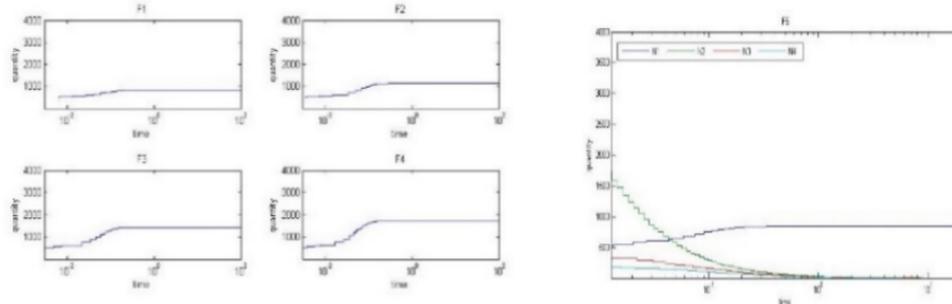

Figure 2 The Population Evolution of Ecological Building Materials

4 Conclusions

Other parameters and conditions of the same, change the function value of the influence of the evolution of ecological industry is significant. Curve F1 as the base period, and gradually increase the

function value changed the uncertainty trend of evolution, accelerate the evolution process to achieve local stability of the time, especially evident on high degree of improving the assignment of Curve F4. At four groups evolution process, N1 population density increased gradually to a steady state, evolution of the other three groups are gradually become extinct, simultaneously, the population density decrease with the add value of the ability to exploit construction industry resources showing a positive correlation.

Simulation process show that in the case of other parameters are the same, the role of ability to exploit construction resource under the industry evolution, so ecological building materials industry population need strong pre-emption ability to compensate for weaker initial population density to steadily evolved in patches environment.

Abstract: Mobile government (mGovernment) has emerged to be an innovative way of governments around the world to deliver services and information to their citizens, businesses and organizations. The success of mGovernment initiatives is arguably lies in its continuance intention/usage rather than in its initial adoption. Hence, many studies have been conducted to investigate continuance intention/usage of mobile technologies such as mobile commerce, mobile data services, and mobile Internet service and many others. Nonetheless, the scarcity of similar studies in area of mGovernment is obvious, in addition to the fact that most of these scarce studies, if not all, employed theoretical frameworks/models that are dubiously suitable for information technology (IT) initial acceptance only. The information system continuance model (ISCM) has been strongly supported for IT continuance study. Therefore, this research paper attempts to answer this call by proposing ISCM as a backbone model to study mGovernment continuance intention.

Key words: Mobile government; Post-acceptance belief; Continuance intention; ISCM

1 Introduction

Information and Communications Technology (ICT) has changed the landscape of public service delivery considerably. It has increasingly gained recognition of its important roles by governments around the world (Kaliannan et al. 2010). Electronic Government (eGovernment) has been defined in various terms, and most researchers' definitions revolve around the role of ICTs in promoting the delivery of public services to the government, companies and individual persons (Jyoti and Gheorgite, 2004; OECD: The e-Government Imperative, 2003). However, Bassara et al. (2005) have the definition of Mobile Government (mGovernment) as the leveraging of mobile and wireless technologies, devices and applications of all kinds for the betterment of services delivery to all e-Government stakeholders including all government units, businesses and citizens. From this elaboration, it can be understood that mGovernment is a fragment of eGovernment with complimentary value.

The success of eGovernment initiatives worldwide are often noticeable with benefits such as promoting life quality of people, effective knowledge delivery, fostering social unity, generating incomes and finally helping both private and public organizations and bodies remain competitive in the increasingly challenging electronic market place globally (Hesson and Al-Ameed, 2007). By the same token, as a complimentary subset of eGovernment, mGovernment may bring a similar success, only at a greater height.

The success of ICT is often seen from the lenses of its adoption, whether initial or continued ones. However, prior studies argue that ICT success depends more on continuance usage than initial adoption. As claimed by Bhattacharjee (2001) and Kim & Son (2009), rather than initial adoption, benefits derived from information technology (IT) initiatives are only actualized through sustained utilization. This notion became the basis that led to the inception of the infamous Information System Continuance Model (ISCM) constructed by Bhattacharjee (2001). In a systematic literature review of 191 peer-reviewed articles on IS continuance intention, 100 were found (52%) to use ISCM as their underpinning theoretical framework (Nabavi, Taghavi-Fard, Hanafizadeh, & Taghva, 2016). This study attempts to extend ISCM with other post-adoption perceive constructs in addition to the existing Perceived Usefulness (PU).

Thus, the objective of this study is to propose a conceptual model of mGovernment continuance intention by incorporating post-acceptance beliefs into ISCM.

2 Post-Acceptance Beliefs

Previous studies commonly coined the term beliefs when defining expectation. For example, according to Oliver and Linda (1981), Churchill and Surprenant (1982) and Bearden and Teel (1983),

expectation is defined as “individual beliefs or sum of beliefs about the levels of attributes possessed by a product/service” (Thong, Hong, & Tam, 2006). Based on this definition, PU which represents post-adoption expectations, is a belief that is formed after users’ initial acceptance of IT. Post-acceptance beliefs are kept updated by users as they gain more experiences of using an IT. Later, users will assimilate these experiences, causing the expectations towards using the IT to be different from the initial ones (Fazio and Zanna, 1981; Karahanna et al., 1999; Bhattacharjee, 2001).

For the purpose of this study, in addition to existing PU, two additional constructs of post-acceptance beliefs are added to the ISCM: Perceived Enjoyment (PENJ) and Perceived Compatibility (PCOM).

3 Information System Continuance Model (ISCM)

ISCM is the modified model of expectation-confirmation model (ECM) that was proposed by Oliver (1980). ECM is a theory extensively employed to study service marketing, post-purchase and consumer satisfaction, which mostly fall under consumer behavior studies. (Nabavi et al., 2016). Bhattacharjee (2001) suggested an extended model of ECM by importing the belief component of Perceived Usefulness (PU) from Technology Acceptance Model (TAM), which is firstly introduced by Davis (1989), specifically to study IS continuance. ISCM is envisaged to rely on three constructs, that are user satisfaction, the confirmation of expectations through earlier experience with IS use and PU surrogating post-adoption expectations. Bhattacharjee (2001) found that satisfaction is a significant predictor of users’ IS continuance intention, followed by PU as a salient but weaker predictor. Confirmation and PU are primary predictors of satisfaction (Bhattacharjee, 2001; Yuan, et al., 2014).

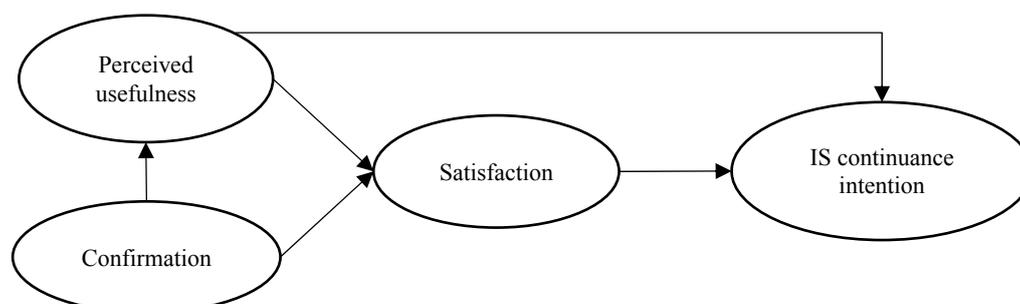

Figure 1 IS Continuance Model (Bhattacharjee, 2001)

4 Proposition Development

There are eight propositions based on ISCM to predict mGovernment continuance intention in this study, based on the findings and rationales from the extant literature. Firstly, users’ satisfaction with IT has a positive influence on mGovernment continuance intention. Prior studies in marketing have found that the main reason why consumers decided to repurchase products or reuse services is the level of satisfaction they gained (Oliver, 1993; Cronin et al., 2000; Szymanski and Henard, 2001). Based on the congruence between individuals’ continued IT usage decisions and consumers’ repurchase decisions (Bhattacharjee, 2001), this study assumes an equivalent relationship in mGovernment long-term usage intention context. Hence, this research posits the following proposition:

P1. Users’ satisfaction with IT is positively related to their mGovernment continuance intention.

Secondly, according to the expectation-confirmation paradigm, user satisfaction is influenced by two main antecedents: post-acceptance beliefs regarding the IS and confirmation of expectations. Confirmation of expectations is the discrepancies between pre-adoption expectations and actual performance of the IS (Bhattacharjee, 2001). The reasoning for these associations comes from cognitive dissonance theory (Festinger, 1957). Users construct early expectations about mGovernment before using it. After the users actually experience mGovernment, they renew their expectations of mGovernment performance according to their direct experiences. When mGovernment performs higher relative to their pre-adoption expectations, their post-adoption expectations are confirmed; otherwise, their post-adoption expectations are disconfirmed. Thus, the following propositions are suggested:

P2a. Users’ confirmation of expectations is positively related to their PU

P2b. Users’ confirmation of expectations is positively related to their satisfaction.

Prior marketing studies have found that as users’ expectations move higher, their satisfaction goes to the same direction (Oliver and DeSarbo, 1988). This finding is supported by LaTour and Peat (1980)

who concluded that beliefs resulting from consumers’ direct experiences are major determinants of consumer satisfaction. Moreover, various studies in IT adoption has constantly discover that PU is the most salient antecedent of users’ adoption intentions (e.g., Davis et al., 1989; Taylor and Todd, 1995; Venkatesh and Davis, 2000). Thus, we postulate the following propositions:

P3a. Users’ PU is positively related to their satisfaction.

P3b. Users’ PU is positively related to their mGovernment continuance intention.

Perceived enjoyment (PENJ), as defined by (Davies et al., 1992), is the degree to which the activity involving the use of IT alone is believed to be enjoyable, aside from any anticipated performance consequences. Motivation is divided into two types – intrinsic and extrinsic (Vallerand, 1997). Extrinsic motivation refers to the drive of goal-oriented activity that leads to rewards or achievement. On the contrary, intrinsic motivation focuses on pleasing and satisfying feelings when involving in an activity (Deci, 1971). Davis et al. (1992) described PENJ as an intrinsic motivation, while PU in Technology Acceptance Model (TAM) is an instance of extrinsic motivation. From this view, PENJ could be a key post-acceptance belief that influences user satisfaction similar to PU that has been theorized to be a user belief that determines satisfaction in the ECM. Provided the current trend where more and more technologies are able to meet various adopters’ needs, it is foreseen that the post-acceptance level of enjoyment would also become vital in developing user satisfaction towards technology usage. Several previous studies have also proposed the role of PENJ in affecting users’ IT usage behavior. In reference to the motivation theory view, Davis et al. (1992) found that PENJ to be the key variable of behavioral intention to use personal computers. Similarly, Van der Heijden (2004) found that PENJ directly affects user intention to use Web service. Hence, our propositions are as follows:

P4a. Users’ PENJ is positively related to their satisfaction.

P4b. Users’ PENJ is positively related to their mGovernment continuance intention.

Compatibility refers to the extent to which an innovation conforms easily to the values and routine of a person (Rogers, 1983; Lee, Cheng, & Depickeré, 2003). Similar finding by Tornatzky and Klein (1982) showed that an innovation stands a better chance to be adopted when it is compatible with individuals’ job obligations and value system. Since mGovernment implementation is still at its infancy stage (Al thunibat, Mat Zin, & Sahari, 2011), it can be viewed as an innovation. Thus, compatibility is expected to be a salient predictor to MGovernment continuance intention. This is parallel to (Shareef, Kumar, Kumar, & Dwivedi, 2011) who introduced compatibility as an another IT innovation factor in eGovernment literature. They claimed that compatibility promotes citizens’ inclination towards using eGovernment system to restrict personal interaction and social influence. Thus, this study formulates the following propositions:

P5: Users’ PCOM is positively related to their MGovernment continuance intention.

5 Research Model

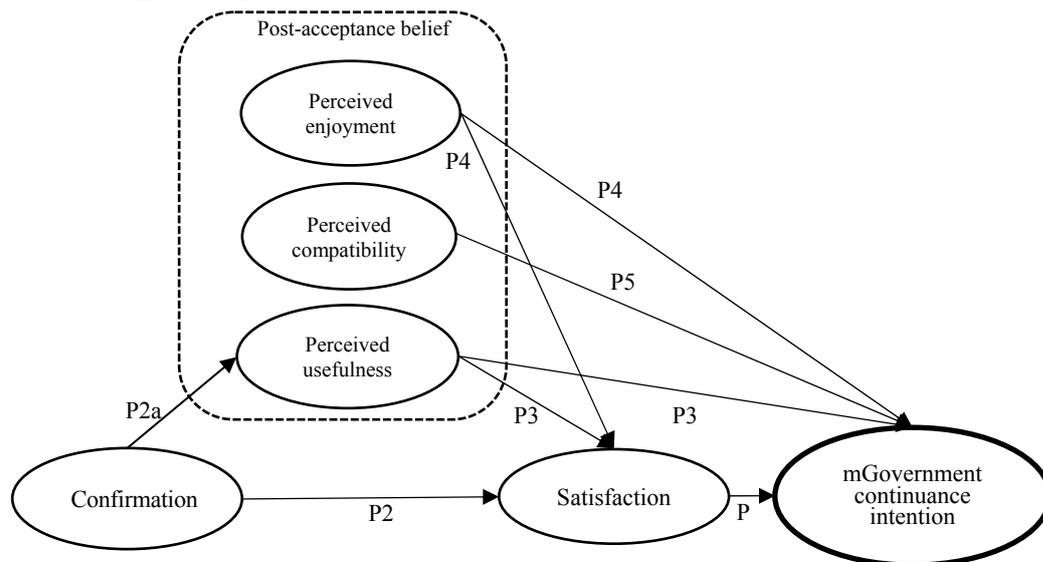

Figure 2 Proposed Research Model

Figure 2 illustrates the proposed research model in which ISCM serves as the base framework with suggested relationships among the independent and dependent constructs.

6 Methodology

6.1 Population and sample

Even though this study is still in the conceptual phase, the researchers intend to postulate the methodology if this research is to be extended to the empirical stage. The population for this study will be Malaysian citizens who has experienced using mGovernment services in any forms such as mobile applications, mobile websites or text-based services. Because reaching the entire population is imagined to be not possible in addition to the absence of sampling frame, non-probability convenience sampling is viewed as the only option. When the population of a research survey is not reachable in entirety, non-probability sampling is not avoidable (Thurasamy, 2016). This convenience sampling will be purposive where qualified respondents are only those who have experienced mobile government beforehand. This technique is supported by Sekaran & Bougie, (2013), who state that purposive sampling is necessary where the sampling is limited to specific types of respondents who can render the intended information. Therefore, the survey instrument will be designed to filter pre/non-adopter and post-adopter respondents.

To lessen the possibility that pre/non-adopter respondents are selected more than the post-adopters, who are the intended respondents, this study will target government servants as the sample respondents. This is important in order to speed up the process of gaining intended sample size of qualified respondents, the post-adopters. Examples of government servants include public school teachers, public higher learning lecturers and government employees who work at government departments and agencies. The rationale behind this is that government servants are more likely to use mGovernment due to job and personal responsibilities such as using Inland Revenue Department's m-filing system for tax purposes, checking out or updating students' marks via mobile devices or applying leaves through mobile human resource information systems.

6.2 Variables and measurement

Table 1 Constructs, Instruments and Questionnaire Items

Constructs	Instrument Used (Authors)	Total Items
Perceived Enjoyment	Thong et al. (2006)	4
Perceived Compatibility	Lin (2010), Verhoef and Langerak (2001), Lee and Kozar (2008)	3
	Shareef et al. (2011)	5
Perceived Usefulness	Bhattacharjee (2001)	4
Confirmation	Bhattacharjee (2001)	3
Satisfaction	Bhattacharjee (2001)	4
mGovernment Continuance Intention	Bhattacharjee (2001)	3

All items for the original constructs of ISCM will be adapted from the originator, Bhattacharjee (2001) while the other two post-acceptance belief constructs will be adapted from others like shown in Table 1. Sample items are as follows:

- a) Perceived Usefulness- "Using mobile government improves my performance in carrying out personal responsibilities".
- b) Confirmation- "My experience with using mobile government was better than what I expected".
- c) Satisfaction- "How do you feel about your overall experience of mobile government use: Very dissatisfied/Very satisfied
- d) mGovernment Continuance Intention- "I intend to continue using mobile government rather than discontinue its use.
- e) Perceived Enjoyment- "I find using mobile government services to be interesting".
- f) Perceived Compatibility- "Using mobile government would fit into my lifestyle".

7 Contribution and Limitation

The contribution of this conceptual paper is that it serves as a preliminary base to explore the intention to use mobile government in the long run in Malaysia since as suggested before, continuance

adoption may realize IT benefits better than initial adoption does. Malaysian Communications and Multimedia Commission (2015) reported that more and more Malaysians have access to the Internet year by year. For example, from 2013 to 2014, the percentage of Malaysians who had access the Internet with their mobile broadband devices increased from 22 percent to 65.1 percent. With the increasing number of Malaysians accessing the Internet through their hand-held devices, it is urgent for the mobile government providers to start studying Malaysian users' inclination towards continuous use of their services. Ignoring this advantage may cost the opportunity of delivering public services and information at a more efficient level.

One limitation of this study is the omission of several other post-acceptance belief constructs that are demonstrated to be important by the literature. For instance, perceived risk and perceived complexity are significant determinants to IT adoption intention with negative relationships. Future researches may include more post-acceptance belief constructs to add more to the robustness of the model.

8 Conclusions

This study has proposed to extend the ISCM, one of the most employed models in IT continuance studies. The extension involves two post-acceptance beliefs, precisely perceived enjoyment and perceived compatibility, which have received much advocacy from prior studies. Since this study is conceptual, no empirical findings yet to be discussed to support the strength of the model. Even so, this study suggests the sampling methods and target respondents to enlighten future researchers who intend to continue this research to the empirical stage. Lastly, this study may serve as a baseline reference to mobile government providers to explore Malaysian users' continuance intention of mobile government services.

Study on Sustainability in Higher Education

Nurfauzana Abd Aziz, Hiroshi Nakanishi

Malaysia – Japan International Institute of Technology (MJIT), Universiti Teknologi Malaysia (UTM),
Malaysia

(E-mail: fauzana.aziz@gmail.com, h.nakanishi@utm.my)

Abstract: Malaysian higher education system is undergoing significant transformation. It started with the effort to corporatize public universities followed by the democratization of higher education that saw many private universities and university colleges being established. The establishment of Malaysian National Higher Education Fund and the formulation of Malaysian Qualification Framework further shaped the new form of Malaysian Higher Education system. The newly launched Malaysia Education Blueprint 2015 - 2025 (Higher Education) clearly justify education sector as a strong contributor towards meeting Malaysia's need for human resources. At the same time the expectation on public institutions of higher education to be the engine of innovation and creativity is rising. Quality and value for money are two issues among the many emerging issues affecting the transformation of Malaysian higher education system. Meeting the bottom-line while offering quality education drives the public higher education sector. This paper aims describe the marketing situations of higher education. It discusses the strength and weaknesses of Malaysian Public Universities and the trends in the development of higher education system in Malaysia with respect to attracting postgraduate students as well as the sustainability of Higher Education in this era.

Key Words: Sustainable development; Public higher education; Marketing practices in public university; Development of public Higher education

1 Introduction

First introduced to the corporate world in the late 1980s, the concept of integrated marketing communication (IMC) is a fairly new phenomenon in American higher education. Research on the concept within higher education, although limited, suggests that more and more institutions are beginning to adopt the practice due to increased competition for students and funding. Oregon State University (OSU), for example, is facing a plethora of challenges, not unlike most American higher education institutions (HEI), stemming from the current competitive landscape. These challenges include declining educational aspirations among traditionally aged, in-state college students; intense competition for state resources; aggressive competition among HEIs; and increased competition for federal research funds. In response, in 2009 OSU developed an IMC plan in conjunction with their university-wide strategic plan to elevate institutional marketing and visibility and further the university's progress toward its vision of achieving top-ten status among land grant HEIs (Oregon State University, n.d. para.3).

Higher education is generally seen as a major (potential) catalyst towards sustainable development, in particular through its traditional missions of education, research and public service (Tom, et al, 2012; Dalal-Clayton, 2002). During the last two decades higher education institutions worldwide have implemented various sustainable development initiatives. In Flanders for example, most universities have signed the COPERNICUS Charter which dedicates universities to becoming leaders in SD through their various activities, including research, education, public service and campus operations. There have been numerous other sustainability initiatives at the institutional level in Flanders, and some regional overarching ones have been undertaken (for example "Ecocampus", "Fenix", "Sociale Economie op de Campus" and "Duurzaam Hoger Onderwijs Vlaanderen") (Tom, 2012)

Strategic marketing framework is sector specific and contextual. The education sector, as a driver of most of the developing economy, demands development of effective delivery mechanism to remain competitive in the international market. This is equally true in the case of marketing by public universities in the domestic market. Thus the researcher is in favour of aligning the framework to that of developmental planning to assist decision makers to co-ordinate economic decision-making over the long run.

2 Sustainability Development

2.1 Society in transition

In response to global environmental crises and vast social inequalities, world political leadership formally adopted sustainable development (SD) as a leading development model at the United Nations Conference on Environment and Development, in Rio de Janeiro in 1992 (Carley, 2000; Dalal-Clayton, 2002; Reid, 2005; Rogers, 2008). Embraced by many stakeholders worldwide (e.g. governments, businesses, nongovernmental organizations, higher education, and citizens), SD is deemed highly imperative for the current and future well-being of humanity and the planetary state (Tom, 2012).

In essence, SD stands for: (Gibson, 2000)

- a solution for environmental and development problems
- a set of principles implying positive objectives
- a focus for positive change
- a critique on conventional thinking and practice

In spite of past commitments and various SD measures taken, the practical implementation of SD on societal or global levels falls short (Lafferty, 2000; Sneddon, 2006; Fergus, 2005; Rees, 2010; Quental, 2011). Humanity is increasingly exceeding environmental limits (GFN, 2010; MEA, 2005; Rockström, 2009) and extreme poverty remain widespread. “Business-as-usual” measures do not suffice for sustainable development to succeed. Far reaching system changes are needed, which challenge and fundamentally alter our prevailing ways of development, including our fundamental beliefs, values and assumptions regarding what constitutes development (Rees, 2010). The first essential and logical step should be to eliminate clearly unsustainable practices (Cairns, 2004). —

True, —triple bottom-line || corporate planning is now fairly commonplace; various protocols for —green-building || compete to influence building codes; —new urbanism, || —smart growth, || and the ecocities movement are gaining ground everywhere; hybrid and electric vehicles are increasing their market share; and green consumerism is becoming mainstream in many developed countries—but none of this activity has made much difference (apart from fostering the illusion of progress) (Rees, 2010).

From a transition perspective, society is currently in the beginning of a chaotic and turbulent period of transformation towards a new equilibrium, where structural changes become visible through the accumulation of various system changes (e.g. socio-cultural, economy, environment, institutions, technology) – “early acceleration” (Raskin, 2002; WCED, 1987). However, it is unclear whether or not SD, understood as a dynamic equilibrium, will be achieved. An unsustainable future is still looming at the horizon. To many, this depends on society’s “willingness to act”, the choices yet to be made and the actions yet to be undertaken (Raskin, 2002).

2.2 Definition and principles

The most popular definition of SD is the one of the report “Our Common Future” (ULSF, 2012) also known as the “Brundtland report”.

"Sustainable development is development that meets the needs of the present without compromising the ability of future generations to meet their own needs." (ULSF, 2012) The report continues stating the two key concepts:

- the concept of ‘needs’, in particular the essential needs of the world’s poor, to which overriding priority should be given; and
- the idea of limitations imposed by the state of technology and social organization on the environment’s ability to meet present and future needs. (WCED, 1987)

The report also clarifies the content of the required change processes and as such renders its famous sustainability definition more concrete and operational: —In essence, sustainable development is a process of change in which the exploitation of resources, the direction of investments, the orientation of technological development, and institutional change are all in harmony and enhance both current and future potential to meet human needs and aspirations. (WCED, 1987)

3 Sustainable Higher Education

3.1 Why should higher education engage in sustainable development?

Sustainable higher education has emerged in response to calls for universities to lead society towards a sustainable future (Cortese, 1992; Lozano, 2012) and is considered a distinct but interdisciplinary specialization of study and practice within sustainability science (Filho, 2005; Beringer, 2008) and education for SD (Beringer, 2008; Fien, 2002). Higher education is generally seen as a major (potential) catalyst to work towards SD (Fien, 2002). The urgent societal need and broad call for SD allow higher education to assume a fundamental and moral responsibility in contributing to SD

(Carley,2000; Cortese, 1992). Through their societal mandate of advancing knowledge, educating leaders, and furthering societal progress and engagement (Clugston, 1999), institutions of higher education should be moral visionaries and centres of sustainability innovation and excellence. As „learning laboratories, “ campuses are to provide the lived experience of sustainable communities (Gonigle, 2006).

As major contributors to the values, health and well-being of society, higher education has a fundamental responsibility to teach, train and do research for sustainability. We believe that the success of higher education in the twenty-first century will be judged by our ability to put forward a bold agenda that makes sustainability and the environment a cornerstone of academic practice. (ULSF,2012)

This is a challenging task, recognizing that higher education (still) contributes to and sometimes even accelerates the sustainability crisis (Tilbury, 2012; Sterling, 2008). The scope and range of the negative impacts of university-educated people on the natural systems that sustain Earth are unprecedented. (Corcoran, 2004) and as Orr states, the sustainability crisis is not so much the work of ignorant people but —[...] largely the result of work by people with BA’s, B.Sc.’s, LLB’s, MBA’s and PhD’s. || (Cortese, 1992)

3.2 The situation

Marketing Management usually tends to be overlooked at the early stage of planning. This in turn will lead to higher spending cost due to redundancy plus expensive non-impact promotional materials. Taking Marketing Management seriously is second to none to ensure organization survival. To solve the problem, a context specific strategic marketing framework will be developed to ensure planned activities during the initial phase of service delivery so that any problem can be fixed at an early stage.

Cheryl Slover-Linett and Michael Stoner deployed a second survey in November 2008 asking a wide group of communications professionals to choose their own top three challenges from among our list of nine, and to share their strategies for addressing those concerns. The respondents were professional colleagues; publicized the survey on listservs (Communications-L; Pubs-L; UWEBD); and even sent email to bloggers with links to the survey for them to convey the survey to the members inviting them to respond to the survey. (Cheryl, et al, 2009)

Response was enthusiastic. They heard from 245 respondents, primarily from the fields of marketing, public relations and development. They heard from institutions small, medium and large, with an equal number of public and private institutions represented. Most respondents were in the Midwest, largely due to strong participation on the previous survey. And the results, coming as they do during a distressed economy, are interesting. (Cheryl, et al, 2009)

According to the survey, if some things never change and that institutions are still challenged by fundamental questions about how to market themselves effectively? Here, in order of prevalence, are the top nine challenges identified by respondents to our second survey:

Table 1 Challenges on Marketing Higher Education

Rank	Challenge	Rating it in Top 3
No 1	Branding and messaging	62%
No 2	Rethinking and expanding communication outreach approaches and formats	52%
No 3	Incorporating new media and/or technology strategies	37%
No 4	Economic downturn in general	36%
No 5	Appealing to a wider range of prospective Students	36%
No 6	Budget cuts or insufficient funding	35%
No 7	Decentralization within the university and/or marketing department	20%
No 8	Internal organizational struggles and staff Turnover	18%
No 9	The cost of higher education	10%

4 Conclusions

In an era of dramatic human-induced environmental problems and failing socio-economic and institutional systems, seriously threatening the well-being of current and future generations, it is widely recognized that higher education has the ethical and moral responsibility to transform itself to become a leading force in catalysing societal changes for sustainable development. Central to its “raison d’être” higher education has always been at the forefront of societal developments and progress through their traditional mandates of education, research, and public service. As such an extension to sustainable development is logical.

For more than two decades, and since Chapter 36 “Promoting Education, Public Awareness and Training” of Agenda 21 – the global sustainability plan of action – higher education has been examining, grappling with, and in some cases engaging with and attempting to implement the concept of sustainable development. One public way of doing this is by signing declarations and attempting to implement sustainability in various activities throughout the institution. However, in transition terms, it can be argued that higher education must take its efforts further and move towards (early) acceleration in which policy and structural changes become visible. In order to accelerate the transition to sustainability in higher education, institutions must (re)orient themselves “towards” SD, and use it as a constant frame of reference.

In moving towards becoming more sustainable, higher education requires a whole systems approach that targets the entire system and its various subsystems (all activities and the way it is organized) in need of fundamental system changes and considering all sustainability principles together. Maybe we should have started to take marketing as part of the tools on sustaining the higher education. While sustainable higher education is still an emerging field of study and practice, the acceleration process can already build upon a sound body of knowledge of implications and approaches for various higher education activities including education, research, public service and campus operations. Insufficient or unavailable knowledge cannot be an argument to slow-down or postpone further action. If any, it is more a question of priority setting, willingness and learning. We hope that this paper contributes to the transition of Flemish higher education towards SD.

A Qualitative Investigation of Sustainable Sourcing Practices in the Nigerian Shea Butter Industry: A Case Study of a Top-Tier Supplier

Sidikat Shitu, Ashemi Baba Ali

Faculty of Economics and Business, Universiti Malaysia Sarawak
(E-mail: siddyshitu@yahoo.com, ashemites@yahoo.com)

Abstract: This paper investigates sustainable sourcing practices in the Nigerian shea butter industry. The paper utilised the case study qualitative approach to investigate the sourcing practice of a registered and certified top-tier supplier (Sokaiko Shea Butter and Agro Processing Co. Ltd), a member of the National Shea Products Association of Nigeria (NASPAN) also a supplier under the auspices of the Global Shea Alliance (GSA). The results from the case study revealed that the top-tier supplier developed a business codes of conduct in line with GSA sustainability guidelines to ensure ethical practices which respects the social, economic and environmental aspects of supply chains. The top-tier supplier provides practical ways of how sustainable sourcing is incorporated into the practices of lower-tier suppliers with support from the external actors. The limitation of this study is that, the study concentrated on a single top-tier supplier and its relationship with the lower-tier suppliers, it is therefore recommended that further research should be done using the context of other certified top-tier suppliers within the supply chain network or a comparative study of the sourcing practices of certified and non-certified top-tier suppliers can be carried out to investigate the level of commitment and behaviour of suppliers towards ensuring sustainable buying and selling practices in the shea butter industry.

Key words: Sustainable sourcing; Shea butter; Supply chains; Standards; Nigeria

1 Introduction

There have been concerns about noticeable social, economic and environmental sustainability challenges in The African shea butter and shea kernel supply chains (Boffa, 2000; Lovett, 2010; Carney and Elias, 2006). Many external stakeholders, such as the government, nongovernmental organizations, communities, multinational companies, consumers and the media have been clamouring for sustainability in the industry as well as change in the supply chain strategies and practices of suppliers (Abujaja et al., 2013). In the context of the Nigerian shea butter industry, the external stakeholders' i.e. NEPC, GIZ, GSA, NSCEPA who are not directly part of the supply chain saw the concerns as a wakeup call for intervention to ensure that suppliers and buyers act responsibly in their supply chain activities. Researchers suggest that engaging in responsible supply chain will pave way for innovative ideas and strategies to rejuvenate the shea butter industry and give room for the implementation, transmission, adoption and use of sustainable standards and certification in supply chains, this will further promote sustainability in rural commodity supply chains (Lovett, 2010; Schneider and Wallenburg, 2012; Tertappen et al., 2013). This study therefore, examines and presents the sustainable sourcing practice of a top-tier suppliers and its relationship with the lower-tier suppliers in the Nigerian shea butter industry.

2 Conceptualising Sustainable Sourcing

Research in the area of sustainable sourcing have gained more momentum in terms of suppliers' relationship as well as buyer-suppliers relationships in the developed nations than what is obtained in the developing and less developed countries of the world (Anisul Huq et al., 2014; Pagell and Schevchenko, 2014; Gimenez and Sierra, 2013). Recently, events and attention around sustainable supply chain management research began to change especially in the past one decade when external stakeholders began to raise their voices against companies who are not taking care of the social and environmental consequences of their activities along supply chains. For instance, Nike was hit by serious agitation by activists and campaigners that it should consider implementing corporate social responsibility which will eliminate the social issues associated with its relationship with network of weak suppliers (Holden, 2012). Schneider and Wallenburg (2012) argued that the implementation of sustainable sourcing in supply chains play a critical role in reshaping the approaches businesses use for procurement and sourcing, though this will require the support of state actors through policy instruments to curb the social and environmental sustainability issues.

Research in this area is considered very important as it encompasses the social, economic and environmental aspect of supply chains which requires adherence to guidelines and standards which must

be respected when sourcing commodities (Gold et al., 2013). Researchers who focused on the social aspect of supply chain in the area of sourcing always advocate of for ethical practices in the relationship between the buyers and suppliers in terms of working condition, pricing and child labour (Leppelt et al., 2013). In this regard multinational companies and other private organization are expected to have ethical code of conducts to promote fair pricing when sourcing commodities, this include SMEs (Wilhelm et al., 2013). While others are advocating for better working condition and prevention of child labour in supply chain (Schneider and Wallenburg, 2012). Nevertheless, in the aspect of environmental protection a lot of research has been done in the area of risk management and resources use and its impact in degrading the ecosystem (Chaplin-Kramer et al., 2015). Researchers have suggested that the interconnections between the triple bottom aspects of supply chain should be studied holistically to determine the performance of buyer-supplier relationship while sourcing commodities (Leppelt et al., 2013).

This development encouraged more researches, in which sustainable sourcing have been termed by various researchers by the different names which all suggest sustainable supply chain management. For instance, some refer to it as ethical sourcing/buying (Chen and Slotnick, 2015), responsible sourcing (Young and Osmani, 2013), responsible procurement/buying (Ferri et al., 2014), socially responsible sourcing/buying (Wesley et al., 2012) environmentally responsible sourcing (Bazan and Jaber, 2016), sustainable procurement (Walker et al., 2012) etc. In a nutshell researchers have come up with various definitions of sustainable sourcing in which the definitions are all struggling to present a comprehensive way of looking at what sustainable sourcing means in the context of triple bottom line. Many researchers have defined sustainable sourcing in various ways but the most encompassing one which brings the triple bottom line approach together, is the definition provided by Pagell et al., (2010) they mentioned that it involves “managing all aspects of the upstream component of the supply chain to maximise triple bottom line (TBL) performance”.

3 Sourcing Strategy in the Nigerian Shea Butter Industry

Sourcing shea products in Nigeria is not fully controlled even though there is increasing demand for shea butter across the globe which has led to agitation by consumers through multinational companies to ensure certification, labelling and traceability to find out the source of shea butter produced from Africa (Bup et al., 2014). Nevertheless, evidences have shown that shea products are mostly sourced in an unethical manner from Africa countries, in which Nigeria is inclusive and most exporting companies are involved in this unethical sourcing which involves exploitation and use of child labour (Vanguard, 2015). For example, Elias and Arora-Jonsson (2016) found that Gurunsi and Moose women use their children for shea nut picking and shea butter processing. To discourage unethical sourcing in Nigeria, the federal government, instituted various programs and adopted some international standards from International Organization for Standardization (ISO) using the Standard Organization of Nigeria (SON), Nigerian Export Promotion Council (NEPC) in collaboration with the state governments, GIZ, local NGOs and adopted multiple standards geared towards achieving socially responsible value and supply chain management to mitigate social, economic and environmental issues in supply chain. The adopted ISO standards that are related to sustainable supply chain are ISO/TC 207 Environmental Management, ISO/PC277-ISO/26000 for Sustainable Procurement, ISO/TC/34 food products, Global Shea Alliance (GSA) sustainability guidelines.

The above mentioned standards are not the only standards available to shea butter industry, there are multitude of voluntary standards that can be adopted and used by buyers and suppliers to manage how shea products are produced and supplied. The logic behind this is that, with sustainability sourcing order, buyers and suppliers can be certified and qualified to participate efficiently in domestic and export supply chains i.e. for shea kernel and shea butter supply chains. This certification can promote products by mere labelling as sustainably sourced and processed. Moreover, research on sustainable sourcing in the context of the Nigerian shea butter industry is relatively scarce, even though a lot of effort is ongoing to make the shea butter industry a sustainable one in terms innovating value chain, supply chain practices and most importantly ensuring that responsible relationship exist between buyers and suppliers as well as with the environment.

4 Sustainable Business Code of Conduct

In the sustainable supply chain literature, the implementation and use of business code of conduct is one of the measures taken by companies to ensure sustainability in supply chains. In which, Barkemeyer et al., (2014) suggested that business code of conduct is a tool that can improve business

ethical performance and the study by Gray (1990) confirms this by emphasizing on the importance of business code of conduct and sustainability in supply chains. As a result of the continuous demand for ethically processed shea butter, the shea butter industry needs to ensure that all layers of suppliers abide by sustainability standards and ethical codes of conducts in their supply chain practices. The identification and choice of responsible suppliers to supply either shea kernel or shea butter is an important responsibility of the buying company (Pouliot and Elias, 2013) as Bello-Bravo et al., (2015) opined that socially responsible sourcing of shea butter and kernel from the lower-tier (rural women) has become a matter of urgency for strong suppliers and buyers of shea butter so as to meet up with the demand of multinational companies who want to improve their own cooperate social responsibility.

This is so because it is now an important practice of the big buying companies to ensure that their business code of conducts and policies are incorporated along their supply chains by influencing suppliers to maintain responsible methods of sourcing by enhancing the relationship between the lower-tier suppliers and top-tier suppliers (Lovett, 2010; Drost et al., 2012). Though buyers and consumers may be unconvinced with suppliers' sustainable business code of conducts and be thinking it is just mere business strategy as it is obtained in many commodity supply chains. Many top-tier suppliers may have aligned to various public rules and guidelines for supply chain within their country of operation but may not be able to convince foreign buyers that those guidelines are good enough and can be reliable for international business. For example, the guidelines provided by a state department on sustainability may be recognised within the state of operation but may not be acceptable in the global context. In a bid to find a solution to this challenges many private sustainability standards came up to counter the doubt and that was why most agricultural commodity supply chains are aligning with private standards setting organizations such as Fairtrade (Elias and Saussey, 2013; Elias and Arora-Jasson, 2016)

5 Research Objective

To give an account of a top-tier supplier sustainable sourcing practices and its relationship with the lower-tier suppliers (rural women) in sourcing shea butter and shea kernel in the rural communities of Niger State, Nigeria.

6 Methodology

We adopted a qualitative case study methodology to investigate the sustainable sourcing practice of a top-tier supplier in the shea butter industry. We selected this top-tier supplier (Sokaiko Shea Butter and Agro Processing Co. Ltd) because it is a registered and certified top-tier supplier and a member of the National Shea Products Association of Nigeria (NASPAN) also a supplier under the auspices of the Global Shea Alliance (GSA, 2013). The data collection approach is semi-structured interview approach supported by secondary data from GSA website. The director of Sokaiko Shea Butter and Agro Processing Co. Ltd was interviewed in February, 2015. Going by the research objective, the questions asked were based on the supply chain practices of the top-tier supplier which include buyers-suppliers relationships, use of sustainability standards, and business code of conducts. The logic behind the use of interviews for this study is to get the view of the top-tier supply on sourcing practices in the Nigerian shea butter industry. This approach is exclusively used because not so much is known about sustainable sourcing in the Nigerian shea butter industry and an insight to the phenomenon is required. Letter of consent for the interview with a sample of the interview checklist was sent to the company to seek permission for questioning the director and to use voice recorders for audio recordings and camera for video recordings and photos of the interview session. The data collected were transcribed and analysed using QSR Nvivo 10, this was done thematically and not only the interviews were analysed, the nonverbal expressions of the interviewee was equally considered (Fontana and Frey, 2000).

7 Results and Discussion

This case study focuses fully on Sokaiko Shea Butter and Agro Processing Co. Ltd, a top-tier supplier in the Nigerian shea butter industry, a member of the National Shea Products Association of Nigeria (NASPAN) and it is listed among the top suppliers under the auspices of the Global Shea Alliance (GSA, 2016) the company supplies processed and certified shea butter produced by the company and shea kernel sourced from the rural women but sorted and repackaged by the company. As a certified supplier, the director of the company is an executive member of the Global Shea Alliance who is saddled with the responsibility of ensuring sustainability in supply chain. Sokaiko Shea Butter

and Agro Processing Co. Ltd provides the lower-tier suppliers with the required guidelines to facilitate sustainable practices, the company ensure that it source its shea kernel and butter from registered cooperatives by the state government, some them are also listed as members of the Global Shea Alliance, this is done to show sustainability in the chains of supply. Sokaiko Shea Butter and Agro Processing Co. Ltd also support the cooperatives in the practice of responsible supply chain by providing them with information related to the sustainability of the industry through trainings and sensitization. The managing director of company gave a detailed account of the challenges the company encounter while relating with the lower-tier suppliers especially with the presence of social, economic and environmental sustainability challenges in the shea butter industry.

The Niger State Commodity and Export Promotion Agency (NSCEPA) in collaboration with German Technical Cooperation (GIZ) and Nigerian Export Promotion Agency (NEPA) launched three shea-butter-villages in Farinshinge, Assanyi and Kodo villages to support sustainability and improve buyer-supplier relationship in the industry. The director described sustainable supply chain as “a means of reducing poverty among women and rural communities” (Jibril, 2015). When the director was asked to describe the companies sourcing strategies in relation to sustainable sourcing, Jibril (2015) explained that:

We respect the ethics in the shea butter industry, as part of our mandate we don't support under age people participation in our supply chain because that is child labour, even our international buyers and development partners don't encourage the use of children in shea butter production.....To discourage this, we pre-finance the products we buy from the rural women so that they can get adults to work for them in shea nut picking and processing, for instance if a ton is sold for 150,000 naira we give them about 70, 000 to 80,000 Naira to aid ethical production and when they finish processing we pay them the balance.....Also, we buy about 2000 metric tons every year, we contract the middle-men (local buying agents) to help us buy the quantities that we want from the rural women in the villages because it is the fastest way to get the required quantity though we provide them with our code of conduct which respects the principles of sustainability.

He further described the company's labelling and traceability strategy as:

What we usually do is that, we tell the local buying agent to label the products from the source, so that we will be able to know the villages where the shea kernel is coming from because we also monitor the processing practices of the women in various villages. So that we can understand the kinds of quality we are getting from different places and whether the product is ethically produced. We report back to the rural women if the quality is either good or bad..... I have been trained and I have been in the field for 10 years I have gone for different local and international seminars on shea nuts and shea butter processing, we do this because quality and traceability is equally important to our buyers.

Sokaiko's business code of conduct touches the triple bottom line aspect of supply chain. This is shown by its business principles which is in strong alignment with the Global Shea Alliance sustainability guidelines. The sustainability guideline was developed in consultation with various women's groups, non-profit organizations, US and European food and cosmetic brands, and international oils and fats suppliers in which Sokaiko Shea Butter and Agro Processing Co. Ltd was actively involved to promote women's empowerment, decent working conditions for actors, development of local communities where shea is processed, and the protection of ecosystems by outlining best business practices for all actors (GSA, 2015). When asked about the relationship between the company other top-tier suppliers and buyers in promoting sustainable sourcing, he responded by saying:

We need to continue working together to ensure sustainability but the situation is that, the market itself is a buyer driven market because the buyers determine the price and not the suppliers and what it means is that we the suppliers are price takers. We give price usually when there is scarcity and shortage. Though price negotiation at the international market is ok, because the price has relationship with the price of cocoa and it is regulated by different actors from different countries with the support of our international body (Global Shea Alliance).

Jibril (2015) is of the conviction that the shea butter industry can become completely sustainable in the nearest future especially with the intervention of the external factors such as the government, NGOs, communities, multinational companies (buyers), consumers and the standard setting organizations. Innovating the supply chain strategy of the actors involved is an intricate process as many actors who are unregistered are involved which have negative implication for the shea butter industry. Even those unregistered lower-tier suppliers who are willing to practice sustainable supply chain face challenges of lack of infrastructure, inadequate finance and cost of registration to get

certified.

8 Conclusions and Limitation

This research is limited to a single certified top-tier supplier. The case of Sokaiko Shea Butter and Agro Processing Co. Ltd demonstrates how the lower-tier suppliers are carried along in the practice of sustainable supply chain. It demonstrated that the top-tier suppliers' business code of conducts can impact positively on the lower-tier suppliers in their supply chain practices. The participation of Sokaiko in the Global Shea Alliance sustainability program has earned it a global recognition in the very competitive African shea butter industry. Though Sokaiko's concentration on the lower-tier suppliers in Niger State, could limit its potential as a company towards extending its sustainability practices to the other producing states in Nigeria. Nevertheless, the top-suppliers implementation of Global Shea Alliance sustainability guidelines and principles is its major contribution to social, economic and environmental sustainability in the shea butter industry. Conclusively it is recommended that other top-tier suppliers in the shea butter industry could adopt Sokaiko's sustainable sourcing strategies in order to innovate and promote sustainability in the Nigerian Shea butter industry.

Further research can be carried out using the context of other certified top-tier suppliers or a comparative study of certified and non-certified top-tier suppliers sourcing practices can be carried out to investigate the level of commitment and behaviour of suppliers towards ensuring that social, economic and environmental aspect of supply chains is respected in the shea butter industry.

The Dilemma and Countermeasures on Development of Circular Economy in Iron and Steel Industry in China

Yin Zhiping

School of Management, Wuhan University of Science and Technology, Wuhan, P.R.China, 430070
(E-mail: 470589406@qq.com)

Abstract: By analyzing the current situation of the development of circular economy in China's iron and steel industry, the article points out the bottleneck of the current steel industry, and puts forward reasonable and effective measures to solve the problem. The purpose is to provide constructive reference for iron and steel enterprises to move towards the trend of economic development. At the same time, to deal with the more and more urgent problems of resources and environment, to relieve the pressure of environment and resources, and step forward to the national sustainable development strategy are of great significance. Iron and steel enterprises are gradually developing into resource saving industry, and shaping great significance to the national sustainable development strategy.

Key words: Circular economy; Iron and steel industry; Dilemma; Countermeasure

1 Introduction

The development of national economy relies on foundation industry support. Only when the foundation industry development is established on a solid foundation, can national economy be built steadily and high. As one of the cornerstone industries of the national economy, iron and steel industry supports and promotes the development of national economy. It also shows the level of national economic development.

In the process of foreign industrialization, the developed countries have also encountered problems such as environment, energy and so on. A series of representative theories and methods have emerged. The theory of sustainable development and the theory of circular economy are worthy of our reference. In China, with the rapid development of society and the fast growth of the national economy, resources and environment have become the world's highly concerned problem. Because of the deep dependence on resources and great pollution to the environment, iron and steel enterprises are inevitably subject to more and more constraints. Therefore, it is imperative to explore the development of circular economy in iron and steel industry (Mathews J.A., 2011).

The concept of a circular economy was first proposed by two British environmental economists, Pearce and Turner (1990), who put forward a similar loop of material flows within an economy. It was further used to analyze the relationship between economic and natural systems (Su et al., 2013). Based on the ideas of "reduce, reuse, and recycle", circular economy is a mode of economic development that aims to protect the environment, reduce pollution, and keep sustainable economic development. Consistent with the trends of the globalization, China's iron and steel enterprises are positively implementing the circular economy development schema. Under this background, a lot of scholars have conducted extensive research into the subject in many aspects.

When it comes to researches on the circular economy development in iron and steel industry, Cui and An (2008) affirmed that the circular economy development of the Hebei Iron and Steel Group used the practices of Tangshan Iron and Steel and Handan Iron and Steel to carry on their harbor development mode and city development mode, respectively. Gao et al. (2007) pointed out that the circular economy development of the Hebei Iron & Steel Group should focus on three ways, which are inter-enterprise material circulation, regional circulation, and social circulation. On the basis of study on the theory of industrial circular economy, Wang (2009) suggested that establishing an eco-industrial park would be an excellent model for the Anshan Iron & Steel Group.

By comparison, foreign studies mainly focus on the exploration into the potential of a circular economy as a model for industrial organization at the global level. Central to the circular economy in iron and steel industry is the idea that open production systems, in which resources are extracted, used to make products and become waste after the product is consumed, should be replaced by systems that reuse resources and conserve energy. (Su, B.W., 2013; Troschinetz, A.M., 2014; Tseng, M.L., 2013)

Owing to future-oriented technology and advanced conception, foreign developed countries have accumulated a great deal of experience in the development of circular economy, and there are definitely lessons they can teach us.

2 Status of Circular Economy in China’s Iron and Steel Industry

2.1 The status of steel output

It is well known that China’s steel production has been steadily increasing in the last ten years. Figure 1 indicates China’s steel output data from 2005 to 2014. At the same time, China’s iron and steel industry is also highly energy-intensive, accounting for approximately 15% of all energy consumption in China. In recent years, the iron and steel enterprises have been searching for new methods to increase energy efficiency and reduce energy consumption.

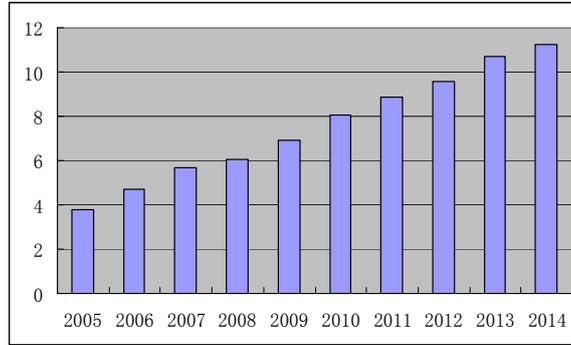

Figure 1 China’s Steel Output,2005-2014 (100million tons)
Source: China Steel Yearbook, 2005-2014

2.2 Energy consumption

Over the past 10 years of this century, it is obvious to all that China has achieved rapid development, with high rates of industrialization and urbanization. The direct consequence is that it has to face severe resource related and environmental challenges. Building a circular economy is considered to be essential to fulfill the strategic objectives of building a harmonious and healthy society. Table 1 shows that China’s national key iron and steel enterprises have reduced their energy consumption across the board. For example, the biggest difference of energy consumption with respect to steel rolling is up to 233 kgce/t, which reveals that there exists a wide gap in the process of energy consumption, thus energy saving is quietly potential. Only by adopting circular economy principles, can China’s iron and steel industry survive and develop in the 21st century.

Table 1 Energy Consumption of Main Process of Key Steel Enterprises in 2014 (unit:kgce/t)

Process energy consumption	Sinter	Pelletizing	Coking	Puddling	Convertor	Electric furnace	Steel rolling
average	66.38	42.11	142.21	466.21	26.57	209.89	92.91
advanced value	52.06	19.22	88.13	395.41	-3.77	146.31	53.68
lagged Values	108.6	83.3	229.15	591.81	75.23	325.44	286.89
the difference	56.54	64.08	141.02	196.4	79.01	179.23	233.21

Source: China Steel Yearbook, 2014

2.3 The Significance of the implementation of circular economy in iron and steel industry in China

With the development of society and economy and the increasing requirement to the living environment, the steel industry has been put forward stricter resources, energy and environmental protection. Ecological environment has become a fundamental problem affecting the development of iron and steel industry. Therefore, the implementation of circular economy is the only way to sustainable development of the iron and steel industry (Yuan Wei, 2014).

The China’s achievements in the development of circular economy of iron and steel enterprises mainly focus on energy saving and emission reduction, technical reform and corporate structure change. Energy conservation and emission reduction includes recycling on energy and resource and comprehensive utilization of waste. Without the support of advanced science and technology, the development of circular economy in iron and steel industry cannot be carried out smoothly.

Iron and steel industry is the basic industry of the national economy, is also the high energy consumption, high water consumption and high pollution industry. How to accelerate the rapid development of iron and steel industry in our country, and to improve the efficiency of resources and environmental protection, has become an urgent task. Therefore, circular economy provides an effective way.

2.4 Assessing a circular economy in iron and steel industry

Early studies on the circular economy in iron and steel enterprises mainly focus on the evaluation of cleaner technology (Bao et al., 2003; Zhou et al., 2001); subsequently, the principle of “efficiency” was introduced to evaluate the system, including resource efficiency and iron resource efficiency (Dai and Lu, 2006). Referring to the literature and consisting with the connotations of the term “circular economy” and the characteristics of steel industry in China, this study suggested the following formula:

$$CEECI = \sum_{i=1}^n \lambda_i * W_i$$

Where:

CEECI is the circular economy efficiency composite index,

λ_i is the weights of indicators, and

W_i is the normalized index value.

The first indicator expresses the level of facility used, such as coal injection into a blast furnace and iron resource efficiency; the second one is the comprehensive utilization efficiency of materials such as coke oven gas, converter gas, blast furnace slag, and so on. The third one indicates the pollutant level (i.e., SO₂ emissions), and the fourth one explicates the resource consumption level of fresh water. To ensure that the indicators are comparable, they are supposed to be normalized in advance.

The weights of these indicators were given by conducting a questionnaire survey of at least eight experts, by which we can objectively synthesize those experts' experiences and subjective opinions, then make reasonable estimates of the weight values following several instances of consultation, feedback, and adjustment. Each indicator weight was obtained by reorganizing the information given by those experts after a couple of consultation, feedback, and adjustment sessions.

3 The Dilemma in the Development of Circular Economy in Iron and Steel Industry

Under the common efforts of all sectors of the country, the development of China's iron and steel enterprises achieved remarkable results. But due to the short time of the development of circular economy in China, the development of circular economy of iron and steel enterprises in China is facing the following difficulties (Feng Zhengjiang, 2011).

3.1 Management dilemma

The management of iron and steel enterprises affects all aspects of the internal and external development of enterprises. As long as there is only one problem, it will lead to mistakes in decision-making, even result in huge losses. Because of lack of experience, the enterprises encountered a bottleneck in management. Therefore, the more modern scientific management has become an important part of the development of circular economy in iron and steel enterprises.

3.1.1 Resource management

Taking into account the long-term utilization of resources and the impact of frequent and even over exploitation on the ecological environment, as a major steel producing country, although China's vast territory, abundant resources, and rich iron ore reserves, we still need a lot of foreign imports every year. This leads to an increase in the cost of steel production. On the contrary, as the world's largest iron ore imports, Japan's iron ore import price is far lower than other countries. The reason is that Japan's iron ore resources are acquired by collective purchase. So the enterprises use the advantages of large demand to get more affordable prices. Our country can learn from Japanese experience. On one hand, it can greatly reduce production costs, On the other hand, it is conducive to the management and planning of resources.

3.1.2 Energy management

Due to technological backwardness and lack of energy use planning, energy cannot be fully utilized. In recent years, the lack of energy has made the purchasing cost more and more high, and at the same time, the loopholes in the energy management also increase the production costs.

3.1.3 Product quality

Most enterprises still control product quality by using computer system, which results in lower quality products, and cannot make products among high- rank. Obviously our product quality control is still not perfect and there are loopholes in many aspects.

3.1.4 Production efficiency

As a manufacturing enterprise, the efficiency level of enterprise depends on the production efficiency. If the production efficiency is low, when the customer's demand is great, short supply will

come into being, and enterprises need to pay extra for overtime work. This will make the production cost higher.

3.1.5 Financial management

China's iron and steel enterprises' financial management only stays in daily business settlement. There is no overall, general plan in capital flow, material flow and information flow. Funds cannot be better used, which results that enterprises have no more money to seek a breakthrough.

3.1.6 Information integration management

Due to the influence of information source and information processing, extraction and the speed of information feedback, enterprises cannot get timely and accurate information on consumers and the market. Subsequently, the manager cannot adjust and change the enterprise decision-making timely according to the market change, which affects the long-term development.

3.2 The dilemma in the technology and equipment

In the development of circular economy, China's iron and steel enterprises require both overall arrangement and leading scientific and technological level. The problems such as lower product quality, lower production efficiency, higher energy consumption and higher pollution emissions can be solved only through the progress of science and technology. At the same time, the progress of equipment also cannot be ignored. China's iron and steel enterprises have a lot of room for improvement in technical equipment.

3.3 The dilemma in fund

Due to the short development time, there are many deficiencies in technology and management, it is necessary to buy some foreign advanced technology, and hire foreign top professional with high salary. This makes the financial pressure of China's iron and steel enterprises to become larger. In the face of such a higher investment but less return, many iron and steel enterprises need to support from the state funding. In view of the current downturn in the steel industry, the country's financial burden is also growing, the enterprises are also facing the risk of layoffs.

3.4 The dilemma in talents

Talent problem is the biggest bottleneck in the development of circular economy in iron and steel industry. Talent problem is the biggest bottleneck in the development of circular economy in iron and steel industry. Currently, the overall technology innovation level is low. The building of innovative talent team remains to be strengthened. In China, large and medium-sized state-owned iron and steel enterprises hold relatively more innovative talents, while the small-sized enterprises hold relatively less talents. In addition, although most enterprises pay high attention to the introduction and training to talents, the brain drain is still serious owing to the enterprise system, enterprise efficiency, social environment and other factors.

4 Countermeasures to Implement Circular Economy in Iron and Steel Industry in China

As a typical process manufacturing, iron and steel enterprises have the characteristics of resource intensive and energy intensive. Due to the complex manufacturing process and structure, a large amount of substances and energy are released in production, which contains the possibility of reduction, reuse and recycling process. The implementation of recycling industry chain construction is an effective way to realize energy saving and emission reduction in iron and steel industry. The following measures will be fully considered.

4.1 Countermeasures in resource management

China's iron and steel industry is not concentrated enough, and cannot play a great demand to drive down the price in the resources import. This is also the fundamental reason for the high price of iron ore resources. Therefore, the government should intervene to carry out macroeconomic regulation and control to the iron and steel enterprises, promote the merger of iron and steel enterprises, and play the advantages of advanced technology and adequate capital. Enhancement of enterprise concentration is helpful for the information exchange among the enterprises and the formation of a healthy competition. In order to increase the low utilization rate caused by the waste of resources, the only solution is to develop science and technology to catch up with the advanced level abroad. Only so, can all the iron and steel enterprises make common progress.

4.2 Countermeasures in energy management

Because of the similarity of energy and resources, it is equally important to improve the level of science and technology. As some kind of the energy produces harmful environmental pollutants during

use, iron and steel enterprises have to look for alternatives to clean energy. These alternatives not only reduce energy consumption, but also reduce environmental pollution.

4.3 Countermeasures in product quality and production efficiency

Product quality and production efficiency are related to the management to workers. The enterprises should establish and improve the monitoring mechanism and reward and punishment mechanism to regulate the management to workers. Mutual supervision between workers should be encouraged. A clear division among workers should be introduced. Only when each link in the production of division of labor is very clear, it is conducive to control product quality and improve production efficiency.

4.4 Countermeasures in talents

In the development of circular economy, whether it is management or technical problems, the participation and support from professional personnel is the key to solve problems. The personnel training can be carried out from two aspects at the same time. On one hand, the senior managers of enterprises should receive higher professional training such as MBA. On the other hand, On-the-job training should be offered to new employees.

5 Conclusions

China's Government clearly put forward the target of major pollutants emission reduction and the development of circular economy strategic in 12th Five-Year Plan. As China's major energy consumption, iron and steel enterprises must carry out the two energy recovery and utilization to promote energy conservation and emission reduction by using the principle and principle of circular economy, which has become the key factor in the development of iron and steel enterprises (Yang Xiaodong, 2014).

Facing more and more pressure from resources and environment, iron and steel enterprises must carry on to develop circular economy, commit to the development of eco-friendly enterprises, and adhere to the strategy of sustainable development. In the process of developing circular economy in iron and steel enterprises, due to the lack of experience and theoretical concept, there appeared a lot of problems such as management, technology, human resources, finance, resources, energy and pollution treatment. As the theme of social production and economic growth, the implementation of circular economy is not only the corporate responsibility, but also a challenge and an opportunity. Implementing circular economy can strengthen the competitiveness of China's iron and steel enterprises and enhance the economic strength of the country. The dream of China's "iron and steel power" is closer.

Practice proves that it is the only way to execute sustainable development for China's iron and steel enterprises to develop circular economy, improve the efficiency of resource utilization, improve production efficiency, eliminate backward production capacity, and achieve comprehensive utilization of waste. This study is only a preliminary probe into the circular economy in China's iron and steel industry. Further study is required in the future. By prescribing the aforementioned countermeasures, the iron and steel industry can increase its energy efficiency, reduce its resource consumption, and improve environmental quality. For the national iron and steel industry, the next step would involve building harmonious partnerships in the process of carrying out the aforementioned courses of action.

Health and Environment Ranking: A Study of the Countries at the Ibero-American Region and Its Challenges ahead

Cristina M. Alcântara de Brito Vieitez, Arnaldo Jose de Hoyos Guevara
Pontificia Universidade Católica - São Paulo, Brazil
(E-mail: cristina.alcantara@hotmail.es, arnoldodehoyos@yahoo.com.br)

Abstract: This is an exploratory study of Health and Environment conditions concerning 132 countries in the world, that lead to produce a ranking among 21 Iberoamerican countries, based on World Bank Data (2015) and the guide for sustainable planning – GPS prepared by the Future Studies Center of PUC-SP (Pontifical Catholic University of São Paulo) for the Observatory of the Iberoamerican Region - ORIBER. Through a mixture of Multivariate Statistical Analysis techniques this work came to a list of 10 most representative variables of Health and Environment development of the Latin American Region that help to build a rank and classified the region into levels of development, that may help for strategic planning, monitoring and control at a country and regional base.

Key words: Health; Environment; Iberoamerica

1 Introduction

Improvements on the quality of environmental and health policies can make a big difference in the quality of life of the population anywhere. Food, water and energy are basic resources related to health and environment that need to be maintained and well administered in the search for a sustainable development. Iberoamerican countries have different economies, resources, infrastructure, governance, and a number of other factors that influence economic growth, causing inequality between people and disharmony opportunities. Some are more rural, poorer, more unequal internally, others deal with a share of more concentrated workers in urban areas, with a more bourgeois population, that control the means of production, but dealing with so many problems that reverberate in poor health and a lack of protected environment. In other words, the difference between the countries with regard to health and the environment calls for an adequate customization of the application of administrative and financial resources applied. It is important to say that, although Latin American region may have improved over time, there is still a long way in pursuit of sustainable development for which is the main concern of this study.

The concepts behind the theme Health and Environment were taken from the World Bank (2015) and the guide for sustainable planning – GPS prepared by the Future Studies Center of PUC-SP (Pontifical Catholic University of São Paulo) for the Observatory of the Iberoamerican Region – ORIBER. The last one is a document about the Sustainable Public Management. According to the GPS (2016), one of the big challenges facing today for the Ibero-American region is to identify how to balance the necessary economic dynamics to environmental sustainability and social balance in the context of an open, democratic and participative management.

One way to contribute to overcome to this challenge is to promote in each country, through the planning offices, synergies between the scientific, technological, socio-cultural and institutional sectors: such synergies should harmonize the processes and impacts of development in each country and region, making them sustainable, encouraging citizen participation as a contribution to improve the quality of life, and enjoying effectively the exchange of information and exchange of information and experiences with other countries in the Latin American region (GPS. 2016).

The economic, social and environmental imbalances in the Iberoamerican Region motivated the search for responses from the international community, and lead to the proposal of the 2030 Agenda for Sustainable Development and the 17 Sustainable Development Goals (ODS) including 193 countries represented at the United Nations General Assembly adopted in September 2015. These commitments recognize equality and sustainability as the guiding, shared and universal principles on which to base a new set of strategies and global regional and national policies (CEPAL. 2015).

Before the presentation of the subjects of this analysis and data involving the countries, it's important to present the framework behind.

2 The Theoretical Framework

According to the GPS - Guide to Sustainable Countries (2015), the Latin American and Caribbean

countries suffer from a large gap between the theoretical knowledge of environmental health and its practice in public policy. Access and benefits to the population are affected. This contrasts with the richness of these regions in biodiversity, yet extremely threatened. Most of the population is concentrated in urban centers, live in precarious conditions and its development model is historically linked to the predatory extraction of natural resources and exploitation of the land due to large monocultures for export, primarily to the colonies. This process today is called neocolonialism extraction (CEPAL, 2015).

Unfortunately, the destruction of the environment has often been much higher than should be acceptable for the survival of the human species. According to CEPAL (2015), nowadays, it shows two singularities. One of them is that the impact is not only local but affects common resources: the atmosphere, oceans, ice caps and biodiversity. The second is that, for the first time, there is a conscious and informed generation, from scientific evidence of this impact and the risk that human activities pose to the environment.

Changes in climate variables such as temperature and rainfall, have impacts on: reduced yields of subsistence crops such as potatoes and corn in Central America and the Andean countries; reduction in grazing areas, with effects on livestock productivity in Argentina and Paraguay; increased incidence of dengue and malaria in most countries; modification of plant and animal biodiversity, increasing desertification and deforestation; involvement of the hydropower sector of most countries in the Andean Region (Argentina, Bolivia, Chile and Peru) by reduced flows and increased sedimentation, and impact on tourism and infrastructure by high impact events (hurricanes and El Niño / Southern Oscillation) (CEPAL, 2015a, 2014b, 2014c; BID/CEPAL, 2014a, 2014b y DNP/CEPAL/BID, 2014).

As a recent IPCC report (2013) reiterates warming of the climate system is unequivocal (ex. storms in the Rio de La Plata, which have caused severe flooding, and the waves in the Mexican Pacific, as well as in Argentina and Uruguay). It is expected that extreme flood events are becoming more frequent and affect urban areas of the east coasts of the Caribbean and South America, mainly Brazil (CEPAL, 2012b) at the same time droughts are becoming more critical.

According World Health Organization (2015), the variables below traduce some of the Health and Environment problems to confront with:

- Maternal mortality rate (deaths/100,000 live births): The annual number of female deaths from any cause related to or aggravated by pregnancy or its management (excluding accidental or incidental causes) during pregnancy and childbirth or within 42 days of termination of pregnancy, irrespective of the duration and site of the pregnancy, per 100,000 live births.

- Stillbirth rate (deaths/1,000 live births): Third trimester fetal deaths (> 1000 grams or > 28 weeks), per 1,000 live births.

- Child mortality rate (deaths/1,000 live births): The probability of a child born in a specific year dying before reaching the age of five per 1,000 live births.

- Deaths from infectious diseases (deaths/100,000): Age-standardized mortality rate from deaths caused by tuberculosis, sexually transmitted diseases, HIV/AIDS, diarrhea, pertussis, polio, measles, tetanus, meningitis, hepatitis B, hepatitis C, malaria, trypanosomiasis, Chagas disease, schistosomiasis, leishmaniasis, lymphatic filariasis, onchocerciasis, leprosy, dengue, Japanese encephalitis, trachoma, intestinal infections, and other infectious diseases per 100,000 people.

- Access to piped water (% of pop.): The percentage of the population with a water service pipe connected with in-house plumbing to one or more taps or a piped water connection to a tap placed in the yard or plot outside the house (World Health Organization/UNICEF Joint Monitoring Programme, 2015).

- Access to improved sanitation facilities (% of pop.): The percentage of the population with improved sanitation, including flush toilets, piped sewer systems, septic tanks, flush/pour flush to pit latrine, ventilated improved pit latrines (VIP), pit latrine with slab, and composting toilets (WHO/UNICEF Joint Monitoring Programme for Water Supply and Sanitation, 2015).

- Indoor air pollution attributable deaths (deaths/100,000): Age standardized deaths caused from indoor air pollution, including indoor air pollution-derived cases of influenza, pneumococcal pneumonia, H influenza type B pneumonia, respiratory syncytial virus pneumonia, other lower respiratory infections, trachea, bronchus, and lung cancers, ischemic heart disease, ischemic stroke, hemorrhagic and other non-ischemic stroke, chronic obstructive pulmonary disease, and cataracts per 100,000 people. In the SPI model, data is scaled from 3 (<30 deaths per 100,000 people) to 1 (>100 deaths per 100,000 people).

- Life expectancy (years): The number of years a newborn infant would live if prevailing patterns of mortality at the time of its birth were to stay the same throughout its life.

- Non-communicable disease deaths (between the ages of 30 and 70 – probability of dying): The probability of dying between the ages 30 and 70 from cardiovascular disease, cancer, diabetes, or chronic respiratory disease.

- Obesity rate (% of pop.): The percentage of the population with a body mass index (BMI) of 30 kg/m² or higher (age-standardized estimate), both sexes.

- Outdoor air pollution attributable deaths (deaths/100,000): The number of deaths resulting from emissions from industrial activity, households, cars and trucks, expressed as the rate per 100,000 people.

- Health expenditure, public (% of total health expenditure) 2012: Public health expenditure consists of recurrent and capital spending from government (central and local) budgets, external borrowings and grants (including donations from international agencies and nongovernmental organizations), and social (or compulsory) health insurance funds. Total health expenditure is the sum of public and private health expenditure. It covers the provision of health services (preventive and curative), family planning activities, nutrition activities, and emergency aid designated for health but does not include provision of water and sanitation.

- External resources for health (% of total expenditure on health) 2012: they are funds or services in kind that are provided by entities not part of the country in question. The resources may come from international organizations, other countries through bilateral arrangements, or foreign nongovernmental organizations. These resources are part of total health expenditures.

- The Human Development Index (HDI) measures the progress of a nation from three dimensions: income, health and education United Nations Development Programme <http://www.pnud.org.br/atlas/ranking/Ranking-IDH-Global-2013.aspx>

- The Government Effectiveness (Governance): consists of the traditions and institutions by which authority in a country is exercised. This includes the process by which governments are selected, monitored and replaced; the capacity of the government to effectively formulate and implement sound policies; and the respect of citizens and the state for the institutions that govern economic and social interactions among them. The Worldwide Governance Indicators report on six broad dimensions of governance for 215 countries over the period 1996-2013: Voice and Accountability, Political Stability, Regulatory Quality, Rule of Law and Control of Corruption.

- The Environmental Performance Index (EPI): ranks how well countries perform on high-priority environmental issues in two broad policy areas: protection of human health from environmental harm and protection of ecosystems. <http://epi.yale.edu/epi>

- Happy Planet Index 2012 (HPI): is the leading global measure of sustainable well-being.

The HPI measures what matters: the extent to which countries deliver long, happy, sustainable lives for the people that live in them. The Index uses global data on life expectancy, experienced well-being and Ecological Footprint to calculate this. The index is an efficiency measure, it ranks countries on how many long and happy lives they produce per unit of environmental input. The 2012 HPI report ranks 151 countries and is the third time the index has been published (ABDALLAH, 2012).

- Ocean Health Index Score (OHI): The Ocean Health Index establishes reference points for achieving ten widely accepted socio-ecological objectives, and scores the oceans adjacent to 171 countries and territories on how successfully they deliver these goals. Evaluated globally and by country, these ten public goals represent the wide range of benefits that a healthy ocean can provide; each country's overall score is the average of its respective goal scores: Food Provision(harvesting seafood sustainably), Artisanal Fishing Opportunities(ensuring food for local communities), Natural Products(harvesting non-food ocean resources sustainably), Carbon Storage(preserving habitats that absorb carbon), Coastal Protection(preserving habitats that safeguard shores), Coastal Livelihoods & Economies(sustaining jobs and thriving coastal economies), Tourism & Recreation(maintaining the attraction of coastal destinations), Sense of Place (protecting iconic species and special places), Clean Waters(minimizing pollution), Biodiversity(supporting healthy).

- GINI index (World Bank estimate): measures the extent to which the distribution of income (or, in some cases, consumption expenditure) among individuals or households within an economy deviates from a perfectly equal distribution. A Lorenz curve plots the cumulative percentages of total income received against the cumulative number of recipients, starting with the poorest individual or household. The Gini index measures the area between the Lorenz curve and a hypothetical line of absolute equality, expressed as a percentage of the maximum area under the line. Thus a Gini index of 0 represents perfect equality, while an index of 100 implies perfect inequality.

- Social Progress Index (SPI): measures a complex mix of Basic Human Needs, Foundations of Wellbeing and Opportunity; and "(...) depends on the policy choices, investments, and implementation

capabilities of multiple stakeholders – government, civil society, and business” (Michael Porter, <http://www.socialprogressimperative.org/global-index/>, 2016).

Due to these all aspects, to deepen the understanding of the data of the variables that make up these issues may help in confronting and overcoming the challenges through which they pass the region.

3 Presentation and Analysis of Results

For the purpose of analyzing how the Iberoamerican Region as a whole is doing regarding Health and Welfare, the present study compares three Regions among a total of 132 countries: The Iberoamerican Region (AIBER) with 21 countries, an Advance Economies Region (AVECO) with 27 countries and the rest of other countries (OTHERS) with 84 countries. The study begins with an exploratory descriptive data analysis to understand the 20 indicators influence the Health and Environment of such countries. For this comparison was used the ANOVAs, based on the Knoema statistical database.

3.1 Individuals

Individuals of this analysis are the 132 countries analyzed by a number of international benchmarks. The data analyzed in each country are the Twenty variables described below.

- Seven Synthetic Indicators: Social Progress Index, Human Development Index - HDI, Governance Index, Environmental Performance Index - EPI, Happy Planet Index (HPI), Health Index Of Oceans - IHO and Inequality Index social or Gini.

- Thirteen Analytic Indicators: Maternal Mortality Rate, Stillbirths Rate, Infant Mortality Rate, Deaths by Infectious Diseases, Access to Piped Water Access The improved sanitation facilities, Deaths Attributable to Air Pollution Indoors, Expectation Life (years) Deaths by No Communicable Diseases Between the Ages of 30 And 70 (Dying of probability) Obesity rate, Deaths Attributable to Air Pollution Exterior, Public Health expenditure, External Resources for Health.

The 21 countries of the Iberoamerican Region which are going to be considered are: Argentina, Bolivia, Brazil, Chile, Colombia, Costa Rica, Cuba, Dominican Republic, Ecuador, El Salvador, Guatemala, Honduras, Mexico, Nicaragua, Panama, Paraguay, Peru, Portugal, Spain, Uruguay and Venezuela. Generally speaking, Spain and Portugal are always doing better regarding Health a Social wellbeing, so they may serve as examples for the rest.

Through a Dendrogram, that is a specific type of diagram or iconic representation which organizes certain factors and variables based on its similarity or distance, below it is showed the clusters or groups by how correlated are the variables; and hence showing similar behavior.

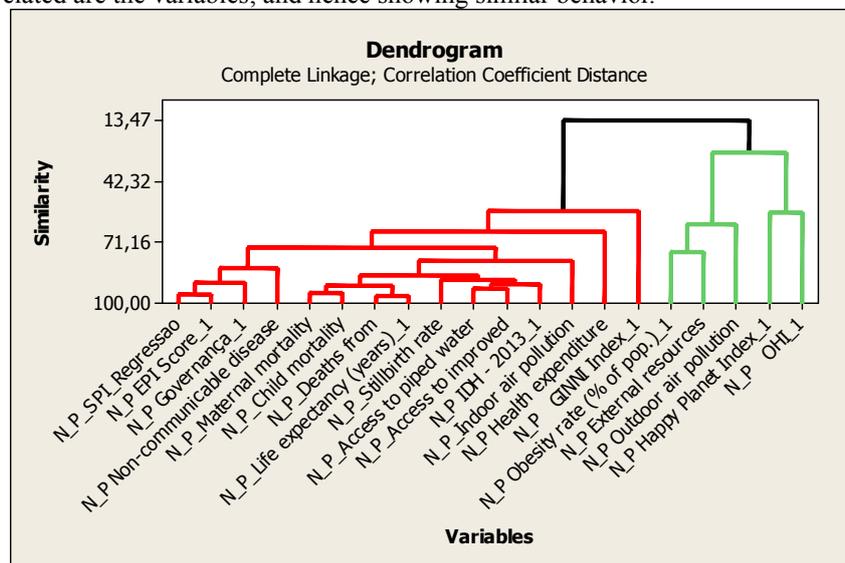

Figure 1 Intercorrelations among the Variables
Source: by authors, 2016.

This figure 1 shows particularly a high degree of behavior similarity among the variables: SPI, EPI, Governance, HDI, Maternal Mortality, Child Mortality, Deaths from Infectious Diseases, Life expectancy, Access to piped water, Access to improved water, Stillbirth rate, Indoor air pollution and

Non-communicable disease; in another level of correlation and for another group of countries, there are the variables Health expenditure, HPI and Gini, , in another degree of similarity, there are: Obesity, External resources, Outdoor air pollution and OHI.

Moreover, SPI and HDI are very closely related, so for practical purposes one may simply use this last one that is simpler and have a longer data history, and actually both are basically dealing with Social Conditions.

A statistical analysis of 132 countries lead to the selection of ten variables (all rescaled from 0 to 100 and positivized - the higher the better) more representative of the Health and Environment conditions. They were: Deaths from Infectious Diseases, Access to piped water (% of pop), Obesity rate, Outdoor air pollution, HDI (0 – 100) Governance, EPI Score (0 – 100), Happy Planet (0 – 100), Ocean Health Index OHI (0 – 100), GINI (0 – 100).

Table 1 helps to understand similarities and differences between the 3 selected Regions. The higher the F the higher the difference among the 3 Regions; so that Governance (GOV) makes the higher difference (F = 97,02), and the AVECO Region has a much higher value (83,25), twice as more, than other two Regions. This could be seen very clearly in Graphic 2 that allows more easily to visualize differences and compare the regions observing where and how much do they differ each other in relation to each of these 10 dimensions.

Table 1 ANOVA Comparing Means of the 3 Regions: AIBER, AVECO and OTHERS; As Well as Fs for the Variables (All Variable were Normalized 0 - 100, and Positivized: the Higher is the Best One)

	Deaths ²	Access ³	Obesity	Outdoor ⁴	HDI	Governance	EPI	HPI	OHI	GINI
OTHER	70,63	47,27	66,88	74,76	47,46	33,36	37,95	41,79	51,07	62,44
AIBER	92,89	85,22	46,68	82,09	65,62	42,48	52,70	72,36	55,45	43,08
AVECO	98,90	94,89	53,73	77,50	85,11	83,25	81,39	50,58	24,24	79,91
F ¹	19,03	37,63	9,5	1,32	34,45	97,02	69,68	22,69	29,45	24,45

Source: by authors, 2016.

Notes: ¹The higher the F distinguished from other regions; ²Deaths from Infectious Diseases; ³Access to piped water; ⁴Outdoor air pollution

The Figure 2 shows that the AVECO's region has better conditions than the others in GINI, Access of Piped Water, EPI, Governance, and HDI. In Outdoor Air Pollution, Deaths from Infectious Diseases and Obesity, it is very close of AIBER's region. In Obesity AIBER and OTHERS regions have scores close. Related to Ocean Health Index Score (OHI), and Happy Planet Index, AIBER's region has better scores than AVECO's region. Related to OHI, AIBER's region and Others' region has scores close each other. In resume, the AVECO group is close to Governance and EPI and far from OHI. The AIBER, although closed to the Happy Planet, is far from Gini. And the OTHERS' group is close to Obesity and far from Access to Piped Water.

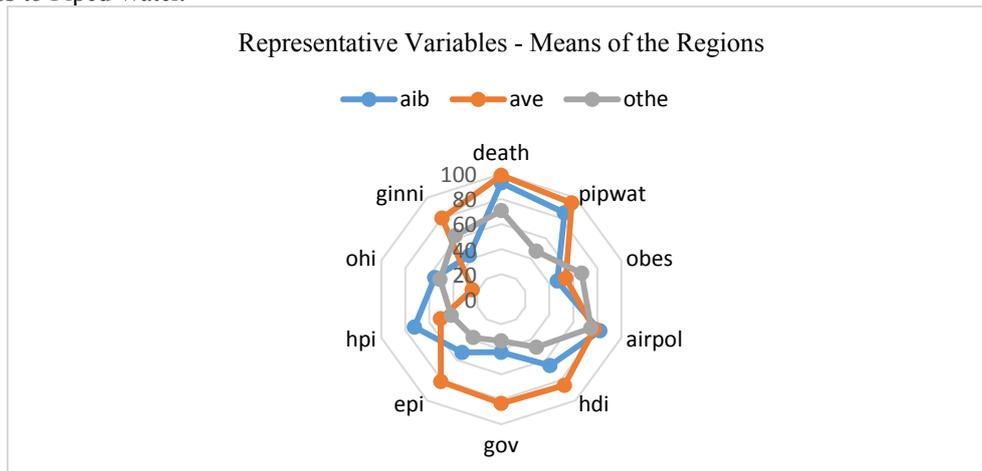

Figure 2 Radar of Means of the Regions AIBER, AVECO and OTHERS
Source: by authors, 2016.

Now using the first three Principal Components (eigenvalues > 1,0) related to these 10 variables and considering the relative contributions of each one of these variables to these component by means of

Stepwise Regressions one may build up a New Synthetic Indicator that we are calling HEN that clearly shows the general relative conditions and differences among the 3 Regions as shown by the ANOVA in figure 3.

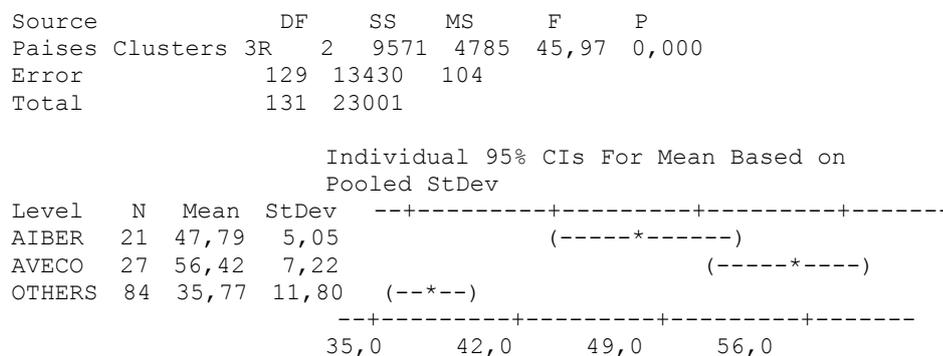

Figure 3 One-Way ANOVA: HEN Versus 3 Regions

Moreover, this new HEN Health and Environment Synthetic Indicator; allows to us to define a normalized ranking (0 – 100) among the countries of the Iberoamerican Region as shown in Table 2 and somehow establish its present level of conditions in the area.

Table 2 HEN Ranking

Iberoamerican Country	Ranking	Level
Spain	100,00	HIGH
Chile	81,69	HIGH
Costa Rica	79,74	HIGH
Cuba	72,27	MIDDLE
Argentina	69,55	MIDDLE
Panama	68,71	MIDDLE
Portugal	67,23	MIDDLE
Venezuela	60,72	MIDDLE
Uruguay	56,63	MIDDLE
Mexico	52,40	MIDDLE
Brazil	48,87	MIDDLE
Colombia	43,38	LOW
Peru	43,38	LOW
Ecuador	38,45	LOW
El Salvador	24,94	LOW
Dominican Republic	22,38	LOW
Bolivia	14,14	VERY LOW
Paraguay	10,39	VERY LOW
Guatemala	6,95	VERY LOW
Nicaragua	2,67	VERY LOW
Honduras	0,00	VERY LOW

4 Conclusions

Reflecting on the result of the statistical methods applied to the data, it is clear that most Latin American are still at a stage of low level of development and environmental protection and health, confirming the historical data, although the general situation is better than in OTHERS Countries, moreover as we can see by the ranking the worst conditions seem to be somewhat regional (LOW and VERY LOW).

As expected, environmental factors can be improved in general in Latin America. The infrastructure of public health available in each country should also be the focus of attention to resolve the predispositions to diseases.

A few points are worth mentioning. In Latin America, the GPS provided that Argentina, Chile and Uruguay were performing a little better in terms of Environmental Performance Index (EPI) for example, which remains true, although Argentina has dropped a bit on this scale. Brazil improved somewhat in the past few years, so that the HDI rises a little its level, but still very low. Moreover, what is becoming

more evident everyday worldwide is that what makes the greatest difference is the Governance factor; and in this sense we still have a long way to go in at least in the Latinamerican Region, perhaps with a few exceptions of smaller countries like Chile, Uruguay, Costa Rica and Panama.

Therefore, what is expected is that all these data from the Observatory ORIBER will help the responsible public and private institutions that are involved in the monitoring and control of environmental and health risks in order to develop measures and campaigns to prevent impacts and promote the well-being of the population of Iberoamerican countries; but no doubt this will depend on how fast we advance regarding Governance, and to what extent we become more aware about the Environmental Impacts on our health.

Engineers as Entrepreneurs: A Dual Role for Successful In-House Entrepreneurial Orientation and Talent Retention

Idris Osman, Fauziah Noordin, Normala Daud

Faculty of Business and Management, University Teknologi MARA (UiTM) Shah Alam, Selangor, Malaysia, 40450

(E-mail: idrisphd2015@gmail.com, fauziah716@salam.uitm.edu.my, normala648@salam.uitm.edu.my)

Abstract: The rarity of the employment of engineers-entrepreneurs dual roles often raises issues of poor in-house entrepreneurial orientation (EO) activities, in which the potential entrepreneurs cannot be developed to support organizational high technology development and innovation. Changes in technology have influenced engineers' career expectations to upgrade specific skills and general competencies to suit engineering demands. Reducing EO from the individual level has been shown to be related to adverse effects in engineers' behavioral intention to leave current jobs. Therefore, this paper fills the gaps in the literature by discussing the emerging role of engineers as entrepreneurs in the context of EO from an individual analysis. In addition, this present paper discusses the relationships between individual EO (innovativeness, proactiveness, autonomy and risk-taking) and talent retention among engineers. Multi behaviors and roles of engineers-entrepreneurs are important factors for confronting engineering task-related problems and the wide exercise of engineers-entrepreneurs dual roles will impact engineers' technical knowledge and non-technical routines. There is strong evidence that individual EO dimensions can be used for measuring engineers' entrepreneurial behaviors and to predict positive behavioral intentions toward current employments. In conclusion, developing engineers as potential entrepreneurs is a crucial organizational entrepreneurial strategy and understanding engineers' behavioral expectations will impact greater career satisfaction and retention.

Key words: Engineers; Entrepreneurial orientation; Entrepreneurs; Retention; Talent

1 Introduction

Entrepreneur is a term used in describing engineers' entrepreneurial role and it is an organizational profit formulation in promoting in-house entrepreneurial activities among engineering talents (Igbaria, Kassiech & Silver, 1999; Menzel, Aaltio & Ulijn, 2007; Tremblay, Wils & Proulx, 2002). Individual entrepreneurial development involves engineers' unique behaviors and attitudes (e.g. creativity, innovativeness and proactiveness), as these prime forces are meant for influencing engineers' positive behavioral intention toward current employments (Guidice, Heames & Wang, 2009; Igbaria & Siegel, 1992; Mitchel & Zatzick, 2015). At this point, a crucial link between behaviors and employment expectations is an essential combination to develop engineers' internal entrepreneurial development and to sustain sufficient amount of autonomy and innovation activities within organizational area. An official issue that is most likely to be debated, in a different view, when there is less information about engineers-entrepreneurs dual roles in the behavioral intentions research (Kharbanda & Stallworthy, 1990, Menzel et al., 2007; Tremblay et al., 2002). In passive reviews on engineers-entrepreneurs dual roles, efforts to leverage engineers-entrepreneur potentials can only be a temporary strategic human talent planning. Beyond an organization's control, determine whether matching engineers-entrepreneurs dual roles useful for predicting years of remaining in particular employments, it has been now known as an organizational long-term focus.

Early discussions of research into engineer-entrepreneur dual roles include an individual's engineering performance, career satisfaction and entrepreneurial intentions. The conclusion reached by Kharbanda et al. (1990), Igbaria et al. (1992) and Igbaria et al. (1999) argued that, there is no other primary clarification that can change the facts that engineers are now becoming a potential entrepreneur. Although entrepreneur roles are extensively discussed, however, the arguments are limited to engineers' career management and orientation, and entrepreneurial intentions, whilst the entrepreneurial orientation theory (EOT) was not widely introduced and explained in predicting engineers' retention decisions (Igbaria et al., 1992; Williamson, Lounsbury & Han, 2013). Another prime conclusion is that, unless a consistent low score relationships between engineers' entrepreneurial behaviors and career satisfaction, and retention (e.g. intention to stay and leave) are evident; a further study can be unnecessary (Gigliardi, Petroni & Dormio, 2005; Singh, Fuoad, Fitzpatrick, Liu, Cappaert & Figueredo, 2013). Such a benchmark, however, did not disappoint present scholars to interpret engineers' positive behavioral

actions into same arguments. A great interpretation on engineers-entrepreneurs leading roles and competencies will, as a result, enhance engineers' autonomy, entrepreneurial creativity, innovation, pure challenges and proactive behaviors (Abdull Rahman, 2012; Alavi, Moteabbed & Arasti, 2012; Andree & Hansson, 2015; Korte & Li, 2015).

Often, in highlighting an entrepreneur-engineer dual role and talent retention, a perfect relationship establishes in connecting engineers' pure behaviors, attitudes and traits. Putting behaviors, attitudes, or even traits into engineers' positive employment expectations indicate the highest degree of validity, where two mutual aspects of behaviors and expectations are commonly integrated (Campbell, Gluesing & Perelli, 2012; Kharbanda et al., 1990; Oyedele, 2010). If both aspects are continuously linked, developing engineers with high potential entrepreneur roles should not be overlapped with other contamination elements. Growing technology, for example, has an instant reaction towards changes in the labor market demand. Some have argued how technology influences an engineer's bigger performance and positive behavioral intentions toward current employment (Grip & Smits, 2012; Menzel et al., 2007; Oyedele, 2010). Accurate assumptions thus develop that the power of technology closes engineers' gaps on engineering task performances and behavioral actions. The impact of technology can be seen in improving engineers' superior technical knowledge and solving engineering task-related problems, creating engineers' level of competitiveness through adding new skills and competencies and optimizing the opportunity for engineers' spreading talents in global talent competitiveness.

If technology benefits organizations, key individual's behaviors are now the actual contamination overlaps between engineers' behavioral expectations and in-house entrepreneurial development. According to Covin and Slevin (1991), behavior performs a critical component in the entrepreneurial process. Of course, in a fragile form, engineers' behaviors can be flexible, unpredictable and continuously evolving over time (Campbell et al., 2012; Newman, 1998). In today's 'war talent' competitiveness, engineers' behaviors can be changed drastically. If technology is a key issue, engineers' massive task challenges interfere with engineers' strong determination in improving technical knowledge, skills and competencies ability (Andree et al., 2015; Duxbury & Halinski, 2014; Grip et al., 2012; Williamson et al., 2013). If talent exists in a unique form, is rare and cannot be imitated, investing a huge cost for replacing new engineering talents is a major decision that only a single organization has (George, 2015; Ghosh, Satyawadi, Joshi & Shadman, 2013). Because discussing engineers-entrepreneurs dual roles and retaining engineering talents remain vague at arguments and from the theoretical aspect too, linkages of both aspects tend to have low validity to explain engineers' in-house entrepreneurial behaviors and engineers' talent retention. Therefore, this study aims at discussing the following objectives:

- a) Engineers-entrepreneurs dual roles from engineers' behaviors, attitudes and traits perspective;
- b) Entrepreneurial orientation theory (EOT) from an individual engineer's entrepreneurial behavior; and
- c) Relationships between individual entrepreneurial orientation (IEO) and talent retention among engineers.

2 Literature Review

When an engineer plans to move to another job, there exist a gap between engineers' personal career orientations and behavioral expectations. The rationale for updating new specific technical knowledge, ideas, experiences and general competencies are the common principles for fulfilling engineering job requirements (Grip et al., 2012; Kharbanda et al., 1990; Lee, 1994). Relocating engineers' behaviors at the optimum career expectations will stimulate engineers' innovative ideas into clear strategic focus and transform those ideas into tangible results to sustain business performance and positive work environment (Kharbanda et al., 1990). When these two elements disappear (behaviors and employment expectations), or one counted weak, primary focus on evaluating engineers' behaviors is likely to be outstripped. Meaningful strategies, such as adapting technical and entrepreneurial systems and/or carrying both systems (also known as hybrid orientations) into core engineering tasks will carry a high degree of understanding engineers' behavioral expectations and career orientations (Alavi et al., 2012). Here, engineers-entrepreneurs dual roles come into play. When a high level of technical knowledge requires skills to solve engineering-related problems, an engineer-entrepreneur incorporates his or her general competencies and specific skills to increase the entrepreneurial values within an organization area (Grip et al., 2012).

2.1 Engineers-entrepreneurs dual roles

Entrepreneur refers to an independent entrepreneur whose practicing entrepreneurial activities within an organization (Menzel et al., 2007). Numerous sources described entrepreneur as a person who has skill, willingness to take responsibility, risk and opportunity, committed to tasks, working more independently and proactively develop new ideas (Buekens, 2014; Williamson et al., 2013). Entrepreneur exists once an engineer's career anchor is identified and developed. Engineers who compete with a high technical ability need the technical and managerial competence, autonomy, work stability, sense of dedication, pure challenge, life style integration and entrepreneurial creativity (Alavi et al., 2012). A consensus to classify engineers as knowledge workers, professional workers and talented workers have extended to a well-function of an engineer's capability to acquire elite knowledge and skills, attain high level of autonomy, well-experienced in managing uncertainty situations, leadership skills, innovative and advanced in his or her education levels (Abdull Rahman, 2012; George, 2015; Tansley, 2011; Sigler, 1999). This classification appears to be some agreement that engineers can be called as entrepreneur as these dual roles expose rigorous challenges to accomplish major projects, as well as his or her powers at managing non-technical responsibilities. To establish whether engineers are entrepreneurs, Table 1 provides the specific characteristics of describing those dual roles.

Table 1 Engineers and Entrepreneur's Characteristics

Engineer's Characteristics	Entrepreneur's Characteristics
<ul style="list-style-type: none"> ○ Autonomy ○ Flexibility, adaptability and the capacity to cope with and manage change ○ Self-motivation and drive ○ Analytical ability and decision making ○ Communication and interpersonal skills ○ Team working abilities and skills ○ Organization, planning and prioritization abilities ○ Ability to innovate ○ Mental and physical resilience ○ Leadership ability ○ Managing long term projects ○ Time management ○ Risk-taking ○ Creativity ○ Agent of change 	<ul style="list-style-type: none"> ○ Vision ○ Initiative ○ Internal motivation ○ Autonomy ○ Risk-taking ○ Internal control ○ Commitment and persistence ○ Market knowledge/customer orientation ○ Knowledge of organizational structures and willingness to cross-functional borders ○ Flexible problem solving ○ Visionary thinking style ○ Resistance to change (openness to change) ○ Orientation to innovation ○ Agent of change

Commenting on entrepreneurs-entrepreneurs' behaviors, Menzel et al. (2007) argue that educating engineers as entrepreneurs often focus on business and market knowledge as crucial engineering environment demands. The added technology entrepreneurship in engineering practice allows engineers to experience more opportunities of his or her self-determination on engineering paths, a freedom to make task-related decisions and a power to impose his or her self into accomplishing organizational major projects. One reason why engineers are considered as entrepreneurs is the interpretation of engineers' personality and traits. Prior to fit engineers' new roles into technical innovation and product development, meaningful traits, such as introversion, intrinsically motivated, flexible and creativity, and analytical ability will improve engineers' innovation opportunities and react instantly to the new technology demands (Williamson et al., 2013). Creativity and non-routine engineering problem solving are important sources for positive implications on engineering management where increasing innovation and product development can be guaranteed. As regards to confronting resistance to change, engineers-entrepreneurs dual roles will screen the entrepreneurial uncertainty environment and act accordingly by defining the strategic focus on market changes (e.g. technology, technical knowledge) and analyzing functional strategies to match those changes with available resources (Kharbanda et al., 1990). Multi behaviors and traits, namely leadership skills, autonomy, adequate resources, team work and engineering knowledge are necessary pillars to support engineers-entrepreneurs' successful in-house entrepreneurial orientation to solve engineering task-related problem solving (Campbell et al., 2012).

2.2 Entrepreneurial orientation theory (EOT) and engineers' entrepreneurial behaviors

Entrepreneurial orientation theory (EOT) is commonly related to the processes, practices and decision-making activities when a new entry exists in the competitive marketplace (Lumpkin & Dess, 1996). Areas where new entries are significantly visible in the marketplace can be seen in a tendency of an entrepreneur to act autonomously, be innovative and take risks, have a higher degree of

aggressiveness toward competitors and proactively looking at marketplace opportunities (Lumpkin et al., 1996). In the literature, autonomy, innovativeness, risk-taking, proactiveness and competitive aggressiveness are the dominant dimensions related to entrepreneurial orientation (EO) (Covin & Slevin, 1986; Lumpkin et al., 1996; Miller, 1983; Rauch, Wiklund, Lumpkin & Frese, 2009). Table 2 shows the definitions of EO dimensions adopted from Miller (1983); Covin et al. (1991); Lumpkin et al. (1996) and Rauch et al. (2009). The use of EO dimensions can be linked to environmental factors (e.g. dynamism, munificence, complexity and industry characteristics) and organizational factors (e.g. size, structure, strategy, strategy-making processes, firm resources, culture and top management team characteristics), all of which are important factors to impact the overall performance (e.g. sales growth, market share, profitability and stakeholder satisfaction) (Lumpkin et al., 1996). External and internal environment, organizational mission strategy, business practices and competitive tactics are major factors that strongly affect the entrepreneurial posture and organizational performance (Covin et al., 1991).

Table 2 EO Dimensions and Definitions

EO Dimensions	Definitions
Innovativeness	Support new ideas, novelty, experimentation for new products and services
Proactiveness	Act in anticipation of future problems, needs or changes
Risk-taking	Proclivity to engage in risky projects and prefer bold actions for achieving firms' objectives
Autonomy	Actions of individuals or teams are relatively independent
Competitive aggressiveness	Intensively challenges its competitors for improving position in the marketplace

According to Covin et al. (1991), willingness of an entrepreneurial organization to take high risks in completing major projects and aggressively pursuing business opportunities will impact organizational high return performance. Furthermore, an entrepreneurial organization who leads in technology, research and development tends to capture new market opportunities over the late movers. Strong evidence of positive impact of EO on organisational performance has increased in number of the existing empirical studies that have examined this relationship. Published studies on EO and organizational performances (for example, Davis, Bell, Payne & Kreiser, 2010; Entebang, Harrison & Run, 2010; and Zhang et al., 2011) found that, innovativeness, proactiveness, risk-taking, autonomy and competitive aggressiveness behaviors enhance organizational strategic orientation and commitment to obtain high returns in the marketplace. However, in relation to a higher performance of an organization, Kollman, Christofor and Kuckertz (2007) argued that the successful in-house entrepreneurial organizations that are strongly related to the organizational members' behaviors and attitudes (individuals) are those who are actively involved in any organizational business strategy activity. In their critique of using EO at the individual level, Kollman et al. (2007) considers Gartner's (1985) four key principles of EO from an individual analysis is potentially important. A successful entrepreneurial organization must address these key dimensions:

- 1) Individual (the persons involved in starting the organizations);
- 2) Process (the action undertaken by the individuals to start the new venture);
- 3) Organization itself (the kind of firm started); and
- 4) Environment in which the organization is active (the situation involving and influencing the new organization)

Questions have been raised about the use of EO behaviors in predicting individual performances and entrepreneurial intentions (Bolton et al., 2012). From an individual analysis, EOT requires assessing individual behaviors towards entrepreneurial intentions (Zhang & Bruning, 2011). EOT connects entrepreneurial intentions and individual behaviors, traits and attitudes to produce an entrepreneur within an organization (Bolton et al., 2012). Focusing on entrepreneurial behaviors and attitudes will make key individuals acquire the ability to recognize opportunities to exploit competitive business demands and to satisfy the current resources. A number of authors have argued that transforming EO into the individual level is an essential strategy to exploit opportunity and develop employees to become an entrepreneur (Kollman et al., 2007; Usaci, 2015). Usaci (2015) reported that successful entrepreneurial behavior of teachers (61.2 percent) is supported by learning and positive entrepreneurial attitude, such as proactive personality, attitude towards learning, attitude towards entrepreneurial behavior and social norms. With an intensive demand in technology, the EO moved further in explaining the acceptance of entrepreneurial behavior towards technology at the workplace (Gupta, Niranjana,

Goktan & Eriskon, 2015). Strong evidence of individual EO was significantly interacted with perceived ease-of-use and willingness to engage with technology, and incorporating between both explained 24.3 percent variance in technology adoption. Kollman et al. (2007) showed how individual EO can be grown in the culture, political and legal, macro-economic and micro-economic environment and these factors are crucial for developing entrepreneurial behaviors.

EO and individual engineers-entrepreneurs' dual roles behaviors cannot be separated in explaining individual entrepreneurial orientation (IEO). As mentioned earlier, IEO is characterized by five main dimensions, namely innovativeness, proactiveness, risk-taking, autonomy and competitive aggressiveness (Covin et al., 1991; Lumpkin et al., 1996). To measure IEO on entrepreneurial intentions and performance, Bolton et al. (2012) investigated 1,100 university students' entrepreneurial intentions and found that the items for innovativeness (α -0.80), proactiveness (α -0.765) and risk-taking (α -0.765) had higher internal consistency, whilst autonomy (α -0.208) and competitive aggressiveness (α -0.585) were removed for further analysis due to lower consistency. In another major study, Wu (2009) examined 337 students' entrepreneurial intentions and he highlighted four key behaviors, namely opportunity recognition, proactiveness, need for achievement and risk-taking propensity. Instead of assessing autonomy and competitive aggressiveness behaviors, Wu (2009) used opportunity recognition and a need for achievement behaviors to explain students' actual entrepreneurial intentions. Although the impact of competitive aggressiveness in predicting an individual's entrepreneurial intention is understudied, previous authors have failed to provide sufficient information that competitive aggressiveness can be used to measure individual behaviours. To date, there is less evidence that competitive aggressiveness and individual behaviours are associated with an individual's entrepreneurial intention and individual performance (Bolton et al., 2012; Gupta et al., 2015; Kollman et al., 2007; Wu, 2009).

This present study believes that innovativeness, proactiveness, risk-taking and autonomy dimensions are core behaviours in predicting engineers' entrepreneurial potentials and positive behavioral intentions. There are several reasons why these behaviors deserve attention. Firstly, changes in technology and technical knowledge require engineers to innovate ideas and strategies to develop innovative ideas and transform them into tangible results (Alavi et al., 2012; Igbaria et al., 1992). Secondly, engineers often emphasize on creativity to solve technical problems and are able to think conceptually (Chambell et al., 2012; Menzel et al., 2007). Thirdly, prior to engage in risky projects, engineers coordinate with project owners, advisors and contractors to ensure that the projects' objectives can be met (Kaewsri et al., 2013; Kharbanda et al., 1990). Lastly, engineers' creativity can be promoted when there is autonomy in their work and engineers are used to work with challenging tasks (Igbaria et al., 1992; Kharbanda et al., 1990). The published study of Rodrigues and Rebelo (2013) about proactive personality and innovativeness potentials with 243 engineers reported that 71 percent of engineers' personality (e.g. extraversion, openness and conscientiousness) had supported engineers' innovative behavior and highly complex job performance. It has conclusively been summarized that entrepreneurial behaviours (innovativeness, proactiveness, risk-taking and autonomy) increase engineers-entrepreneurs' dual roles potential and the ability to engage technology entrepreneurial demands with risks and uncertainties.

2.3 The relationships between in-house entrepreneurial orientation and talent retention among engineers

Talent can be defined as a capital, giftedness and a valuable subject and it can be referred to a person who leads in special skills or abilities (Dries, 2013). A person who has high skills, knowledge and experience in his or her fields potentially be an excellent and unique performer (Festing & Schafer, 2014; Govaerts, Kyndt, Dochy & Baert, 2011). Talent differs not only in individual differences (e.g. personality) but also appears rare, valuable and hard to imitate (Collings & Mellahi, 2009). Talented employees are usually segregated by competencies, skills, abilities, experience and knowledge. Many studies described talented employees as a key individual of organisations and retaining them has become a crucial corporate agenda (Gelens, Dries, Hofmans & Pepermans, 2013; Lewis & Heckman, 2006; Zhang & Bright, 2012). Retaining talent is an important element of talent management and it is defined as a long-term focus of encouraging key employees to remain in the same jobs (Claes & Heymans, 2008; Gangrade, Dubey & Chouhan, 2014). One major issue in retaining talent is brain drain, where huge costs for recruiting new entrants will be invested if the existing talents voluntary leave their current employers (Doh, Smith, Stumpf & Tymon, 2011). A relative importance of retaining talents is a clear employment expectations and behavioral intentions toward career obligations among talented employees. Therefore, linking behavioral intentions and career expectations create mutual understanding between

talented employees and employers toward career satisfaction and positive behavioral intentions.

In response to behavioral intentions and career expectations, high level achievement makes an engineer secure of his or her future engineering paths. An adverse impact of stronger career determination affects engineers moving to other jobs (Yang, Ma & Hu, 2011). Issues related to engineers' leaving current employments can be explained from several factors. Some authors (for example Anvari, Fraccaroli, Sarchielli, Ullrich & Dick, 2014; Bigliardi, Petroni & Dormio, 2005; Ramayah, Lo, Amri & Noor, 2011) highlighted learning and development, career advancement, career aspirations, organizational socialization and self-efficacy as crucial motivational factors for engineers' career satisfaction and decision to remain in their jobs. Other authors (see Abdull Rahman, 2012; Erturk & Vurgun, 2015; George, 2015; Igbaria et al., 1992) predicted role stressors, job involvement, perceived organizational support and organizational commitment as the main players for professionals' and engineers' retention decisions. However, Kharbanda et al. (1990) and Williamson et al. (2013) argued that retaining talented engineers must be linked to behavior problems in solving 'war of talent' and talent competitiveness issues. To avoid premature job performance among engineers, expose to engineers' development and entrepreneurial technology involve engineers' behaviors and traits, such as innovativeness, creative and proactiveness to develop new product development.

Decreasing EO activities concern the growing number of turnover within an organization (Yi, Sheu & Zhi, 2009). The nature of EO remains connected by influencing key talents' behaviors in making task-related decisions, working independently and generating new ideas (Sangar & Rangnekar, 2014). In support of in-house entrepreneurial activities, engineers require a huge amount of autonomy, task challenges, creativity and a freedom to innovate ideas into physical things, and to respond to the competitive engineering demands. As far as EO is concerned, Igbaria et al. (1992) placed EO as an organizational strategic talent agenda in predicting engineers' positive behaviors towards career satisfaction and retention decisions. Innovative behaviors and talented engineers cannot be separated. Higher level of innovativeness is significant behavior in influencing engineers' decision to stay (Guidice et al., 2009; Igbaria et al., 1992). Innovativeness is applied according to the nature of engineers' tasks dealing with innovation processes and product development (Williamson et al., 2013). Articles related to innovativeness often emphasize the need for engineers to upgrade human capital to align with organizational competitive strategy (Grip et al., 2012). The entrepreneurial process educates engineers to be a proactive employee (Crant, 2000). Weak proactive behavior has a significant impact on engineers' seeking feedback, information and opportunities to improve engineering task-related problems. As a result, identifying and assessing engineering problems cannot be generated and entrepreneurial development will slowly disappear. At this stage, lower influence of engineers' expectations toward proactive behavior will affect a great motivation factor for engineers to stay in the same employment (Singh et al., 2013).

A strong relationship between risk-taking and talent retention is likely to be related to train engineers solving technical problems and enhancing engineers' enjoyment to stay the same job (Tremblay et al., 2002). To establish career satisfaction on engineering professions, engineers need to develop his or her interests (e.g. working with risky tasks and work challenges) to solve current risks environment and technical problems. Once these interests are well-developed, most task-related problems can be tackled easier, quicker and less cost. Surveys such as that conducted by Campbell et al. (2012) have shown that 110 engineers who are being exposed to major projects likely felt a powerful effect on his or her tasks toward risks and uncertainty situations. From the risks they learned to think conceptually and critically, and several traits (e.g. leadership, autonomy) have shaped the way engineers' perform best. At least three major implications are gained from risk-taking behaviors. Firstly, great engineers' commitment towards engineering tasks, secondly, various engineering problems have integrated engineers' ability, skills and competencies to identify and analyze rationale solutions, and lastly, acceptance towards risks and pure challenges will make engineers' voluntarily decide to stay. A relationship also exists between an engineer's autonomy and his or her decisions to stay in the same employment. It is clear that autonomy increases attraction and retention among talented individuals (Badaracco & Ellsworth, 1991). For example, opportunities to make decisions in engineers' tasks and work schedules have influenced engineers' career preferences (Tremblay et al., 2002). Other studies reported that engineers' involvement in decision-making processes is an on-going approach to control his or her jobs. Instead of full entrepreneurial being exercised, the amount of autonomy strengthens engineers' commitment and desire to stay for longer periods (Abdull Rahman, 2012; Igbaria et al., 1992; Udo, Guimaraes & Igbaria, 1997).

3 Conclusions

This paper discusses the engineer-entrepreneur dual roles from engineers' behaviors, attitudes and traits perspective. In this paper, the authors provided some insight on how the entrepreneurial orientation theory (EOT) explains the individual EO based on engineers' behaviors. Lastly, this paper highlights the relationships between EO dimensions, namely innovativeness, proactiveness, risk-taking and autonomy, and talent retention among engineers. Engineers and entrepreneurs can be tightly defined from the combination of characteristics, behaviors and traits. Those terms are used to refer to an agent of change and engineers-entrepreneurs clearly obtain autonomy, adaptability and flexibility, risk takers, innovative and creative in performing engineering tasks, non-routine problems and managerial responsibilities (Antoncic et al., 2011; Campbell et al., 2012; Ganiron et al., 2013; Gundogdu, 2012). In previous discussions, the engineer-entrepreneur dual roles are used in the entrepreneurial organizations and this concept stresses research and development activity within organizations. Technological innovations need engineers to perform as entrepreneurs to discover and exploit opportunities from external environmental factors (e.g. dynamism, munificence, and complexity and industry characteristics). In a study conducted by Menzel et al. (2007), several issues emerged relating to entrepreneurial capacity within organizations. They questioned about the definitions of engineer-entrepreneur, requirements of managerial and organizational support to support future entrepreneurs and the educational and work-related consequences once entrepreneurial activities have been developed. From these issues, however, this paper considers that the definition of engineers-entrepreneurs should first be identified and developed to link engineers' behaviors, attitudes and traits.

Associative engineers-entrepreneurs dual role can be seen in four major dimensions, namely innovativeness, proactiveness, autonomy and risk-taking behaviors, as all these behaviors are linked to EO theory. The relationship between EO dimensions and organizational performance (e.g. profit, growth) has been widely investigated (Davis et al., 2010; Entebang et al., 2010; Zhang et al., 2011). This paper argued that a successful in-house EO does not only rely on organizational tangible resources (e.g. cost; technology). In support of EO within organizations, individual behaviors have emerged as catalysts to ensure that the processes, practices and decision-making activities can be implemented successfully. In the engineering industry, engineers determine every single process, practice and decision-making related to his or her behaviors. As was mentioned in the literature review, innovating and developing ideas, emphasizing creativity, thinking conceptually and critically, engaging in task risks and uncertainty situations are the leading engineers' entrepreneurial behaviors. Prior to match these behaviors with an individual EO, engineers' specific skills and general competencies must be defined precisely. This paper strongly argues that EO from an individual level is far more effective to explain engineers' entrepreneurial intentions and positive behavioral intentions (Bolton et al., 2012; Gupta et al., 2015; Kollman et al., 2007; Wu, 2009). Therefore, adoption of individual EO in predicting engineer's positive behavioral intentions (e.g. intention to stay) towards their current employment is relevant investigation for future research.

This paper extends our knowledge about the concept of engineers-entrepreneurs dual role from the engineer's behaviors, attitudes and traits, and how individual EO can be used to predict engineers' entrepreneurial intentions and retention decisions towards their current employment. The theoretical implication of this study is that EO can be used for measuring individual entrepreneurial intentions. This paper has raised important questions about the use of EO and engineers' entrepreneurial behaviors, and how EO behaviors can be expended into talent retention effectiveness. Although this current paper purely discusses the EO-related issues, attention should be given on establishing individual EO items for future researchers investigating entrepreneurial intentions and positive behavioral intentions among engineers. The present paper raises the possibility that individual EO can be used to predict engineers' intention to stay, and the future findings may help researchers to understand engineers' career orientation and satisfaction. In general, this paper helps human resource (HR) managers, engineering practitioners and organizations in upgrading engineers with new specific skills and knowledge, and general competencies to respond to technology development and business challenges.

Temporal-Spatial Evolution Characteristics and Its Causes of Innovation Output in Yangtze River Economic Belt

Yang Lei, Zhang Lingyan, Wu Yonghang, Tang Gennian

School of Economic and Management, Zhejiang University of Technology, Hangzhou, P.R. China, 310023

(E-mail: 18767117645@163.com, 625057328@qq.com, 916852840@qq.com, tanggennian@zjut.edu.cn)

Abstract: This study took Yangtze River Economic Belt as a spatial observing unit to discuss the temporal-spatial evolution characteristics and its causes of innovation output, with local Gini coefficient, spatial auto regression and panel data model, measured by the number of patents authorization and other related data. The result indicated that the overall innovation output in the Yangtze River Economic Belt had been increasing, while the geographic concentration of it presented a fluctuated downward trend. The agglomeration degree of innovation output showed a shape of mirrored Z with a fluctuated upward trend. The hotspots area of innovation output, the scope of which had been extending, developed into a monopole-prominent spatial pattern in Yangtze River delta area from a dual-central spatial structure in Yangtze River delta area and Chengdu-Chongqing area. Besides, the cold spots regions were in the middle reaches of Yangtze River; Economic foundation, technology spillover, government actions, spatial proximity and financial supports could make significantly positive effects on the innovation output in Yangtze River Economic Belt. According to the conclusions, this paper also propounded corresponding policy recommendations.

Key words: Temporal-spatial evolution; Causes analysis; Yangtze river economic belt; Innovation output

1 Introduction

Regional innovation is one of engines to promote the economical development. Innovation output is a main method to measure regional innovation, which can reflect regional ability of innovation as well as the level of it. In the background of regional economic integration, the Yangtze River Economic Belt has become one of the most economically developed and strategically important areas, but this area still has broad space for development (Zeng H, Yu R, Zuo Y,2015), with which Chinese other inland economic zones cannot compare (Lu D,2014) Shanghai, Hangzhou, Wuhan, Chongqing, Nanjing and other 33 cities, just like bright pearls, are inlaid on the Yangtze River Economic Belt, constituting the main representative urban agglomerations and leading the development of Yangtze River Economic Belt. Consequently, to study the temporal-spatial evolution characteristics and its causes of innovation Output of the inlaid cities in Yangtze River Economic Belt not only fits into the current background, but also can improve the innovation ability and enhance the overall competitiveness of Yangtze River Economic Belt, so that this study may help this area even China find a way to realize the sound and fast economical development.

In recent years, domestic and foreign scholars had discussed a lot on the innovation output and gained abundant theoretical achievements. The discussions mainly had involved the construction and measure of evaluation systems (Wan Y, Wen H,2009; Yang C, Zhang Q, Ding S.,2015), efficiency (Shi F,2010) and its internal and external drive mechanism(Dibrov A.,2015). Besides, there were other studies which had revealed the spatial effect (Li H.,2012) and economic growth effect (Fang D, Sun M,2015). Wan Yong had created an evaluation system which was based on the data of international papers number, granted patents and contracted values in technological contacts (Wan Y, Wen H,2009). Shi Feng had discovered that the innovation output efficiency in China was low and the trend of it was declining (Shi F,2010). Artem Rebrov used the data such as transaction cost and labor innovation resistance to confirm that technological change and the policy replacement might reduce the resistance to innovation, thereby increase the level of innovation output (Dibrov A.,2015). Li Heng had found out that Chinese innovative output presented a phenomenon of spatial agglomeration by spatial autocorrelation analysis (Li H.,2012). According to the results of recent researches, temporal-spatial evolution characteristics of innovation output had been one of the research focuses in regional economic development. But as for the researches on the Yangtze River Economic Belt, most researchers had researched this area only from five aspects such as the practical significance and influence (Bai Y,

Guo S.,2015), the regional economic differences (Chen X.,2008), spatial structure (Zheng D, Chen Y,2015) as well as the evolution of the industrial structure (Huang Q, Zhou Z, Liu H.,2014) of construction in Yangtze River Economic Belt, rather than from innovation output. But, what about the development of innovation output in Yangtze River Economic Belt? Is there any spatial agglomeration? Why could the innovation output difference be? These questions haven't been solved yet. Therefore, studying on temporal-spatial evolution characteristics and its causes of innovation Output in the inland cities of Yangtze River Economic Belt seems to be of great theoretical and practical significance.

This study was supposed to use local Gini coefficient and spatial autocorrelation to explore innovation output of inland cities in Yangtze River Economic Belt. And the study built a panel data model, combining with economic base, technology spillover, spatial location, innovation, and government behavior and financial support, to analyze the causes of innovative output differences, in order to enrich the regional innovation theoretical researches and provide Yangtze River Economic Belt even China with suggestions on the Innovation-Driven Development Strategy.

2 Methods and Sources

2.1 Methods

2.1.1 Local Gini coefficient

There are many econometric models to measure spatial agglomeration, such as Entropy index, Herfindahl index, Coefficient of Variance and local Gini coefficient. Since the local Gini coefficient is more of mathematical thoughts and easier to operate, it adopted in this study. The formula is shown as the following (He J, Zhang H, Ye Y,2013).

$$GINI = \frac{1}{2n^2 \bar{x}} \sum_{i=1}^n \sum_{j=1}^n |x_i - x_j| \tag{1}$$

Above formula, n represents the number of the cities; \bar{x} indicates the average of innovation output; x_i represents the innovation output of city i, while x_j represents the innovation output of city j.

2.1.2 Global spatial autocorrelation

This study calculated the global Moran's I index to measure the global spatial autocorrelation of innovation output. The formula is shown as the following (He J, Zhang H, Ye Y,2013).

$$I = \frac{n \sum_{i=1}^n \sum_{j=1}^n W_{ij} |x_i - \bar{x}| |x_j - \bar{x}|}{\sum_{i=1}^n \sum_{j=1}^n W_{ij} \sum_{i=1}^n |x_j - \bar{x}|^2} \tag{2}$$

In the formula, the meaning of x_i , x_j and n is the same as the meaning of the corresponding variables in formula (1). W_{ij} is a spatial weight matrix in binary system. To test spatial autocorrelation characteristics of innovation output, this study also calculated the standardized statistic Z. The formula is shown as the following (Jiang T,2013).

$$Z = \frac{I - E(I)}{\sqrt{VAR(I)}} \tag{3}$$

2.1.3 Local spatial autocorrelation

Due to the heterogeneity of spatial units, spatial autocorrelation is generally unsteady. Thus, the study introduced Getis-Ord G_i^* index, a local spatial autocorrelation statistic, to analyze local spatial aggregation deeply. The formula is shown as the following (Jiang T, Hua M, Zhang Y,2014).

$$G_i^*(d) = \frac{\sum_{j=1}^n W_{ij}(d)x_j}{\sum_{j=1}^n x_j} \tag{4}$$

n , x_j and W_{ij} are the same as the variables which in formula (1) and formula (2).

2.2 Index selection and data

As for the measurement of single index, the patents granted are one of commonly used measures of innovation output levels. Cao Xianzhong used patents granted as a measure of innovation output, and concluded the Yangtze River Delta Innovation overall output efficiency is low, but rising (Cao X, Zeng G, Zou L,2015). Wei Yanhui measured the regional innovation output capacity and its trends in mainland China by using patents granted (Wei Y, Zhang H, Wei J,2015). Li Guoping taking the data of patent applications as a measure, combining with the exploratory spatial data method to analyze provincial spatial distribution of innovation outputs, concluded that innovation output varied with

regions(Li G, Wang C,2012). Most scholars had adopted patent data as a measure to analyze issues of innovation output. In consideration of the large-span area and the different levels of development, this study used a single indicator, patents granted, to take an analysis. In view of the economic development and status quo of innovation output in Yangtze River Economic Belt, available scientific data and reference to the relevant research results, the chosen inlaid cities which were Shanghai, Chongqing, Hangzhou, Nanjing, Chengdu, Hefei, Wuhan, Changsha, Nanchang, Ningbo, Suzhou, Shaoxing, Wuxi, Ma'anshan, Luzhou, Yueyang, Jiaxing, Huzhou, Zhoushan, Nantong, Changzhou, Zhenjiang, Yangzhou, Anqing, Tongling, Chizhou, Wuhu, Chaohu, Huangshi, Ezhou, Jingzhou, Yichang, Huanggang, Xianning, Panzhihua, Yibin, Jiujiang and Zhaotong.

The data of patents granted and explanatory variables were from *China City Statistical Yearbook (2001-2014)* and other statistical yearbooks of provinces and cities.

3 Temporal-Spatial Evolution Characteristics of Innovation Output

3.1 Regional overall difference characteristics

In order to analyze regional geographic concentration of innovation output in Yangtze River Economic Belt, the study calculated the local Gini coefficients by using the R programming language based on the formula (1). And the averages and local Gini coefficients of innovation output were plotted in Figure 1.

From the Figure 1, the averages of innovation output rises year by year which in a shape of an opposite *L*, While the local Gini coefficient presents a fluctuating downward trend. From 2000 to 2007, the average of innovation output increases slowly and the overall growth rate in eight years is 41.05%; From 2008 to 2012, it increases rapidly and the overall growth rate in four years is 91.11%, but it decreases in 2013. As for the local Gini coefficient, it reaches the maximum (0.7386) in the chosen interval in 2003, which means the geographic concentration of innovation output in this area is relatively largest; while in 2006, it reaches the minimum (0.6229) reflecting the geographic concentration is relatively smallest. Generally, the changes of local Gini coefficient can be divided into such four stages: 1) From 2000 to 2003, there is an intermediate-speed-increasing stage, where the local Gini coefficient increases as 0.7386 from 0.6987, with the growth rate of 1.33% per year; 2) From 2003 to 2006, there is a high-speed-decreasing stage, where the local Gini coefficient decreases as 0.6229 from 0.7386, with the reduction rate of 3.86% per year; 3) From 2006 to 2012, there is a low-speed-increasing stage, where the local Gini coefficient increases as 0.6734 from 0.6229, with the growth rate of 0.84% per year; 4) From 2012 to 2013, there is a intermediate- speed-decreasing stage, where the local Gini coefficient decreases as 0.6393 from 0.6734, with the reduction rate of 3.41% per year. Figure 1 shows that from the of 2000 to 2013, the level of innovation output of inlaid cities of Yangtze River Economic Belt city mosaic has increased steadily, while the geographic concentration presents an inverted letter *W* shape with a downward trend, indicating that innovation output has changed to be more balanced.

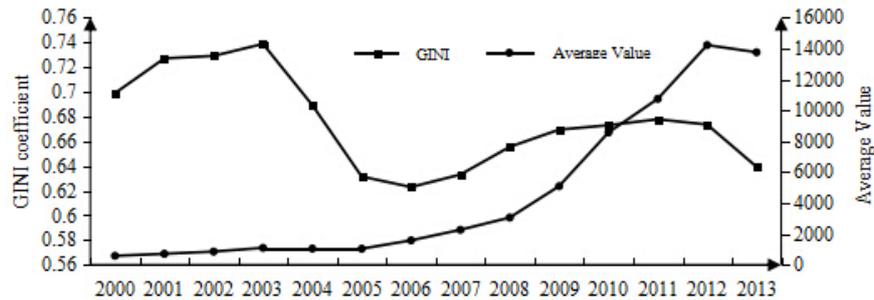

Figure 1 Average Value and Local GINI Coefficient of Innovation Output in Yangtze River Economic Belt

3.2 Spatial evolution characteristics

Based on the formula (2), this study calculated Moran's I indexes with Arc GIS software, and the result was plotted in Figure 2. Figure 2 shows that from the year of 2000 to 2013, the innovation Output in Yangtze River Economic Belt presents as significant spatial agglomeration and the aggregation intensity trends to fluctuating upward. In detail, from 2000 to 2003, the Moran's I index fluctuates slightly around 0.05, which manifests the spatial agglomeration degree is relatively low and stable; Between 2003 and 2007, the Moran's I index rises to 0.0402 from 0.2983 rapidly with an average annual growth rate of 6.45%, which means the degree of spatial agglomeration is growing; During the period of

2007 to 2013, the Moran's I index gets into another trend of fluctuations, which is around 0.3. In term of extreme points, the Moran's I index reaches a minimum (0.0402) in 2003, proving that the degree of spatial agglomeration of innovation output is relatively smallest at that time; Then it reaches a maximum value (0.3339) in 2010, revealing that the degree of spatial aggregation is relatively largest at that time. Overall, the degree of spatial agglomeration of innovation output in the inland cities of Yangtze River Economic Belt is growing, and the Moran's I index is converging to 0.30. The curve of Moran's I index shows a mirror Z shape.

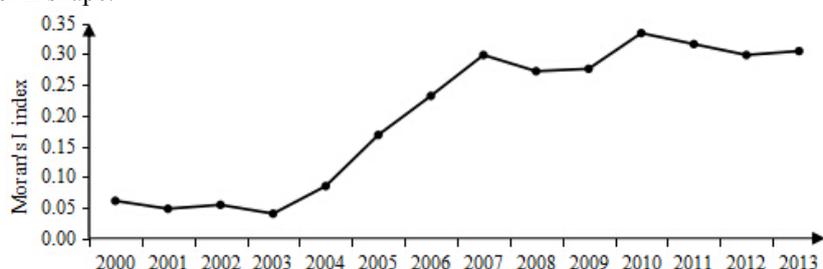

Figure 2 Global Spatial Autocorrelation Coefficient of Innovation Output in Yangtze River Economic Belt

3.3 Spatial hotspots distribution

To explore the spatial pattern of innovation output in Yangtze River Economic Belt further as well as learn its local spatial autocorrelation more, taking 2000, 2007 and 2013 as time notes, this study calculated Getis-Ord G_i^* indexes by ArcGIS 10.1 software. As the Figure 3 shows, the earned Getis-Ord G_i^* indexes were divided into five degrees such as hotspots area, vice hotspots area, random distribution area, vice colds pots area and colds pots area.

According to the Figure 3, The hotspots area of innovation output develops into a *monopole-prominent* spatial pattern in Yangtze River delta area from a *dual-central* spatial structure in Yangtze River delta area and Chengdu- Chongqing area, and the scope of hotspots area is extending, while the colds pots area is concentrated in the middle reaches of Yangtze River. Wherein, the hotspots area of innovation output in 2000 contains Shanghai, Ningbo, Jiaying, Zhoushan, Nantong, Suzhou, Chengdu and Yibin, showing the innovation capacity in these areas is very strong and forming a significant pattern of agglomeration; The vice hotspots area includes Yangzhou, Zhenjiang, Changzhou, Wuxi, Huzhou, Hangzhou and Chongqing, and the vice hotspots area is close to the hotspots area, indicating hotspots area has space radiation on the vice hotspots area, and there are positive interactions between them; The vice colds pots area includes Wuhan, Hefei, Nanchang, Huangshi, Jiujiang, Yueyang, Xianning, Ezhou and Chaohu; The cold spots area contains Anqing, Huanggang and Chizhou. Generally, in 2000, the hot-cold-spots distribution of innovation output presents a *U* shape, and levels of innovation output in Sichuan-Chongqing area, Shanghai and the cities around Shanghai is higher, while the levels in Anhui, Hubei and Jiangxi provinces are relatively lower.

The scope of the hotspots area in 2007 is more extended than 2003. Compared with the hotspots area in 2003, the area in 2007 absorbs Hangzhou, Shaoxing, Huzhou and Wuxi, but removes Chengdu and Yibin. Since some of the vice hotspots cities evolve into hotspots cities, the vice hotspots area is reduced, such as Yangzhou, Zhenjiang and Changzhou, concentrated in Jiangsu Province and nearing the hotspots area. The vice colds pots regions are Chaohu, Tongling, Changsha, Jingzhou, Yichang, Luzhou, Panzihua and Zhaotong, the spatial distribution of which is relatively dispersed; The colds pots area increases significantly compared with 2000, including Hefei, Chizhou, Anqing, Huanggang, Wuhan, Ezhou, Huangshi, Xianning, Yueyang, Jiujiang and Nanchang. In 2007, the hot-cold-spots distribution of innovation output presents a lying *L* shape, and the hotspots area is mainly concentrated in Jiangsu, Zhejiang and Shanghai regions.

In 2013, compared with 2007, the hotspots area stays the same and forms a stable pattern, which contains Shanghai, Ningbo, Jiaying, Zhoushan, Nantong, Suzhou, Hangzhou, Shaoxing, Huzhou and Wuxi; the vice hotspots area increases Nanjing, Wuhu and Ma'anshan, indicating that the degree of spatial interaction of innovative output in east of Yangtze River Economic Belt has been enhanced; The vice colds pots regions decreases, containing Hefei, Chizhou, Changsha, Jingzhou, Yichang, Panzihua and Zhaotong; The colds pots regions also decrease, but still include Wuhan, Nanchang, Ezhou, Anqing, Jiujiang, Huanggang, Yueyang, Huangshi and Xianning, mostly in Hubei Province and Jiangxi Province. The hot-cold-spots distribution of innovation output in 2013 is similar to 2007, both lying *L* type, and the hot spots area is gathered in Jiangsu, Zhejiang and Shanghai.

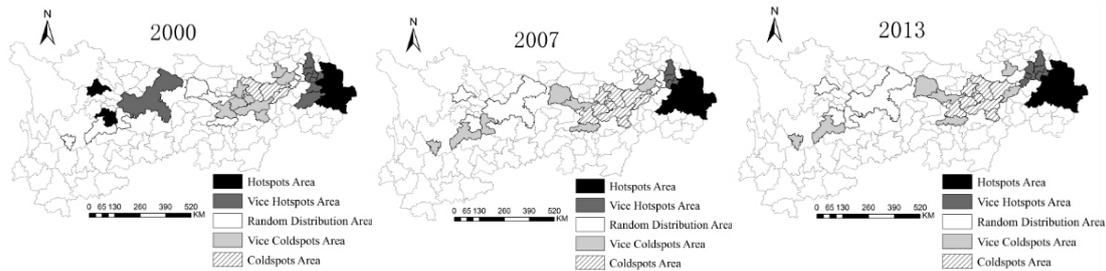

Figure 3 Spatial Hotspots Distribution of Innovation Output in Yangtze River Economic Belt

4 Cause Analysis of Temporal-Spatial Evolution Characteristics

4.1 Construction of regression model

Scholars have gained a series of research results on the cause analysis about temporal- spatial evolution characteristics of innovation output. Jiang Tianying found that technology spillovers, spatial location, economic base and policy regimes have a significantly positive impact on innovation output (Jiang T,2014). Mayer and Sager concluded government action played an important role to support regional innovation (Mayer H, Sager F, Kaufmann D, et al,2016). Throughout the papers which have been learned and considering the available data, this study summarized the explanatory variables into six aspects such as economic basis, technology spillover, spatial location, innovation input, finance support and government behavior. In details, GDP per capital represents economic basis; because the import and export trades make the exchange of information and goods among different regions, which leads technology spillovers, this study take total volume of foreign trade to measure the technology spillover. Total passenger traffic indicates the spatial location; Innovation input contains innovation investment and innovation staff input. Taking the availability of the data and the representativeness of the explanatory variables into account, this study took the number of people who were employed in scientific research, technical service and geologic prospecting to measure the innovation input; The loans of national banking system and public finance expenditure for science and technology represent the financial support and government action respectively.

In this study, innovation output [PAT (item)] is an explained variable, and economic base [Eco (yuan /person)], technology spillover [Tec (million dollars)], spatial location [Spa (million people)], innovation inputs [Inp (million)], government action [Gov (ten thousand yuan)] and financial support [Fin (ten thousand yuan)] are explanatory variables. In order to eliminate the differences in dimension and reduce heteroscedasticity of variables, this study made each variable logarithmic, except the innovation input. The model is as follows:

$$\ln Pat = \alpha_0 + \alpha_1 \ln Eco + \alpha_2 \ln Tec + \alpha_3 \ln Spa + \alpha_4 \ln Inp + \alpha_5 \ln Gov + \alpha_6 \ln Fin + \varepsilon \quad (5)$$

This study measured and analyzed panel data for factors in above model through STATA 12.0 software and the regression result was shown in Table 1. In the regression analysis, this study used Hausman Test. Hausman Test is an indispensable testing tool in the empirical study based on panel data model, helping individual effect make a choice between random-effect model and fixed-effect model (Chen Q, Long Z, Ling G,2013). The inland cities in Yangtze River Economic Belt were divided into three groups in this study, with the purpose of analyzing the causes of regional differences in innovation output, such as all cities (named Group 1), the cities on the lower reaches of Yangtze river (named Group 2) and the cities on the middle and upper reaches of Yangtze River (named Group 3). Wherein, the Group 2 includes Shanghai, Hangzhou, Nanjing, Ningbo, Suzhou, Wuxi, Shaoxing, Huzhou, Jiaying, Zhenjiang, Nantong, Changzhou, Zhousha and Yangzhou; the others were in the Group 2.

4.2 Regression analysis

4.2.1 Regression analysis on Group 1

Based on the results of Hausman Test, the regression model of Group 1 is the fixed-effect model I. Economic basis, technology spillover, spatial location, government action and financial support all have a significantly positive impact on the Group 1. After comparing each variable coefficients, according to the intensity of influence from each variable on innovation output, this study sorts the variables from strong to weak as follows, spatial location, financial support, technical spillover, government action and economic basis. But the innovation input doesn't pass the significance test, indicating that this factor doesn't have a significant influence on the innovation output of Group 1. The reason could be that probably innovative activities often show production externalities somehow, which means the public

benefits of it may over private benefits. So, such production externalities may cause innovation input lacking enthusiasm. Also, today's imperfect innovative input-output mechanism may fail to significantly promote innovation output.

4.2.2 Regression analysis on Group 2

According to the results of Hausman Test, the regression model of Group 2 chooses the fixed-effect model III. From the result of regression, economic basis, technology spillover, spatial location, innovation input, government action and financial support all have significant impact on Group 2, and from highest to lowest are the economic basis, government action, technology spillover, spatial location, innovation input, and financial support. Compared with the regression results of Group 1, the impact of economic basis effects is more significant, the regression coefficient of which is 1.549, indicating that the economic basis is an important promotion to innovation output for Group 2. But the coefficients of technology spillover and financial support are negative and they pass the significance test in Group 2, which means increasing technology spillover and financial support may decrease the innovation output in the lower reaches of Yangtze River. The reason may be that the cities in Group 2 are advanced innovative regions, whose technology presents a negative externality; and the operation in innovation value chain is high-risk. Such risks are from technical development and the exploration of unknown factors in the upstream of innovation value chain. Therefore, in the Group 2, technology spillover and financial support have a negative correlation with innovation output.

4.2.3 Regression analysis on Group 3

In the light of the results from Hausman Test, the regression model of Group 3 took the fixed-effect model V. On the basis of the result, economic basis, spatial location, technology spillover, innovation input, government action and financial support all have significant influence on Group 3. By comparing the coefficients of Group 1 and Group 2, here comes a point that the influence of technology spillover, spatial location and financial support on innovation output of Group 3 rises, indicating that the impetuses to improve the level of innovation output in Group 3 are diverse. Increasing technology spillover, rational utilization of spatial location and enhancing financial support may promote the regional innovation to improve the levels of innovation output.

5 Conclusions

This study took the 38 inland cities in Yangtze River Economic Belt as spatial observing units to discussed regional overall difference characteristics, spatial evolution characteristics, spatial hotspots distribution of innovation output and its causes with the data patents authorization and other related data, and made conclusions as follows.

1) From 2000 to 2013, the overall innovation output in the inland cities of Yangtze River Economic Belt had been increasing year by year, while the geographic concentration of it presented a fluctuated downward trend. The level of innovation output of inland cities of Yangtze River Economic Belt city mosaic had increased steadily, the curve of which is in a shape of a mirrored *L*. While the geographic concentration showed an inverted letter *W* shape with a downward trend, indicating that innovation output had changed to be more balanced.

2) The agglomeration degree of innovation output showed a shape of mirrored *Z* with a fluctuated upward trend; the hotspots area of innovation output developed into a *monopole- prominent* spatial pattern in Yangtze River delta area from a *dual-central* spatial structure in Yangtze River delta area and Chengdu-Chongqing area, and the scope of hot spots regions had been extending. Besides, the cold spots regions were in the middle reaches of Yangtze River.

3) As for the 38 inland cities in Yangtze River Economic Belt, spatial location, financial support, technology spillover, government action and economic all had significant positive impacts on the innovation output in this area, and the degrees of these impacts were declined by the order; As for the cities which were on the lower reaches of Yangtze river, the economic basis, government action and spatial location play an important role to promote the innovation output, and the degrees of them were declined by the order; As for the cities which were on the middle and upper reaches of Yangtze river, the spatial location, financial support, technology spillover, government action and economic basis played an important role to promote the innovation output, and the degrees of them were declined by the order.

Based on the above conclusions, this study proposed the following policy recommendations.

1) Understand the differences of innovation between regions fully, and optimize the spatial layout of innovation output. When actively creating a good atmosphere for innovation, government may have an objective awareness of regional differences of innovation output in spatial aggregation and spatial characteristics. Try to build a regional linkage development mechanism of innovation output. Focus on nurturing a multi polar regional innovation center, and building a platform for technology sharing and knowledge exchange.

2) Try collaborating and establishing a sound service system for innovation. Governments at all levels can make overall plans and take all factors into consideration to set and implement policies, and the development of innovation might be carries out according to local conditions. As the research institutes and business innovation are the main forces of innovation output, governments at all levels can encourage them to conduct innovative researches and introduce some positive policies, such as the economic support.

3) Collocate the driving element rationally and make the innovation output increase balanced. The impetuses to improve the level of innovation output in Yangtze River Economic Belt are diverse. Increasing technology spillover, rational utilization of spatial location and enhancing financial support may promote the regional innovation to improve the levels of innovation output. For example, in Yangtze River Delta area, the level of innovation output is sensitive to the economic basis. So, the local government can promote the development of innovation output by developing the local economy.

4) Improve the innovation value chain mechanism and internalize the innovation externalities. Introduce various policies, such as financial subsidies and technical protection, to encourage innovation input and form a good conversion mechanism between innovation input and innovation output. Build risk management system to reduce the innovation risks in the process of innovation value chain and attract financial supports. Integrate the innovation resources timely and promote researches with the integration process.

Abstract: The purpose of this paper is to analyze the impact of social norm on TEA in Malaysia Context. In this study, Social norm as IV includes Equalinc, Nbgoodc, Nbstatus, Nbmedia. In other words, to examines the relationship between the TEA and social norms indexes as subsection of the entrepreneurial attitudes. The study was drawn from country-level data provided by the National Malaysia GEM (Global Entrepreneurship Monitor) to evaluate the current status of entrepreneurial environments in the country. The findings show that the early stages of entrepreneurship development in Malaysia are very dynamic and volatile. The number of early-stage entrepreneurial activities in Malaysia is still lower than in other parts of developing countries. This paper provides the Malaysian government with theoretical support so that the government can utilize limited resources to develop entrepreneurial activities. This study demonstrates the value of Big Data analytics in understanding of issue within a community. The result of our systematic mapping can help policy makers to obtain an overview of existing situation and identify areas in the field that require more attention.

Key words: Business development; Entrepreneurial activity; Global entrepreneurship monitor; Big data analytics; PCA

1 Introduction

A lot of studies have shown that entrepreneurship has been the primary driver for the economic progress of every nation (Christensen, C. M., Johnson, M. W., and Rigby, D. K, 2002). Entrepreneurship has played such a substantial role in creating innovation, diversity, enhancing the competitiveness, generating new ideas, creating employment opportunities, other than providing social adjustment and economic growth in industrialized and developing economies (Robson, P. J. A., and Bennett, R. J. SME Growth, 2000 Gürol, Y., and Atsan, 2006). Several scholars have illustrated the fact that entrepreneurship is both beneficial and crucial to achieve a healthy economy (Gorman, G., Hanlon, D., and King, 1997 Henry, C., Hill, F., and Leitch, C, 2003), W. A significant remarkable causal relationship between entrepreneurship, economic growth and poverty reduction has been proven in previous studies. The emerging concept of entrepreneurship originates from the formation of entrepreneurial opportunities, the understanding of entrepreneurial aspiration, which kick-starts new business enterprise. In the Malaysian context, (Ariff and Abubakar Ariff, M., and Abubakar, S. Y, 2002) have observed that since the 1970s, small businesses begun by entrepreneurs had become a net creator of jobs, and wealth creation. Quoted from Abdullah (Abdullah, M. A. H, 1999), in a developing country like Malaysia, entrepreneurial activities via small businesses creation serve as a mechanism to improve income distribution, to stimulate economic growth, and to give a new shape to the economic structure. In essence, entrepreneurship is important to the wellbeing of the Malaysian economy.

Since entrepreneurship development is a forceful instrument of activating the nation's economic growth, many industrialized and developing countries have taken some measures to promote entrepreneurship activity among their community. Thus, many researchers have been stressing more on the studies on entrepreneurial environments, opportunities and growth. However, at present, theoretically speaking, most researches are based on the qualitative research analysis. There is a body of evidence that relies on empirical data attempting to study the nature of the entrepreneurship environment in Malaysia. In this regard the works that were based on developed countries, and their conclusion may not always tally with the Malaysian context and perspective. Entrepreneurial surroundings that have been experienced by up-and-coming entrepreneurs from developing countries may not be the same as those in developed countries, as the latter may have more institutional support and the education and training systems that are more ahead, thus they offer support to entrepreneurship activities and

environment. Due to the fact that Malaysia has some unique economic, cultural, value, educational, political and social environments; the study on the consequences of entrepreneurial environments on the opportunities and growth carries a practical significance in boosting regional entrepreneurial activities. The reason that causes the above condition is the trouble in gauging entrepreneurial environments, opportunities and growth. Therefore, theoretically it is vital to pursue the research further. Moreover, while the Malaysian Government proposes a worthwhile strategy of “entrepreneurship as career of choice”, it is feasibly significant to study how entrepreneurial environments determine the entrepreneurial phenomenon in Malaysia. It is based on this landscape that this study was undertaken. From this perspective, this paper tries to establish a sound theoretical foundation to the relevant authorities aiming to develop a series of effective strategies and plans to improve the Malaysian entrepreneurial development.

Malaysia is deemed an appropriate case when it comes to evaluating the role of entrepreneurship in developing countries for a number of reasons. First, from 2000s onwards, Malaysia has illustrated a remarkable economic growth, with the average of 3-5 per cent per year. Based on the assumption that the gross domestic product (GDP) is linked with the entrepreneurship levels, it can be expected that there is a sufficient bandwidth across time to record the changes in the characteristics of entrepreneurship. Second of all, Malaysia has taken part in the Global Entrepreneurship Monitor (GEM,2016) since 2006 on multiple occasions. As a unique project, the GEM that uses standardized methodology to assess entrepreneurial activity all over the world. As a result, the role of entrepreneurship can be assessed in economies in unique development phases. As Malaysia has participated in the GEM study, it gives us the chance to cross-reference data that have proven to be helpful in this study. Moreover, the empirical results in GEM function as a framework for the interpretation of the results established in the Malaysian case. To this end, let us look at how this paper shall be organized. First of all, the next sections shall discuss the literature that concerns with the entrepreneurship environment and economic development. In the subsequent sections, the methodology of the present study is then elaborated, followed by a presentation of the findings that have been gathered. The study ends with the inevitable conclusions and recommendations for future research.

2 Literature Review

A steady body of literature has been known to link entrepreneurship and the stage of economic development. Entrepreneurship is generally accepted to be a vital condition for a sound long-term economic development (Carree, M. A., and Thurik,2003), A. R. The term “economic development” refers to any activity serving to help increase the standard of living in both a community and country. This not only includes an increase in the income for the people, but also it betters the standard of living. Therefore, it is an integration of an increase in wealth and quality of life for every layer of the community. A lot of studies advocate that economic development can be associated with entrepreneurship activity on the national or regional level, based on the growth rate or the GDP as the indicator of the economic growth or development. Development economists outline three major phases of economic development: It has been found in various studies that the economy concentrates on the production of agricultural products and

- 1) Small-scale manufacturing;

- 2) The economy shifts from small-scale production towards manufacturing; and

- 3) With increasing wealth the economy shifts away for manufacturing towards services proposed in a text that countries have to undergo five stages of economic growth:

- 1) The traditional society;

- 2) The preconditions for take-off;

- 3) The take-off;

- 4) The drive to maturity; and

- 5) The age of high mass-consumption.

While these stages suggest on the simpler way of looking at the development of modern economies, they have also recognized critical events.

2.1 Literature linking entrepreneurship environment

The environment for entrepreneurship is imperative for a new firm venture (Delmar, F., and Wiklund, J,2008 Ahmad, S. Z., Abdul Rani, N. S.,2010) The term “entrepreneurial environments” refers to a combination of factors that play a role in the development or in the nurturing of entrepreneurship and

entrepreneurial activities. As the infrastructure develops and as the entrepreneurial system prospers, the system will survive only if the environment is deemed suitable for entrepreneurial activity and new venture creation (Pennings, J. M., and Kimberly, J.,1980). The entrepreneurial environment may ascertain the continued or successful existence of the organization. Vast literature has not left the effect of a variety of factors of entrepreneurial environments on entrepreneurship (Ahmad, S. Z., Abdul Rani, N. S.,2010). For instance, (Wennekers, S., Uhlaner, L., and Thurik, R,2002). debated that technology, level of economic development, culture, and institutions are all the influences for the demand for entrepreneurship by creating opportunities available for startups. (Fogel, G,1994). opined that governments can influence market mechanisms, making them function successfully by removing the conditions that give way to market flaws or administrative rigid rules and regulations. (Beck, T., and Demircuc-Kunt, A,2006). argued that for new business to grow, it is crucial for the entrepreneurial environments to be solidified. Changes in the entrepreneurial environment have either a negative or positive impact on the growth or failure of small businesses (Ahmad, S. Z., Abdul Rani, N. S.,2010).

2.2 Problem statement

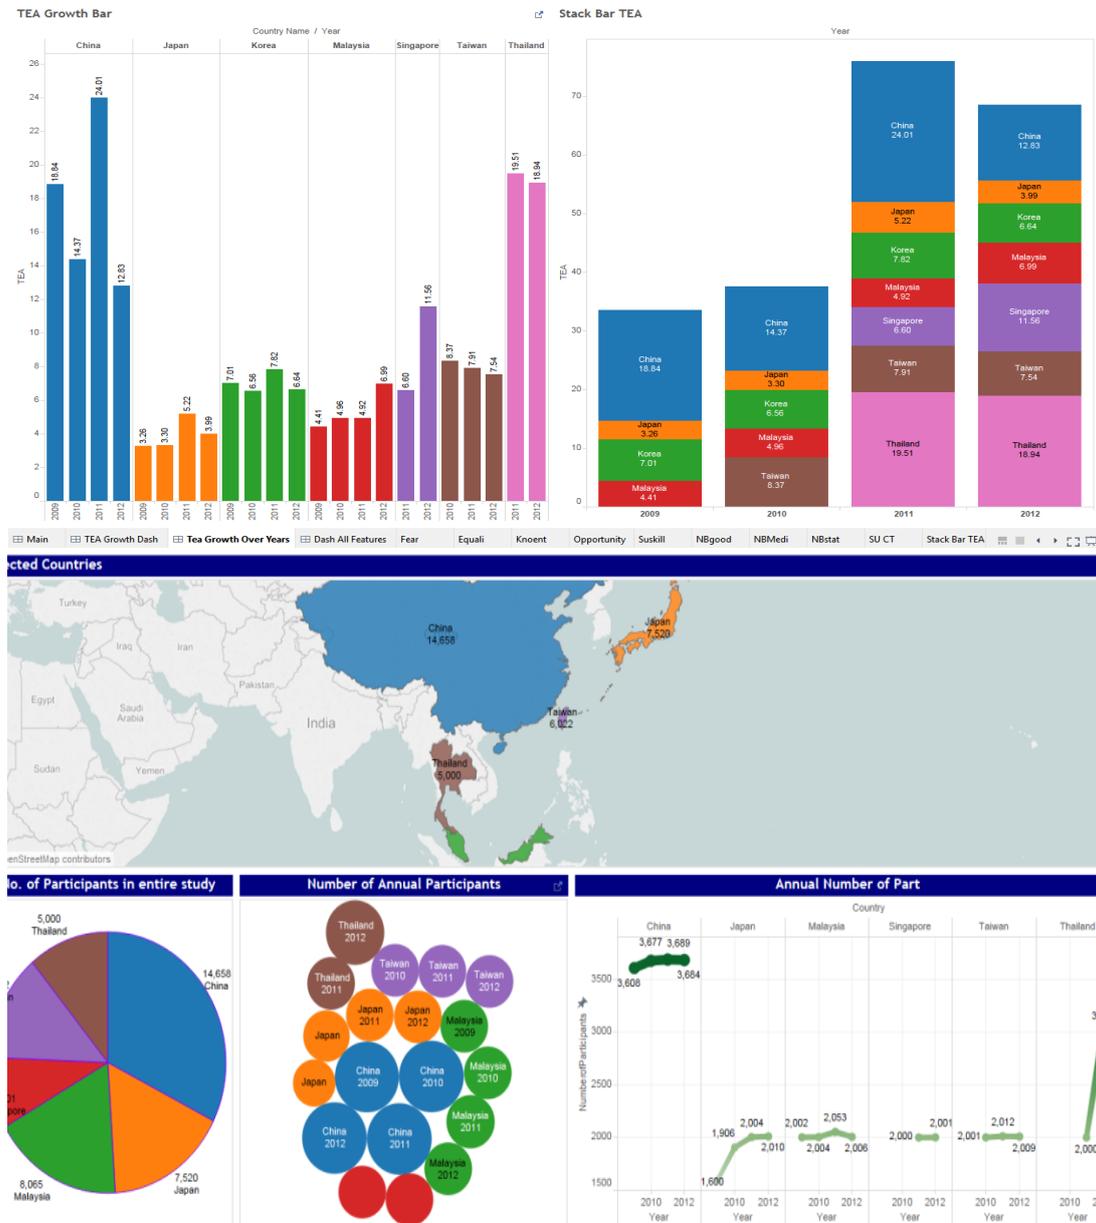

Figure 1 Big Data Visualization to Demonstrate the Malaysia Situation
(Source: GEM Adult Population Survey 2009 - 2012)

Malaysia is amongst the few economies in the Asia Pacific and South Asia region where finance and physical infrastructure to support entrepreneurship are widely available. However, despite such positive factors, the country's Total Early stage Entrepreneurial activity rate (TEA) is the second lowest in the region, with only Japan having a lower rate and this caused low performance consequently (Fig 1). The proportions of those intending to start a business, and of those with positive attitudes towards entrepreneurship, are also amongst the lowest in the region. Growth expectation is relatively low, with less than 7% of new businesses expecting to hire more than 20 workers. Close to 84% see themselves creating less than 5 jobs. The country has a forward-looking entrepreneur-friendly national policy. Indeed, the conditions for entrepreneurship in Malaysia match or better those found in other efficiency-driven (medium development) and even some innovation-driven (most developed) economies. However other factors such as bureaucracy and poor education and training have impeded entrepreneurial growth. The average entrepreneur in Malaysia is likely to be 35-44 years of age, more likely to be male than female, with an upper secondary level of education and a mid-range household income.

3 Research Methodology

3.1 GEM Research model GEM research methodology and sources

Being reminded of the objective, GEM adopts a full view of entrepreneurship and sheds light on the role of the individuals in the entrepreneurial process. As opposed to most entrepreneurship data sets that measure newer and smaller firms, GEM analyses the individual behavior when it comes to starting and managing a business. This sets the GEM data apart from other data sets, most of which are a record of the firm-level data on (new) firm registrations, as established in the GEM 2008 Global Executive Report. New firms are normally started by individuals. Even in established organizations, entrepreneurial attitudes, activities, and aspirations are not the same among individuals. Another guiding principle of the GEM research is that entrepreneurship is a process. Therefore, the GEM observes the actions of entrepreneurs who thrive at different stages of the process of creating and sustaining a business. For the GEM, the wage payment made to anybody for more than three months, is well regarded as the "birth event" of actual businesses. Individuals who actively supply resources to start a business that they expect to own themselves, but who have not achieved this "birth event" are termed nascent entrepreneurs. Those who presently own and manage a new business that has paid salaries for more than three months but not more than 42 months, are known as new business owner-managers. The cutoff point of 42 months has been made on the integration of theoretical and operational grounds. The emerging number of nascent entrepreneurs and new business owner-managers may be viewed as an indicator of early-stage entrepreneurial activity in a country. It depicts the dynamic new firm activity—the extent of experimentation in new business models by a national population. Established business owners usually own and manage their respective business that has been in operation for more than 42 months. Their businesses have survived the liability of newness. High rates of established business ownership may imply some positive conditions for firm survival. However, this may not have to be the case. If a country demonstrates a high degree of established entrepreneurship, coupled with low degree of early-stage entrepreneurial activity, there will be an indication of a low level of dynamism in the entrepreneurial activity. Last but not least, the GEM identifies individuals who have not continued a business in the last 12 months. These individuals may have to penetrate the entrepreneurial process again. The GEM 2009 Global Executive Report includes 54 countries all over the world. In each of these 54 countries, a survey was conducted among a representative sample comprising of not more than 2,000 adults. More than 180,000 adults went for an interview between May and October (outside holiday seasons) and answered questions on their attitudes toward, as well as their involvement in the entrepreneurial activity.

3.2 Data sources

The empirical data in this paper derive from the Malaysian reports of the GEM research program carried out in year 2009 until 2012. The data collection method consists of two main parts: the Adult Population Surveys (APS) and National Experts Survey (NES). The primary data source was collected through the national APS. The second data collection method is NES, a questionnaire that contains questions concerning the assessment of the situation with regard to the entrepreneurial framework conditions (EFCs). The NES was conducted through face-to-face interviews with experts. The national experts' survey is an important component of GEM as it provides insights into the entrepreneurial start-up environment. These experts come from government, universities and organization of venture investment. It is important to note that research findings about the total entrepreneurial activities, characteristics of entrepreneurs, and new business structure are based on the APS, whereas, in order to determine the

environment for entrepreneurship, the responses to NES are used. They grade entrepreneurial conditions according to GEM module. These grades lie from 1 to 5. Higher grade shows finer condition.

3.3 Principal component analysis (PCA)

The dimension of a huge data set can be trimmed down by using principal component analysis (PCA), which is considered as one of the most prevalent and useful statistical methods for uncovering the potential structure of a set of variables. This method is used for explaining the variance of a large set of interrelated variables by transforming them into a new, smaller set of uncorrelated (independent) variables, namely principal components (PCs). In other words, Principal component analysis (PCA) is a multivariate technique that analyzes a data table in which observations are described by several inter-correlated quantitative dependent variables. Its goal is to extract the important information from the table, to represent it as a set of new orthogonal variables called principal components, and to display the pattern of similarity of the observations and of the variables as points in maps.

4 Measures

The APS data document the behavior and characteristics of entrepreneurs and non-entrepreneurs. As such, the survey includes several items some of which parallels those used in other studies to measure the theory of planned behavior variables.

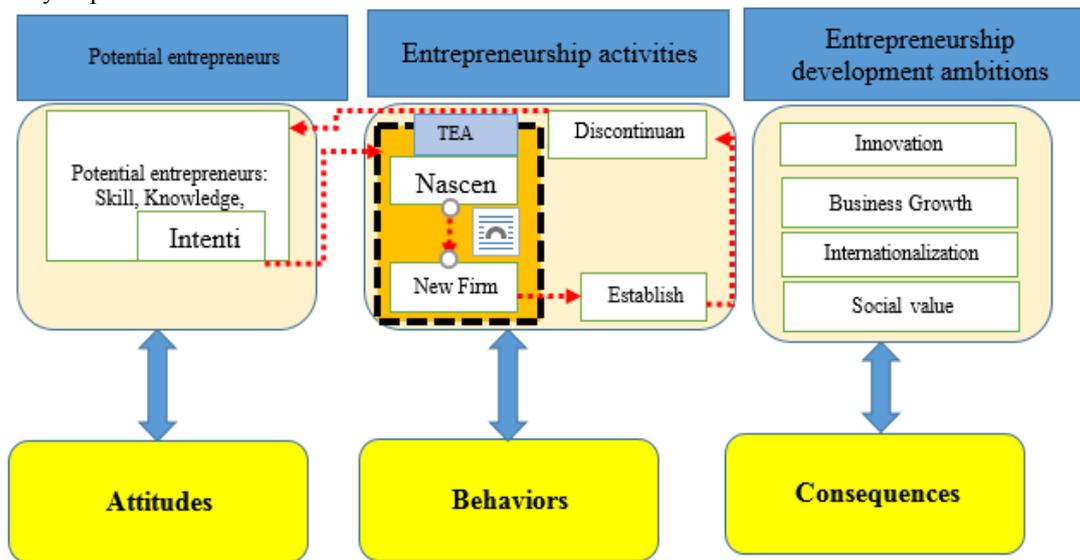

Figure 2 The Entrepreneurship Process and GEM Operational Definition

5 Result

A lot of studies have shown that entrepreneurship has been the primary driver for the economic progress of every nation. Entrepreneurship has played such a substantial role in creating innovation, diversity, enhancing the competitiveness, generating new ideas, creating employment opportunities, other than providing social adjustment and economic growth in industrialized and developing economies. Several scholars have illustrated the fact that entrepreneurship is both beneficial and crucial to achieve a healthy economy. In the Malaysian context, since the 1970s, small businesses begun by entrepreneurs had become a net creator of jobs, and wealth creation. (Quoted from Abdullah, M. A. H.,1999), in a developing country like Malaysia, entrepreneurial activities via small businesses creation serve as a mechanism to improve income distribution, to stimulate economic growth, and to give a new shape to the economic structure. In essence, entrepreneurship is important to the wellbeing of the Malaysian economy.

5.1 The indexes relevant to the entrepreneurial attitudes

1) Dependent variable:

Total Early-Stage Entrepreneurial Activity (% of 18-64 Adult Population) (TEA)

2) Independent variables:

Equalinc: In your country, most people would prefer that everyone had a similar standard of living.

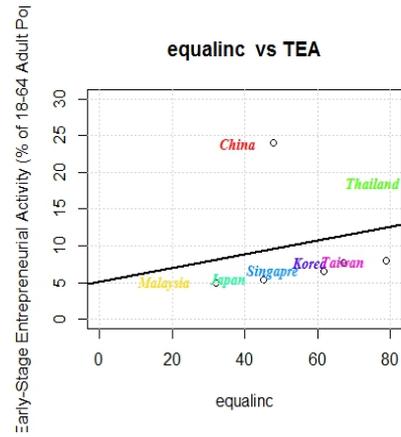

Figure 3 Percentage of the Respondents Who Would Prefer That Everyone Had a Similar Standard of Living

It can be said that individual would prefer that everyone had a similar standard of living will have positive attitude toward entrepreneurship. On the other hand, individuals who do not a similar standard of living have not the positive attitude starting entrepreneurship.

NBGOODC: In your country, most people consider starting a new business a desirable career choice.

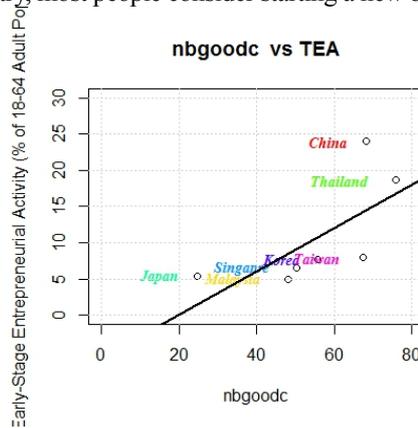

Figure 4 Percentage of the Respondents Who Consider Starting a New Business a Desirable Career Choice

It can be argued that individuals who consider starting a new business a desirable career choice and therefore a positive attitude toward entrepreneurship.

NBSTATUS: In your country, those successful at starting a new business have a high level of status and respect.

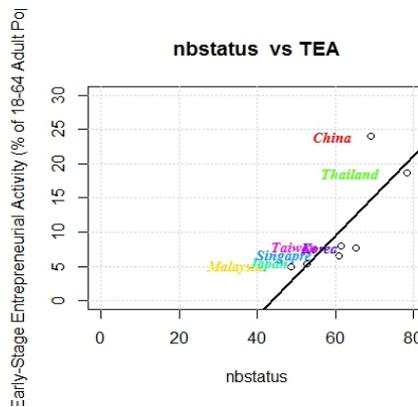

Figure 5 Percentage of the Respondents Who Those Successful at Starting a New Business Have a High Level of Status and Respect

It can also be argued that individuals who a high level of status and respect will be more interested in starting a business and therefore will have a positive attitude toward entrepreneurship.

NBMEDIA: In your country, you will often see stories in the public media about successful new businesses.

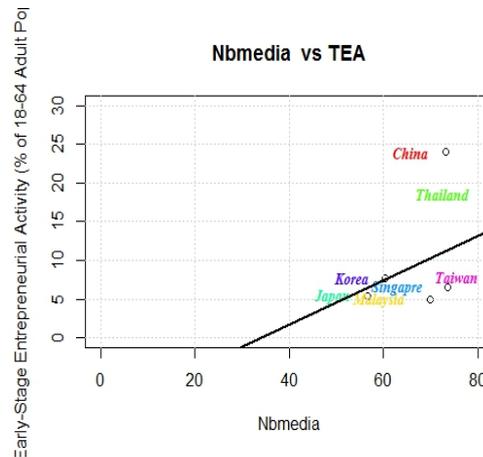

Figure 6 Percentage of the Respondents Who Have Often Seen Stories in the Public Media about Successful New Businesses

Additionally, it can be argued that individuals who have often seen stories in the public media about successful new businesses will have a positive attitude toward entrepreneurship. On the other hand, individuals who have not often seen stories in the public media about successful new businesses will have not positive attitude toward entrepreneurship.

6 Conclusions

This paper constructs Big Data technologies to test and analyses the relationship between social norms indexes and TEA according to the conceptual model of GEM and Big Data technologies. Based on the data derived from GEM reports, we use Principal Component Analysis (PCA) to study the impacts of social norms on TEA empirically. The study is based on regional data derived from Malaysia entrepreneurship monitor research program. The social factors comprise equalinc, nbgoodc, nbstatus, and nbmedia that advance the integrality and typification of the study. To some extent, the analyses based on empirical data are also beneficial supplements to current researches. With respect to the statistical results, this paper reveals the relationship between social norm and TEA, and indicates the impacts of social norm on entrepreneurship. Meanwhile, Consideration of the various factors like demographic information for the entrepreneurial activity and their quantitative assessment remain to be discussed.

The Co-Innovation Alliance Scan, Tool for Effective Collaboration with External Partners

Frans Stel

Avans University of Applied Sciences, Centre of expertise Sustainable Business, The Netherlands
(E-mail: fg.stel@avans.nl)

Abstract: In order to select and assess co-innovation partners, I have developed an integrative framework coined as the co-innovation alliance scan that consist of four 'fits' between alliance partners: a strategic, operation, relationship and network fit. Each fit contains three indicators, to be rated from 1 (unfavorable) to 5 (favorable). High rated indicators prognosticate success, low ones might hamper or impede successful co-innovation cooperation. Using the scan, I constructed a serious "alliance game" in order to develop competencies of (future) alliance managers.

Key words: Alliance management; Partner evaluation; Serious game

1 Introduction

The development and marketing of new products or services is becoming increasingly expensive, complex and uncertain. There are often multiple disciplines required while there is less time to recoup development costs (KPMG, 2012). Therefore, collaborating within (international) alliances and networks is increasingly important (Vanhaverbeke and Noorderhaven, 2001; Chesbrough, 2006). An inter-organizational network is a source of knowledge and learning, and network membership will lead to more information transfer and learning, a larger knowledge base or improved process and product innovation (Beckman and Haunschild, 2002; Caloghirou et al., 2003). Through networking with partners from diverse backgrounds, companies are able to gain from different points of view.

At the same time, inter-organizational cooperation is complex because within an alliance, partners cooperate and compete simultaneously, known as co-opetition (Brandenburger and Nalebuff 1996). Who will spend the time and money and who will benefit from the partnership? Who owns new jointly developed Intellectual Property (IP)? Does the new IP belong to your own company or your partner? Who will benefit from IP-royalties? Effective collaboration does not imply disclosing all IP to every partner in a network. Cooperating with external partners entails added complexities and risks. Even when potential synergies with partners are present, firms face substantial difficulties attaining them. In many cases, implementation of alliances will evolve problematically (Stel, 2011). Four aggregation levels interact often problematically during the implementation: the individual, team, as well as the organizational and network level. Successful implementation implies effective co-ordination of the activities on all four levels (Duysters et al., 2002; Garcia-Valerrama and Mulero-Mendigorri, 2005).

2 The Co-Innovation Alliance Scan

In order to develop crucial alliance competencies and determine and discuss beforehand whether potential alliance partners fit well with your business, I have developed a 'co-innovation alliance scan'. The scan is building on existing alliance scans in use at companies¹ as well as the work of Cameron and Quinn, Denison and Mishra, Rosinski and Trompenaars. I tap from four theoretical domains: the network, contingency, organizational learning, and resource-based perspectives. I include aspects of networks, such as indirect/direct ties, and structural / personal ties, several 'fits' of compatibilities between alliance partners: strategic, operation, relationship and network fit. I focus on facilitating and blocking factors in competence development, on dynamic and combinative capabilities. I use key concepts of the organizational learning theory such as absorptive capacity, combinative capability, cognitive distance and the paradoxes of information and replication. I include facilitating factors and difficulties for organizational learning and competence development in co-innovation alliances (Gomes-Casseres, 1996; Madhok and Tallman, 1998).

I am following the methodology of Insights Learning & Development. This international psychometric assessment and training company has effectively brought into practice Carl Jung's theory on personality and behavioral styles. I have integrated task related and relationship related issues with issues of Introspection and Extraversion. When I combine all four elements, I am able to integrate in a partnership assessment tool organizational and relationship dynamics.

¹ Philips (c.f. Bell et al, 2011; Bell, 2012) and Elly Lilly (Stach, 1996; Futrell et al., 2001).

Task-related aspects are for instance a strategic compatibility between partners (strategic fit) and the ease of operation (operational fit). Relationship issues are included because at implementation, people make the difference. Excellent entrepreneurs and their ‘virtuoso’ teams (cf. Boynton and Fisher, 2009) can make a success of mediocre strategies or products, though under-performing individuals or teams will definitely not win a competitive battle. When venture capitalists decide whether or not to take an equity stake in a new venture, they rely primarily on their judgment of the quality of the entrepreneur and his team. Only if they are to be trusted, will a business plan be considered. First the man, then the plan. Interpersonal relationships are important because without them, potential synergies from the alliance are likely to remain dormant, which could result in an underperforming alliance. I distinguish interpersonal aspects as trust, and commitment (personal fit) as well as network relationships (network fit), as is illustrated in Figure 1.

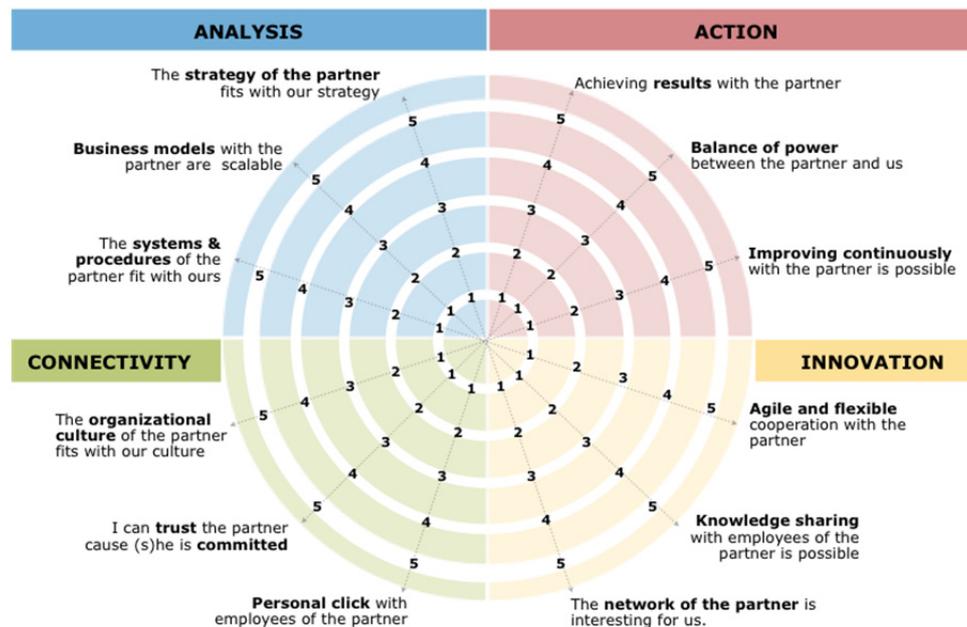

Figure 1 The Co-Innovation Alliance Scan

I will discuss the four elements of the co-innovation alliance scan: analysis, connectivity, innovation, and action.

3 Analysis (Strategic Fit)

In complex, uncertain and dynamic markets, it is impossible to make an estimate of the future. It is certainly not a continuation of the past. In an uncertain world, strategy and business planning cannot be considered purely as a step-by-step rational process based on stringent market and competitive analyses. The traditional analytical and deductive sequence is becoming obsolete. In this approach, known as “causation”, firstly a strategy is defined. Based on this strategy, the expected results are defined. Actions are then implemented in order to fulfill the prescribed strategy.

Instead, a more flexible and pragmatic “effectuation” approach to strategy is necessary (Sarasvathi, 2001, 2008). This approach is means-oriented, based on experimentation, existing competences and cooperation with external partners. Strategy is much more adaptive instead of being defined beforehand. Learning based on trial-and error and forming alliances with external partners should play a part as well as analytical prediction. Do partners in the alliance –now and in the near future- share ambitions, strategic goals, and strategic approaches? Are the strategies of the partners compatible?

Finding a viable business model is not just a linear, analytical process based on fixed assumptions. Instead it requires iterative experimentation, talking to potential customers, trying new things, and continually making adjustments. As such, discovering a new business model is inherently risky, and is far more likely to fail than to succeed. Are the partners able and willing to take the risk of developing jointly new scalable business models? Do the systems and procedures facilitate and enable experimentation?

In the section “Analysis”, I ask the following questions:

- Do the strategic goals and ambitions of the partners match with each other and the market?
- Are joint business models with partners scalable?
- Do the systems and procedures of partners match with each other?

4 Connectivity (Personal Fit)

Connectivity is becoming increasingly important; between businesses and the earth's resources, between ideals and operations, between partners in a network, or between leaders and followers within organizations. In order to make an impactful and lasting partnership, using both head and heart are relevant. When developing a lasting solution of global sustainability issues, both relationship dynamics as well as task related dynamics should be considered. If a company is able to communicate the purpose, cause or beliefs of a partnership properly and consistently, it will win the hearts and minds of both partners and stakeholders, which in itself will lead to greater loyalty as well as the necessary long-term commitment. From Simon Sinek's book "Start with the Why": "I follow those who lead, not because I have to, but because I want to. I follow those who lead not for them, but for ourselves (Sinek, 2009)." Are the values of the employees of the alliances partners connected?

In the section "Connectivity", I observe:

- Do the organizational cultures of the alliance partners match with each other?
- Can one expect trust and commitment between alliance partners?
- Do the alliance partners feel personally bonded to their counterparts in the alliance?

5 Innovation (Network Fit)

In order to implement international business opportunities, radical renewal will be necessary. Business-as-usual cannot bring us to sustainability or secure economic and social prosperity; these can only be achieved by radical change, starting now (World Council of Sustainable Business Development, 2010). Solving sustainability challenges should be beyond incremental change: it lies with systemic change and radical breakthrough innovation. Therefore, a main success factor is radical "thinking out of the box". In order to convert the huge sustainable challenges into business opportunities, an open and creative mindset is essential. This involves breaking out of the status quo in order to consider new possibilities, and exploring new as well as unusual combinations. To paraphrase a famous quote of Albert Einstein: "I cannot solve our sustainability problems using the same thinking as when I created them".

Some unique discovery skills or "Innovator's DNA" abilities are essential: associating, observing, questioning, and experimentation (Dyer et al. (2009). Associating is the ability to successfully connect seemingly unrelated questions, problems, or ideas from a wide range of disciplines. Associating involves observation carefully the activities of customers, suppliers, other companies, or environmental trends that suggest new ways of doing things. The ability of 'questioning' is important, challenging the status quo asking "Why?" and "Why not?" and "What if?" questions. A culture that fosters "experimentation" is relevant. Especially in the early stages of development, experimentation is a means of learning quickly because it allows timely and cost-effective adjusting of development projects (Ries, 2011; Blank, 2007). In order to implement international sustainable business in time, the ability to learn and adapt quickly. Like Darwin's adage, "it is not the strongest that will survive, but the most adaptable".

Learning is defined as "the ability to process knowledge through which the range of potential behaviors can be increased" (Huber, 1991: 89). Previous success complicates the learning of new practices. Because of their success in the past, companies tend to be less eager to change their practices. Often, they will over-value existing practices. As Keynes wrote in 1937, "The difficulty lies not in the new ideas, but in escaping from the old ones". This complacency is known as "corporate rigidity". The adage "never change a winning team" should be substituted by "change a winning team at the right moment". Unlearning obsolete practices is a vital - and often problematic - first phase in learning to adapt. Learning involves acquisition and the use of new knowledge by an organization (Kumar and Nti, 1998).

A firm's ability to value, assimilate, and utilize new external knowledge is known as absorptive capacity (Cohen and Levinthal, 1990; Lane and Lubatkin, 1998). Absorptive capacity is considered to be an important source of competitive advantage (Ghoshal, 1987; Kale and Singh, 2007), which involves the identification, acquisition and use of new technologies¹. Agility, i.e. a combination of speed and

¹ Todorova and Durisin (2007) describe the following actions: identification of new technologies, making it

flexibility, is important for sustainable international business. Market conditions are changing faster and becoming more uncertain. In order to benefit from a smaller window of opportunity, sustainable companies should be agile, react quickly and flexibly. Several aspects of networks are relevant: size, diversity, interdependence, structure, intensity, as well as the position of partners within a network.

Therefore, at “innovation” I analyze the following questions:

- Can one expect agility flexibility within the co-innovation alliance?
- Is knowledge sharing and technology transfer possible between the alliance partners?
- Do the networks or ecosystems of the partners yield the alliance?

6 Action (Operational Fit)

Resilience – the capacity to recover quickly from difficulties - is indispensable for successful sustainable business because it involves the development and marketing of new products and services. Novelty brings with it unforeseen obstacles. You never know in advance which projects ultimately leads to new business. Results can often only be achieved after a little inspiration and a lot of perspiration. Half of the innovations in the world were a result of great insight, the other half happened by accident, and none of them happened on schedule (McNamee as cited in Estrin, 2009: 25). It is important to be aware of the potential hurdles, to be prepared to withstand unforeseen difficulties, to learn and re-focus. To achieve sustainable results, it is essential to strive to continuously improve the alliance, adapt and if needed -as Mullins and Komisar (2009) named their book- : “Get to plan B!”. One must have the stamina to cope with setbacks and delays. The same applies to the relationship between alliance partners in development projects. The relationship should be resilient in order to withstand strain, conflict and unforeseen setbacks. Therefore, perseverance and resilience are indispensable.

In the section “Action”, I consider:

- Can one expect to achieve sustainable results with the alliance?
- Can one expect a balance of power and control within the partnership?
- Are the proposed partners willing to continuously improve the partnership?

7 Conclusions

In interactive workshops, I have tested the alliance scan. The scan provides a nice overview of both the partner selection process as well as an estimate of future organizational and relationship dynamics of an alliance. I use the scan to train skills of future alliance managers and to optimize the search process for potential co-innovation partners. In workshops, based on the alliance scan, I discuss the impact of the four ‘fits’ of partner selection and partner cooperation. I identify paradoxes and balances in partner cooperation, the alignment of several critical items, and the feasibility of - e.g., technology transfer to and from partners, potential new business models and "dos and don'ts" of leading alliance teams.

I have developed a holistic scan – grounded in theory and practice. The scan deals with the complexity of implementing the alliance cooperation at four levels: the individual, team, organizational and inter-organizational level. Using Jung’s theories that have been operationalized by Insights Learning & Development, I offer a shared language to diagnose, build, support, and intervene in alliances.

During alliance cooperation, the scan helps to determine which aspects are developing well or need adjustment. For instance, a looming imbalance of power between alliance partners can be discussed in order to prevent eroding trust and commitment. In order to improve agility of the alliance, certain systems or procedures can be put on the agenda in order to adapt. Strategic, personal, operation or network fit between the alliance partners contribute to alliance effectiveness, while decreasing fits may result in an increasing risk of underperformance or even premature ending of the partnership.

I would like to invite academics and practitioners who are dealing with co-innovation alliances to comment on the scan in order to improve the tool. In addition, I intend to cooperate with researchers in conducting jointly longitudinal case studies in order to study and develop alliance competencies.

A Research on Scientific and Educational Integration Mode for Innovative Talents Training in Marketing Major of University

Ma Ying, Hu Jingjing

School of Management, Wuhan University of Technology, Wuhan, P.R. China, 430070

(E-mail: mying331@163.com, 969196032@qq.com)

Abstract: This paper analyzes the problems and shortcoming of innovative talents training in marketing major, and puts forward a concept of marketing professional and innovative talents training on the basis of integration of science and education, and constructs three kinds of innovative talent cultivation frameworks: the framework that based on "project as a link", the framework based on center or base, the framework for setting up "modular" teaching curriculum. Relying on these frameworks, universities can explore the mode of scientific and educational integration for innovative talents training in marketing major, in order to cultivate innovative talents in marketing major.

Key words: Marketing; Integration of science and education; Innovative talents

1 Introduction

Integration of science and education is a strong support for the sustainable development of colleges and universities, it is an important way to cultivate innovative talents and promote scientific and technological innovation in China. The so-called integration of science and education that keeps innovative talents training on premise makes the scientific research and teaching permeate each other, and it has deeper meaning about what we widely advocated that the combination of scientific research and teaching. The integration of science and education that we advocate, do not stay in the form of combination and superposition, and must be placed on the top of rich and varied understanding of contemporary scientific research and teaching. By doing so, we can understand that the integration of science and education has deep meaning, as shown below.

The integration of science and education is based on the consistent understanding of scientific research and teaching (Wang Zhijun, 2013; Jon Kolko, 2012), which makes the scientific research and teaching permeate each other and form a new innovative talents training path¹. The benefits of mutual penetration are reflected in two aspects: on the one hand, research can improve teachers' teaching quality and academic level, enrich and renew the teaching content, it can also help students to understand and get familiar with the method and the process of the study, then change the simplicity of teaching. On the other hand, teaching is a research process of the arrangement and reflection of teaching content, which is helpful to scientific discoveries of systematic and theoretical, and it also help scientific researchers to update their knowledge systematic, and can promote the teacher's ability and level of scientific research (Tang Shuyan, 2015).

The integration of science and education is based on the diversity understanding of scientific research activities (Qiu Dan, 2015). It is the extension of the connotation of scientific research and teaching. In a sense, the boundary between research and teaching is no longer clear. University teaching is in the field of research (Zhou Guangli, Ma Haiquan, 2012), and scientific research play a supporting and leading role during the development of university, that is to say, university achieve the purpose of education in the process of scientific research (Wu Dexing, 2014). But at present, there is a phenomenon of conflict and separation between research and teaching, and scientific research is narrow in teaching (Li Yuhuan, 2015). Specifically, Chinese universities are generally divided into two kinds, one is the research university, heavy research; the other is the applied university, heavy teaching (Zhao Zhi, 2014). This phenomenon is contrary to the concept of coexistence of research and teaching in university.

The integration of science and education is aimed at developing the students' creativity and their initiative (Ma Longhai, Lan Baoiang, 2012). Although there are many scholars researching on the implementation of the integration of science and education as the entry point. Such as scholar Burton Clark believes that "scientific research is an important form for teaching and a valuable way for learning", namely "teaching and learning based on research", which is an important way for modern

¹ Ambient Insight Research. 2012 Learning Technology Research Taxonomy [DB/OL]. 2012. <http://www.ambientinsight.com>

higher education to realize the integration of science and education (Burton R Clark,1997). Haley promotes the students' inquiry learning as the goal, and design four courses that embodies integration of teaching and research (M Healy,2005). Blue puts forward the construction of "inclusive scholarly knowledge-building communities", as the core for this new integration mode's operation (Brew A ,2012). But the above researches want to get a breakthrough in the reform of teaching, they do not carry out the research from the students' individual or group initiative, creativity and innovation.

2 Teaching Purpose and Idea that Based on the Integration of Science and Education to Cultivate Innovative Talent in Marketing Major

2.1 The purpose of teaching that based on the integration of science and education

Combined with the needs of the state and society, and the training objectives of higher education that proposed by Ministry of Education, as well as the background that innovative talents training in marketing major, college marketing major's teaching that based on the integration of science and education has its specific purpose.

1) To perfect the course system of marketing major in Colleges and universities, and to improve the students' ability of innovation

Under the joint efforts of school, the teacher and the students, integration of science and education makes marketing professional curriculum system more perfect, and it is conducive for marketing major to form the ecological chain of discipline, major and teaching; it is conducive to change the marketing professional current unhealthy tendencies that is often said "paid more attention on research, and less on teaching";well, it is also conducive to make teacher devote themselves into teaching, by doing so, it lays a good foundation for the marketing professional innovative talents training. Finally, in the whole society, we can build a large-scale, multi-level, multi-field innovation talents training system of marketing major, and improve the student's innovation ability.

2) To improve students' basic knowledge and enrich their professional knowledge

For the marketing major in Colleges and universities, the integration of science and education makes the scientific research and teaching permeate each other and form a new innovative talents training path. On the one hand, students can concentrate on their study to learn professional knowledge; on the other hand, student can improve their scientific research ability and enrich their professional knowledge, and this can be realized when student conduct market research, analysis the research under the guidance of the teacher.

3) To enrich students' practical experience and improve their practical ability

Nowadays, many college graduates only have theoretical knowledge but lack of practical ability in the work, they are often called "high marks but poor competence". If the university education focus on training the students' ability of innovation and practice, lets the student participate in the activities of scientific research and develops their scientific research ability and practice ability, they would make progress rapidly in practice, master more theoretical knowledge. By doing so, it will be easy for students to accept new things, learn new skills, then, it will improve the competitiveness of students in a great extent and meet the social needs for talents. Based on the integration of science and education, colleges and universities carry out systematic practice teaching for the students of marketing major and cultivate their scientific research ability and practical ability. That makes the students majoring in marketing adapt to the working environment quickly and has a strong ability to innovate, to satisfy the demand of the jobs.

2.2 The idea of teaching that based on the integration of science and education

1) Strengthening the people-oriented teaching idea

Students are the principal part of learning, and schools are existed because of the students, so school's education activities should take the students as the center. On one hand, education should meet the needs of the social economic development, on the other hand, it should pay attention to students' demand of success. Therefore, in the science and education integration teaching process of cultivating creative talents of marketing major, it's necessary to improve the students' subject status, which is one of the important embodiment to insist and implement the scientific outlook on development, meanwhile it is the modern education request. From the perspective of education consumption, the students are the main body of education consumption, so schools should pay full attention to maintenance the marketing major colleges to entitle the legal rights to be educated, to participate and to choose in the process of education, and give full guarantee to cultivate their independent consciousness, improve their innovation ability in the education management system.

2) To promote the education idea of democracy and equality between teachers and students

Creating a good democratic environment and establishing a new type of relationship between teachers and students is an important condition for the intelligence development of students. The traditional idea of teaching formed a single teaching environment, which restrain the enthusiasm and initiative of the students. Modern education regards students as the main body, and pay attention to the equality between teachers and students, which encourage students to think, to speak, to express their views that is different from teachers. Guiding students to think problems, to research and solve problems positively in a timely manner makes bilateral interactive effect get fully reflected. The integration of science and education in marketing major can make a more harmonious relationship between the teachers and students: teacher try their best to teach, students are happy to learn. A teaching environment of equality, freedom, happiness, will greatly stimulate the learning enthusiasm of students and improve their innovation ability.

3) Strengthening the idea of individualized education

To make every student become the professional talent, colleges and universities must take measures that based on the truth, they should offer different training models for different groups of students, such as the classification of teaching, stratified teaching. The implementation of science and education integration give more chance to students, on the one hand, it provides a good scientific research platform for the students who have better scientific research ability; on the other hand, it provides the practice opportunity for the students and enriches their experience. Eventually, it makes the marketing professional graduates have a strong ability to innovate, so that they can meet the needs for innovative talents in society.

3 The Framework of the Scientific and Educational Integration Model for Innovative Talents Training in Marketing Major

3.1 The idea of framework that based on "project as a link"

1) The connotation of innovative talents training based on "project as a link"

The basic connotation marketing professional innovative talents training mode based on "project as a link" is that teachers of marketing major in colleges select scientific project and design project around the goal of training innovative talent. Project drives the implementation of the selection of teaching content and the teaching process, which enables students improve their practical ability and enhance their ability of explore the unknown field during the completion process of the project. By doing so, they can achieve objectives and requirements of innovative talents training in marketing major and enhance the innovation ability of students.

2) The practical significance of innovative talents training based on "project as a link".

Project is the core elements of innovative talents cultivation, which runs through the whole process of innovative talents training. Students can train skills, learn skills, cultivate ability, and enhance the professional quality during the implementation of the project.

Prominent feature of innovative talents training mode based on "Project as a link "is that teaching will be fully integrated with project and project drive the whole process of innovative personnel training, which is conducive to improve the effectiveness and pertinence of teaching. For marketing professional students, if teachers integrate the school education and scientific research, not only can improve the students' theoretical knowledge, but also students can use their knowledge that acquired from project to help enterprises and society. In a word, this mode can realize "zero distance contact" between students and enterprises, social and greatly improve their literacy of marketing aspects, truly achieve the educational idea that take the demand of innovative talents in colleges and universities education as the purpose, take the employment as the guidance, and the combination of production, education, research.

3) The basic framework of innovative talents training based on "project as a link"

Innovative talents training mode that based on "project as a link" in marketing major take teaching objectives as a starting point, shape the professional ability as the core, and make the "project" as the carrier, in order to make "project" drive the choice of teaching content, promote the implementation of the teaching process, promote teaching evaluation reform, drive school enterprise cooperation. Project driven marketing professional and innovative talents training process so that education goals can realize when the marketing professional students in the process of learning and the completion of the project. The specific basic framework as shown in Figure 1.

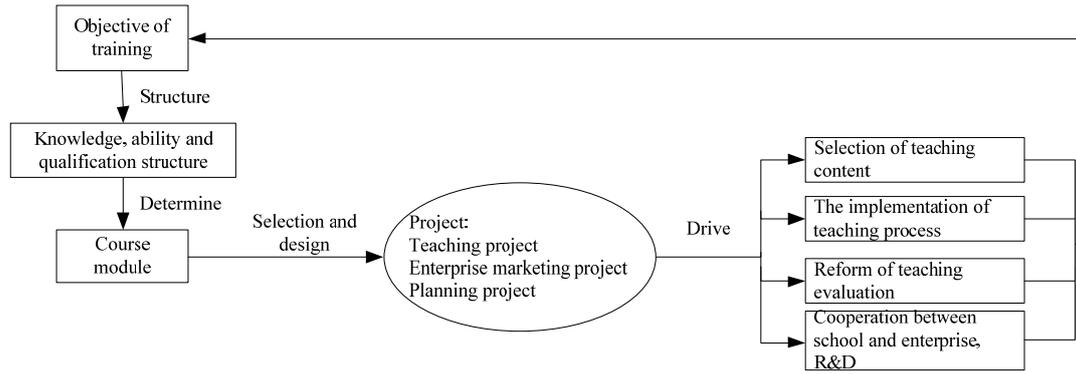

Figure 1 The Basic Framework of Innovative Talent Training Based on "Project as a Link"

3.2 The idea of framework based on center or base

1) The connotations of the creative-talents cultivation based on center or base

With respect to universities marketing professionals, in order to develop more innovative marketing professional personnel, firstly, based on center or base, analyzing the actual situation of the existing personnel training, and then develop training target according to the actual situation and the needs of society for scientific and rational talent. With the talent training centers or bases, marketing professional students can practice, freely discuss, what's more, timely to explore, discover problems and then solve the problems through scientific and reasonable way, which will provide a platform to show their talents. Through that platform, the students can be performed both in-campus and off-campus practical training to get a good workout. As a result, the objectives to develop the marketing professional innovative personnel and to enhance students' creativity will be achieved.

2) The framework of innovative talent training based on center and base

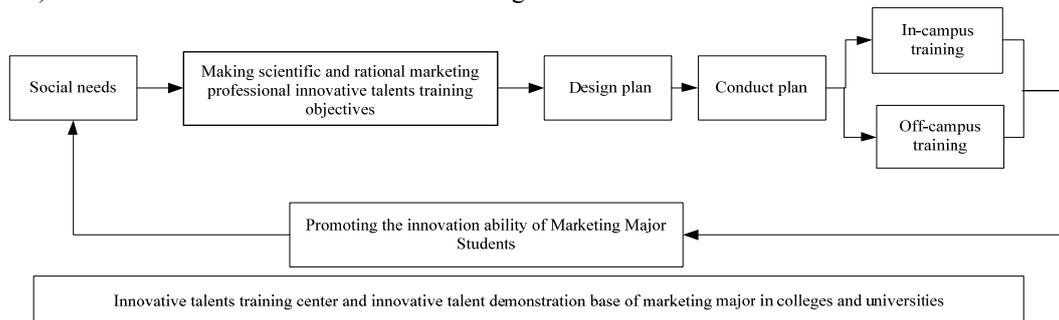

Figure 2 The Framework of Innovation Talents Training Based on Innovation Talents Training Center or the Base in Marketing Major

In order to meet the needs of the society for creative marketing personnel, colleges and universities can alone or corporate with the relevant enterprises to establish marketing professional and innovative talents training center or demonstration base of innovative talents. Taking "talent training center" or "talent demonstration base" as a platform, students of marketing major in colleges and universities would have a talent show stage. According to the needs of society, we can establish training target, and build platforms to design scientific and rational plan for training innovative marketing talents in detail. On the one hand, "talent training center" or "talent demonstration base " provide a practical training opportunity for marketing professional students, make students to exercise their marketing thinking in the simulation environment, advance the true feelings of the marketing environment of society; on the other hand, it can cooperate with enterprises to organize the practice for students, let the students complete the sales task personally, and temper their willpower, cultivate innovative marketing thinking in the changeable market environment. Finally, through in-campus and off-campus practical talents training, it improves students' innovative ability and meets the social marketing professional demand for innovative talents.

3.3 The idea of framework for setting up "modular" teaching curriculum

1) The connotation of "modular" teaching mode

"Modular" is a complex system, it can be decomposed into some semi-autonomous subsystems according to certain rules, and then these semi-autonomous subsystems can integrate into a more complex system process. We called these semi-autonomous subsystems "modules". The modular teaching mode is a set of teaching system in which the teaching content is designed according to the idea and principle of the program, it is under the guidance of established training objectives to compose all teaching content according to a certain standard or rules. That makes it become a relatively independent teaching module, and each module can be selected according to a certain rule to recombine. Students can choose modules according to their own interests and professional orientation, in order to achieve different goals, by doing so, college or university can achieve the intended course teaching objectives and practical requirements

2) The idea of the construction for setting up "modular" teaching curriculum in marketing major

In specialized course teaching process, modular teaching mode help to cultivate students' solid foundation of knowledge and basic theory of generous and solid professional skills. After that, the basic requirements that students must have wide caliber, thick foundation, high quality can be realized, and their innovative spirit and innovation ability can be improved, the innovative talents training teaching objective of marketing major in colleges and universities can be achieved. Taken the purpose that we cultivate innovative talents who have wide caliber, thick foundation and high quality in marketing major into consideration, the marketing professional course is divided into three parts: general module, personalized module, practice module, as shown in Figure 3.

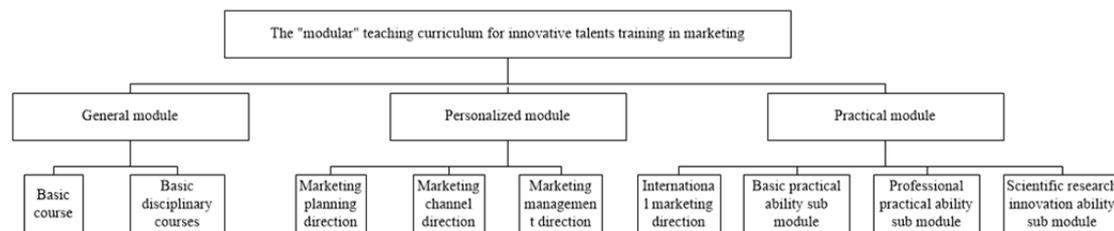

Figure 3 The "Modular" Teaching Curriculum Design for Innovation Talents in Marketing Major

① General module. General module mainly consists of two parts courses including basic courses and basic disciplinary courses. The main purpose is to cultivate students "broad caliber", cultivate their basic labor ability, learning ability, thinking ability, expression ability, communication ability and the basic self-control ability, help them establish the correct values, so that they can adapt to the social environment and lay a foundation for their further study and growth. The basic courses including ideological and political, military history, legal basis, English, computer, sports and so on, these courses help them strengthen their personality shaping; the basic disciplinary courses is about the professional course of the marketing, this course help students learn professional skills.

② Personalized module. The design principle of personalized module is: under the unity of the training objectives, students are given greater freedom of choice that they can choose practice according to their expertise and interest, which contribute to the individual initiative. Specific to marketing major, personalized module focuses on cultivating students' basic skills and ability of professional and technical work, training students' understanding and analysis ability of the practical problems with the use of professional theory, and training students' actual operation ability of study and work in society. Specific can be subdivided into: marketing planning direction, marketing channel direction, marketing management direction, international marketing direction, etc.

③ Practical module. This module is designed for the practice of marketing major, which is composed of three parts: basic practical ability sub module, professional practical ability sub module and scientific research innovation ability sub module. The basic practical ability sub module establish the course of practical teaching in the teaching process, including professional practice in English and computer skills training; professional practice ability sub module is an important link to cultivate and train the students to observe the society, to understand the society and to improve the students' ability to analyze and solve the problems with the combination of marketing theory and professional knowledge; scientific research innovation ability sub module aims to cultivate students' innovation ability, and improve students' scientific research ability in marketing major.

After the study of three modules, it will greatly improve the innovation ability of marketing professional students, and can make it better meet the needs of the community for innovative talents.

4 Conclusions

Through the literature review of the relevant theories of the integration of science and education and current research situation of China, this paper combines integration of science and education and innovative talents training in marketing major, and constructs three kinds of innovative talent cultivation framework: the framework that based on "project as a link", the framework based on center or base, the framework for setting up "modular" teaching curriculum. These theoretical frameworks have a certain reference value for China's colleges and universities, and make contribution to the construction of marketing disciplines.

Abstract: We have made a hypothesis verification of the focus strategy with the case study of Minimal Fab, that is a new concept of the National Institute of Advanced Industrial Science and Technology (AIST) in Japan, when Small to Medium Enterprise & Start-up companies entry into the semiconductor manufacturing industry. We have used a framework of ecosystem as a verification method. It was found that as a focus strategy: their technology development strategy should not follow ITRS, they should have variety & variable production systems which perform short delivery time and low cost and their product category should be a low-end semiconductor device under constrain conditions that the ecosystem is needed and they have Absorptive Capacity,

Key words: Semiconductor manufacturing; Innovation; Minimal fab; Ecosystem

1 Introduction

In the 1990's, Japan's semiconductor device manufacturing companies accounted for more than half of the world's semiconductor top 10 companies and they occupied more than 50% of the world market. According to the World Semiconductor Trade Statistics, they accounted for 24% of the world market share, even bursting of the IT bubble in 2001. However, they lost market share every year. In 2013, it became 11%, and it was a half of the bursting of the IT bubble.

Currently the semiconductor device manufacturing is progressing oligopoly in Intel Corporation, TSMC and Samsung Electronics. The semiconductor industry has been conducting research and development in accordance with ITRS (International Technology Roadmap for Semiconductors), which has been referred to as the "Wish Map" (Kameyama, 2010) of leading semiconductor device manufacturing companies. How can SME (Small to Medium Enterprise) & Start-up companies cause innovation if they follow the ITRS? Additionally, the maturity of the industry means that even if innovation does happen; whether it is the segregation of existing major semiconductor related companies, how can it be used? SME & Start-up companies have limited resources. Also, even if large companies have a lot of resources, the success probability of business is increased by the focus strategy to focus their resources on the specific technology development and product area (Matsuda & Suzuki, 2010). Based on these, we would like to issue our research question as follows: "When SME & Start-up companies try to enter the semiconductor manufacturing industry, which has such characteristics and issues, what kind of strategy can they enter the semiconductor industry in if they focus it?"

Miyake (2015) described a hypothesis and constraint conditions of the focus strategy as follows:

The hypotheses are,

a. Process innovation isn't to follow ITRS.

b. The process innovation that is an increment innovation that a short delivery time and low cost are enabled.

c. The product domain is a low-end semiconductor device.

d. The production method is a variation & variable production system.

The constraint conditions are,

a. An ecosystem should exist.

b. The SME & Start-up company should have Absorptive Capacity.

We conduct verification of these hypotheses by a case study, and we intend to show a constraint condition necessary to carry out the focus strategy when SME & Start-up companies go into the semiconductor manufacturing industry.

2 The Framework of This Study

Adner & Kapoor (2010) showed the general scheme of the business ecosystem as shown in Figure

1.1. It is composed of the following companies: Complements Company that complements innovation of the customer for value creation, the Focal Firm which becomes factors of the customer’s innovation and the Components Company which supplies a component to the Focal Firm.

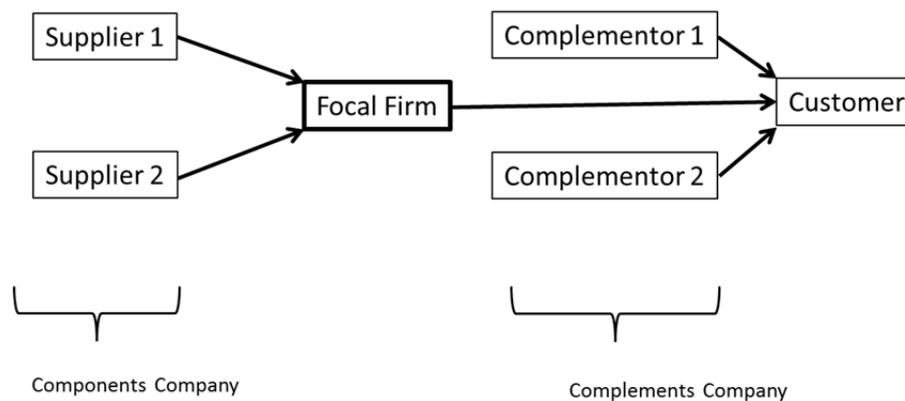

Figure 1 The Generic Schema of Business Ecosystem (Adner & Kapoor, 2010)

Adner & Kapoor (2006) showed the ecosystem of the lithography equipment in the minute processing process of the semiconductor production system like Figure 2 as an example using the framework of Figure 1. The success of innovation of the exposure manufacturer, which is the Focal Firm, dependent on the outcome of Components Company such as lens manufacturers and lamp manufacturers, which develop a component for part of the equipment. In addition, semiconductor device manufacturer, which is a customer of the Focal Firm, cannot produce leading-edge semiconductor devices by the exposure equipment alone, even if the innovation of the exposure equipment succeeded. Also, the semiconductor device manufacturer is affected by the results of the Complements Companies, which supplies materials such as photo mask and photo resist. In this way, Adner & Kapoor (2006) analyzed the impact of challenges of Components Companies and Complements Companies relate to the Focal Firm.

In the semiconductor manufacturing process, the primary equipment is not only the exposure. There are semiconductor manufacturers in need of more than 100 kinds of manufacturing equipment. Therefore, as a framework of the ecosystem in this study, we apply Figure 2 of Adner & Kapoor (2006) to all semiconductor production equipment as an analogy.

Furthermore, we adopt the following framework for the ecosystem generation that were described in three points by Adner (2012):

a. Co-innovation risk

The risk is that the success of the innovation of oneself depends on the success of the innovation of other companies.

For example, leading-edge semiconductor device production, such as resolution, in the ten nanometer range is needed for the innovation of exposure equipment makers. An example is the liquid immersion technology.

b. Adoption chain risk

The risk is that the intermediary who offers the value to the end user, accepts the value before the end user evaluates it.

For example, when a semiconductor device manufacturer develops a leading-edge semiconductor device, the general consumers, who are an end user, cannot evaluate the device if a set makers does not implement the device in products such as a smart phone.

c. Value blueprint

This represents an overall picture that shows the connection of the partners that make up the ecosystem. In addition, we show the degree of connection with each partner using the familiar color of the traffic signal. The green signal is strongly connected. The yellow signal has a weak connection. The red signal is not connected.

For example, the ecosystem is not formed if we cannot draw the perspective with the connection similar to the food chain ecosystem.

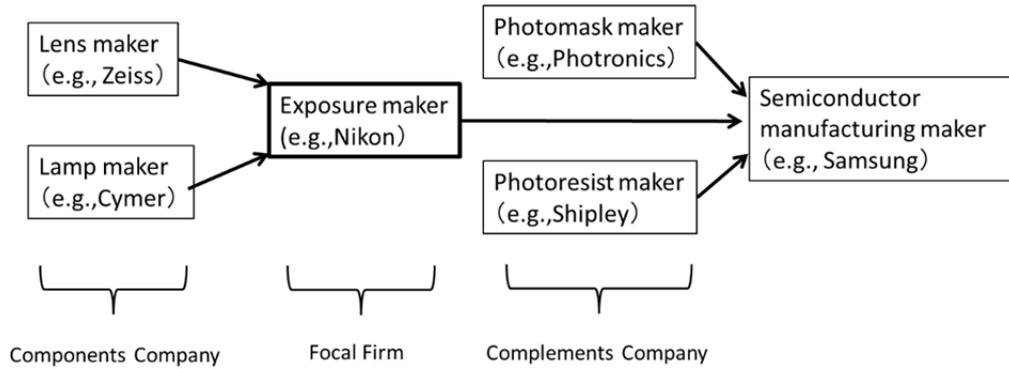

Figure 2 The Ecosystem of Semiconductor Lithography Equipment (Adner and Kapoor, 2006)

3 Framework Analysis of Existing Semiconductor Production System

We apply the ecosystem of semiconductor lithography equipment (Figure 2) to all process, e.g. diffusion process, thin film process, for semiconductor device production. This includes Focal Firm, Components Company such as a valve, a pump and Complements Company such as a semiconductor design tool, photo mask, gas, and chemical (Figure 3).

The dashed line shows the association between ITRS. The major semiconductor device manufacturers such as Intel, which are the demand side, presents the time frame when the technology is necessary for the supply side, such as Components Company, Focal Firm and Complements Company, in the necessary technology according to the product road map of the major semiconductor device manufacturers using ITRS.

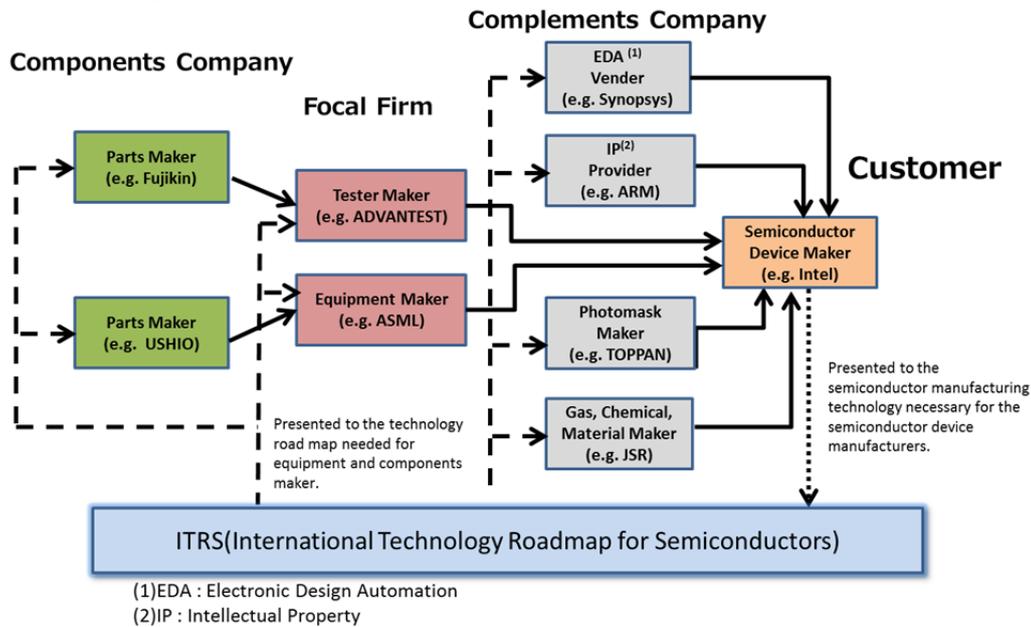

Figure 3 The Ecosystem of Existing Semiconductor Production System

Therefore, the success of its own innovation (Adner, 2012), is co-innovation risk that depends on the success of other companies on innovation has become very low by ITRS. Furthermore, the adoption chain risk has also become very low because ITRS is equipment and components in accordance with the Wish Map of leading semiconductor device manufacturer.

We show the value blueprint indicating the connection with the partner constituting the ecosystem in Figure 4. The dashed line shows connection with ITRS. This is the technology road map in accordance with the product roadmap of leading semiconductor device manufacturer. Therefore, products of Focal Firm, Components Company and Complements Company, related to semiconductor manufacturing, are always purchased. Thus, Focal Firm, Components Company and Complements

Company in the value blueprint are connected to the semiconductor device manufacturer as shown by the solid line. Therefore, between the Focal Firm and Component Company, semiconductor device manufacturer and Complements Company, Focal Firm, become all green signals.

As circulating ecosystem, we think that the huge ecosystem has been built on a global scale by ITRS.

In the next chapter, we will perform a Minimal Fab case study, and indicate that a new ecosystem that has a different value network with the ecosystem of existing semiconductor device manufacturing has been established. Thereby we will verify that the focus strategy hypothesis is implementing.

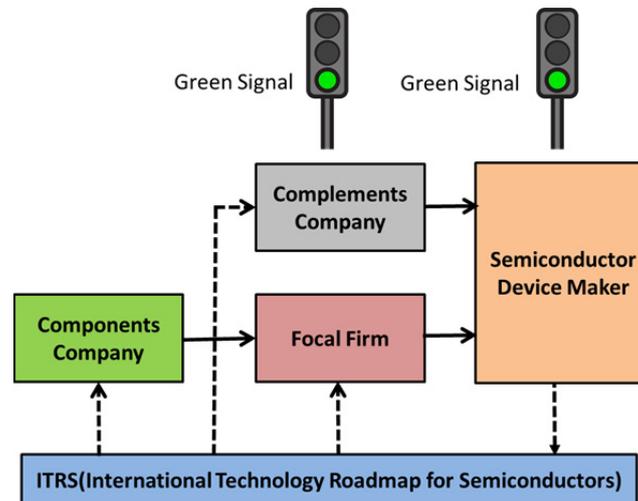

Figure 4 The Value Blueprint of Existing Semiconductor Production System

4 Minimal Fab

4.1 What is Minimal Fab

The semiconductor device production industry becomes the oligopoly, and initial investment has reached more than 5 billion US dollars. Furthermore, there is great waste in existing semiconductor production systems as shown in Figure 5. For example, a complex circuit is designed by a semiconductor design miniaturization. Design verification cost accounts for 90% of the total design cost. There are multifunctional manufacturing equipment. So, software debugging cost account for 70-80% of the equipment manufacturing cost. Fab has waste that the utilization rate of the manufacturing equipment, that price is in the tens of millions US dollars. This means clearly that the utilization rate is low. Additionally, Fab has a mixed production of producing more than 500 kinds of semiconductor devices. Plus, Fab has waste that small amount needed semiconductor device, that is mounted on a satellite, is used only 1-10%. The residual is discarded because the minimum unit of production of semiconductor devices is from hundreds to thousands.

Fab System Research Consortium, which is organized by AIST, proposed a variety & variable production system that is called Minimal Fab (Hara, et al., 2011) as a way to solve this problem. This is contrary to the larger diameter wafer on ITRS, as shown in Figure 6, by using the diameter 12.5mm wafer is 1/1000 area compared to the diameter 300mm wafers in existing Fab, the width of the manufacturing apparatus is 0.294m from existing of about 2m, in addition, clean rooms and clean suits also are eliminated by developing a wafer transport container that is a minimal shuttle and PLAD(Particle Lock Air-tight Docking), that are the local cleaning front chamber system to simultaneously shut out the fine particles and gas molecules, therefore, the goal of capital expenditures of semiconductor factory has been 5million US dollars, that is 1/1000, compare to the existing system.

In existing semiconductor manufacturing systems, equipment contour and size vary in differently from small to large by the manufacturing process. In Minimal Fab, the housing that has been unified as a consensus standard, it is 294 x 450 x 1440mm (Figure 7, Figure 8). In addition, they have performed a standardization of the transport system, wafer and the factory system, further, it has also carried out intellectual property and branding.

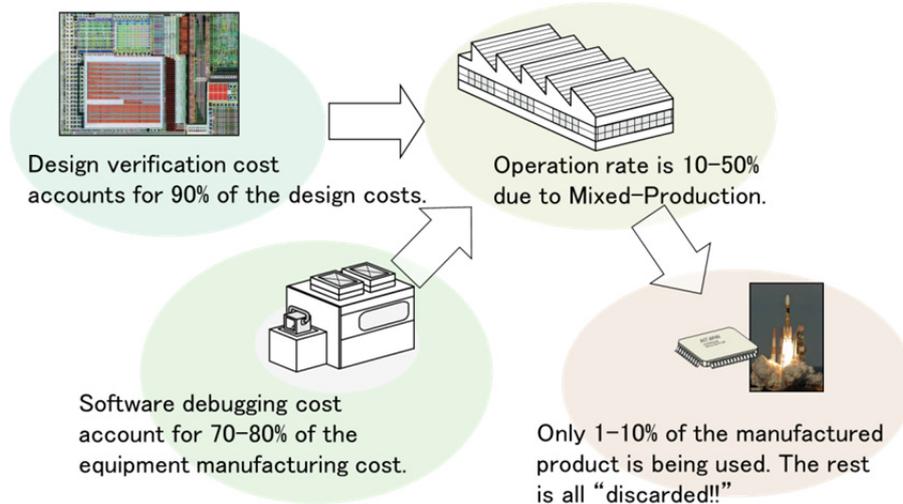

Figure 5 Great Waste Produced in Existing Supply Chain (Hara, 2012)

Figure 6 Minimal Fab (Kubouchi & Hara, 2012)

Figure 7 Minimal Equipment (Hara, et al., 2013)

Figure 8 Minimal Fab by Fab System Research Consortium

4.2 The framework analysis of Minimal Fab

We have conducted the analysis of the Minimal Fab as shown in Figure 9, based on the framework analysis of the existing semiconductor production system was carried out in chapter 3. The member companies of Fab System Research Consortium consist of Components Companies, Focal Firms, Complements Companies and the semiconductor manufacturing makers, which are the customers of Minimal Fab, as well as the ecosystem of existing semiconductor production systems (Figure 3). As an alternative to ITRS, AIST is presenting a Minimal Fab development roadmap (Kubouchi & Hara, 2015). The dashed line indicates the relations. As with existing, the co-innovation risk has become very low. However, Minimal Fab development roadmap of AIST isn't in accordance with the Wish Map of semiconductor device manufacturers. Hence, we think that Minimal Fab will be difficult to be adopted by existing semiconductor device manufacturers. Accordingly, Minimal Fab has adoption chain risks.

We show the Value blueprint that is indicating the connection with each partner of Minimal Fab in Figure 10. As for the difference with existing production systems (Figure 3), adoption chain risk of the existing semiconductor device manufacturer has become yellow signal. We think that the entry barrier of Minimal Fab is relatively high, because the semiconductor device manufacturers have customized their production system for their semiconductor device manufacturing. For example, the automotive semiconductor device, if the semiconductor device manufacturer has changed all of the production systems, such as manufacturing equipment and material, to Minimal Fab, it is necessary to take a product authorized examination of the automobile manufacturer again.

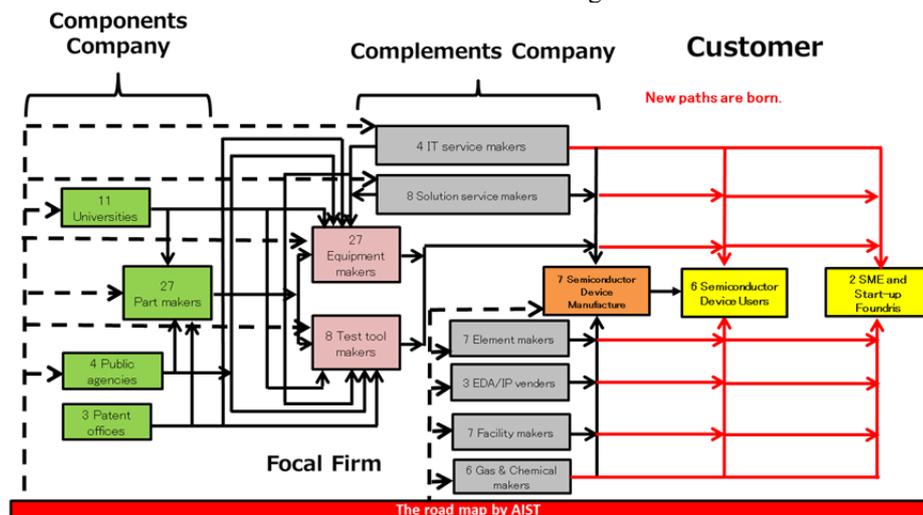

Figure 9 The Ecosystem of Minimal Fab

However, the value network is replaced from the mass production system of existing Fab to the variety & variable production system of Minimal Fab. This system does not need a large amount of capital investment. Thus, the user companies in semiconductor device manufactures have become able

to produce their own semiconductor devices by Minimal Fab. Therefore, the new connections, that are from Focal Firms and Complements Companies to semiconductor device user companies, are born. It is never seen in the existing value network. In fact, The first customer who purchased Minimal Fab is not a semiconductor device manufacturer but JTEKT which is automotive-related company. Moreover, SME & Start-up companies have started a foundry service (Nihon Keizai Shimbun morning edition, 10/20/2014) due to the low barrier to semiconductor manufacturing by Minimal Fab. In other words, these companies have forged a new path to complement the adoption chain risk of the existing semiconductor device manufacturers (Figure 9, Figure 10).

We think that Minimal Fab, which was completed in March 2015 by the national project, is the incunabula of the new ecosystem showing to Figure 9 with the value network by the variety & variable production that is different from the existing system.

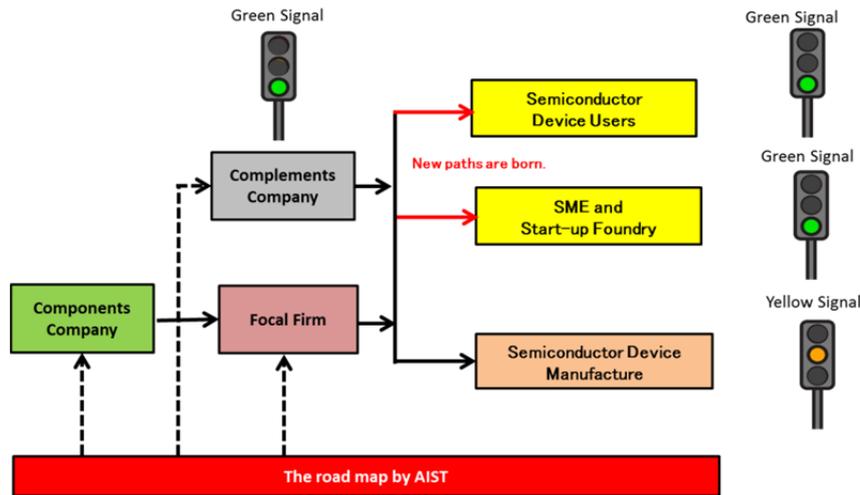

Figure 10 The Value Blueprint of Minimal Fab

5 Discussion

This study is based on the ecosystem by the hypothesis with constraints, we have discussed the ecosystem of a semiconductor production system that compares to the existing Fab with Minimal Fab by the framework. Table 1 shows these differences.

The main constituents of Components Companies, Focal Firms and Complements Companies is SME & Start-up companies. As this reason, the big companies, such as ASML, Tokyo Electron, have performed at leading-edge R&D that is indicated by ITRS, and the price of their development equipment is from several hundred million to tens of millions US dollars. However, the price of Minimal Fab equipment is several hundred thousand US dollars, so the business model is different and we think that it has become the dilemma of the innovation (Christensen, 1997).

Miyake et al. (2015) conducted a questionnaire survey to Fab System Research Consortium. About 5% of the companies are conducting R&D that does not follow ITRS. The reason for this, we consider that the semiconductor industry has reached at mature phase and they actively participate in Minimal Fab innovation and they are looking for new business. In addition, as activities that contribute to the core technology improvement of the company, about 60% of companies have cooperation with universities, public research institutes, large companies, SME & Start-up companies. In other words, it is open innovation. Ogawa & Tatsumoto (2009) considered that open innovation, such as a conventional national project, has not been made with the distinction of working with competitors, therefore, they have not generated a synergy effect. However, they have created synergies in Minimal Fab.

The reason for this, AIST has made developing minimal standards for PLAD, user interface and the housing that is commonly part of the equipment as a consensus standard. In addition, AIST in the same way as ITRS is responsible for the technology roadmap of Minimal Fab. A part of cooperation and competition became clear with these points. For example, equipment maker competes with a process and control unit that are needed originally, and they have a working group and the synergy effect with other companies in the common parts such as: interface, transfer system, and vacuum system. The standardized equipment in this way has become the platform of Minimal Fab.

Table 1 The Difference of Ecosystem of Existing and Minimal Fab

	Existing semiconductor production system	Minimal Fab
Components Company	ULVAC, Carl Zeiss and so on large companies	27 companies to SME & Start-up as the main
Focal Firm	ASML, Tokyo Electron and so on large companies	35 companies to SME & Start-up as the main
Complements Company	Shin-Etsu Chemical Co., Tokyo Ohka Kogyo and so on large companies	35 companies to SME & Start-up as the main
End User	Intel, TSMC and so on large companies	<ul style="list-style-type: none"> • Semiconductor user company such as Set maker, Automotive parts maker • SME & Start-up that have entered the foundry business
Platform	ITRS indicates the wafer size and finer level.	Standardized Minimal Fab equipment
Value blueprint	Mass production system	Variety & variable production system
Co-innovation risk	Reduction by ITRS	<ul style="list-style-type: none"> • Reduced by Minimal Fab development roadmap by AIST • Reduction by Fab System Research Consortium
Adoption chain risk	Reduce by ITRS that is made by semiconductor device manufacturer, also they are an end-user	<ul style="list-style-type: none"> • Because existing semiconductor device manufacturer customizes a production system, the entry barrier is high • The entry barrier is very low for a company which does not produce semiconductors.
Others: Consensus standard	SEMI standard	Authentication by Minimal Fab standard

6 Conclusions

As the findings of this study, we found that Minimal Fab has the potential that can be the new ecosystem with the value network by variety & variable production system that is different from existing. Also, this new ecosystem has the customer not only a semiconductor device manufacturer but also semiconductor device user companies and SME & Start-up companies. In other words, it is possible to have the segregation from the existing semiconductor device manufacturing because the ecosystem is different.

Thus, new ecosystem with the different value network to the ecosystem of existing semiconductor manufacturing system has been established and we found that they carried out the following focus strategies that we postulated.

a. R&D does not follow ITRS.

b. Deploy variety & variable production system that will enable short delivery date and lower cost.

c. Focus on low-end semiconductor device manufacturing according to the Minimal Fab roadmap by AIST.

In order to enter the semiconductor device manufacturing industry, SME & Start-up company implement this focus strategy. We think that the feasibility of the focus strategy is enhanced more if they have "Absorptive Capacity" (Veugelors and Cassiman, 1999) that can absorb the technology of the other companies which they got by open innovation. Also, Miyake et al. (2013) describes a quantitative evaluation method of Absorptive Capacity.

This study analyzed by the framework in the semiconductor device industry that has the technology road map. Therefore, in order to generalize the ecosystem generation factor in the early stage, we think that it is necessary to continue to refine the system through a case study with the exception of semiconductor related cases.

Management of Future Generation Needs Through Sustainable Development Law and Environmental Ethics

Mohd Haris Abdul Rani

Malaysia-Japan International Institute of Technology, University Teknologi Malaysia, Kuala Lumpur,
Malaysia, 54100

(E-mail: harisrani66@gmail.com)

Abstract: Ever since the 1992 Rio de Janeiro's Earth Summit, sustainable development law is an object and purpose of many international treaties for both the developed and developing countries as the preambular reference. It influences the international courts and tribunal decisions and national judges who observed its principles. Since positioned at a junction where international economic law, international environmental law, and international social law met, it has since become 'the talk of the town', where its interpretation focuses primarily on ensuring future generations needs through curbing societies zeal for progress. This article aims to review, in general, a range of treaties from 1945 to 2002 to identify whether elements of 'sustainable development law' exist. Secondly, to examine the international convention; the United Nation Convention on The Law of The Sea (UNCLOS), as a comprehensive tool for world ocean management from a new perspective of environmental ethics. This paper serves to contribute towards the importance of recognizing the actual purpose of all treaties; achieving global peace as the ultimate need for future generations through a philosophical method of accomplishing it.

Key words: Sustainable development law; United nations treaties and convention; UNCLOS; environmental ethics; Arrogance theory

1 Introduction

It has been 24 years since the United Nations Conference on Environment and Development, also commonly known as the 'Earth Summit' managed to boost environment consciousness efforts into a global agenda. The 'Earth Summit' was able to directly influence the nations to adopt a global solidarity method to save the world through series of agreements and action plans aimed at stamping out environmental degradations. This concerted effort is a welcomed change compared to the days prior to it where only a few nations had the awareness about the degrading condition of the environment. They now aptly realized that such prolongation would give negative impact not only to the global environment but to the global health as well and also the ability for future generations to live in peace and harmony.

2 Sustainable Development Law

Sustainable development law is featured as an object and purpose for many developed and developing countries to rely on the various international economic, environmental and social treaties¹ as a mean to ensure the protection of their future generations' needs². Thus, sustainable development law is a form of international laws, able to meet the needs of the present generation without compromising the ability of future generations to meet their own needs (K.H. Gupta, 2016). Current generation must reasonably foresee the future generations' rights to survive on whatever resources and conditions left behind for them. In other words, sustainable development law is asking current generations to not be selfish and arrogant in reaping all available resources without even considering future people needs.

This paper investigates evidence of sustainable development law within the treaties and conventions formulated under the United Nations at the time of their incorporation and any future

¹ First introduced by the Brundtland Commission's report *Our Common Future* (1987) and became the central elements within the "Earth Summit". See J. Lee, 2. Sustainable Development, *Yearb. Int. Environ. Law.* 24 (2014) 367-372. doi:10.1093/yiel/yvu017.

² World Commission on Environment and Development, *Our Common Future* (Oxford: Oxford University Press, 1987). Defines the concept of needs as essential needs of the world's poor where overriding priority must be given, and the concept of limiting the social and technology in line with the ability of the environment to meet present and future needs.

amendments. Since there are ambiguities on the status of all treaties and conventions, whether they are encapsulated within sustainable development law per se or not, it is therefore pertinent to conduct such determination in order to establish the reach of sustainable development law.

Table 1 below is the list of international treaties and conventions existing from the formation of the United Nations until 2002.¹ Listed by international law category according to priority, relevance and significance over the other.

Table 1 International Treaty & Convention (1945- 2002) and Category of International Law²

Year	Name	Category
1945	Charter of the United Nations	So, Ec, ³
1946	International Convention for the Regulation of Whaling	En, Ec, So
1947	General Agreement on Tariffs and Trade	Ec, So, En ⁴
1948	Universal Declaration of Human Rights	So, Ec, En ^{5,6}
1957	Treaty Establishing the European Economic Community ('Treaty of Rome')	Ec, So, En ⁷
1958	Convention on Fishing and Conservation of the Living Resources of the High Seas	En, Ec, So
1960	Founding Convention of the Organization for Economic Co-operation and Development	Ec, So, En ⁸
1966	International Covenant on Economic, Social and Cultural Rights	Ec, So, En ⁹
1969	Convention on the Law of Treaties ('1969 Vienna Convention')	So, Ec, En ¹⁰
1972	Declaration of the UN Conference on the Human Environment	En, So, Ec
1973	Convention on International Trade in Endangered Species of Wild Fauna and Flora	En, Ec, So
1974	Declaration on the Establishment of a New International Economic Order	Ec, So, En ¹¹
1982	United Nations Convention on the Law of the Sea (UNCLOS)	So, Ec, En ¹²

¹ Scope of this study.

² So = International social law; Ec = International economic law; En = International Environmental law.

³ The UN Charter does not specifically mention the word 'environment' or 'sustainable development'. See 'Introduction,' UN Documentation: Environment, accessed September 10, 2016, <http://research.un.org/en/docs/environment>. Nevertheless the World Health Organization (WHO) define 'health' as to be about promoting health through a healthy environment with environmental health outlook contained in the document as per Article 13, 55, 57 and 62.

⁴ See Article 20, on general exemption from GATT rules on matters relevance to the protection of the environment: paragraphs (b) & (g).

⁵ Article 28. Everyone is entitled to a social and *international order* in which the rights and freedoms set forth in this Declaration can be fully realized.

⁶ Though there is no specific mentioning on environment, nevertheless the role of environmental threats to *international order* and security is an ever important international political agenda taking the form of water wars, drug wars, diamond wars, oil wars-given the proliferation of resource wars in an era of scarcity-climate change, deforestation or pollution. See J.C. Pereira, Environmental issues and international relations, a new global (dis)order - the role of International Relations in promoting a concerted international system, Rev. Bras. Política Int. 58 (2015) 191-209.

⁷ There is no specific mentioning of 'environment' or similar theme about the environment but recourse to article 235(power to enact the appropriate provisions) allows the Community to develop actions in the field of environmental policy.

⁸ There is no specific indication on the environment mentioned in the original document however later with setting up of OECD's environmental committee in 1970 and OECD's council adopting guiding principles for environmental policy in 1972, reflects a growing awareness of interaction between social and economic development with the environment.

1994	Agreement on Trade-Related Aspects of Intellectual Property Rights (TRIPS)	Ec, So, En ⁷
1994	UN Convention to Combat Desertification in Those Countries Experiencing Drought and/or Desertification, Particularly in Africa ('Desertification Convention')	En, So, Ec
1997	Protocol to the Framework Convention on Climate Change ('Kyoto Protocol')	En, Ec, So
2000	Millennium Declaration	Ec, En, So ⁸
2001	Doha Ministerial Declaration	Ec, So, En ⁹
2002	Johannesburg Declaration on Sustainable Development	En, En, So
2002	Plan of Implementation of the World Summit on Sustainable Development	En, En, So

The table classification results (category column) indicate that each of the 30 documents contains all of the three international laws categories, making them all with the exception of the Charter of the United Nations be classified as sustainable development law. Even though there are some variations in the degree of coverage, nevertheless, they remain as the recurring theme in all the documents investigated. From the range of period studied, 'all' instead of 'many' that has been stated by the Centre for International Sustainable Development Law (CISDL) (2005) do have the same object and purpose of sustainable development law. There is also a trend move from the earlier economic and social base toward environment starting from the early 90's to date. The paper deduces that such results might not be about the realization of mankind about the importance of sustainability alone but mankind realization that the ultimate goal of the UN itself must be upheld; global peace and security.¹⁰ Sustainable development law, therefore, helps to ensure future generations need by ensuring peace and security. If this realization is not attainable, they (the future generation) would be put in conditions prone to war, thus defeating the creations of the international documents in the first place. Sustainable development law ultimate purpose is

¹ Article 1 (2) The human right to development also implies the full realization of the right of peoples to self-determination, which includes, subject to the relevant provisions of both International Covenants on Human Rights, the exercise of their inalienable right to full sovereignty over all their natural wealth and resources.

² Article 2 (1)(vii) to promote in the full range of its activities environmentally sound and sustainable development;

³ Preamble of the treaty states: "DETERMINED to promote economic and social progress for their peoples, within the context of the accomplishment of the internal market and of reinforced cohesion and environmental protection, and to implement policies ensuring that advances in economic integration are accompanied by parallel progress in other fields."

⁴ Preamble of the treaty states: "UNDERTAKE each of the preceding in a manner consistent with environmental protection and conservation". See also Article 104, 715, 903, 904, 906, 907, 909, 913 and 915.

⁵ The whole document is about sustainable development and this could be seen from the use of the word "environment", printed 1167 times.

⁶ Preamble of the agreement states: "Recognizing that their relations in the field of trade and economic endeavour ... conducted with a view to raising standards of living ... while allowing for the optimal use of the world's resources in accordance with the objective of sustainable development, seeking both to protect and preserve the environment and to enhance the means for doing so in a manner consistent with their respective needs and concerns at different levels of economic development."

⁷ See Article 27 (2) and (3) on exclusion from patentability inventions to avoid serious prejudice to the environment.

⁸ Part IV is about the protection of common environment.

⁹ Refer to item no. 31 to 34 and 51 on "Trade and Environment".

¹⁰ See the preamble and Article 1 of the United Nations Charter 1945.

therefore focusing on achieving global peace. It reflects the global community humility in setting aside their self-interest by formulating an alliance to form treaties, agreement, and conventions. However, the question remains over the position whereby there are nations who are arrogant by refusing to join these treaties. What about the role of promoting awareness among the nations?

In promoting sustainable development law, CISDL is an example of an organization created for the promotion of legal education protecting the ecosystems, through an understanding of implementing the development and international sustainable development law. Governed by a distinguish Board of Governors, the CISDL comprises of Senior Director, Lead Counsel, research fellows of professors, academicians, justices and senior legal professionals and associate fellows, all of which are employed to help in ensuring every legal scholars and researches, publication, articles, working papers, legal briefs, academic workshops, dialogue sessions, legal expert panels to international negotiations, law courses, and seminar series are met with a common aim where legal knowledge would empower targeted society in defending proper sustainability of any development.

CISDL to date has produced priceless efforts in educating the developing and poor countries to be together in the awareness campaign. They defend main aims of these treaties and that includes the decisions of the courts.¹ There is indeed no doubt that their importance is to ensure global environment agenda is met with.² Without such efforts, global environment protection awareness would surely be affected. It is a humble and noble act to strengthen the communities in making them aware and to not become selfish by ensuring their own needs are met with, making CISDL's legal awareness programmer a critical part towards global peace and security.

3 Legal Awareness, Sustainable Development Law, and UNCLOS

Legal awareness is meant for all, as it is a global concern and everyone must be made aware of its importance (M. Haris,2014). Legal empowerment is able to provide the poor and marginalized to use the law, the legal system, and legal services to protect and advance their rights as citizens and as economic actors (2008,2014). It should have been made a fundamental human right since there is no point of giving the ability to be protected by the law when individuals themselves are not aware of such rights.³

One would argue that the awareness level for those living in developed countries are much better than those developing and poor countries; normally associated with the South. However, as the developing countries had correctly pointed out, it is the North which had consumed most of the world's natural resources. (I. Iqbal, C. Pierson,2016) This has led to the current world conditions as we have today (D. Tladi,2007) and therefore awareness about sustainable development should not be burdened to the South, leading to an extension of Kyoto Protocol implementation until 2020 (R.L. Bryant,2015). The situation occurs since the South continuously argues that the contribution to the degradation actually originates from industrialization countries themselves (N.C. Sahu, A.K.). Nevertheless, the same argument was also said about the South where many serious environmental problems resulted from extreme poverty and a lack of economic and social development (M.K. Tolba, I. Rummel-Bulska,1996, S. Bernstein,2004). The burden of debts suffered by the South increases all existing inequalities between developed and developing countries affecting sustainable development efforts envisaged by the United Nations. Adding to this is the lack of willingness of richer nations to forgive the debts of poorer nations (A.M. Dickerson,2007) thus the blaming game is prolonged without a proper solution.

When it comes to awareness, it is not focused to the society per se but more to the leaders of those countries in implementing the object and purpose of international documentations. If the leaders themselves are oblivious to the existing laws, national policies are unable to be formed making it unsusceptible to promote sustainable development laws. This can be seen from the

¹ Jorge Cabrera, Frederic Perron-Welch, Alexandra Wandel and Plarent Ruka, *Designing Future Just Laws on Biodiversity: Training Materials for Government Officials and Parliamentarians* (Hyderabad, India: CISDL and WFC, 2012)

² See International Court of Justice case: *Gabčíkovo-Nagymaros Project, Hungary v Slovakia*, Judgment, Merits, ICJ GL No 92, [1997] and also *The Permanent Court of Arbitration, Arbitral Award on Arbitration Regarding the Iron Rhine ("Ijzeren Rijn") Railway (Belgium v. Netherlands)* (May 24, 2005).

³ Fundamental human rights as per the United Nations, see *The Universal Declaration of Human Rights (UDHR)*

inability of the leaders to commit and agree in signing and rectifying the international documentation into their national laws. They are also leaders who had signed the documentations and rectified them into their own laws, but chose not to adhere to them at all.

Thus, the United Nations Convention on The Law of The Sea (UNCLOS) (1982) is an instance remedy to highlight such situations. UNCLOS is an international legal tool that works as the management mechanism and also as a working system for the overall management of the sea (H. Smith, A.,2002). It is the most significant multilateral conventions in history. Established in 1982, and completed in 1994 with the revision on Deep Seabed Mining, the Convention is today applied by all 167 nations plus the European Union. It comprises of 17 parts and 320 articles concerning rights, conservation, and management as being a comprehensive rule of law that has been agreed upon by all signatories' nations. Given the additional of several annexes, the Convention is well recognized as the prevailing document on the law of the sea. UNCLOS has taken over 25 years to develop and has achieved a remarkable breakthrough in oceans law giving coastal nations the needed avenues to utilize their coastal resources and maritime sovereignty while ensuring the continued protection of navigational freedom as being fundamental for global trade and commerce. It entails the ability of the world community to gather and set aside their selfishness and be humble in creating a comprehensive administration and management document for the world ocean (G.K. Walker.,1982)

All countries should be transparent about their aim in adhering to the sustainable development law. For example, the United States of America, although they are on of the signatories of this international documentation, they are quite slow in rectifying it, unlike the rest of the world who had earlier signed and rectified it into their own laws.¹ They have put forwards the ground of security interest and economic basis for the contestation (A. Dastyari,2015). While China, another superpower nation status, who signed the UNCLOS documentation and had rectified it, refuses to abide by the dispute mechanism system over issue decided by the legal system provided. This happens when it comes to their claims over the 'island' located within the South China Sea (M. Haris,2016). This failure would have disastrous effects on the rights of those countries who are members of the convention and to other countries who adhere strictly to the provisions of the conventions.

Both situations above describes the selfishness and arrogance of these two major countries to realize that their actions are contributing to the adherence to this so-called 'Constitution of the Sea' (T.T.B. Koh,1982, P. Ehlers,2016, G. Wright, J. Rochette, T. Greiber,2016). One could only ponder about the adherence to similar documentation by the rest of the world.

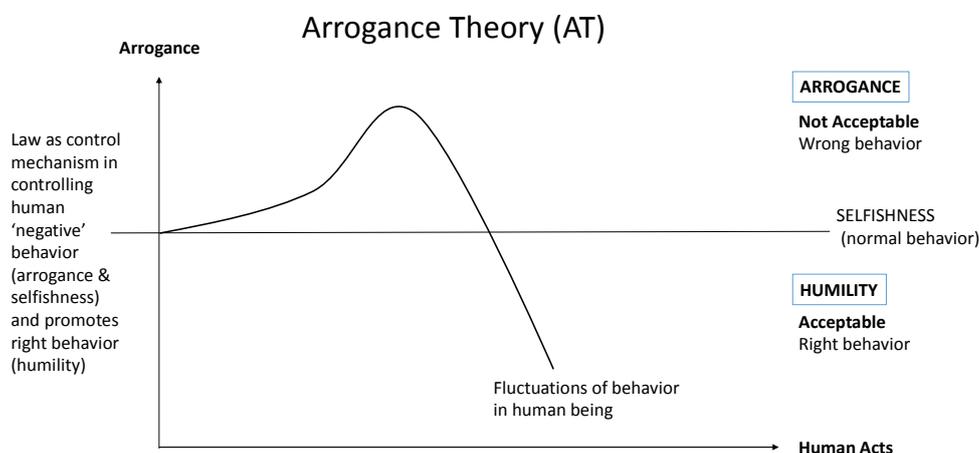

4 Arrogance Theory and Environmental Ethics

The problem of our society is to determine a universal moral standard that are applicable in determining human conduct whether they are 'right' or 'wrong'. This is important as only with the right method of determination will the acts be judged correctly and proper action is taken towards eliminating wrongs behaviors. Given that societies are naturally different in their societal makeup, structures, time and locality, and so does their moral standards, it is even more difficult to determine when religious beliefs are taken into account making a universal right and wrong behaviour could not be conclusively determined. Nevertheless, if there is a common denomination over major behavioral characters, it might lead to the step towards tackling moral and ethical issues.

Amazingly, human behavior is timeless. Behavior allows humans to interact with one another, in a positive or negative manner. Every culture and civilization know about these behaviors and how they are relate to each other. Among the behavior, one which is having disruptive nature would be of arrogance. It is universal in nature and can be identified anywhere, in any locality, culture and society in the world, whether in a civilised society or to those living in a distant jungle would be bound to know about arrogance and its disruptive nature. Everyone has it, no one is excluded. It is inbuilt within us and never dies.

¹ Objection of the United States has been addresses by the Agreement Relating to the Implementation of Part IX of the United Nations Convention on the Law of the Sea (1982) in 1994

Another human character which is the opposite nature of arrogance is humility or humbleness, which allows a human to generate all the good behaviors like love, compassion, mercy and benevolent. Without humility, mankind would not be able to be merciful towards others. Then, there is also selfish behavior, where we humans act selfishly, acting only when it brings personal benefits rather than benefiting others. This character is founded on survival instinct which enables humans to survive. From these three main behavioral traits come all the positive and negative acts of mankind.

Arrogance theory is a philosophical theory about human nature and their conflicting characters (M. Haris, 2016). It divides human behavioral characters into three major types; arrogance, selfishness and humility. Selfishness is viewed as a constant value in human character due to their human nature which acts mainly for survival (R.F. Baumeister, B.J. Bushman, 2013) behaving similarly to animals (J. Maritz, 2010). Realistically, we act selfishly in order to gain as many advantages towards ourselves known as psychological egoism, attributed to Thomas Hobbes and Jeremy Bentham (M. Velasquez, 2016). It is only natural and an inbuilt survival mechanism in humans (R. Dawkins, 2016, D.P. Fry, 2015), regarding self-preservation and the need for reproduction (R. Stokes, 2013), by being self-centered and self-motivated (Gupta, 2007). It starts at the infant stage and progresses constantly throughout human's life (D. Stove, 2013, S. Williston, 1836, M. Hancock, 1999).

Whereas arrogance and humility are not the same, as they fluctuate over time. Greed, for example, is arrogance as compared to compassion as for humbleness. One can only act truly compassionate when he is in humility. Of course then, one can argue that a person can also act compassionately while being arrogant, however, they are not the same and this would not result in the reduction of negative behavior of that particular individual. Human moral conduct does not rest on the society moral standards but based on the person itself because of their own free choice to do whatever they like despite the existence of the law. If arrogance in that person is not suppressed it would harm the particular human in the long run as arrogance level have the tendency to increase as long as the human maintains arrogance in them.

Humility, on the other hand, must be nurtured (R. Minthorn, A.F. Chavez, 2014, J.E. Cooper, 2010) as an acknowledgement of equality, whereas arrogance¹ has a tendency to behave like addictions as it might increase over time if not checked and toned down towards humility. This is observed by looking at repeated offenders (recidivism)² where they have the tendency to commit increase crimes. From theft to assault, assault to robbing, robbing to raping and towards the pinnacle of crime; murder. A change from this criminal lifestyle (2013) is therefore needed. There

¹ Hobbes called it as pride, see endnote no. 32 (Julie E. Cooper) for further insight of Hobbes's pride and humility arguments.

² "Recidivism is one of the most fundamental concepts in criminal justice. It refers to a person's relapse into criminal behavior, often after the person receives sanctions or undergoes intervention for a previous crime." [39]

must be efforts to maintain the highest level of humility so that good behavior and outcome would generate from it.

In respect of the sustainable development law, it is natural for countries to be selfish in their behavior to gain all possible benefits for their country. It is their own right to progress and develop according to their official mandated national policy and as part of sovereignty principles. Such behaviors allow a spirit of competitiveness amongst nations and with it, positive interactions would lead to bilateral and multilateral cooperation between nations or its counterparts,¹ (bilateralism, plurilateralism, and multilateralism as against unilateralism) would lean towards attaining global peace (2005, R. Huisken, 2009, V. Aggarwal, S. 2013). Whereas arrogance would make a country behave in a way that it will only benefit themselves while at the same time suppressing the rest of their own rights. An arrogant country would only see other countries as subservient to them. They want to gain advantage without even considering the rights of others by belittling and ignoring them. An incremental build-up of arrogance would only bring animosity and differences between countries and these could lead to war. The negative impact must be avoided as it disregards the future generations' need of peace and security.

This behavioral condition is perhaps best captured in the area of environmental ethics in regards to the negative impact of development towards the environment and how to solve it based on the morality of mankind. It became a topic of discussion based on mankind's destruction attitude towards the world's ecosystem, with mankind's excitement for development and progress. It is basically about the human's own ethical relationship with the natural environment caused by the widespread use of negative activities or negative impacts that threaten the public health and facilitate the destruction of wildlife. The destruction of the world that we are witnessing now is basically founded on the arrogance of man, by not acknowledging the importance of the environment or not seeing that their destructive actions are a real cause to the burden of cleaning up, along with having others who face negative effects linked to pollution such as reduced body resistance, sickness, disease and even death.

If only we are to adopt humility while observing that we are indeed the selfish kind, we would be made more aware of our actions. It can guide mankind for identifying and rectifying the cause of pollutants, and this perhaps would resolve this issue because pollutants are an outcome of the arrogance of man. It is estimated that currently there are around 5.25 trillion pieces of plastic debris in the ocean. From that mass, 269,000 tons are floating on the surface, while some four billion plastic microfibers per square kilometer litter at the deep sea (L. Parker, 2015). If every one of us is able to identify our own actions, whether they are done in arrogance or not, then we could perhaps make a drastic change to our environment. States who have signed UNCLOS must be able to respect other nation's rights by not being arrogant to reap all that they can from the sea which would cause other states to suffer, unable to enjoy their marine rights.

The environmental awareness of the western society is akin to the lesser level of arrogance or humility as compared to the eastern countries, where most of them adopts the 'couldn't care less' attitude because their justification is that since everyone is doing it, then why not they do the same, or since we are fighting a failing battle, if you cannot beat them, join them. This accelerates the destruction because of our disrespect towards the environment. Since we never want to respect the environment, failure to acknowledge this would surely bring disastrous effects, not just to the environment, but to all of mankind and animals alike.

5 Conclusions

In concluding, let us be reminded to not cloud ourselves with the current theme but instead to look at the bigger goal of all the laws and treaty that have been created by the United Nations. The answer is only one, that we should make the world a better place for everyone else including ourselves. Having realised this, let us gather all efforts in promoting sustainable development law, not just educating the society about the importance of environment, social and economic alone but

¹ In September 2016, 350 Chief Executives, Heads of State and Government, leaders of UN Agencies, Funds and Programmes, and leaders from civil society, business associations, foundations and investor groups will attend the United Nations Private Sector Forum 2016 to jump-start progress on the Sustainable Development Goals (SDGs) to secure a peaceful and sustainable future for all.

as intermediaries' efforts towards the ultimate goal of the founding members of the United Nations; global peace.

The international and national leaders should be more aware about the importance of protecting the environment as our last frontier of global society. It is not only to focus on specific laws and regimenting the minds of the society into thinking about the laws that have direct effects on the sustainability of the environment as important, but also those not listed which carries similar or even more significant than those of the sustainable development laws. We must not get carried away with the names of the laws or categorized them as specifically targeting specific agenda without being able to properly inform the society of the other laws which may even help further the cause of global environment protection and the future generations.

Abstract: The university innovation team is a core research team which focuses on academic issues, stands on the frontier of science and technology, and carries out scientific researches on major national research projects. However, the construction of university innovation team in China started late, and the relevant theories and experience is insufficient, which leads to a series of problems to be solved and improved in the construction and development of University Innovation Teams. On the basis of relevant literature, this paper takes science and technology innovation teams in Hubei's universities as research objects and sets up four following modes: team integration mode, major projects mode, industrial technology research institute mode, and collaborative innovation alliance mode. This paper is expected to improve the existing theories about construction and operation of university innovation teams and offer a guidance for scientific and technological innovation.

Key words: University innovation team; Innovation in hubei; Modes

1 Introduction

The university is not only a gathering place for talents, but also a place for innovation teams. In addition to knowledge innovation, university innovation team should take the missions including technology innovation, technology transfer, serving in the industry development, and serving in the regional economic development. It is an important manifestation of the advantages of intelligence resources in Hubei Province of China where there are a lot of universities and colleges. Currently, more than 120 universities and colleges are located in Hubei Province. It brought together with a large number of high-quality technological innovation talents and academicians from the Chinese Academy of Sciences and Chinese Academy of Engineering, and form strong science and technology innovation teams playing a crucial role in Hubei construction process. The research and development system which is led by a number of national laboratories, engineering centers and covers from basic research, application development to the industrialization of scientific and technological achievements has been set up. Furthermore, Hubei university innovation teams become an important force and supporting conditions for economic and social development in Hubei.

2 Literature Review

As for the innovation teams, the discussions among foreign sociologists, scientists, and experts from scientology to psychologists are different to some extent. The most representative one is presented by Kuhn (1980) and Bernardo (2003). On the basis of the concept of "paradigm" and sociological "Community", Kuhn put forward the concept of "scientific community", which serves as a conceptual tool for the analysis of the science and technology innovation team's formation and maintenance. Moreover, from the viewpoint of Chris Harris's opinion (2005), innovation team, a kind of organization, which takes up a non-continuous work, aims to meet the extraordinary demand and obtain extraordinary efficiency and gains. In general, innovation team has basic features of cooperation, unity, integrity, complementary, self-confidence, and team spirit.

Until 1990s, the theory of "Innovative Research Team" was presented, gradually, spread in the field of scientific research in China. In particular, the plan of "high-level Creative Talents Program" was launched officially by the China Ministry of Education in 2004. The first level of the plan, which focused on the implementation of "Changjiang Scholars and Innovative Research Team" program, strongly advocates the construction of university innovation team in scientific research around the country, and concentrates on providing financial assistance to the outstanding scientific and technological innovation teams which focus on top-notch innovative personnel and engage in national key development areas or international cutting-edge research about science and technology.

On the study of operating features of university innovation teams, many scholars generally only explore the common innovation team features, such as organizational mode, behavioral framework, interactive process and the inherent law. Li Jing (2008) gave a definition of the mode of university innovation teams, by using the experience about the mode gained by famous foreign university innovation teams. She advocated and regarded “leaders, academic leaders, academic backbone, academic development power” as a new mode of university innovation Team. Meanwhile, Wang Yiran and Zhang Nannan (2010) believes that the university innovation teams form a multiplayer interactive system in certain situations. Rational and irrational interactions between members constitutes the framework of team behavior. Team members will exchange and cooperation with each other through some interactive processes such as knowledge sharing, team cohesion and risk taking. Thus, it will promote the development of the level of team interaction. Further, it will ensure significant improvement of team performance. Starting from the current practices of the construction of university innovation team, Chen Jin, Xiang Yang Xue and Liu Hongzhi (2010) have focused on the formation conditions and the dominant power which construct the mode of university innovation team, and their study is based on R&D chain, industrial chain and service chain which are related by Industry-University-Research strategic alliances. The inherent law of the accreditation, establishment, management, operation, evaluation and incentive of the university innovation teams has been systematically revealed.

In summary, the theory of university innovation team is still in the exploration and development stage, and it has not formed a complete theoretical system yet. Most scholars focus on the overall profile of the construction of university innovation teams in China. Thus, a research on local university innovation teams is obviously insufficient. Especially, the empirical study of university innovation teams of Hubei is relatively weak. So, combining the characteristics and status quo of the different regions, this paper has important theoretical and practical value for researching on construction of modes which are suitable for local university innovation teams.

3 Team Integration Mode of University Innovation Teams Serving for the Innovative Hubei Construction Project

Based on the strategic alliance of industry-university-research cooperation, universities in Hubei should produce effective innovation output according the key input features including academic background, ability advantage, resource integration, network contact and innovation performance in the process which they grasp the right scientific research positioning in. Thus, it will promote systematic, structured, dynamic innovation of team integration mode. As shown in Figure 1.

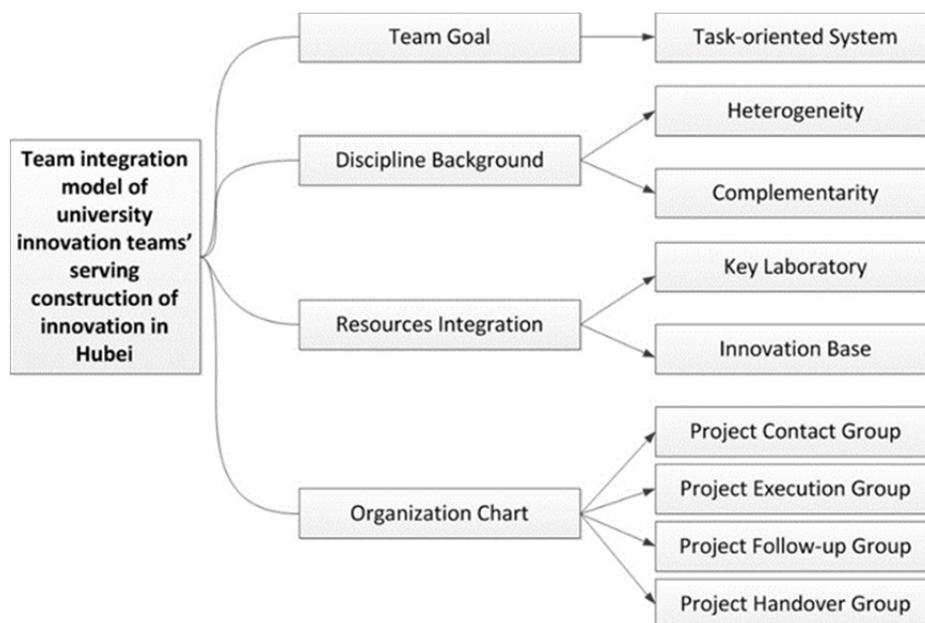

Figure 1 Team Integration Mode of University Innovation Teams' Serving Construction of Innovative Vision in Hubei

1) Universities innovation teams are formed with the aim that it's asked to achieve a given task. The reason they exist for is serving to innovation. Task-oriented system is mainly realized through clear team goals and explicit team norms.

2) From the point of view about discipline backgrounds, university innovation team should be armed with discipline development advantages of systematic research and development, which is interdisciplinary. Knowledge with high levels of "heterogeneity" and "complementary" makes members have the cross-departmental and interdisciplinary expertise to achieve the team goals.

3) In the process of integration of resources, it can rely on national key laboratories, national key disciplines, Science and Technology Innovation Platform of "985 Project" or Philosophy and Social Sciences Innovation Base, "211 Project" Construction Base and other types of organizations. Thus, it can have an integration of the interior resources of universities including technology, intelligence, knowledge and others to form an effective crucial power of intensive scientific research and development. In addition, it also needs a good multi-disciplinary nature on the knowledge structure and capability advantages.

4) In the step of designing organizational structure, team members will take a stable one according to project cooperation process. That includes project contact group, project execution group, project follow-up group and project handover group.

The mode has an operation mechanism which combines integration, sharing, service and innovation with support features. The nature that are publicity, service, cross-organization, combination involving production, teaching and research determines a kind of essence that it is based on innovation of cross-organizational cooperation and technical alliance body providing coordinated services. And it plays a core role whose responsibility includes leading, supporting, organization and coordination in the aspects covering from gathering, integration, optimization, openness and sharing of scientific and technological resources to promoting the industry development and regional innovation. Therefore, it forms a long-term, stable and symbiotic R & D network through building an interdisciplinary cooperation research platform. So, it can have an effective integration of theory research, technology export and talents cultivation. Ultimately, it will serve to science and technology innovation activities of the whole society through conducting cross-organizational cooperation innovation and collaborative service.

4 The Major Projects Mode of University Innovation Teams Serving for the Innovative Hubei Construction Project

The word "major" in the description of the major projects shows its important strategic significance, and these projects usually are aimed to solve the problem about strategic high-tech fields or people's livelihood.

In this mode, government of Hubei Province should establish the major projects leading group, and regard it as a specialized management agency for guiding major projects directly.

Its main function is entrusted by the competent authorities and other relevant government departments, the co-ordination and daily management for the major projects will keep the pace with it. "Major projects leading group" have three committees which are responsible for financial management, administrative management and technical management. As shown in Figure 2.

Implementation of the projects should go through seven stages from the top-level design, project application, implementation and management, project acceptance, transformation of achievement, project evaluation to following up. According to modern project management theory and combining with major projects in Hubei province, we have designed the specific work for each stage. As shown in Figure 3.

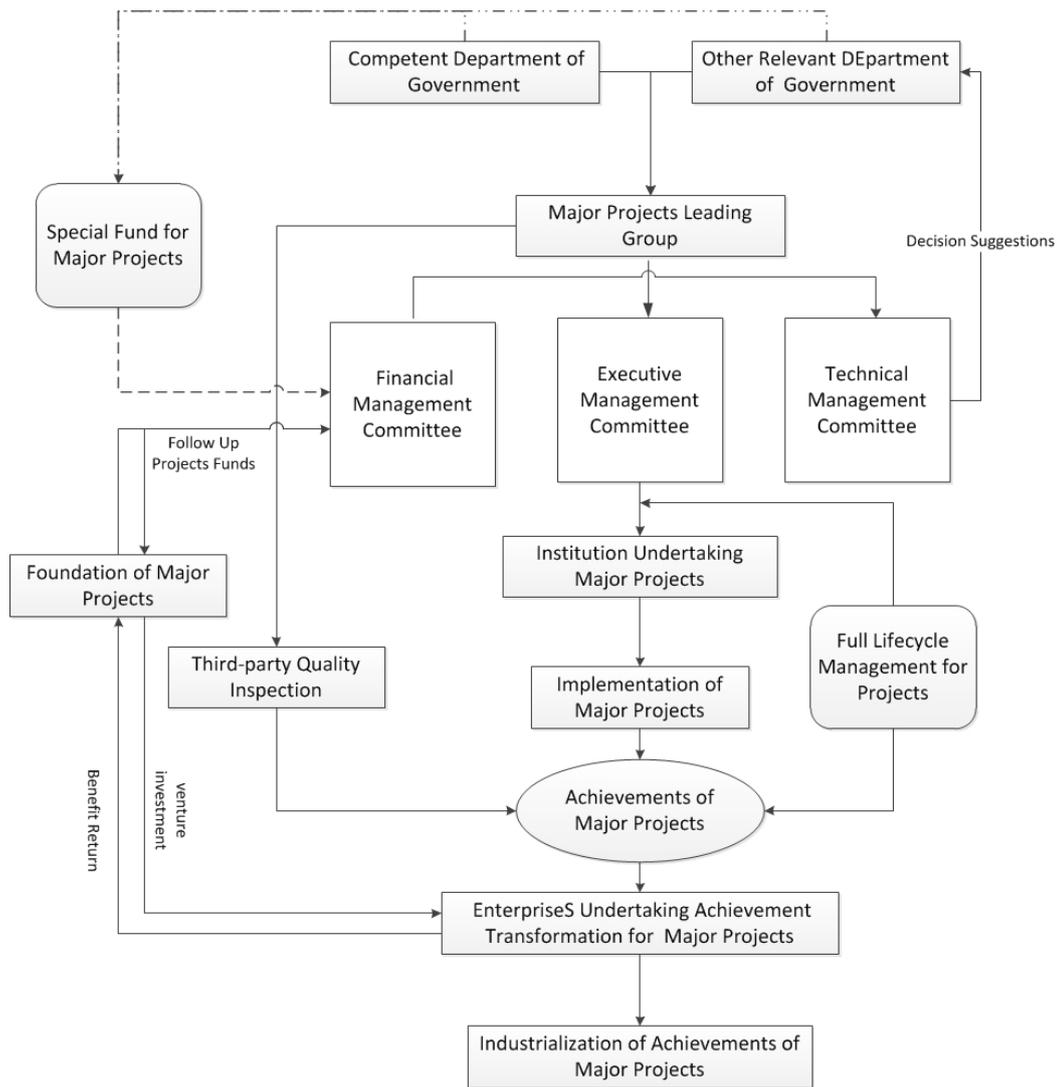

Figure 2 The Major Projects Mode

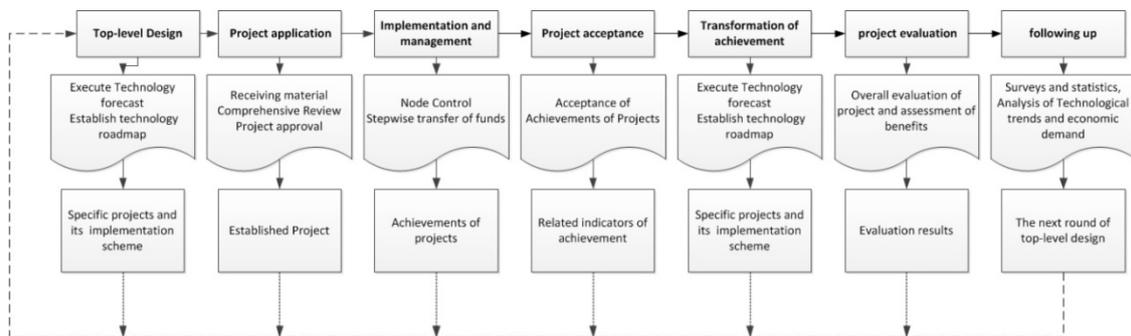

Figure 3 Specific Work Design for All Stages of Full Life-Cycle

5 Industrial Technology Research Institute Mode of University Innovation Teams Serving for the Innovative Hubei Construction Project

Industrial Technology Research Institute (hereinafter referred to as "ITRI") first appeared in Taiwan, China, in the 1970s. After 30 years of development, Industrial Technology Research Institute of Taiwan have produced a lot of research achievements spreading to the whole industry by technology transfer

and technical guidance. It has become one of Taiwan's three major research institutions. And compared with similar institutions from other countries all over the world, the cumulative number of patents it had obtained is in first place.

1) Positioning and Function of ITRI of Hubei

The establishment of Industrial Technology Research Institute of Hubei should regard promoting development of key industry and projects as the core, industrial technology integration as a link, commercialization, industrialization and marketization of innovative, critical, forward-looking technology as the goal. It will become a core hub institution promoting the efficient resource collaboration between government, enterprises, universities and research institutes. It also will become a technical service institution which allocates a various types of innovation resources effectively and enhances the ability of industry innovation greatly. Its positioning is shown in Figure 4.

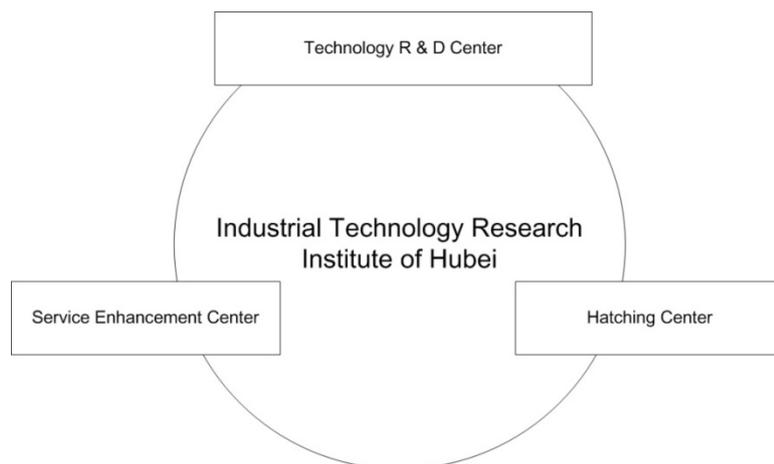

Figure 4 Positioning of Industrial Technology Research Institute of Hubei

① Research and development center of Hubei for key technology of major industry. It mainly researches and develops key technology, generic technology and forward-looking technology, and it provides technical support for major industry of Hubei.

② Incubator center of major industry of Hubei Province. It will be promoted as a new growth point of major industry of Hubei Province through technology transfer, incubation system and so on.

③ Service Enhancement center for major industry of Hubei. It is aimed at providing enterprises with public technology services and information training services such as product design, development, test, process, inspection, detection and standardization. And it will optimize survival and development environment for small and medium enterprises (hereinafter referred to as "SMEs") in Hubei Province to enhance their competitiveness.

Table 1 Five Functions of ITRI of Hubei

Function	Overview
Technology research and development	Combining enterprises, universities with research institutes and conducting research and development of application about key technology, generic technology and forward-looking technology around key industries in Hubei Province.
Public technical service	Setting up SME-oriented public technical service platform to provide information consulting services for government, enterprises, universities and research institutes.
Technology transfer and incubation	Promoting the level of technological achievements transfer, technological achievements incubation and technological achievements training which are researched and developed by ITRI, universities and research institutes; Promoting the industrialization of technological achievements.
Investment and financing	Establishing project financing platform for industrialization of new industrial technology of Hubei. To achieve effective transformation of technological achievements by means of market.
Training management	Providing SMEs with personnel training, management training, technical training and other multi-level services.

ITRI of Hubei is asked to have five functions which are technology research and development, public technical service, technology transfer and incubation, investment financing and training management. As shown in Table 1.

2) Organizational structure and Operational mechanism of ITRI of Hubei.

The establishment of ITRI of Hubei should be mainly lead by government. It will be a research and development institution which has open applications and a qualification of independent public institution legal person and which is nonprofit. It also will adopt the model of public institution legal person management and enterprise operation. About the organizational structure, it will adopt president responsibility system under the leadership of the Council. So, it will have extensive autonomy in all aspects such as organization, staffing, budget and technology transfer etc. As shown in Figure 5.

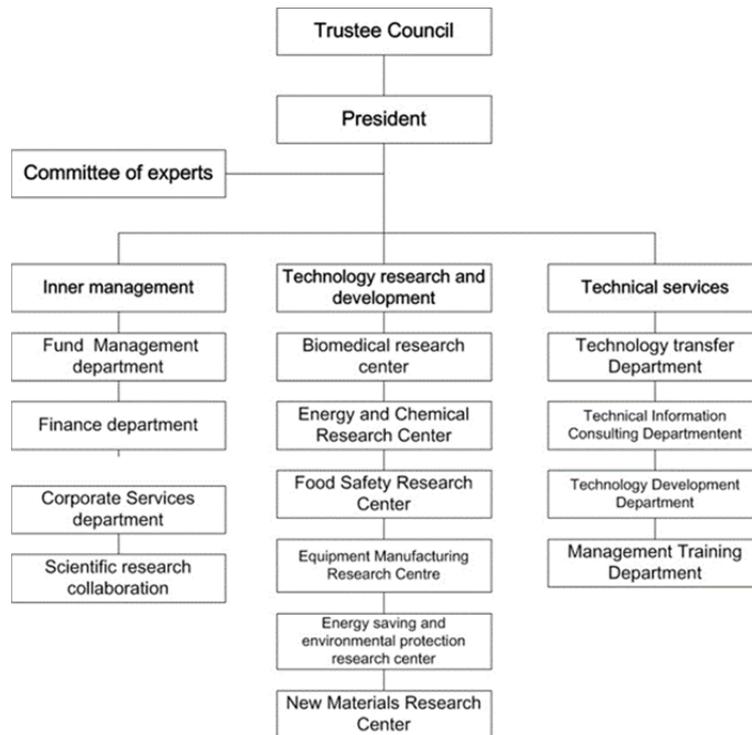

Figure 5 Organizational Structure of ITRI of Hubei Province

Hubei Province will adopt the idea that it needs strong government support, efficient industry-university-research cooperation and market-oriented operation. Eventually, ITRI of Hubei will achieve its unique role in industrial innovation system, and then it will enter the social circle. The operating mechanism is mainly reflected in the following aspects:

1) Fund operation mechanism. In the initial phase of ITRI, the government provides sufficient and stable special funds to support its development. Thereafter, the ITRI can strengthen service capabilities, and then contracts projects and topics entrusted by relevant departments of government or enterprises.

2) R & D projects selection mechanism. Selection of R & D projects should be industrial development-oriented. Whether it carries out research and development to meet the technology needs of major industries or to create new industries by regarding technology as a starting, knowing about the actual situation of the surveyed enterprises should be the first step in the selection.

3) Technology research and development mechanism. Research and development conducted by ITRI should focus on dislocation with academia and industry. Generic applicable technology and forward-looking technology should be concerned. It includes own research and development and technology transfer, as well as industry-academia cooperation and other forms.

4) Technology diffusion mechanism. In the aspect of technology transfer, there are different directions which the ITRI can concentrate on, such as technical cooperation and technical services for individual enterprise, generic technology R&D for a number of enterprises, forward-looking innovation for technology without receiver in the industry and so on.

6 Collaborative Innovation Alliance Mode of University Innovation Teams Serving for the Innovative Hubei Construction Project

In 2011, Chinese president Hu Jintao proposed the idea — “collaborative innovation” at the centennial celebration of Tsinghua University, and he said that university should have deep cooperation with scientific research institutions and enterprises to establish a strategic alliances of collaborative innovation. The Industry-University-Research Cooperative innovation is based on the collaborative idea which is in order to promote technological innovation carried out by University, scientific research institutes and enterprises. They will achieve the goal by sharing resource, working together, fusing capital, distributing benefit, undertaking risk.

In the collaborative innovation service mode, the main functions of the government, university and enterprise are specific and confluent. As shown in table 2.

Table 2 The Functions of the Three Subjects in Collaborative Innovation Service Mode

Subject	Positioning	Function
Government	Driving power	The government plays an important role in the government-university-enterprise collaborative innovation activities, and provides policy support, exchange opportunities, fund financing and implementation platform.
Institute of scientific research in Universities	tractive power	Universities and research institutes should actively play a leading role in the government-university-enterprise research cooperation. It means that they should overcome the tendency of breaking away from social practice, and carry out extensive cooperation with the industry and society, and enhance the ability of social adaptation.
Enterprise	pulling power	Enterprise is the pulling power of need in the government-university-enterprise cooperation. At the same time, enterprise should attach great importance to the linkage with government and university. Besides, enterprise have to break the negative, passive situation, and actively carry out technological innovation, and actively make a use of research results of universities or research institutes to improve competitiveness.

Based on the reality of the situation in Hubei Province and analyzing systematically the related literature, this paper has summarized the types and characteristics of the domestic and foreign mode of government-university-enterprise cooperative innovation. According to the partition of the relationship between cooperation subjects, we set up the collaborative innovation alliance mode of university innovation teams’ serving construction of innovative vision in Hubei from three different types which are the single dominant mode of cooperation (the university dominant), double leading mode of cooperation (university-government dominant, the university-enterprise dominant) and multiple dominant mode of cooperation (university-government-enterprise dominant) . As shown in table 3.

1) Single dominant mode of cooperation is the most basic mode in the industry-university-research cooperation. It is also a currently popular one. This mode mainly includes technology transfer, transformation, university science and technology industrial park, personnel training, technical consulting, university-owned enterprise, establishing Asset Management Co. Ltd. etc.

2) Double leading cooperation mode is the main form. It means there are multiple research units to cooperate with each other, but it only takes two of them as the leading. This mode has two types, the university-government cooperation and the university- enterprise cooperation. The first one includes cooperation with other countries in the world (international cooperation or overseas cooperation), as well as cooperation with China’s central government ministries or local government. The other one includes joint cultivation of talents and talents exchange, joint research and development (tackling key technical problems, technical commission), building a joint scientific research base (R&D institutions, laboratories, engineering technology research center), establishing high-tech entities together (technology appraised as capital stock). etc.

Table 3 Collaborative Innovation Alliance Mode of University Innovation Teams' Serving Construction of Innovative Vision in Hubei

Type of Mode	Leading subject	Form of Mode	Case of Mode
Single dominant (the most important)	University	Technology transfer, transformation, University science and technology industrial park, personnel training, technical consulting, university-owned enterprise, the establishment of asset management Co., Ltd.	Tsinghua Science Park, Tsinghua Tong Fang, Founder of Peking University
Double leading dominant (the most basic)	University - Government	Institute of research cooperation, the establishment of the Institute of technology, industry-university-research cooperation fund	Wuxi industry university research base, China Medical City research and Development Center
	University - Enterprise	Joint training and personnel exchanges, joint research and development (technical research, technical Commission), university- enterprise cooperation base of scientific research (R & D institutions, laboratories, engineering technology research center), joint high-tech entities (technology appraised as capital stock) etc.	Sound Research Institute of Nanjing University, Sinopec (Shanghai) Joint Laboratory, Jinchuan Metal Chemical laboratory
Multi dominant (Highest form)	University - Government - Enterprise	collaborative innovation platform (base), the strategic alliance of industry-university-research cooperation	Collaborative innovation platform of universities in Shanghai

3) Multi dominant mode is the highest level of form in the industry-university-enterprise cooperation. It includes the platform (base) of the collaborative innovation, and the strategic alliance of industry-university-research cooperation, etc.

7 Conclusions

As the uppermost existence of university innovation teams, the modes of university innovation teams serving for the innovative Hubei construction project have important means for healthy and efficient development of university innovation teams. This paper has come up with several modes such as team integration mode, major project mode, industrial technology research institute mode and collaborative innovation alliance mode. The choice of modes for university innovation teams depends on teams' characteristics, types and mechanism.

Game Analysis of Mode Selection about the Industry-University-Research Collaborative Innovation

Li Li

School of Management, Wuhan University of Technology, Wuhan, P.R.China, 430070
(E-mail: 991269268@qq.com)

Abstract: This paper designs two industry-university-research collaborative innovation modes through literature review: commission development mode and technology intermediary mode, and describes their basic principle of respective operation. Then, the game model of the two industry-university-research collaborative innovation modes would be constructed using the method of game theory, with the purpose of providing theory reference for enterprises choices of Industry-University-Research collaborative innovation modes and formulation of related policies and strategies in enterprises and government.

Key words: Game theory; Industry-university- research cooperation; Mode; Innovation

1 Introduction

With the increasingly fierce competition in the economy, technological innovation has becoming the key to gain a foothold and the driving force behind the development of enterprises. Enterprises rely on their own resources and ability to carry out technical innovation activities have become increasingly difficult. Collaborative innovation has become an inevitable choice. Enterprises need technological achievements of universities and research institutes to gain competitive advantages. At the same time, universities and research institutes (learning research side for short) is call for approaches to transform scientific and technological achievements. So there is interdependence between them, which is an important reason for industry-university-research collaborative innovation. In this process, selecting the mode of cooperation is a crucial issue. The cooperation between the subjects of the industrial-academic-research cooperation often leads to the failure or rupture of the cooperation because of the improper mode selection. So choosing a fair and reasonable mode of cooperation has become the key to successful cooperation.

The research on industry-university-research cooperation appeared along with more and more cooperation in the mid-1970s. The process of industry-university-research collaborative innovation was also the whole process of knowledge and technology production (Gibbons, 1994). Bloedon pointed out that in the process of cooperative innovation within an organization's internal agent was superior to the intermediaries', furthermore. And the information exchange and research cooperation is conducive to innovation (Bloedon 1994). Industry-university- research cooperation can indeed give the learning research side with more benefits, and improve its enthusiasm of technology research and development (Campbell,1995). Enterprises, which adopted the open type R&D strategy and high R&D investment, tended to view universities as a source of innovation (Laursen, 2004). Gulbrandsen pointed out that the professors funded by enterprises claimed that the research is applied to a wider range, and they can bring more papers and business results (Gulbrandsen, 2005). Universities and enterprises can use a variety of collaborative innovation cooperation channels, such as consultants and contract research, joint research or training, patent or spin-off activities (Este, 2007). The mode selection results of the evolutionary game can be all chooses the building economic entity mode or all selects the technology acquisition mode or reaches a stable state (Luo Xiaofang, 2014). Some policy recommendations should be given such as building a reasonable additional revenue allocation and cost apportionment scale, establishing effective incentive and punishment mechanism, enhancing the value of collaborative innovation and curbing speculative behavior and positioning the role of the government in the collaborative innovation correctly (Li Gaoyang, Liu Mingguang, 2014). Based on the new industry-university-research cooperation model of regional innovation capability, we should establish internal motivation mechanism, interest distribution mechanism, organization mechanism and build up external social mechanism, policy mechanism, adjustment mechanism, in order to make innovation effects of the regulation system of industry-university-research alliance into full play (Liu Yifeng Sun Haojin, 2015). Through consulting literature, the study on industry-university- research collaborative innovation focused on the specific cases and empirical research.

2 Industry-University-Research Collaborative Innovation Modes

In this part, I design two industry-university-research collaborative innovation modes: commission development mode and technology intermediary mode. Based on the two modes, I will analyze the game later.

Commission development mode is on the premise of forming a commission relationship between enterprises and universities, research institutes. Universities and research institutes make use of relevant resources provided by enterprises to conduct customized development according to the needs of enterprises. As shown in Figure 1, Universities and research institutes have the advantages of talent, discipline, research resources. While enterprises have the advantages of technological innovation, industrialization of scientific research and marketing expansion capabilities. Enterprises judge the shortage technology according to market demand. Then they commission universities and research institutes and support funds and equipment to universities and research institutes. Ultimately, universities and research institutes provide new technologies, new crafts to enterprises.

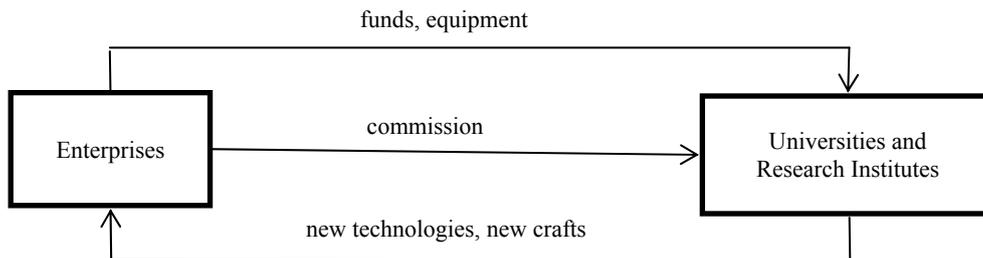

Figure 1 Commission Development Mode

Technology intermediary mode, which comprehensive resources of government, enterprises, universities and research institutes, is an industry-university-research collaborative innovation mode, regarded technology intermediary as the collaborative innovation center. As shown in Figure 2, Technology intermediary is the core part of this mode, playing a role of bridge. Government's support and guidance is an important guarantee for cooperation. Government provides finance, banking, tax and other concessions for enterprises, and provides policy support for universities, research institutes and technology intermediary. Enterprises are the main source of funding. But for the critical investment in basic technology, sharing technology and forward-looking technology, the government should set up special funds to reduce the pressure on the enterprise. At the same time, universities provide technology, equipment, and talent for technology center.

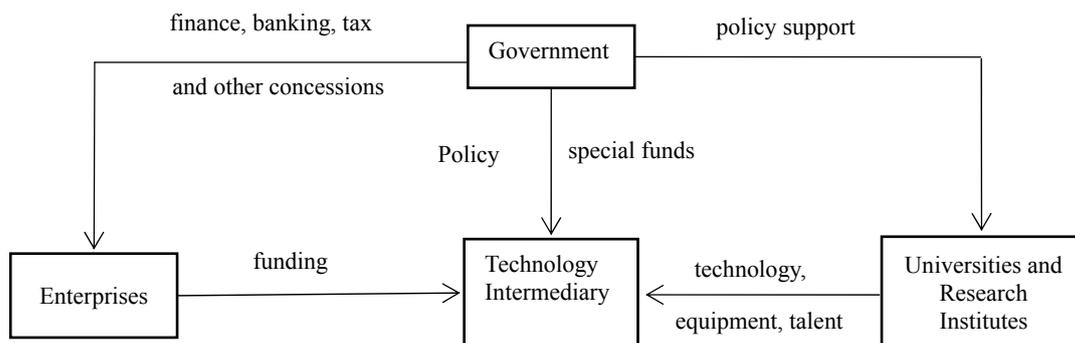

Figure 2 Technology Intermediary Mode

3 Game Model of Industry-University-Research Collaborative Innovation Mode Selection

From the above, selecting the proper industry-university-research collaborative innovation mode is the key to the success in cooperation. However, universities, research institutions and enterprises are different types of organizations, based on different organizational goals and organizational characteristics. Their choices of cooperative mode utterly different. In other words, among universities, research institutions and enterprises and even among different universities and different enterprises, technical capabilities of their own, the attitude to innovation risk, and revenue expectations are totally

different. Therefore, universities, research institutions and enterprises have different preferences for the mode of cooperative innovation. Only when universities, research institutions and enterprises make a consistent selection, the cooperation can be reached. Thus, the choice of the cooperative modes is the result of the game. Next, we will analyze the game selection on collaborative innovation mode.

3.1 Hypothesis of game model

In order to construct the game model, I made some basic Hypothesis in the first:

1) Assuming that enterprises only choose from two modes, one is commission development mode, the other is technology intermediary mode.

2) In general, learning research side's preference for cooperation mode is the same. So I put them as one side of the game, put enterprises as the other side.

3) Assuming that the probability the enterprise proposed commission development mode to learning research side is ρ according to their own condition. The probability learning research side accept is α according to their reputation and financing.

4) Assume innovation capability of the enterprise is X , innovative ability of learning research side is Y . In general, $X < Y$.

5) In the commission development mode, assume that enterprises paying learning research side commission fee is P . learning research side's cost to developed outcome is C_1 .

6) Assuming that the future return of the enterprise Π is increasing function of innovation ability. So the return of enterprises' individual innovation is $\Pi(X)$, the return of innovation of learning research side is $\Pi(Y)$, so $\Pi(X) < \Pi(Y)$. In the commission development mode, if learning research side cooperate with enterprises, enterprises will gain the benefit from cooperation is $R_1 = \Pi(Y) - P$, and learning research party gain the benefit from the cooperation is $R_2 = P - C_1$; If learning research side won't cooperate with enterprises, the return of enterprises' individual innovation is $R_1' = \Pi(X)$, and learning research side gain the benefit $R_2' = 0$.

7) In the technology intermediary mode, assume the total input of two sides is C , the input of enterprises is mC , the input of learning research side is $(1 - m)C$, and the benefit of cooperation is $\Pi(X + Y)$. If learning research side agree to cooperate with enterprises, the profit distribution proportion between learning research side and enterprises are $1 - \mu$ and μ , which we already set before cooperation. So enterprises gaining in the cooperation is $R_3 = \mu\Pi(X + Y) - mC$, and learning research side is $R_4 = (1 - \mu)\Pi(X + Y) - (1 - m)C$. If learning research side won't cooperate with enterprises, the return of enterprises' individual innovation is $R_3' = \Pi(X)$, and learning research side gain the benefit $R_4' = 0$.

8) Assume two sides won't consider their risk aversion, that is to say, ignoring the risk cost. Enterprises proposed a mode, learning research side elects cooperation or non-cooperation.

3.2 Game model construction

According to the above assumptions, the game tree in Figure 3 shows the game process of mode selection about the industry-university-research collaborative innovation.

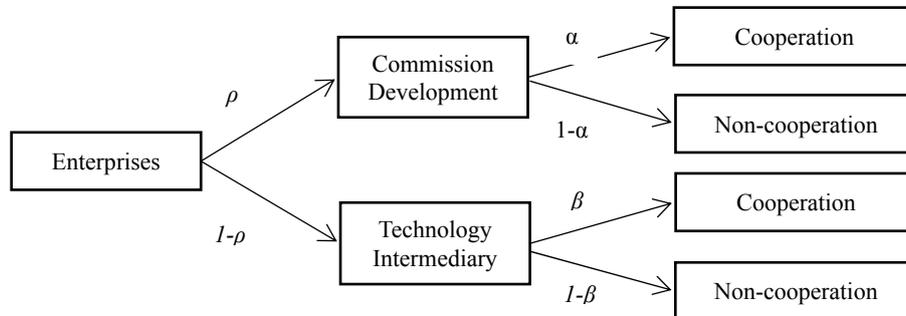

Figure 3 Game Tree of Industry-University-Research Collaborative Innovation

In the process of game, enterprises based on their own research and development funds,

technological innovation capabilities, market environment, social needs and other aspects to put forward a mode of cooperation. According to the game tree, we can get the game matrix of it (Table 1).

Table 1 Game Matrix of Industry-University-Research Collaborative Innovation

		learning research side	
		cooperation	non-cooperation
Enterprises	Commission Development	$\Pi(Y) - P, \Pi(Y) - P,$	$\Pi(X), 0$
	Technology Intermediary	$\mu[\Pi(X+Y) - mC], (1 - \mu)\Pi(X+Y) - (1-m)C$	$\Pi(X), 0$

It can be concluded that the expected return of each mode is:

1) The expected return of enterprises choose commission development mode to cooperate with learning research side is

$$E_1 = \alpha[\Pi(Y) - P] + (1 - \alpha)\Pi(X) \tag{1}$$

2) The expected return of enterprises choose Technology Intermediary mode to cooperate with learning research side is

$$E_2 = \beta[\mu\Pi(X+Y) - mC] + (1 - \beta)\Pi(X) \tag{2}$$

3) Average expected return of enterprises is

$$\bar{E} = \rho E_1 + (1 - \rho)E_2 \tag{3}$$

Therefore, when $E_1 > E_2$, i.e. expected return of commission development is greater than technology intermediary for enterprises, the enterprise choose commission development mode. At the same time, when $P > C_1$, learning research side will accept the cooperation, vice versa.

When the $E_1 < E_2$, i.e. expected return of the commission development is less than technology intermediary for enterprises, the enterprise choose technology intermediary mode. At the same time, when $(1 - \mu)\Pi(X+Y) > (1 - m)C$, learning research party will accept the cooperation, Vice versa.

4 Conclusions

In this thesis, the two cooperative modes of industry-university-research collaborative innovation are analyzed by game theory, considering that choice of industry-university-research collaborative modes is a process of mutual game. There is asymmetric information in the process of cooperation, making adverse selection appears. On the one hand, it has taken positive influence to the learning research side. Because of the uncertainty in research and development progress, so the learning research side needs subsidies for research and development from enterprises especially when research and development brings low results. On the other hand, because of the asymmetry of information, the market is flooded with low results. Furthermore, some universities and research institutions in order to obtain short-term interests, regardless of the damage the long-term interests of enterprises, and there will be some phenomenon of the achievements in scientific research of low cost but have high purchase cost due to the black-box operation.

Therefore, in order to promote research collaborative innovation reached smoothly, I put forward the following policy recommendations.

First, the government should establish the linkage mechanism of industry-university-research collaborative innovation. I recommend to establish the Conference group leading by the Municipal Economic Commission, making up of Municipal Development and Reform Commission, City Commission, Municipal Finance Bureau and other departments. Conference would regularly address important issues of local industry-university-research collaborative innovation, promote major projects, and promote cooperation smoothly.

Second, the two sides should build a reasonable income distribution scale. Participants are to achieve the goal of maximizing their own interests. Only to reach equilibrium proportion of income distribution, the two sides can accept. We should make comprehensive measure of resources of both sides' input factors, contribution degree, risk factors and innovative capacity, introducing third-party assessment institutions, so as to determine a synthesis coefficient proportion of income distribution as a basis for revenue distribution.

Third, we need establish an effective incentive and penalty mechanism. On the one hand, we should give both material and moral incentives based on reasonable incentive system, and fully mobilize

the enthusiasm of the participants, and ultimately improve the success rate of collaborative innovation. On the other hand, when the two sides signed a collaborative research agreement innovation, we must define their respective rights and obligations. Defaulting party must be given severe financial penalties, increasing the cost of the defaulting party's breach.

Abstract: The Ministry of Education, Malaysia (MOE) launched the Malaysia Education Blueprint 2015-2025 (Higher Education) in April, 2015. The blueprint specifies concrete plans on how to move Malaysia forward in the higher education sector. This paper looks at the development process of the blueprint by the MOE team, and examines the Open Innovation approach used during the blueprint development. The paper also highlights some of the benefits gained from the Open Innovation approach. Finally, the paper concludes with some suggestions on how Open Innovation approach can be further implemented in the future.

Key words: Open Innovation; Malaysia; Higher education blueprint; Crowd innovation

1 Introduction

The ‘Malaysia Education Blueprint 2015-2025 (Higher Education)’, or the MEB (HE) was launched by the Prime Minister of Malaysia on April 7th, 2015. As the name suggests, the blueprint serves as a guide for the development and growth of the higher education sector in Malaysia over the next ten years. According to the Ministry of Education (MOE), the blueprint sets “to create a higher education system that ranks among the world’s leading education system and that enables Malaysia to compete in the global economy”.

It took two years for the MOE to develop the blueprint, and during that time they collaborated with various stakeholders to come up with the comprehensive plan. At its core, the blueprint outlines 10 Shifts as the main agenda to further promote excellence in the higher education sector in Malaysia. The 10 shifts are shown in Figure 1 below.

Figure 1 The 10 Shifts

While it is important for every Malaysian to understand the blueprint and what the 10 Shifts entail, this research is not going to go into the details of its content. This particular study is to understand what went behind the scene while the committee was preparing the blueprint. Of particular interest is to understand what the process was like, and how Open Innovation concept was applied in the development process.

2 Literature Review

Innovation is very critical to the survival of any organization. According to Chesbrough (2006), organizations that don't innovate will die. Based on this premise alone, it is very important for any organization to keep innovating to ensure its survival. Interestingly enough, Chesbrough(2006) further asserts that most innovations fail. Thus, the question is no longer whether the organization should innovate, but rather, what kind of innovation approach should the organization adopt to remain relevant in the marketplace?

Traditionally, many leading companies had their internal Research and Development (R&D) teams to create new products or services. According to Chesbrough(2006), these companies performed their research using internal R&D resources, and viewed the internal R&D as a strategic asset, and even a barrier to competition. Established companies like IBM and AT&T did most of their research internally, and because of that, they became successful and were leaders in their respective industries. This traditional way of innovation is called 'Closed Innovation'.

These days, however, the way companies generate new ideas and produce new innovations is undergoing a drastic change. According to Chesbrough(2006), established companies are facing strong competition from many newcomers, who may not conduct much of internal R&D on their own. They use research findings of others in their innovation process. Companies have now moved to a new paradigm called 'Open Innovation', and the traditional approach of Closed Innovation has eroded in various industries. The Open Innovation paradigm treats R&D as an open system, whereby valuable ideas can come both from inside or outside the company.

Why do companies move to Open Innovation? One of the reasons is that, companies cannot possibly hire all the best brains in the market. So, by opening up the innovation process, companies will be able to produce products faster at lower cost (Reeves,2011). Furthermore, by combining external and internal ideas, the resulting products will suit customers' requirements better (Hilgers,2010).

Of late, Open Innovation has been receiving more and more attention. A lot of research has been performed to understand the practice of Open Innovation by various companies and industries. The continuous increase in popularity is due to its relevance to industry practice (Bughin,2012; Chesbrough,2012; Harison,2010). Large firms, such as Procter & Gamble and Dell, complement their internal R&D functions with external intermediaries such as InnoCentive and IdeaStorm to solicit new ideas and solutions to solve their problems. This has allowed them to innovate faster and at a lower cost than competitors (Bayus,2013; Reeves,2011). By leveraging external knowledge to supplement their R&D, smart companies such as Cisco and Genzyme are able to challenge the leadership positions of large industry players (Whelan,2011).

As expected, the high technology industries such as IT are well-known in their quest to embrace various forms of open innovation for many years (Alexy, 2012). Not to be outdone, the more traditional industries, such as banking and insurance, have been able to utilize ideas from external parties in their new product development (NPD) processes as well (Ramaswamy,2010). In their research, Ramaswamy and Gouillart(Ramaswamy,2010) describe how a large European bank has managed to introduce a new product by getting all the internal and external stakeholders involved in the product design process. The sale of the new product had surpassed expectations, and was the most successful product launch in the company's history.

Open Innovation concept is not just applicable to private companies or organizations. Many public institutions are adopting Open Innovation approach to bring new ideas and innovations to better serve their customers: the public. Collm and Schedler (Collm,2012) did a study on how governments are using crowd innovation approach to open up innovation processes in the public sector, and the challenges they face using Web 2.0 technologies. According to them, these public institutions "invite their stakeholders to participate in a weakly structured, public process of generating and developing innovations in the administration". Hilger and Ihl (Hilgers,2010) meanwhile, present how citizen sourcing can provide new ways for citizens to participate in the government's effort to improve their public services. They argue that, "by incorporating a much larger variety of ideas and knowledge into new product and service development, the performance of this process will improve, and the resulting

products will have a better fit with the public requirements”.

While Open Innovation concept has been widely explored worldwide, not much research has been done to look at Open Innovation practice in Malaysia. In one such study, Nasqhandi and Kaur (Nasqhandi, 2011) did a quantitative study on 60 Malaysian firms, and they conclude that informal organizational structures suit Open Innovation paradigm more than the rigid formal structures. They further argue that firms also need to have strategic alignment with their stakeholders, such as suppliers and customers, in order to be successful in their Open Innovation approach.

This leads us to another question: How can Malaysia benefit from Open Innovation? While the answer is not so simple, the author believes that Open Innovation could be one of the catalysts for Malaysia to transform into an advanced economy, as envisaged in the Vision 2020. Since Malaysia still lacks the extensive R&D capabilities of developed nations, Open Innovation could be the breakthrough to bring new ideas and innovations required to move the country forward. More studies need to be done to explore how Open Innovation can be implemented in Malaysian organizations. One way is to look at some Malaysian organizations which have opened up their innovation process to come up with new products or services, and learn from them. One such example is the Ministry of Education (MOE), where they used some aspects of Open Innovation when they were developing the higher education blueprint recently. Therefore, it is definitely fitting for us to do a study on how the MOE used Open Innovation approach during the development of the blueprint. Hopefully this will add new knowledge and interest on Open Innovation in Malaysia.

3 Methodology

The purpose of the research was to explore and understand the development process of Malaysia Higher Education Blueprint 2015-2025, and how Open Innovation concept was used during the development of the Blueprint. The following research questions were formulated to guide the understanding of the research:

Q1: How did the MOE develop the Higher Education Blueprint?

Q2: What Open Innovation approach did they use to develop the Blueprint?

For this study, a qualitative approach (Silverman, 2013) was adopted as the researcher aimed to understand what the respondents went through in the process of developing the blueprint. The study was not intended to seek generalization, but rather to look more in-depth into the subject matter.

The study used case study method (Yin, R. K, 2009) as we were only interested to study one case in detail from the perspective of the participants involved. The unit of analysis here is the blueprint development. As for the data collection, the methods used were semi-structured interviews, document analysis and personal observation.

For the interview part, the researcher conducted a one-hour interview each with two respondents. The respondents were chosen because they were key team members of the committee responsible for the blueprint development. **Respondent A** was a higher education consultant, and one of the key members of the blueprint committee. He had about 30 years of experience in higher education. **Respondent B** was a Program Lead in the Ministry of Education, and a member of the blueprint committee. He had more than 30 years of higher education experience.

4 Research Findings and Discussion

This section will discuss major findings after the data were analyzed. The findings are related to the main topic of the research by getting the answers to the earlier research questions.

4.1 Process Flow of Blueprint Development

The findings of this section help to answer the following research question:

Q1: How did the MOE develop the Higher Education Blueprint?

According to Respondent A, the Higher Education Blueprint was not developed from scratch. It was developed based on a review of the National Higher Education Strategic Plan, or Pelan Strategik Pengajian Tinggi Negara (PSPTN). The PSPTN was earlier published in 2007 as the strategic plan for Malaysia Higher Education for 2007 to 2020. It contains 23 key initiatives or Critical Agenda Projects to further propel the Higher Education sector in Malaysia (Ministry of Education Malaysia, 2007).

The development of MEB(HE) was divided into three phases, as shown in Figure 2, below:

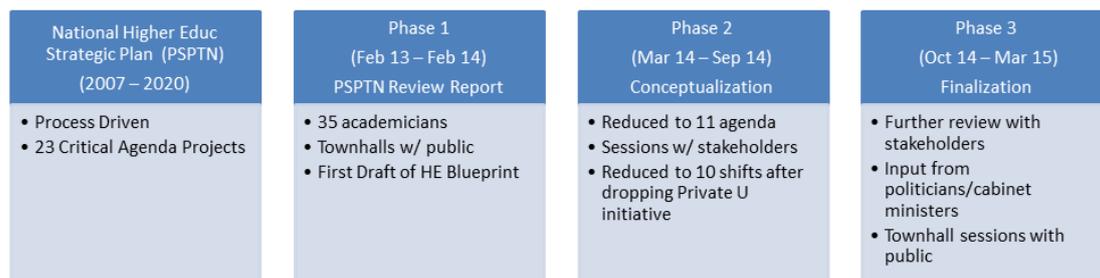

Figure 2 Phases of Higher Education Blueprint Development

Phase 1 started from February 2013 to February 2014, where a review of PSPTN was conducted. A team of 35 academicians were invited to sit on the review panel. Just like any initiative, the ministry wanted to know how well they had performed based on the PSPTN initiatives. The review panel spent a year to study the performance of Malaysia Higher Education sector and, how well they followed the PSPTN implementation. The review panel studied the achievements and shortcomings of the PSPTN, and evaluated the successes and limitations of these key initiatives based on the available data.

According to Respondent A, the data were only half of the story. To get the full picture, they also needed to get the feedback from the public and people on the street. To do that, they conducted town hall sessions to listen to what the public felt about the impact of Malaysia higher education to them. Throughout the town hall sessions, they gathered the feedback from the public to understand the impacts they felt in terms of their outlook, and how they had benefitted from the PSPTN initiatives.

After they had studied the available data and the feedback from the town hall sessions, the review panel came up with the PSPTN Review Report. The report contained the findings as well as recommendations for future initiatives, and different strategies to recommend. This PSPTN Review Report then became the basis for the development of the higher education blueprint.

Phase 2 (March to September 2014) was the Conceptualization stage of the blueprint. At the start of this phase, the MOE set up its own internal committee to handle the development of the blueprint. The committee started to study the PSPTN Review Report in an attempt to further improve the proposed blueprint. In the previous PSPTN, according to Respondent A, the plan was process driven, meaning it was based on achieving certain Key Performance Indicators (KPIs) eg. how to strengthen research innovation, how to strengthen the universities etc. However, for the new blueprint the committee had decided that it should be driven by outcomes. So, while studying the PSPTN Review Report, the committee also tried to align the recommendations with the new thinking (outcome-based). After further deliberation, they had narrowed the 23 key agenda from PSPTN to 11 Shifts. The shifts were the major initiatives that would spur continued excellence in the higher education system. With 11 Shifts, the committee thought that they could capture the immediate needs, and would be scalable enough to cater for future needs.

After that, the Deputy Prime Minister (also the Minister of Education) invited a group of national thought leaders to solicit their views on the initial proposal of the Blueprint. This group of people were prominent people in their fields, such as former chairmen of the university boards, former Vice Chancellors, prominent educationists, scientists, National Laureates, etc. The Deputy Prime Minister chaired the one-day workshop to enable these people to give their input. At the same time, the team also arranged for feedback sessions with various other stakeholders such as the board of universities, Vice Chancellor committee, Deputy Vice Chancellor committee, student leaders and other groups. The team also met the private higher education association, and to their surprise, the private university group was not agreeable to a shift specifically for private higher education. After listening to the feedback from the private higher education group, the team decided to drop the shift specifically for private higher education, and the blueprint now had 10 Shifts, instead of 11.

The last phase of the blueprint development was Phase 3, the Finalization phase (October 2014 to March 2015). To finalize the blueprint, the committee invited relevant stakeholders again to give their final feedback to the committee. In addition to that, the committee also presented the proposed blueprint to the cabinet ministers and politicians. Several town hall sessions were also conducted to allow the public to review and provide their recommendations to the blueprint.

After the committee was satisfied with the content of the blueprint, the Malaysia Education Blueprint 2015-2025 (Higher Education) was launched on April 7, 2015 by the Prime Minister of Malaysia, Dato' Seri Najib Tun Razak.

4.2 Why open innovation approach?

The process of developing the blueprint involved using Open Innovation approach by collecting data and getting feedback and ideas from external parties or stakeholders. While the committee did not specifically label this as Open Innovation, it was clear that the work they did conform to the Open Innovation concept as defined by Chesbrough (2006).

During the interview with the respondents, they stated several reasons why they chose this approach. According to respondent A, it was very clear at the outset that the committee wanted the blueprint to be consensus, meaning that it had to get the support and buy-in from the people involved in higher education. They did not want to shove it down to people's throat, so to speak. To achieve this, the relevant stakeholders must be part of the process through open discussions and various feedback sessions which the committee had planned to organize.

Another way to get the buy-in and support from the people was by getting the external parties to be involved in the process. This was evident when they got people in education to actually do the work such as writing some chapters of the document. The writing team included people from the ministry, the directors, heads of division, university professors, Deputy Vice Chancellors etc. Once these people got involved in the process, it would be easier to get the support and buy-in from them.

4.3 Open innovation methods

This section will take a look at various Open Innovation methods the committee had employed in the development process. This section will attempt to answer the following research question:

Q2: What Open Innovation approach did they use to develop the Blueprint?

There were various methods the MOE used in adopting the Open Innovation strategy. One prominent method they did was conducting engagement sessions with various stakeholders to seek their views and recommendations on the blueprint. To ensure they covered all angles, the committee invited various groups of stakeholders to the engagement sessions. Among the groups invited were :

- Higher Learning Institution Chairmen, Vice Chancellors, CEOs
- Higher learning institution staff
- Industry/professional bodies
- National Education Councils
- Senior Thought Leaders & Professors
- Parent Teacher Associations (PIBG)
- Unions & Associations
- Students & Alumni
- Ministry staff

The engagement sessions were done to explain what the proposed blueprint was all about, and to seek feedback from the audience. They held more than 30 engagement sessions for each of the stakeholder groups separately. In most of the engagement sessions, they would start with a presentation on the proposed blueprint. After that, the participants would be allowed to ask questions, and provide their feedback on the plan.

Besides the normal engagement sessions, some sessions were also conducted using workshop style. This was to cater for bigger groups, such as student representatives, the committee of Deputy Vice Chancellors and National Thought Leaders. In a workshop, a brief presentation would be conducted by the committee before the participants were divided into smaller groups. Each group would need to discuss among themselves what they thought about the blueprint, what should be included, and what should be removed from the blueprint. They were also encouraged to offer any suggestions for the improvement of the blueprint. After the breakout sessions, the groups would come back, and a representative of each group would present their findings.

Another method the committee organized was town hall sessions. These sessions were conducted to cater for bigger audience, especially involving the public. In a town hall session, the committee would present an overview of the proposed blueprint. After that, the floor would be opened so that the audience could ask any questions, or provide their views on the blueprint.

In conjunction with the town hall sessions, the committee also arranged what they called "Satellite" setup. A Satellite is a temporary public place where the committee put up posters and whatever documents related to the blueprint. Members of the public could visit the Satellite and view the information available, and ask any related questions to the MOE team. According to Respondent A, they

set up 6 different Satellites in Sabah, Sarawak, Penang, Johor, the East Coast and the West Coast.

In the sessions with the stakeholders, not all participants would have a chance to air their views, especially if it was a big group. Therefore, questionnaires were also provided for everybody to give written feedback on the blueprint. The questionnaire contained simple questions, as well as space for written comments. Besides questionnaires, anybody from the public could also provide their input online or via email.

Another aspect of Open Innovation was the use the various media to blast the information. Print media, electronic media and the internet were used to disseminate information about the blueprint to the public. Various appearances on TV shows were also arranged to highlight the blueprint to the public.

With various means provided for the stakeholders and the public to give their opinion on the blueprint, the committee felt that they had covered every angle in terms of soliciting feedback for the betterment of the blueprint. As Respondent A put it, “so, in terms of engagements, I think we were very thorough. There was not one segment that we felt we missed. And if anybody says that they missed, of course we cannot get everyone involved. But at least the representatives were there, and at least everybody was given the opportunity to be involved. Whether they actually get involved or not, that’s a different matter”.

5 Conclusions

This study has shown that the MOE has successfully adopted the Open Innovation approach in developing the higher education blueprint. They made every effort to get various stakeholders to work and collaborate with them in formulating the blueprint that would meet the stakeholders’ requirements.

By having open discussions with various external parties, the committee had uncovered certain requirements which they did not realize before, such as the need to remove specific shift for Private University only, and the need for National Identity to be included after consultation with the public. If they did not collaborate with the external stakeholders, the committee might have excluded these important requirements from the stakeholders.

While there were challenges in organizing various engagement sessions, they definitely benefitted from the process. In the end, the blueprint was designed based on the feedback from the people, not just the internal MOE team. Therefore, the end result was the blueprint which took into consideration every aspect of requirements from the stakeholders.

Perhaps one limitation of the approach was the main use of face-to-face sessions with the stakeholders to get their feedback. While this approach had its advantages, the MOE could have utilized the latest ICT technology (Web 2.0) more to enable wide range of participation from stakeholders. For the record, MOE did use email and its website as mechanisms to gather feedback from the public. However, this method was not the main method utilized, and not well known by the public. In the future, MOE or other organizations should use more of the latest ICT technology to collaborate more effectively with the public and stakeholders.

One way to implement this is for MOE to create an online Open Innovation system during the implementation stage of the blueprint. The implementation stage is scheduled from year 2015 to 2025. While the blueprint looks good on paper, the real test is to see how well the whole blue print can be implemented and how it benefits the nation as a whole. There will be a lot of challenges to be faced, and it would be good if the MOE create an online Open Innovation System in the process. This will allow the stakeholders to access the Open Innovation System and give feedback anywhere and anytime convenient to them, not just during face-to-face meetings. The MOE should also publicize and encourage the public to use the system so that they can collaborate and give feedback or suggestions to better implement the blue print for the benefit of the nation.

Throughout this paper, we have seen how the MOE has benefitted from the Open Innovation approach in getting the blueprint to cater to the requirements of various stakeholders. As Open Innovation concept has proven to be beneficial, other Malaysian organizations (public or private) should also be encouraged to adopt Open Innovation approach in their R&D effort, or even in any process improvement.

A Survey on the Contributions of Rational Redeployment of Higher Learning Institutions in the Vast Chinese Countryside to the All-around Healthy Development in China

Ke Meishu

School of Foreign Languages, Wuhan University of Technology, Wuhan, P.R. China, 430070
(E-mail: kelaoshi@126.com)

Abstract: With the analysis on the economic practices and literatures in the developed countries, based on the fact that China is now in the booming period in its economic development, the article puts forward the suggestion that some Chinese colleges and universities should move to the vast countryside from big cities. With the analysis on the economic and cultural benefits of this practice to the local communities of the new campuses, the article gets the conclusion that the redeployment of Chinese higher education institutions in the countryside is economically and socially beneficial to the national development and gives some suggestions on the rational redeployment.

Key words: Chinese higher learning institutions; Redeployment; Contributions; Chinese national development strategy

1 Introduction

With the rapid economic development, the urban-rural developmental gap is becoming bigger and bigger in China. Because of economic reasons, the development of cities in China has been supported by the governmental policies. Up till now, this practice is practical. Urbanization is one of the major features of market economy. At the beginning of Chinese economic opening up and reform, cities had to take the leading and demonstrating position of new economic practices to be the models for the underdeveloped regions to copy. On the one hand, Chinese cities have consumed the major part of national developmental resources, fulfilled the leading and demonstrating role in economic practices and have become overdeveloped even worldwide. The urban population has increased from about 18% to about 56% of the total Chinese mainland population from 1979 to 2016. This reality has greatly boosted Chinese economic development and China is now ranking 2nd among the world economies. On the other hand, the economic development in the vast countryside in China is still comparatively slow compared with the economic development speed in the urban areas. Besides the economic development, the cultural development in the vast Chinese countryside is also comparatively backward. In some rural regions, the main economic activity is still family farming. The main function of agricultural activities is to meet the need of family survival. In some regions, the rural residents' knowledge is limited and this gives possibilities to social instability.

A healthy state should be a state healthily developing both in economy and culture nationwide. Considering the present proportion of the rural residents among the national population (about 44% of the total 1.37 billion populations), the development of the rural areas in China will be a key sector in the national prosperity strategy and its success will decide the success of the national development.

It is time to boost the development of the countryside in China. What is the most economical but fruitful way to achieve this target? At present, the redeployment of higher learning institutions in the countryside is sure the most effective way to boost the economic and cultural development in the vast Chinese countryside. It is the demand of Chinese reality and modern times.

The functions of higher learning institutions are educating, innovating and serving. Some scholars in China have done some relevant researches. Wang Zhuo (1990) did researches on nationality education. Xie Anbang (1998) did some researches on the space distribution of higher learning institutions. Up till the 21st century, some other scholars did some researches on the regional disparity of higher learning institutions (Xue Huiying, Xuelan, 2003; Du Ruijun, 2007). And some other scholars did some researches on educational equality and effectiveness (Shen Hongmin, Liu Qiushi, 2008; Yu Hongliang, Meng Xianyun, 2013). This article will analyze the benefits, the possible difficulties and the corresponding measures of the redeployment of Chinese higher learning institutions in the vast countryside in China.

2 The Significant Influences on Regional Economic and Societal Development of the Distribution of Higher Learning Institutions

2.1 Theoretical basis of the higher learning institutions' functions in regional economic and

societal development

The Regional Competitiveness Theory thinks the key factor to promote regional competitiveness is the “national quality and science and technology” from higher education. IMD and WEF regard science and technology competitiveness as the core competitiveness of the eight key factors of international competitiveness.

The New Growth Theory points out that human resources and knowledge are the decisive factors of economic development. The scientific and technological development from higher learning institution is the decisive factor of regional economic development.

The Unbalanced Growth Theory points out that higher learning institutions can function well in innovating technology, upgrading local industrial structure and educating labors with necessary knowledge.

The Theory of Newly-developed Advantages points out innovation is the key to have the advantages of developing late. Innovating is just one of the 3 main functions of higher learning institutions.

We can get the conclusion from the previous four theories: higher learning institutions are the power sources of regional economic development. This will provide us a fundamental theory basis for the rational redeployment of higher learning institutions.

2.2 Facts on the functions of higher learning institutions in promoting economic and societal development

In Europe in the 18th century, education, especially higher education was attached to great importance in promoting national economic and societal development in England, France, Germany etc. Since the industrial revolution in the 19th century, developed countries actively promote the reform and development of higher learning institutions. Since late 19th century, in the world economy history, some less developed countries surpassed the more developed countries. For example, Germany surpassed England, America surpassed England, Japan passed European economic powers. All these show the rapid development of higher education is a necessity of economic booming.

In a nationwide region, many famous universities, with their own scientific findings and discoveries, become the regional locomotives, and therefore, accelerate their own further development. In some sense, we can say Stanford University makes chip valley and the University of Utah and Brigham Young University boom Utah state.

3 Stimulation on Economy

The redeployment of Chinese higher learning institutions will be a very big project. Up till 2016, the number of Chinese higher learning institutions is 2879 (Ministry of Education of PRC); the number of college and university students is 26.253 million (Ministry of Education of PRC). Even if only part of them will be redeployed outside big cities, the project will contribute a lot to the economic development.

3.1 Direct economic positive influence

The reconstruction of the higher learning institutions is sure to contribute greatly to the economic development in a relatively long period of time. The construction cost of an average college or university in the cities in China is at least 2 billion RMB yuan. Considering the comparatively cheap labor and low land and building material prices in the rural areas, the construction cost of an average higher learning institution is at least 1 billion RMB yuan. This is a very big project for a local community. It will promote the local economy greatly. Nationwide, the redeployment of higher learning institutions is a super huge project, besides other positive influence in the national development, it will directly stimulate the national economic development at least for ten years. It will provide local people many employment opportunities and directly increase the local economy.

Table 1 Some Changes of the Local Community Economy before and after a Community College was Built in Hubei Province in China

Before the college was built		After the college was built
Number of local manufacturing businesses	13	25
Number of local service businesses	25	83
Local unemployment rate	4%	1%
Per capita income of local community	¥ 2000/year	¥ 6000/year

3.2 College people's contribution to local economy

People learning or working at universities or colleges are great consumption power, and their need for daily necessities is sure to contribute to the local economy. This will greatly change the local production types and forms and will provide a lot of chances for the local services. Every average Chinese university or college is just like a well-organized small town. It can play a core role in a local economy. Population is the basis of consumption. Consumption patterns and demands determine the production modes. College people usually lead the fashion, culture and technology tides. Their demands are various, modern, fashionable, which will give demands on the local markets and so promote the local economy.

3.3 The function of colleges and universities in changing local economic developmental modes

Colleges and universities are just like small societies formed of social cultural and technical elites. Colleges and universities can not only provide convenience of specific technical educations, but also change local people's ways of thinking. College people's general living ways usually represent the current tendency of modern times. Their living ways will gradually influence the locals' living ways and make the local people's living ways meet with the needs of modern times. The most significant change will be the shift of local economy from small-scale farming or animal husbandry economy to market economy. This will make the underdeveloped regions in China to catch up with national economic developmental pattern in a comparatively short period of time. To change the production modes to satisfy the college people's needs (of course, to make more profits), the locals are sure to change their thinking ways and learn more knowledge to become more modern.

Table 2 Some Changes of the Local Community Economy before and after a Community College was Built in Hubei Province in China

	Before the college was built	After the college was built
Types of local manufacturing businesses	3	11
Types of local service businesses	5	23
Local unemployment rate	4%	1%
Per capita income of local community	¥ 2000/year	¥ 6000/year

4 Colleges' and Universities' Function in Reforming the Local Community Culture

4.1 Colleges and universities can gradually change locals' knowledge quantity and composition

Colleges and universities play a very important role in modern mature economies. as mentioned above, colleges and universities will not only provide locals specific technical educations and instructions, they will also promote locals' knowledge and civilization level. Reforming people's thinking ways and increasing their knowledge is the easiest way to accelerate civilizing communities. Once people's mind has been changed, the corresponding actions will be a matter of course. At present, it is not feasible for the government to pour a lot of money into each underdeveloped region directly to improve the local people's living conditions because there are too many underdeveloped regions in Chinese countryside and the state funds are limited. So, changing people's mind in the underdeveloped regions and give them necessary and specific educations and instructions to make them know the necessity and feasibility to change their life better themselves is a very practical and economical way. The redeployment of universities and colleges outside big cities will not only reduce the pressure of big cities, but also improve the facilities of the newly-built universities and colleges and promote the development of the underdeveloped local communities. College people bring in new things of modern tendency and can greatly narrow the urban-rural developmental gap, especially civilization gap.

4.2 The redeployment of colleges and universities in the vast Chinese countryside can significantly improve the local living and cultural facilities

Colleges and universities are well-organized social public institutions. The necessary school facilities will benefit the locals a lot. For one thing, the locals' sharing the use of the facilities will save the government funds in public facilities in the local communities (which is a necessary responsibility for a responsible government); for another, the facilities of the well-organized educational institutions can better meet people's needs, and can be good models for the local government to copy to build other local public facilities. This will surely promote the overall civilization and the scientific urbanization of the local communities. Modern life ways and civilization advocated by college people will infiltrate into locals' life and locals will join in the main stream of modern civilization unconsciously. This will surely contribute to the national culture civilization as well as the economic prosperity.

4.3 Colleges and universities can bring the locals modern awareness and the concept of national prosperity developmental strategy

Colleges and universities function as educational and training institutions. Besides the subtle demonstrating influence of college people's life ways and modern awareness on local people, colleges and universities can also function as publicizing bases of national prosperity strategy. By educating the locals as well as the students the necessity and rationality of the national developmental strategy, colleges and universities can unify people's thinking and understanding on the national developmental strategy and accept it. This will greatly contribute to the execution and realization of the national developmental policies and measures, and it will also benefit the formation, development and stabilization of the national prosperity idea among people, especially among the locals in the underdeveloped regions. All these will greatly promote the modernization of the underdeveloped regions and improve the civilization of the local people.

Table 3 Some Changes of the Local Community before and after a Community College was Built in Hubei Province in China

	Before the college was built	After the college was built
Rate of locals accepted specific technical trainings	1.8%	23%
Local illiteracy rate	18%	3%
Internet and smart devices penetration	10/100 families	81/100 families
Private vehicle ownership rate	0.1/100 families	10/100 families

5 Conclusions

The economic development of China has passed the extensive development stage and has entered the booming stage. In the first stage, cities consumed the majority of governmental resources to take the leading demonstrating post in the national development strategy. Chinese cities have become highly developed economically even worldly. The target of the first developmental stage of Chinese economy development has been realized. The benefit of economic reform and opening up has now been recognized by the majority of Chinese people. Economic reform and opening up has become a necessity and a center in Chinese economic activities. Economic development and prosperity have become an undeniable request and a necessity in China. The target of the second economic developmental stage is to urbanize the vast countryside in China and infiltrate the benefits of economic reform and opening up into the underdeveloped countryside regions and make economic development a request from the locals in those regions.

The biggest obstacles of redeploying higher learning institutions might be the cost and the college and university staff members' willingness to move to the new campuses. In fact, these are not problems (See *Necessity and feasibility: A study on the redeployment of Chinese higher learning institutions in the countryside at resent, Proceedings of the 12th international conference on innovation& management, pages 569-573*).

The redeployment of colleges and universities nationwide is a very large-scale project. It should be planned carefully and scientifically. The redeployment of colleges and universities might have some exceptions, but it usually should be planned according to the principle of rational distribution.

The distribution of colleges and universities in a region should take into consideration the cost of redeployment. Colleges and universities are usually redeployed in the regions near where they were to reduce the redeployment cost.

The distribution of colleges and universities in a region should take into consideration local population. Densely populated regions need more colleges and universities.

The distribution of colleges and universities in a region should take into consideration local needs. For example, in a pasturing region, colleges and universities featured with animal husbandry may be considered first. It is the same with crop farming areas. In some national autonomous regions, nationality higher learning institutions should be considered.

The distribution of colleges and universities in a region should be considered together with establishing new ones if necessary. In some regions, to build a new college or university might be cheaper than move and redeploy one from a faraway place.

The purpose of redeploying higher learning institutions in the vast Chinese countryside should center around the principle: to serve the national material and cultural prosperity strategy, and to serve the people.

Issues and Challenges of Entrepreneurship Education in Malaysia

Hartini Mohamed, Akbariah Mohd Mahdzir
Management of Technology

Malaysia Japan International Institute of Technology, University Teknologi Malaysia
(E-mail: tinirayyan@gmail.com)

Abstract: This research is a program evaluation of an entrepreneurial education in public and private higher education institution in Malaysia. Among the problems of the Entrepreneurial Education face by Ministry of Higher Education Malaysia as stated in Entrepreneurship Development Policy for Higher Education Institution (HEI) is the lack of mechanisms for quality, effectiveness and impact measurement. This study aims to evaluate what are the issues and challenges in the implementation of entrepreneurship education practices by Higher Education Institution (HEI) in Malaysia. There are two higher institutions involved in this research, University Teknologi Mara (UiTM) and International Islamic College (IIC). Both institution offer Bachelor of Entrepreneurship and have more than one cohort of students graduated. This study adopts qualitative approach utilizing case study method. The collection techniques included semi-structure interview, document analysis and observation. This study focuses on entrepreneurial program at public and private Higher Education Institution (HEI) and it contributes to the present literature on the real phenomena of entrepreneurship education in this country, specifically focusing the actual issues and challenges which relates to the monitoring and evaluating the effectiveness of the entrepreneurship education programs faced by the Ministry of Higher Education and the Higher Education Institutions in Malaysia.

Key words: Evaluation; Entrepreneurship Education; Issues and Challenges

1 Introduction

There are various policies and plan emphasizing on the human capital development. In Vision 2020 working paper in 1991, our former Prime Minister, Tun Dr Mahathir Mohamad has highlighted the need to establish 'a scientific and progressive society' as the sixth challenge out of nine outlined in the national agenda. Until now various efforts provide by the Malaysian government with the assistance of many agencies in establishing programs to the young entrepreneur and graduates in a tandem to this national agenda. Small Medium Enterprise Corporation (SME Corp), Malaysia External Trade Development Malaysia (Matrade), Ministry of Entrepreneur and Co-operative Development (MeCD), have been offering grants specifically for local SMEs and small/medium industries that meet the criteria. Obviously, the government wanted to see more technopreneur and entrepreneurs running the small and medium enterprises (SMEs) in the country.

As for the education sector, Ministry of Higher Education has instructed all local public and private universities and colleges students are required to seat for the entrepreneurship course. The intention of the Ministry of Higher Education (MoHE) of revitalizing entrepreneurial acumen of all graduates and also in tandem with the Ministry of Entrepreneur and Co-operative Development (MECD) to encourage young generations to venture into business and be courage to explore opportunities through this sector (Mansor & Othman, 2011). On top of that MOHE is also including the entrepreneurship skill as one out of nine generic skills or domains that should be possessed by the students in a new Outcome Based Education System (OBE). This skill needed to ensure graduates at all discipline are not solely depending working with others but creating a thinking of having their own business in the future. "We are producing more graduates than jobs," said Minister of Higher Education (MoHE), YB Dato Seri Mohamed Khaled Nordin during the launch of Ready Work portal held at University Teknologi Malaysia (UTM) Kuala Lumpur Campus. He added that entrepreneurship education helps stress the power of ownership to create wealth. (November 2, 2012)

Several studies have shown that entrepreneurship has been identified as a potential catalyst for expanding economic growth and to maintain competitiveness in facing the challenges of globalization. (Minniti, M. & Levesque, 2008). The involvement of graduates in the field of entrepreneurship is supported by the government as an alternative to reduce the unemployment rate in the country (Othman, Othman, & Ismail, 2012). However, past studies are based on the studies conducted abroad of how the effectiveness of Entrepreneur Education implemented that lead to the reducing number of unemployment rate among graduates.

This present study focuses on issues and challenges of the entrepreneurial program within the public Higher Education Institution in Malaysia by using the system approach based program evaluation.

This part will also touch the research gap, research objectives and research questions, research framework and research scope.

1.1 Research gap

There are a number of gaps that show the ineffectiveness of entrepreneur education in Malaysia as indicated by the previous researcher such as those involving the gap in skill expectation and skills acquisition. The studies show the ineffectiveness of entrepreneurship education in Malaysia in matching students' skill expectations with their skill acquisition. (Cheng, Chan, & Mahmood, 2009). Then it follows by the gap between the aim of Entrepreneurial Education and the curriculum imposed for this program. The aim of Entrepreneurial Education on the expected entrepreneurial characteristic hold by the students after they learn this field but there was no deeply evaluation done to the curriculum teach to the students, whether it is enough to meet the required expectation. (Ismail & Ahmad, 2013)

At the same time according to Ismail & Ahmad, 2013, The lecturer was rated low in term of performance, there were few research highlighted the competency standard that should be possess by the Entrepreneurial Education lecturer/ instructor. (Ismail & Ahmad, 2013)

Apart from that there is also a gap between the government aim and the actual outcome of the grandaunt. The government intention/aim/plan toward EE's students to be self-employed but the real outcome contradicts with this intention/aim/plan. (Liv Anne Storen, 2014). Gaps in the implementation of the entrepreneurship program, reflecting an imbalance in the entrepreneurship education process (method of teaching, curriculum) and the program objectives aimed at producing future entrepreneur. (Nasrudin & Othman, 2012)

1.2 Research objectives

The purpose of the program evaluation proposal is:

To determine issue and challenges of Entrepreneurial Program in Higher Education Institution in Malaysia in achieving its Program Education Objective through the lens of the System Approach Based Program Evaluation Model (Fatma Mizikaci, 2006)

1.3 Research questions

In this study a system approach based program evaluation model will be deployed, therefore the research questions will be divided into the three sub components that comprise of Social System, Technical System and Managerial System.

1.3.1 social

1.3.1.1 To what extend does the Ministry of Education give support in ensuring the success of this program in meeting its objectives?

1.3.1.2 Is there any mechanism use by the Ministry to monitor and evaluate the success of the Entrepreneurship Program in Higher Education Intuition in Malaysia?

1.3.1.3 Are the stakeholders satisfy with the outcome of this program?

1.3.1.4 Are the institutions concerned about the continuous improvement of this program?

1.3.1.5 What effort has been made to ensure the continuous quality improvement of this program?

1.3.2 Technical

1.3.2.1 To what extent have the resources needed able to meet the program requirements

1.3.2.2 To what extend the curriculum provided meets the Program Educational Objectives

1.3.2.3 How is the institution following the activities/strategies that have been previously outlined? Execution/implementation strategies?

1.3.2.4 To what extent does the program meet program educational objectives?

1.3.2.5 Are the employer satisfied with the performance of the graduates?

1.3.3 Managerial

1.3.3.1 What are some alternative strategies or approaches that could be used to enhance the merit of this program?

1.3.3.2 Does the policy, vision and mission of the organization in line with the objective of the program?

1.4 Conceptual framework

This research will evaluate an existing entrepreneurial education in public higher education institution in Malaysia using System Approach Based Program Evaluation Model in quality system. According to (Mizikaci, 2006a), this model is powerful in two ways:

1) it is a well-integrated model for program evaluation and understanding of the quality systems in higher education institutions from the perspective of systems approach.

2) it offers a multiple-sources approach to stakeholder-oriented measurement in terms of both varieties of dimensions and sources. (Mizikaci, 2006b)

The entire system is open to internal interactions and external influences. The relationships are analyzed using a program evaluation approach. Quality implementations are described in relation to the subsystems for achieving the overall goals. Subsystems are set up for developing systematic evaluation and methods for the analysis of, e.g. social, technical and managerial processes in the given institution. As listed by (Mizikaci, 2006a), there are six steps to follow by this model.

1) Set criteria for program evaluation:

- The criteria and the program are based on the quality concepts re-defined accordingly, representing shift from industry-based concepts to education based concepts and issues for higher education.

- Adopt the systems approach model in order to set the strategies for the program.

2) Stakeholder identification:

- Define the stakeholders as those that have an influence directly or indirectly on higher education of the programs such as students, academic staff, administration, parents, graduates, employers, Higher Education Council, Ministry of Education and other related institutions.

- Conduct interview to define the needs and expectations of the stakeholders.

3) Sector analysis

- Analyse inputs sources, e.g. the graduates and trained personnel in the employment market.

Analyse performance skills and knowledge expected from trained employees.

- Analyse existing employment sources embedded in the community which can have indirect influence on higher education, e.g. public offices and non-governmental institutions, other national and international bodies of research and education.

4) Identification of resources:

- Identify what resources are available.

- Identify whether the resources are appropriate to the objectives defined.

5) Data gathering:

- Gather data from multiple sources.

- Use data analysis procedures.

- Adopt a systematic data collection procedure (collect, analyse, interpret and make use of data systematically)

6) Program development:

- Plan all the stages identified in the technical system of the model.

- Make use of quality measurement tools in planning instructional processes.

- Make use of relevant educational research on planning teaching/learning processes.

- Make use of technologies when planning instructional material

- Emphasize frequent feedback and evaluation.

- Plan continuous education strategies.

- Adopt suitable evaluation strategies for program improvement.

As can be seen here, each stage provides for the implementation of the model components and directs the data interrelated to the sub-system components: social, technical and managerial systems. (Mizikaci, 2006b)

1.5 Research scope

This research will specifically focus to the undergraduate Entrepreneurial Program offered by Public Higher Institution in Malaysia. Through System Approach Program Evaluation Model, the issues and challenges of program will be view through the stakeholder and the organization system as a whole. Therefore, in this research the stakeholder composed of students, the academic staff and the managerial level were interviewed.

1.6 Conclusion

Most of the Higher Education Institution in Malaysia focuses on quality and program evaluation but it has been done in isolation. Therefore, it is a time to use System Approach to Program Evaluation Model which involves a comprehensive evaluation that covers internal and external aspect. This research involves students, teachers, management and stakeholders.

2 An Example

In Malaysia, several researchers have conducted a study on the effectiveness of EE in various aspects, such as focusing on entrepreneurial skills and characteristics. The results show the ineffectiveness of entrepreneurship education in Malaysia in matching students' skill expectations with their skill acquisition. Thus, educational institutions need to review the existing curriculum and design a more appropriate curriculum to develop effective entrepreneurship programs and enterprising individuals. (Cheng et al., 2009). There were also researchers who study the ability of entrepreneur students in highlighting the characteristics of leadership that should be possessed by the entrepreneur. The main purpose of this study was to explore personal competencies of student entrepreneurial leaders (Bagheri, Lope Pihie, & Krauss, 2013).

Like other developing countries, Malaysia should also look at the level of readiness for the implementation of this program. The study indicates that Malaysian students' readiness in terms of entrepreneurial willingness and capabilities are strong. However, the readiness of entrepreneurial attitude and readiness for entrepreneurship education within the internal environment of public universities remains insufficient and requires improvements. (Othman et al., 2012). The level of readiness should also be viewed from the curriculum adopted by the HEI. Does theoretical and practical contents are balance in the existing curriculum. Curriculum and co-curriculum activities need to adopt a more practical and hands-on approach, distinct from business education, while public universities should open up opportunities for students to pursue entrepreneurial education, in order to increase awareness and change the mentality or culture of "wage-earning" careers in favor of entrepreneurship. (Othman et al., 2012).

Effective curriculum is crucial to ensure that the objectives are achieved. This can be seen from the research done on the polytechnic in Malaysia which still have problems with the curriculum. Indeed, this result gives important impact to Ministry of Higher Education (MoHE) in Malaysia, especially polytechnics, in planning and developing Entrepreneur Education in the institutions. Regarding these issues, the reformation of curriculum and pedagogy is important. The entrepreneurship modules, activity and program executed throughout polytechnics are unable to provide students with entrepreneurial tendencies. (Ismail & Ahmad, 2013). In addition, a competent instructor is needed to ensure that students are motivated and really understand the need to become an entrepreneur. Unfortunately most of the instructors who teach Entrepreneurial Education in HEI, equip with theoretical knowledge but do not mastered this entrepreneurial knowledge practically. This finding confirmed that polytechnic lecturers are not imbued with entrepreneurial tendencies. (Ismail, 2013)

3 Data and Methodology

Data for this study were collected through two higher education institutions, University Teknologi Mara (UiTM) and International Islamic College (IIC) where both institutions offer undergraduate entrepreneurship program. The data obtained through interviews conducted with lecturer and coordinator who have been involved in entrepreneurship program (manage to get consent from both interviewee). Researcher also managed to obtain documents which related to the curriculum and course syllabus of these two institutions

In this study, qualitative method is adopted for data collection and analysis. Qualitative research is an inductive process that used to reveal the meaning of significant of participants in their context. It is as described by. (Merriam, 2009, p. 13), qualitative researchers are interested in understanding the meaning people have constructed, that is, how people make sense of their world and the experiences they have in the world.

Case study was chosen to describe in detail and analyze a system that has limits and boundaries. As mentioned by (Merriam, 1998), a case study is an in-depth description and analysis of a bounded system. Entrepreneurial Program is a bounded system where researcher can limit or fence in what is going to be studied.

Semi-structure interviewing, observations and document review are the techniques chose as data collection method for this study. Interview is best used when researcher does not know one's feelings through observation and how people describe what is happening around them. Semi-structure interview according to (Merriam, 1998) is in the middle between structures and unstructured.

4 Result

4.1 Curriculum

The existing curriculum needs a lot of improvement because it must meet the requirements of a

future changes. “For present yes, for future always have to review because the trend that change very fast. So we have to keep up. We have to quite regularly, keep up with the current need of our society”. (Interviewee - 1). At the same time, the course that teaches on how to deal with risks in the business should also be included in this curriculum. It is very important that students know how to deal with a business risk. That was recommended. I think Prof Hassan from Univesiti Teknologi Malaysia, he mentioned about risk course, because recently we have round table dialog with industry. He said, Entrepreneurship is about risk taking. Our students are not tough enough. To become entrepreneur, we need to be very strong, when we go down we have to go up, that is why Chinese they are very persistence, they want to be success and always look forward. (Interviewee - 1)

Most of the contents of this curriculum emphasizes on theory. (Please refer to the Appendix 1 - Curriculum Structure of Bachelor in Administration (Entrepreneurship)) While experiential learning through practical training are required by the students “Theoretical enough, practical is still insufficient. As University Malaysia Kelantan UMK, its organize practical training during semester break to expose students” (Interviewee - 1). It happens to the other HEI, where the existing curriculum is not appropriate to the current requirements The present curriculum should be improved to meet the current changes. According to the feedback, the majority of the IHLs recognize the current challenges faced in executing entrepreneurship education into the present curriculum. (Yusoff, Zainol, & Ibrahim, 2014)

4.1.1 Practical training

Practical training should be given priority as well as providing students with incubator facilities, shops and the like to enable students to always practice what they learned. “To make it difference you have to embed them with the industry then to exposes them with lots of entrepreneur stuff, provide them with incubator and let them practice. Like retail, the program that I teach, we provide the simulation store. Students go in, and then for a week they have to go for three hour training, to expose them on how to handle customer, how to handle with difficult customer and to make sure how to arrange the goods in order, that’s in retail right. It same to entrepreneur, I think we need to provide store so that they can practice what they have learn. This is not materialized yet”. (Interviewee - 1)

The time allotted for practical training was too short, which is supposed to be extended to one year. “Just being discuss and need to revise our curriculum, we are a in the process of reviewing and try to put forward the ideas of one year of internship instead of four months” (Interviewee – 2)

4.1.2 Redundancy

The importance of learning how to create or do a business plan is one of the things that have been emphasized in the Entrepreneur Education. But repeated learning can make students every semester feels bored and lose focus on the lesson. “I think that is redundant. It’s really redundant. In New Venture course students are required to produce with a business plan. Semester 3,4,5 and even in semester 6 they also have to do the business plan, for what?” (Interviewee – 2). This causes students to feel unhappy and expressed their dissatisfaction with the frequent task that they need to do every semester. “So many complain from the students, that’s why at this moment we try to revise back our curriculum, we try to eliminate, for example the latest news I heard last week, Small Business Management will be eliminated. It will be eliminated probably due to the redundancy”. (Interviewee – 2) This shows there are still weaknesses, not only at the curriculum level but the instructor ability in providing a more creative learning techniques are still lacking. Academicians should teach entrepreneurship through learning focus that is upon ‘know how’ and ‘need to know’ rather than functional expertise. The ‘need to know’ stems from the development problems and opportunities of the business. The challenge to academician is therefore to organize knowledge around organization development processes, radically different from the conventional functional paradigms. In guiding them to the survival of a business in the early years, the target might, for example, be to anticipate the problems that lead to business failure and ‘bring forward’ the knowledge in such a way as to enable entrepreneurs to anticipate development problems before they occur and take remedial action. (Zakaria et al., 2011)

4.2 Issues and challenge

4.2.1 Different thought

To ensure an effective curriculum, all those involved, lecturer, program developer and management must work together and unite. The problem faced by many HEI is disagreements between parties. This led to the failure of implementation of the good ideas. We are in the process of reviewing our curriculum and try to put forward the ideas of one year of internship instead of four months. The problem we are facing here. Sometime, those senior do not support the new ideas. Sorry to say, this department is having little tribes, who are untouchable. That’s a problem. When we proposed they cannot accept. Just need to listen to them. (Interviewee – 2). Opinions and ideological differences

arising on Entrepreneurial Education are among the issues and challenges stated in The Entrepreneurship Development Policy for Higher Education Institutions (HEIs). This matter must be addressed by all involved HEI so that it does not give a negative impression on the implementation of this program

4.2.2 Limited time

Way of learning Entrepreneurial Education is different from other education programs, it requires a lot of time doing practical tasks, participate in training and workshops related to entrepreneurship. Unfortunately, in most HEI, most of the students are busy, they involved in activities initiated by the HEI. They have no time to get involved in the entrepreneurial activities. “(Extra curriculum or activities) Being provided but some time if we want to conduct team building, there is no room, no room here means no time, there is so many activities in the UiTM, sometime we cannot put any slot in one semester. It’s very hard to arrange our own activities”. (Interviewee – 2)

4.3 Monitoring and evaluation

4.3.1 Centre of entrepreneur education and development

To ensure the success of EE, a special center should be established in each HEI. The role of this Centre is to mediate between HEI and industry, it is also necessary to evaluate the effectiveness in producing entrepreneur graduates entrepreneurs as expected by the government. The center needs to keep track of graduates and get the latest information about their involvement in the field of entrepreneurship. Besides that, the center is also responsible for providing information about the development of Entrepreneurial Education in the HEI to the Ministry of Higher Education as well as reporting on the effectiveness of EE activities to the Ministry. Unfortunately most of the center is not properly played a role. Ministry do ask about the number of entrepreneur graduates? That's why (Malaysian Academy of SME & Entrepreneur Development) MASMED under hot seat. If you want to ask, ask MASMED, as Retail Program, when the ministry ask, they have some figure. (Interviewee -1)

A radical yet practical approach is to separate entrepreneurship education initiatives from business schools by creating a unique entrepreneurship centre parked under a strategic division that oversees the entrepreneurship development activities at faculties, including Engineering, IT, Humanity, Arts and others (Hindle & Lansdowne, 2005)

4.3.2 Resource person

To evaluate the extent of the effectiveness of this Entrepreneur Education it should be handled by a center or department or unit. In some HEI, a representative of the center is responsible for the respect of the graduates. It is possible if the number of graduates produced is too many. “The effort actually being tried to do by the resource person, I think she does its own her own effort, she made a wide data base, because we are just new, she tried to gather students information, anyone who going into business, which got loose, who further study who did not. She basically did that She simply cannot do that when the increase in number of graduate. She created her own initiative, imagine she was also lecturer in MASMED handling training, I thing by now she could not cope. She did that time I was a coordinator. I remember she said, she created data base, address, contact. (Interviewee -1)

Because there is no special department or unit responsible for the alumni . Most lecturers have to make their own initiative. This is the evidence that shows the absence of a special evaluation conducted by HEI and in getting information about the graduates and no effort to determine whether the PEO is reached or not. “There is no actual person who handle this but through the informal conversation, we try to seek their (students) opinion than we know where they are, that's how we contact our students. For example , my students and I, we always contact , ask about their current position”(Interviewee – 2). Through studies conducted by a group of researchers , the failure of HEI not only in handling Alumni , in fact, there is lack of commitment from the staff that led to the ineffectiveness of the Entrepreneur Education implementation. Among the top challenge was lack of commitment among IHLs’ staff and students. This feedback came from five IHL participants who found that staff and students were not committed to the entrepreneurship programs. .(Yusoff et al., 2014).

4.3.3 The effort done by the HEI in getting a right entrepreneur students

To be an entrepreneur is not only necessary to have knowledge but require high interest and passion in this field. At the top of the list was a lack of soft skills among the students. Students following the entrepreneurship programs lacked communication skills, leadership skills, knowledge of marketing strategies, general business knowledge, and abilities in networking .(Yusoff et al., 2014). Thus in UiTM starting this semester, students who want to enter into this entrepreneur program has to go through an interview session to ensure that they are really interested. We just started recently. Before this, the student intake just like any other program that’s why we decided recently, we just implemented this

semester, we need to interview. Otherwise we get garbage. Just people who come in not interested and then they become not so interested. The first batch was quite bad because the students they don't know, they took this program because they have the opportunity to study. (Interview - 1)

5 Conclusions

Various issues and challenges are centered on an unstable curriculum between practical training and theory as well as internal problems between the academic staff with different opinions and thought as well as the absence of the role played by entrepreneurship center on the implementation of the program. There are also repeated topic in the curriculum especially on the business plan preparation which cause students feel pressured t. All of these issues and challenges need to be improved in order to ensure comprehensive impact on graduates

Enhancing Cooperative Learning in Learning Community: From the Perspective of Knowledge Management

Wu Fei

School of Foreign Languages, Wuhan University of Technology, Wuhan, P.R.China, 430070
(E-mail: woofay@163.com)

Abstract: From the perspective of knowledge management, this paper discusses the migration of knowledge management concept into the field of cooperative learning. By using concept of knowledge management, the process of the cooperative learning in a learning community is analyzed from the aspects of knowledge acquisition, knowledge application and innovation, and knowledge feedback. The author points out the factors that affect the cooperative learning, and puts forward and discusses the measures to enhance the cooperation in learning process among members of the learning community.

Key words: Cooperative learning; Knowledge management; Learning community; Knowledge flow

1 Introduction

Knowledge management emerged as a scientific discipline in the earlier 1990s (McInerney, Claire, 2002). Since Dr. Nonaka published “The Knowledge Creating Company” in 1991, the research of knowledge management has been gradually extended to the field of education from the business community. The milestone was “The Knowledge Creating School” (Hargreaves, 1999) which is considered to be the most direct and significant literature of knowledge management in education. In 2000, the Organization for Economic Cooperation and Development (OECD) collected important papers in the symposium *Knowledge Management in the Learning Society*. Since then, the research is becoming more in-depth and extensive, for example: “Knowledge Management and E-learning in Higher Education” (Darko Dukić, Gordana Dukić, Kay I. Penny, 2012), “Knowledge Management in Higher Education” (Marjan Laal, 2011), and “Constructing Networked Learning Community Based On the Education Knowledge Management Platform” (Yang Lina, 2012), etc. China began her research of knowledge management in education when “On ‘Knowledge Management’ in School” (Liu Yu, 1998) was published. After that, papers like “Multiple Perspective on Educational Technology Practice” (Liu Hehai, 2011), “Specifications of Knowledge Management Research Methods in the Domestic Library and Information Field” (Chu Jiewang, 2012) and “The Application of Knowledge Management in the Management of Higher Education” (Yan Kunwei, 2013), studying knowledge management in educational technology, library and information science, education management and other fields, has been emerging in China.

However, in the field of education nowadays, with the rapid development of the information technology, cooperation and communication appears to be vital in the process of learning. Traditional classroom teaching can no longer meet people’s needs. We still lack interaction and communication between teachers and learners. We advocate personalization education but overlook the influence of cooperation in education. Personal knowledge can be categorized mainly to tacit knowledge, including cognition like perception, vision, value etc., and those techniques and skills obtained from the experience of practice. The exchange and sharing of the personal knowledge helps the innovation and creation of knowledge, improve the competitiveness and the capacity for sustainable development. And this exchange and sharing is advancing at an unprecedented rate to all aspects of the society. That makes the interaction and collaboration between teachers and learners go beyond the boundaries of traditional learning and form a learning community, in which the interdependence and mutual cooperation in the learning process become more and more important.

As two independent research topics, knowledge management and cooperative learning have attracted much attention of scholars, but few studies have been carried out to explore the profound relationship between the two. This paper tries to use the concept of knowledge management to fully understand, collect, comprehend and utilize all kinds of information resources to form knowledge, which can promote cooperation between members in the learning community, enable learners to acquire knowledge and be flexible in the application of knowledge.

2 The Process of Cooperative Learning in Learning Community

A learning community is a group of people who share common academic goals and attitudes, who

meet semi-regularly to collaborate on class work. Such communities have become the template for a cohort-based, interdisciplinary approach to higher education (Goodyear, P., De Laat, M., and Lally, V,2006). It is an organic unity of the modern teaching methods, learning styles, and learning environment. A learning community focuses on the inspiration of social contexts to cognition and learning motivations. It lays stress on the common desire to learn together, emphasizes the sharing of information, insights, and visions among members, and encourage learners to form and render their knowledge via consultations with others or other cooperation activities.

Cooperation is the key component in a learning community. From the perspective of knowledge management, cooperative learning can be described as a process of knowledge to flow, to be obtained, applied, created and finally to get feedback, as an infinite loop in a learning community. With the loop running, knowledge stock, learning ability and the competitiveness of all members will all be improved in a virtuous circle. The following figure presents the process of the knowledge flow of the entire loop in a learning community:

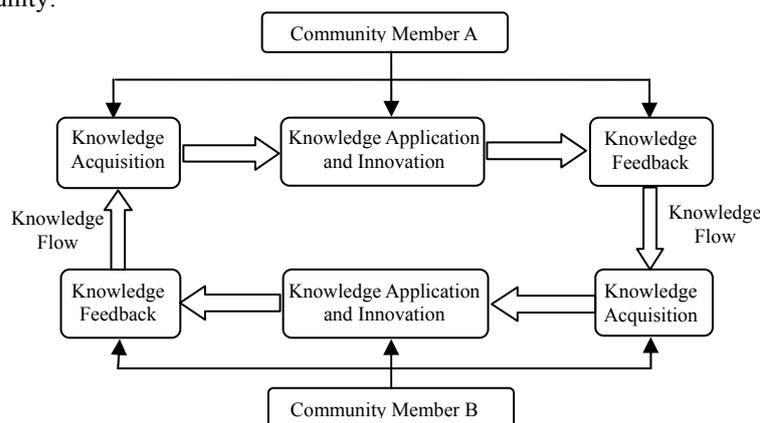

Figure 1 Knowledge Flow of the Cooperative Learning in Learning Community

2.1 Knowledge flow

Knowledge flow refers to the exchange of knowledge through the cooperation and communication among the learners with multidirectional transmission and delivery process in various ways, which includes the acquisition and the formation of knowledge, communication and exchange, transmission and reception. A healthy mechanism of knowledge flow favors the formation of the learning community and the smooth progress of knowledge management. It is a decisive factor for learners in the community to acquire knowledge, enhance their learning ability and competitiveness. It also helps to promote affective interactions thus builds mutual trust among members which enhances the effect of learning.

2.2 Knowledge acquisition

Knowledge acquisition involves complex cognitive processes: perception, communication, and reasoning etc. In a learning community, learners acquire knowledge from internal or external resources, and transmit it to the knowledge that they can use and apply into innovative activities. It includes different sub-activities: a) identify appropriate knowledge from internal or external resources by searching, storing and outputting, evaluating or screening; b) confirm the knowledge captured from internal or external sources by assimilating, collecting and accumulating those important, relevant and reliable knowledge; c) organize the knowledge by refining, localizing, interpreting, compiling or converting it into useful forms; d) store the knowledge in the learning community for exchange or internalize it and convert it into personal knowledge.

2.3 Knowledge application and innovation

Knowledge application is a process which involves the practical use of knowledge one retrieved from resources inside or outside the learning community in an appropriate way to explain new knowledge and the new problems for a particular purpose. It stresses a full coordination and cooperation among all members in the community, including the coordination of the knowledge stock, the absorption capacity, the knowledge processing and utilization ability, and also the ability to interact with social and culture environment timely and appropriately.

Knowledge innovation refers to activities of discovering, acquiring or utilizing prior knowledge to solve problems, or reorganizing the existing knowledge to produce new one. Included in these activities are: proving the effectiveness of innovative knowledge by invoking and applying the existing

knowledge; constructing new knowledge, transferring it and obtaining real time feedback on the basis of the comparison, synthesis and analysis of prior knowledge; and etc.

2.4 Knowledge feedback

Feedback occurs when outputs of a system are routed back as inputs as part of a chain of cause-and-effect that forms a circuit or loop (Andrew Ford,2010). In this process, new knowledge generated in the innovation process goes back as a flow of knowledge to the entire learning community for other members to learn or use. Other members make comprehensive evaluation of the new knowledge during the practice of utilization and send the assessment of the feedback to the new knowledge innovator, who makes modification and adjustment of the new knowledge so as to provide it with the completeness and accuracy. Thus, through formal and informal contacts, knowledge is stored in the intellectual resources of the learning community. After the analysis, evaluation, screening and absorption of new knowledge, positive or negative feedback are obtained to improve the entire loop.

3 Benefits of Knowledge Management in Cooperative Learning

3.1 To knowledge itself

The concept of knowledge management promotes the rapid flow of knowledge and helps to make the tacit knowledge explicit. In cooperative learning, the utilization of new technology expands the horizons of the vision of learners. It offers convenience for the rapid flow of knowledge in the learning community, and also provides a practical basis for the cooperative learning. Knowledge management is a means to combine individual and group, circulate personal knowledge, and contribute to the explication of tacit knowledge. It also helps to integrate the internal and external knowledge or internalize the external knowledge, emphasizing the innovation of knowledge, the sharing and explication of tacit knowledge.

3.2 To learners

Using knowledge management skills in cooperative learning helps learners to grasp the key points of knowledge, gain insights into the nature of the problem, and improve their interaction skills. The quick speed of knowledge flow brings much more information, new views, vision and cognition to learners. Thus they have more opportunities to provide their understanding and views of the problem and discover more profound knowledge. With the unceasing deepening cooperative learning, learners will sink their teeth into a problem and try their high-leveled reasoning and the critical thinking to solve the problem. As a result, they will be more creative, imaginative, and are more likely to try even more diversified strategy and original approaches to deal with the problem.

3.2 To cooperation

Knowledge management serves to promote learners' achievement motivation, improve interpersonal relationship, and strengthen their psychological self-adjustment. Learners share their views, ideas, perceptions and problem-solving methods in knowledge flow among the learning community, where knowledge management helps to provide more information and knowledge to share and reduce prejudices against others. So, less misunderstanding arises while apprehending other people's perspectives and positions. This enables learners to express their views in a more accurate way, to pay more attention to other people's opinion, and it also leads to a better use of knowledge provided by others. All these help to meet the needs of cooperative learning.

4 Influencing Factors in Cooperative Learning

4.1 Incentive mechanisms and the level of trust

Incentive mechanism has a direct influence on cooperative learning and learners' motivation. It plays an important role in the recognition of individuals' tasks in a learning community, which as a spiritual force, is one of the main factors maintaining the cooperation in the community.

Mutual trust is the basis of effective cooperation which promotes mutual understanding and inspires learner's confidence to further efforts. Tacit knowledge in a learning community can only be learned through communication and cooperation among members where mutual trust is needed. It also benefits learners to make close contacts with each other and reduces conflict between them, and thereby facilitates the transfer and the formation of effective incentive mechanism of learning tacit knowledge.

4.2 The ability to accept and disseminate knowledge

Individuals as recipients of knowledge, have to study with a purpose to acquire knowledge, and learned to blend with the existing knowledge with the acquired to create new knowledge. Only after the recipient truly understand and master what they have learned can it be fully converted into their own

knowledge so as to make the knowledge flow and cooperation circulate smoothly. But for individual members, the time and energy needed in understanding the identical kind of knowledge are not the same. Similarly, individuals as disseminators, diversify in the capacity to transfer knowledge. The differences in transmission capacity affect the speed of knowledge transfer and knowledge diffusion, thereby affecting the effective use of knowledge. Besides, the personalities of community members will also affect the transfer and acceptance of knowledge.

4.3 Knowledge stock of members in the learning community

Each member in the long-term learning process has accumulated a wide range of skills and experience, and each of them can master and control their own knowledge. Knowledge transfer depends on a certain basis of technology or knowledge as a prerequisite. So, when the gap between existing knowledge stock and the expected transfer of knowledge is too large, or when learners expect too much for certain knowledge, the transfer will not occur, therefore affects the smooth-going of the knowledge flow. Thus, although knowledge stock is not an essential element of the learning capability of a learning community, the level of knowledge stock has a significant impact on the level of knowledge transfer which further affects the occurrence and process of the cooperative learning.

4.4 Complementarities between types of knowledge to learn and knowledge structure of learners

Knowledge can be divided into explicit knowledge and tacit knowledge. Explicit knowledge can be encoded, expressed and disseminated through a formal language. It can be learned quickly by using certain text materials. However, tacit knowledge is established on the basis of the experience from the organizations or individuals and involves many intangible factors of knowledge which is unlikely to be formularized and formulated. It is a process of knowledge accumulation, and difficult to transfer between learners. Compared with explicit knowledge, tacit knowledge can not be easily transferred, and it is this existence that constricts the smooth progress of cooperative learning. Therefore, with complementary knowledge structure, members can better their cooperation and learning so as to promote each other's progress. This may also bring unexpected skills and knowledge for the learning community. So, the greater the complementarities we have between the members of the learning community, the more frequently the cross integration and innovation of knowledge will occur and the faster the diffusion of knowledge will be.

5 Measures to Enhance Cooperative Learning

5.1 Taking the improvement of learning ability as the purpose of study

Learning ability is the ability of the learners to acquire and absorb the knowledge of the community members. It has certain dependence, and has a great relationship with the learner's knowledge accumulation, knowledge structure and the quality of learners themselves. To get knowledge from the community and make progress, learners must have strong learning desire and clear learning objectives, and take advantage of every opportunity to acquire knowledge and integrate it with their existing knowledge. Due to the different learning effect of different learners, members must take acquiring knowledge as their purpose of cooperation. Thus, they should regard the learning community as a way to enhance their ability rather than an alternative resource to discover knowledge.

5.2 Establishing knowledge protection mechanism

Strengthen the reasonable protection of the member's knowledge against plagiarism and cheating. Constrain their inappropriate behavior, so that learners understand their rights and obligations. Coordinate their cooperative learning by using appropriate methods to complement advantages of each member and realize knowledge sharing in the community, thus to promote learner's all-round development. Only under the premise of full respect and effective protection can the members make full use of the knowledge resources and develop their ability to integrate the knowledge of the community effectively. This premise serves to help learners, according to their own needs for different types of knowledge, to use tacit knowledge resources closely related to themselves to achieve knowledge recombination and acquisition.

5.3 Building a platform in favor of cooperative learning

Use modern information technology to establish a comprehensive information system, such as database, file management system, and information management system to connect knowledge resources of each individual through the network. The network can be used to help learners distinguish and determine general and professional knowledge they need to learn, and keep track of the knowledge disseminators and recipients in order to facilitate the interaction and cooperation among the members. Develop a variety of knowledge sharing methods, such as the activities of face-to-face exchange of

experience so as to promote cooperative learning in the learning community.

5.4 Developing corporate culture and establishing an open and flexible culture environment

Develop corporate culture and provide cultural support for the flow of knowledge among members. Due to the differences of culture, knowledge stock, skills and experience among the members, obstacles occur in the learning process of communication, interaction, and cooperation. The effective measure to solve the problem is to cultivate corporate culture to strengthen the corresponding cognition of learning. Meanwhile, an open and flexible culture environment enables learners to communicate with the outside world, which is conducive to spur learners on to continue the adjustment of their learning of culture and values and promote the knowledge flow and transfer. Correct values and a good learning environment can become the motivation for learning, which contributes to knowledge production, flow, application and innovation.

5.5 Establishing mutual trust and mutual learning mechanism

With the increasing of the learner's knowledge stock, the environment that learners get along with becomes more and more complex and changeable. In such a competitive and cooperative learning environment of the learning community, members must achieve the best balance between competition and cooperation, which requires their mutual trust and cooperation to establish an equal partnership in the cooperative learning. Cooperation helps to the rapid movement of knowledge flow and mutual trust plays a coordinating role to reduce the instability of cooperative learning, and lay the foundation for the stable development of learning community.

5.6 Developing a sense and ability of introspection

Introspection is also a means of self-evaluation. It can promote learners to test their knowledge and promote the innovation of learners' knowledge, which is conducive to the smooth progress of knowledge management. Learners' introspection is one of the key factors to success in learning. It guides learners to timely summation of the attitude, effect and result of their learning. When learners have the awareness and ability of introspection, the cooperative learning is easy to carry out.

6 Conclusions

Knowledge can be used only when it is acquired, and the thoughts and creativity of the people comes not only from the individual efforts, but also requires practice, inspiration and cooperation from a community. The essence is in fact a process of mutual learning in a learning community. The circulating flow of knowledge in the community provides the convenience for the learners to cooperate with each other. However, the generation, formation and flow of knowledge are not out of nothing, but the result of interaction of various factors. Through the application of knowledge management concept in cooperative learning, analyzing its influence and the characteristics of knowledge transfer, learners can improve the management of themselves and their ability of learning.

Abstract: The process of higher vocational colleges' industry-education-research cooperation is dynamic and complex. In the process, there are multiple subjects. The key to the success or failure of their cooperation have a harmonious relationship with the cooperative subjects. Based on the triple helix model, this paper first identifies the cooperative subjects in higher vocational colleges' industry-education-research cooperation. Then constructs evolutionary game model on cooperative subjects, analyzes their game behaviors with bounded rationality in dynamic point of view, discusses their cooperative relationship, and researches their cooperation factors. Finally, some suggestions on their optimal cooperation are put forward.

Key words: Triple helix; Higher vocational colleges; Industry-education-research; Cooperation; Evolutionary game

1 Introduction

Higher vocational education is an important type of China's higher education, which plays a significant role in the development of the national economy in China. Higher vocational education cultivates high-quality technical skilled labor force, meets the demand of enterprise personnel, and promotes the development of technology innovation for small and medium-sized enterprise. In 2014, Opinions of the State Council on Decision on Speeding up the Development of Modern Vocational Education, pointed out those higher vocational colleges should strength the cooperation of industry, education, and research institutes, train the technology skill talented persons who service for developing area, especially technology research and development and product upgrading in small and medium-sized micro enterprise (State Council ,2014). In 2015, the Ministry of Education of the People's Republic of China issued the Action Plan of Higher Vocational Education Innovation and Development (2015-2018), indicated that it should deep the cooperation between colleges and enterprises, promote their cooperation in the field of cooperative running schools, cultivating person, and development (Chang-wen W, Cheng Z ,2015). Obviously, it is a very significant issue to set up industry-education-research cooperative mechanism effectively. However, the cooperative process of industry-education-research in higher vocational colleges is dynamic and complex. For example, the cooperative subjects have different resources, the cooperative information are asymmetric, and different cooperative subjects pursuer different profit. These barriers deterred the industry-education-research cooperation in higher vocational colleges. The triple helix model of colleges-industry -government describes the cooperative subjects' adjacent and collaboration, which can be used to analyze the subjects' cooperative behavior, and clarify the relationship among them (Etzkowitz H,2000). Furthermore, Evolutionary game theory differs from classical game theory by focusing more on the dynamics of strategy change as influenced not solely by the quality of the various competing strategies, but by the effect of the frequency with which those various competing strategies are found in the population (Smith J,1982). It is widely used to discuss on social habits and economic activity. As a result, this paper applies the evolutionary game theory, analyses on cooperative subjects' game behaviors with bounded rationality, discusses their cooperative relationship of industry-education-research cooperation in higher vocational education, and provides a theoretical support for their cooperative optimization.

The paper is organized as follows. Section 2 identifies the cooperative subjects by means of the triple helix model, introduces the evolutionary game theory, and creates the evolutionary game model of cooperative subjects. In Section 3 attention is turned to analyses the evolutionary game model of cooperative subjects, explaining influential factors of their cooperative. Section 4 takes cooperation with a higher vocational college and an enterprise as an example to discuss the effect factors on the college

¹Qiu Yinggui is the corresponding author(e-mail:qiuyinggui@126.com)

and enterprise. Section 5 puts forward some their cooperative optimization suggestions.

2 Applicability of Triple Helix Theory Model

2.1 Identifying cooperative subjects based on the triple helix theory

Since the 1980s, the theoretical analysis research on emerges in endlessly. Especially, Etzkowitz and Leydesdorff's Triple helix-concept of relations provides a neo-evolutionary model of the process of university-industry-government cooperation. The Triple helix is a spiral model of innovation. The core of the theory is to regard the government, enterprise and university as three basic elements of the national innovation system and economic development. The three basic elements have the obvious characteristics of interaction and self-converse. Their interaction is that government, enterprise and university exchange to produce knowledge. Otherwise, their self-converse is that government, enterprise and university have their own system to be capable of operating independently.

Cooperative subjects of industry-education-research cooperation in higher vocational colleges are the organizations and persons who participant in the cooperation, including government, enterprises, higher vocational colleges, and students. Based on the Triple helix's theory, the main subjects of industry-education-research cooperation in higher vocational colleges are government, enterprises and colleges. The government aims to promote the performance of system under the jurisdiction. The enterprise is a basic economic unit of regional development, who direct participants to regional economic competition and cooperation. As the most active subject, the enterprise drives the development of technology and economic. Meanwhile, employee training and introducing technological talents in enterprises depend on students in higher vocational colleges. It is the duty that higher vocational colleges cultivate high-quality talents. Therefore, higher vocational colleges must establish cooperative relationship with enterprises to teach practical training, and transform theory to practice.

2.2 Evolutionary game theory

Evolutionary game theory is a new theory that it combines game theory with dynamic evolution process. Different from traditional game theory, it does not limit participants to be perfect rationality and have perfect information. Originated as an application of the mathematical theory of games to biological contexts, it is arising from the realization that frequency dependent fitness introduces a strategic aspect to evolution. Evolutionary stable strategy (ESS) and optimal reaction dynamics are its core contents. In the process of repeated game, limited information individuals are regulated their games continually for maximize profit. They use more satisfactory thing instead of less satisfied situation continually, as a result, reached equilibrium. Recently, it has been used in the field of economy, sociology, and anthropology researches widely.

2.3 Evolutionary game model on cooperative subjects

Based on industry-education-research cooperation in higher vocational colleges, the paper discusses the cooperation between enterprises and higher vocational colleges with the government subsidies. It analyzes cooperation between an enterprise and a higher vocational college in detail. The evolutionary game has two sides. Side A is the muster of the enterprises in participant system. Side B is the muster of the higher vocational colleges in participant system. Both sides accorded with the following basic assumption:

1) Generally, in order to develop the regional economy, the local government designs the support police f . The index of the government offering to industries is θ , while the index of the government offering to higher vocational colleges is $1-\theta$. Here, $0 < \theta < 1$.

2) When there exists no cooperation, $\Delta\pi_1$ and $\Delta\pi_2$ is the profit of enterprise and higher vocational college respectively. $\Delta\pi$ is the excess profit of enterprise and higher vocational college. The index of industrial excess profit is m , while the index of higher vocational college excess profit is $1-m$. Here, $0 < m < 1$.

3) The total cost of the industry-education-research cooperation in higher vocational colleges is c . The index of industrial cooperation cost is r , while the index of higher vocational college cooperation cost is $1-r$. Here, $0 < r < 1$.

4) The strategy space of the industry and higher vocational college is $S = \{s_1, s_2\}$. Here, s_1 is an actively participation in the cooperation; s_2 is a passive participation in the cooperation.

According to the above assumptions, the combination of higher vocational dynamic system formation on static game model's effect matrix as is shown in Table 1.

Table 1 Effect Matrix of University-Industry Cooperative Innovation

		Higher vocational college	
		s ₁	s ₂
Industry	s ₁	$m\Delta\pi + \theta f - rc, (1-m)\Delta\pi + (1-\theta)f - (1-r)c$	$\Delta\pi_1 + \theta f - rc, 0$
	s ₂	$0, \Delta\pi_2 + (1-\theta)f - (1-r)c$	$0, 0$

A side replicated dynamic equation is:

$$E(x) = x(1-x)\{y(m\Delta\pi - \Delta\pi_1) + \Delta\pi_1 + \theta f - rc\} \tag{1}$$

B side replicated dynamic equation is:

$$R(y) = y(1-y)\{x[(1-m)\Delta\pi - \Delta\pi_2] + \Delta\pi_2 + (1-\theta)f - (1-r)c\} \tag{2}$$

3 Analysis on Evolutionary Stable Strategy of Cooperative Subjects

3.1 Evolutionary stable strategy analysis

According to Friedmam, equilibrium points of the group dynamic that described by differential equation system can calculate by the local stability analysis of Jacobian det (Friedman D,1991). Based on Eq. (1) and (2), the Jacobian matrix is calculated.

On the basis of the local stability analysis of Jacobian det, suppose $p = \frac{rc - \Delta\pi_1 - \theta f}{m\Delta\pi - \Delta\pi_1}$,

$q = \frac{(1-r)c - \Delta\pi_2 - (1-\theta)f}{(1-m)\Delta\pi - \Delta\pi_2}$, the equilibrium points can be calculated. The two-sides game has four

local equilibrium points and a saddle point. They are E₁(0,0), E₂(1,0), E₃(0,1), E₄(1,1), and O (q,p), respectively. The evolution system track is shown in Figure 1.

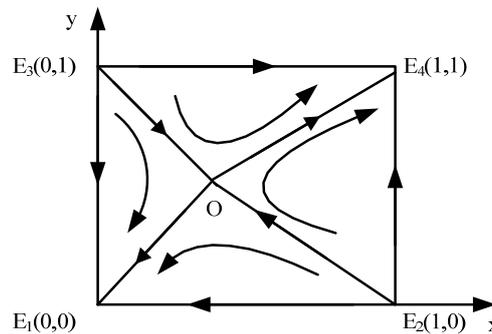

Figure 1 Evolution System Track

3.2 Analyses on evolution stability factors

1) The government affording support f, which can be financial subsidies or is preferential policy, will promote cooperative subjects to cooperate more actively.

Since $\frac{\partial S_{E_2E_1E_3O}}{\partial f} < 0$, $S_{E_2E_1E_3O}$ is the monotonic decreasing function off. From the Figure 1, if the

value of f increases, the area of $S_{E_2E_1E_3O}$ decreases. Thus, the two sides trend to choose the cooperation.

2) Cooperative risk is an important factor to block industry-education-research cooperation in higher vocational colleges. Enterprises tend to cooperate with higher vocational colleges in mature industries, while higher vocational colleges can give full play to offer human resources and intellectual support.

Since $\frac{\partial S_{E_2E_1E_3O}}{\partial c} > 0$, $S_{E_2E_1E_3O}$ is the monotonic increasing function of c. With the cooperative cost increasing, the cooperative risks of two sides increase. Meanwhile, the cooperative system is convergent to E₁(0,0) as well as the area of $S_{E_2E_1E_3O}$ increases. Thus, the probability of cooperation decreases. On

the other hand, since $\frac{\partial S_{E_2E_1E_3O}}{\partial \Delta\pi_1} < 0$, $S_{E_2E_1E_3O}$ is the monotonic decreasing function of $\Delta\pi_1$. Given mature industries, enterprises have gained higher profit $\Delta\pi_1$. Then, the area of $S_{E_2E_1E_3O}$ decreases, the cooperative system is convergent to $E_4(1,1)$, and the enterprise trend to build a cooperative relationship with the higher vocational college. Similarly, since $\frac{\partial S_{E_2E_1E_3O}}{\partial \Delta\pi_2} < 0$, the higher vocational college want to participant cooperation if it has more superior resources in the field.

3) With the increasing of excess profit, industry-education-research cooperation in higher vocational colleges is closer than before. The cooperation of industry-education-research has always existed. Simultaneously, when all factors are fixed, there is an optimal excess profit allocation proportion to support the cooperative system.

Since $\frac{\partial S_{E_2E_1E_3O}}{\partial \Delta\pi} < 0$, $S_{E_2E_1E_3O}$ is the monotonic decreasing function of $\Delta\pi$. Given mature industrial development, enterprises have gained higher profit $\Delta\pi_1$. If the excess profit increases, the area of $S_{E_2E_1E_3O}$ will increase, and they will trend to choose the cooperation. Furthermore, since $S_{E_2E_1E_3O}$ has a minimum, the prolixity of O point moving toward $E_4(1,1)$ reach the maximum, and the cooperative prolixity is maximum.

4 Case Study

To study the evolutionary game in detail, we take a college-enterprise cooperation as an example to discuss the effect factors, such as government support policy, cost and income distribution mechanism, on the college and enterprise.

1) We assume that the government’s support policy f values range from \$0 to \$500,000 dollars; θ is 0.6; $\Delta\pi_1$ is \$500,000 dollars; $\Delta\pi_2$ is \$100,000 dollars; $\Delta\pi$ is \$5,000,000 dollars; c is \$3,000,000 dollars; m is 0.8; and r is 0.7. The effect of government’s support policy on the cooperation is shown in Figure 2. The cooperative possibility of the college and enterprise increases more with the government’s support enhances stronger.

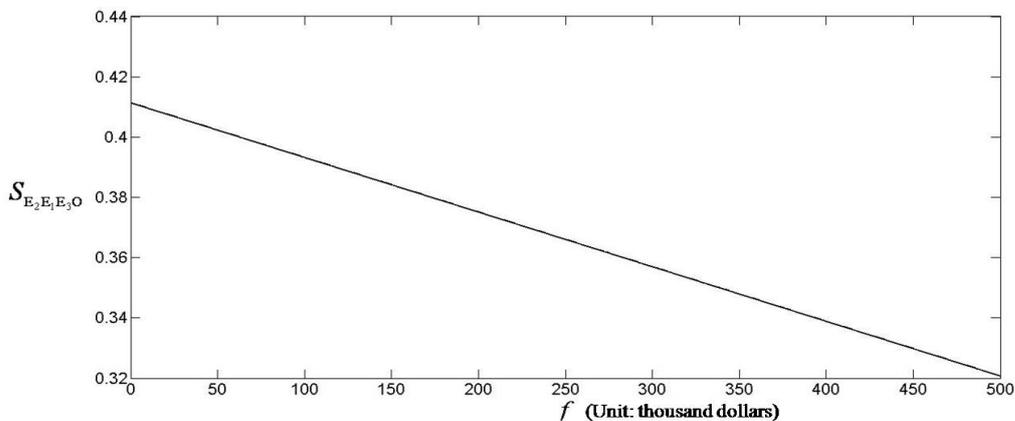

Figure 2 Effect of Government Support Policy on the Cooperation Between College and Enterprise

2) We assume that the research total cost c values range from \$1,000,000 to \$5,000,000 dollars; f is \$200,000; θ is 0.6; $\Delta\pi_1$ is \$500,000 dollars; $\Delta\pi_2$ is \$100,000 dollars; $\Delta\pi$ is \$5,000,000 dollars; m is 0.8; and r is 0.7. The effect of research cost on industry-education-research cooperation is shown in Figure 3. The cooperative possibility decreases with the research cost increase.

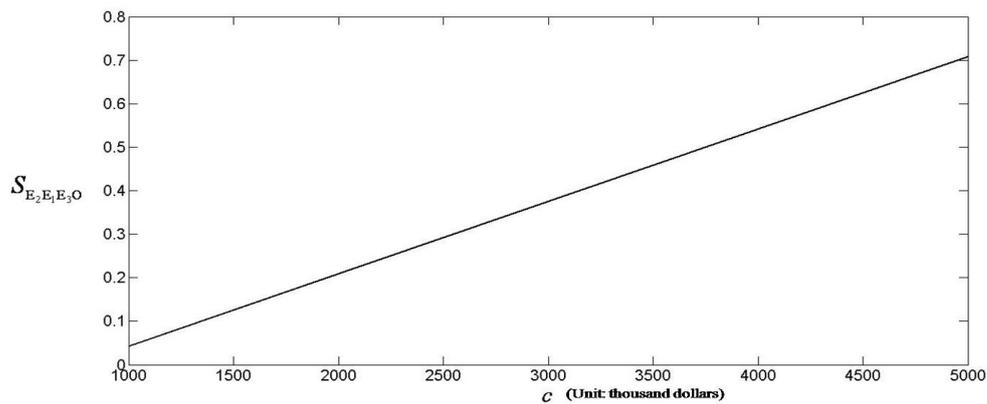

Figure 3 Effect of Research Total Cost on the Cooperation Between College and Enterprise

3) We assume that the index of industrial excess profit m values range from 0.1 to 0.9; f is \$200,000; θ_{is} 0.6; $\Delta\pi_1$ is \$500,000dollars; $\Delta\pi_2$ is \$100,000 dollars; $\Delta\pi$ is \$5,000,000 dollars; m is 0.8; and r is 0.3, 0.5, and 0.7 respectively. The effect of research cost on the cooperation is shown in Figure 3. Rational profit distribution mechanism helps the cooperation between college and enterprise.

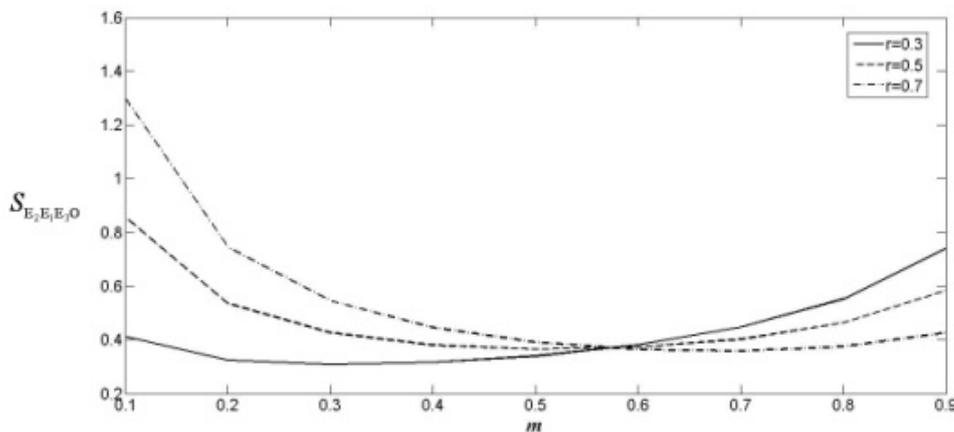

Figure 4 Effect of Profit Distribution on the Cooperation Between College and Enterprise

5 Conclusions

This paper takes evolutionary game theory to analyze the industry-education-research cooperation in higher vocational colleges. In order to promote the cooperation among the subjects, it can take the following measures. Firstly, develop market system construction that completing intellectual property protection system, setting up profit allocation and risk sharing mechanism, which can maintain the cooperative relationship stability. Secondly, create effective supervision mechanism in industry-education-research cooperation. And governments, bank credit departments and mass should supervise the participants' behaviors. Finally, construct rational profit distribution mechanism between enterprises and higher vocational colleges. If we can do these better, we will make progress in industry-education-research cooperation.

A Study of Opportunities in the College Students Affairs from the Perspective of Industry-University-Research Collaborative Innovation

Zhang Qin

School of Civil Engineering and Architecture, Wuhan University of Technology, Wuhan, P.R. China, 430070

(E-mail: 19524269@qq.com)

Abstract: In the new period, college students affairs are faced with both opportunities and challenges. And promoting cooperative innovation has become a major measure to improve the quality of China higher education comprehensively in a new historical period. The research method literature review is adopted in this paper, and the status quo on industry-university-research collaborative innovation is introduced first in this paper. It is acclaimed by the author that industry-university-research collaborative innovation has its impact on college students affairs and promotes the development of the idea, pattern and team construction of college students affairs. At the same time, opportunities and challenges in college students affairs are reviewed and evaluated in this thesis, electing a new pattern of college students affairs from the perspective of collaborative innovation.

Key words: Collaborative innovation; College students affairs; Pattern transformation

1 Introduction

Colleges are shouldering the responsibility of cultivating qualified socialist constructors and reliable successors. And college students affairs is an important component of the educational work in colleges, which should advance with the times with pioneering spirit. Collaborative innovation embodies the integration of technology and economy, and the essence of knowledge economy. Collaborative innovation indicates a new thinking in the improvement of a nation's technical innovation capacity and is an inevitable development tendency of science-technology innovation. As an essential part of scientific research system, colleges are facing a major strategic opportunity to promote collaborative innovation. Meanwhile, innovative thinking should be made in college students affairs.

Since concept of collaborative innovation was put forward, it is embraced with enthusiastic response. And, the promotion of collaborative innovation and industry-university-research collaborative innovation has gradually become the focus of attention in the education circle.

In terms of the innovative significance of industry-university-research, Zhang Li claims (2011) that promoting collaborative innovation, especially facilitating strategic alliance, is both a top design of national strategy and a multi-lateral systematic engineering. A deep integration of resources in industry, university, research and other social aspects is demanded in collaborative innovation. At the same time, a balance between guiding exterior needs and stimulating endogenous power should be achieved, constantly constructing beneficial policy environment and social atmosphere in favor of the sound development of collaborative innovation. Xi Li and Yang Chenlu (2012) make a horizontal comparison the organization patterns of three types of industry-university-research collaborative innovation, that is, enterprise-dominate type, college-dominate type and research institution-dominate type. And, the operation mechanism of enterprise-dominate industry-university-research collaborative innovation has been deeply analyzed by them. All these provide a reference for enterprise-dominate industry-university-research collaborative innovation in various aspects and could further advance the development of enterprise-dominate industry-university-research collaborative innovation.

In terms of industry-university-research collaborative innovation implemented in colleges, Shen Lijian, et al (2013) claim that mechanism of industry-university-research collaborative innovation should be improved from the fields of deepening industry-university-research collaboration, constructing an information platform for achievement in scientific research and strengthening a reasonable overall planning. And his claim has been made on the basis of an analysis of difficulties and challenges faced by industry-university-research collaboration in colleges. Zhou Huali, et al (2010) discuss the industry-university-research collaborative pattern of a type whole-course enterprise involvement, a type of virtual enterprise in college, a type of school-government cooperation and a type of industry strategic cooperation in Beijing Union University. Liu Yuanguo (2010) thinks that educational

thought should be further transformed to deepen education and teaching reform. And a scientific objective of talents training should be determined, the practice training of college students should be strengthened and the structure of major should be adjusted timely. Close connection should be built between the local government, social enterprises and colleges, in order to effectively facilitate mutual development of local colleges and local economic construction. Zhang Shuichao (2014) makes a design of a system prototype of the collaborative innovation in local colleges based on the mechanism of target pattern and pater and target environment. Further, the spiral tactic strategic theory is applied to analyze possible routes for improve the collaborative innovation capacity of local colleges.

British scholars Geuna and Nesta (2006) publishes an academic paper *University patenting and its effects on academic research: The emerging European evidence*, and say that financial support from enterprises could be gained to advance the applicability of research achievements through collaborative innovation between colleges and enterprise. They claim that more academic achievement could be accomplished when new research areas are found out and explored

German scholars Senano and Fischer (2007) propose an idea that synergy effect means cooperative behaviors of all sub-systems will generate a more powerful effect than that of individual sub-system in a big complex system, thus a unified and collaborative effect of a whole system takes shape and exerts exterior positive effect. This idea is included in their *Collaborative innovation in ubiquitous systems*.

British scholars P.D'Este and P.Patel (2007) find in their research that formal cooperative forms, like associated research and development, research and development outsourcing, technology license and joint venture company, are main forms of cooperative innovation. They claim that informal forms of connections (such as personal exchanges, achievements sharing, information communication and seminars) will be attached importance gradually.

A British scholar Etzkoeita (2008) puts forward a trebling spiral model theory, which proposed that inter-coordination should be made between colleges, enterprises and the government to push together the production, transformation, application, industrialization and upgrading of knowledge in a context of knowledge and economy. Etzkoeita says that all the three sides should play their roles well while the integration and multiple overall interaction of complementary resources are strengthened, and all these are the essential conditions for the construction of national innovation system

2 Influence of Industry-University-Research Collaborative Innovation on College Students Affairs

2.1 Idea innovation in college students affairs promoted by industry-university-research collaborative innovation

To innovate working ideas and facilitate sustainable development of young college students is the common target of higher education at home and abroad and the new idea and new method in college students affairs at the background of industry-university-research collaborative innovation. In a new era highlighting collaborative innovation, capacities of knowledge innovation and technology innovation in college students should fostered in college students affairs. Besides, college students should be guided to establish the ideology of lifelong learning, master the method of acquiring new knowledge and explore students' potential in participating and adapting to reforms(John H·Schub, 2011). This idea establishes the dominant role of students and appeals to respect for the subjectivity of students. Students are guided to pay attention to their personality development and build their conduct pattern. Focusing on students' study and development and centering on the thirst for knowledge, creative thinking and practical abilities of students, this idea calls that every student should be guided to make his or her career planing and development program.

2.2 Team construction in college students affairs advanced by industry-university-research collaborative innovation

A sophisticated, scientific and powerful team is an indivisible part of idea upgrading, mechanism reformation and objective innovation of college students affairs. A team with collaborative innovation capacity for college students affairs is more needed in the development of industry-university-research collaborative innovation. Bearing the idea of industry-university-research collaborative innovation in mind, colleges are turning to reform their team construction and provide more intelligent support for the collaborative innovation (Hurtabo, 2003).

2.3 Pattern transformation in college students affairs facilitated by industry- university -research collaborative innovation

An excellent team has its scientific pattern to help make a function. For a long time, colleges are

exploring to improve and transform current patterns in students affairs. It is known that the strategy of industry-university-research collaborative innovation advocates guidance in innovating mechanisms in higher education and policy programs. A deep cooperation between colleges, scientific research institutions and enterprises is encouraged to be finished and strategic alliance in collaborative innovation is guided to be established. Then, resources sharing could be facilitated while major projects are united together to tackle key problems. Finally, substantial achievement will be gained in key fields.

3 Demands of Industry-University-Research Collaborative Innovation on College Students Affairs

Industry-university-research collaborative innovation is a major strategic choice which can promote the combination of education and technology, economy and culture. A better development of national higher education when the percentage of national science and technology innovation in a country renews and economic, social and cultural development requires a new environment.

3.1 Idea upgrading in college students affairs demanded by industry-university-research collaborative innovation

The higher education in China has transformed from the model of elitism to the model of popularization. At the present stage, especially when industry-university-research collaborative innovation strategy has been raised, new requirements have been put forward on talents cultivation by the communist party of China and Chinese government. Colleges should advance with the times, seize the opportunity of development, and propel high-quality talents cultivation program. A higher-level research strength should be given full play in innovation-oriented national construction. All these press for idea upgrading in college students affairs (Rita Colwell,2003). College students affairs should completely transform from the past pattern of experience affairs to the current pattern of academic research, from empiricism to collaborative innovation. Guided by multi-disciplinary theory, college students affairs should aim at technology innovation. Trivial matters in college students affairs should be scientifically integrated, and routine work in college students affairs should be systematically regulated (Gertner,2011)

3.2 Mechanism innovation in college students affairs demanded by industry-university-research collaborative innovation

To achieve the value pursuit in college students affairs powerfully guarantees a mechanism of collaborative innovation. The mechanism of college students affairs is cultivation-oriented, which focuses on establishing an all-member training pattern that covers the whole school and is based on the basic level. As a result, a multi-sector, multi-directional, multi-layer and multi-context collaboration is formed to creatively unite effective operation in the middle level, lay a solid foundation in college departments and spare no efforts to break through problems in the overall development of students (Bruneel J, et al,2010). Measures should be taken initially to effectively improve students affairs organizations, then open the channel for industry-university-research collaborative innovation. Innovation should be made in adjusting the working model in college students affairs, providing support for industry-university-research collaborative innovation. Emphasis should be placed on consolidating the basis of students affairs, thus laying foundation for industry-university-research collaborative innovation.

3.3 Objectives innovation in college students affairs demanded by industry-university-research collaborative innovation

The essence of today education is to cultivate inter-disciplinary talents well developed in an all-around way, who are excellent in comprehensive qualities, character and learning, innovation spirit and high emotional quotient, with both political integrity and professional competence. Currently, higher education puts more emphasis on intelligent education than moral education, theories than practices. Then, it is hard to achieve the goal of fostering an overall development of talents and cultivating inter-disciplinary talents (Bruneel J, et al,2010). As a result, college students affairs should be guided by the idea of industry-university-research collaborative innovation, and objectives in students affairs should be innovated. At the same time, the cultivation of students' collaborative capacities should be given attention to facilitate collaborative development of college students, who are guided to consciously coordinate the unity of individual dreams and social development, harmony between emotion and rationality, study and work. College students also should be guided to finish their career planning actively and rationally, improve their collaborative innovation capacities. Conforming to development demands of industry-university-research collaborative innovation strategy, the goal of

cultivating sophisticated inter-disciplinary talents will be achieved.

4 Route Transformation in College Students Affairs Based on Industry-University-Research Collaborative Innovation

4.1 Establishment of students-oriented working idea

Students-oriented idea is the fundamental starting point and final destination of college students affairs, and the value pursuit in students affairs. In the context of industry-university-research collaborative innovation, the working idea should be transformed promptly to guide students timely.

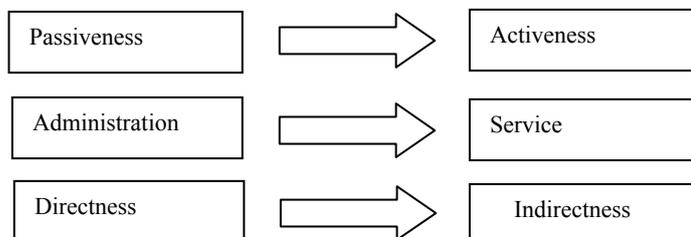

Figure 1 Influence of Industry-University-Research Collaborative Innovation on the Working Idea of College Students Affairs

Passiveness should be transformed into activeness. Measures should be taken to guide students to explore innovation programs. As one of the main subjects in industry-university-research collaborative innovation, college students should actively devote themselves into science and research activities. The working ideas of whole-journey nanny service and parenting style should be avoided in college students affairs. Students should be guided to think dependently and take initiative to explore science and research projects they are interested and actively participate in collaborative innovation.

Administration should be transformed into service. Measures should be taken to help college students to establish a scientific research platform. College students affairs plays an role of bridge connecting all subjects in industry-university-research collaborative innovation strategy, not a single subject role. College students affairs should be transformed from the model of administration to the model of service. And, the transformation will be reflected in new tasks of actively setting up a communication platform and a collaborative platform between students and professional teachers, students and scientific research institutions in industry-university-research collaborative innovation.

Directness should be transformed into indirectness to promote the establishment of collaborative channel in students. Industry-university-research collaborative innovation should aim at not only collaborative innovation between colleges and scientific research institutions, colleges and enterprise, but also collaborative innovation between internal organizations in colleges, different disciplines and enterprises, and students and their supervisors. College students affairs should be improve to encourage communication among students with different major backgrounds, collaboration between students with different discipline background and communication between college students and their supervisors. The, a channel for collaborative innovation in colleges will be opened, facilitating the progress of industry-university-research collaborative innovation strategy (Zheng Quehui,2008).

4.2 Refinement in the construction of students affairs management team

The direction of professionalism of college students affairs team is the premise of team construction. Professionalism of college students affairs team indicates the direct requirement of refinements in functions and distributions of labor in colleges. Professionalism of college students affairs team represents a historical choice of professional belonging and value in the process of developing the colleges students affairs team. Moreover, professionalism of college students affairs team provides powerful guarantee and effective support for industry-university-research collaborative innovation strategy. According to requirements of good political quality, excellent professional ability, strict discipline and upright moral integrity, colleges students affairs team should be built to be the core force of ideological and political work in college students and the backbone team in daily management of college students (Cui Hai,2008).

Persistence in the professional construction of college students affairs team is the foundation of college students affairs. And, a professional and scientific team is needed in industry-university-research collaborative innovation. Ideological and political work is the foundation and premise of college students affairs. And, professional construction of the team of college students affairs naturally reflects

professional requirements for ideological and political education. The working team of college students affairs should keep professional talents of ideological and political education at all levels, ensuring a professional team of college students affairs.

Sticking to the diversified development of the team of college students affairs is the key point. Students affairs is both a practical and comprehensive work and a technical and scientific work. Different majors make different requirements over students, and students from different discipline background are different in features. Under the requirement of industry-university-research collaborative innovation, the team of college students affairs should be diversified to achieve collaboration between different disciplines and complementation between different majors. A diversified team in college students affairs could help better guiding both study and life of college students, which conforms to the development requirements of industry-university-research collaborative innovation strategy in a better way (Zhang Wusheng,2008).

4.3 Working pattern transformed to guide college students to actively participate in industry-university-research collaborative innovation

The working pattern in college students affairs is mainly guided by discipline theories. A research-based and academic working pattern should be adopted to replace past traditional and empiric one. Management of students affairs should be combined with researches, systematizing complex trivial matters. Managing experiences of students affairs should be listed as achievements and managing practices should theorized actively.

An integrated environmental mechanism of college, family and society should be implemented, thus the educational function of society, family and schoolfellows can be given full play. Industry-university-research collaborative innovation strategy is in need of broad horizon and well integrated environment. Previous enclosed school-running pattern in colleges should be abandoned. And college students should be cultivated under the circumstances of a collaborative and harmonious context, in which college, family and society should be integrated. College students should be fostered according to school-running orientation, excised in the light of social demand and molded on the basis of family influence. Respect for individuality should be given to every student, in order to foster all-round developed talents for the new era. At the same time, requirement of collaborative innovation should be met.

Integrated guiding mechanism of moral education, intellectual education and physical education should be implemented to give play to the educational function of ideological education, professional study and scientific research practices. The educational function of college should be strengthened in this process. When cultivating students' individual character, attention should be paid to the molding of perfect personality. A sense of equality should be fostered among college students. Concerns should be given to students, as well as understanding and respect. A working pattern of students affairs, which focuses on construction of study style, should be established. The core status of the construction of study style in college students affairs should be built. The pivotal role of the construction of study style in the quality cultivation program of college students should be ascertained. Physical excises and physical quality of college students should be put emphasis. Physical education curriculum and physical excises should be carried out to enrich students' extra-curricular life.

Integrated working mechanism of class, students organization and scientific research team should be set up to give full play to the educational function of knowledge imparting, interest activities and scientific research tasks, thus improving the educational level in colleges. A tiered team integrated by talents, disciplines and scientific researches is needed in industry-university-research collaborative innovation. Students should be guided to combine curricular knowledge and extracurricular practices together, integrate interests and social demand and correspond scientific research tasks with social practices as required in college students affairs. Classroom learning could help college students to find out how to combine individual interests and social demands. Extra-curricular activities is beneficial for college students to find out how combine professional knowledge with social practices. And, college students could explore how to integrate their abilities with technology innovation in scientific research tasks.

5 Conclusions

When industry-university-research collaborative innovation is being promoted comprehensively currently, colleges across China is press ahead with collaborative innovation to varying degrees. The colleges are actively carrying out researches on teaching, construction of study style, improvement in the science and technology capacities and structural reform based on collaborative innovation. However, researches on the innovation of the working pattern of college students affairs are scarce. This thesis is

based on document researches relevant with industry-university-research collaborative innovation at home and abroad. The function of facilitating college students affairs by industry-university-research collaborative innovation is analyzed in this thesis. It is claimed that idea upgrading, mechanism innovation and objectives innovation are needed in college students affairs in the context of industry-university-research collaborative innovation. Further, a students-oriented idea should be established in college students affairs to guide college students to erect a correct understanding of industry-university-research collaborative innovation. The construction of the team of college students affairs should be refined, the working pattern should be transformed, and multi-directional and integrated working mechanism is complemented.

Abstract: The approach of this paper is to briefly look at the challenges in managing household e-waste in Malaysia and what can be done in terms of innovation management to develop a system that can effectively manage the recovery and treatment of the waste. First the paper looked at the definition and content of the e-waste itself and its impact on environment. The authors found that there is significant gap in terms of material recycling and recovery method between formal and informal material recovering facilities and it is very important for the government to look seriously into how they can solve this gap in order to protect the environment and human health in Malaysia. The paper also proposed innovative actions that can be taken by the relevant authorities to be incorporated in managing e-waste in the future. Malaysia should study systems that have been established internationally and use it as guidance to develop its own system. It is also imperative for Malaysia to ensure the sustainability of the system and to ensure an effective implementation and enforcement for the betterment of the environment in Malaysia and the future.

Key words: E-waste management; Environmental management; Technology; Management; Innovation; Malaysia

1 Introduction

As Malaysia is expected to become a developed nation in the future, it is very important for the country to develop a plan that will be able to sustainably manage its environment. The rapidly increasing volume of e-waste (electrical and electronic waste) is expected to become a serious threat to the environment in the future. It is imperative for the country to take innovative actions in order to develop a plan that will be able to manage this expected threat or challenges in the future. E-waste is expected to be among of the most challenging hazardous type of waste in the country.

E-waste is described as waste generated from electrical and electronic component assemblies that contain smaller parts or components such as accumulators, cathode-ray tubes, mercuric switches or sensors, polychlorinated biphenyl capacitors, electronic parts that are contaminated with cadmium, mercury, lead, nickel, chromium, lithium, or manganese. This definition is derived by Malaysia's Ministry of Natural Resources and Environment (MNRE) since 2005 and is still applicable until today.

Malaysia is expecting to be a developed country by the end of this decade through the implementation of Vision 2020. Rapid economic growth in the country, coupled with massive urbanization, has significantly increased the consumption of electrical and electronic equipment.

According to a research done by Asian Network for Prevention of Illegal Transboundary Movement of Hazardous Wastes (coordinated by Ministry of Environment in Japan), the generation of e-waste in Malaysia was expected to be around 800,000 tons from 2013 and increased to 1,000,000 tons in 2020. With this situation, e-waste has become one of the most challenging types of hazardous waste in the country¹. Electrical and electronic industry is one of the main manufacturing sectors in Malaysia, this situation has significantly contributed to the higher amount of e-waste being generated and disposed (Brandt T & Sue Wei C. 2012). Developed countries such as USA (United States of America), Europe and Japan, legislation and system to properly manage and recycle e-waste have been well developed. Currently in Malaysia, managing household e-waste is basically a business that is driven by the market with less intervention from the government, even though there are some voluntary activities to recycle the e-waste (especially household e-waste).

In accordance to that, the system to be developed in the future should be an innovative system and able to manage the recycling and recovery of useful materials from electrical and electronic products being disposed. The system should also be able to improve the product's life cycle and to ensure that the

¹ Asia E-waste Project. The E-waste Inventory Project in Malaysia, 2009. Available from: http://www.env.go.jp/en/recycle/asian_net/Project_N_Research/E-wasteProject/06.pdf [Accessed 8 September, 2016].

products will be properly disposed and treated to avoid contamination to the environment. In the next section, the authors will discuss in more details about the challenges and innovation in household e-waste management in Malaysia.

2 Challenges in E-waste Collection and Treatment

In country like Malaysia, e-waste is generated from premises such as business offices, housing estates, institutions and industrial areas. They are collected as a complete or dismantled unit. The dismantled unit was not collected as a whole but were being collected as separate components such as plastic casings, fittings, PCBs, metal part and copper cables. However the completed units generated by all the above-mentioned premises (except industrial areas) is presently not collected by e-waste contractors licensed by DoE. This is because currently in Malaysia, the e-waste contractors only collected e-waste generated from the industry. Therefore separate legislation for household (business premises, housing estate and institutions are considered as 'household' in Malaysia) is needed in order to manage this type of e-waste. Figure 1.0 lays out the flow of Malaysian e-waste, from the point of where it is being generated to the point where it will be disposed. The diagrams indicated that there are gaps between licensed vendors facility (partial and full recovery facility) and informal recyclers.

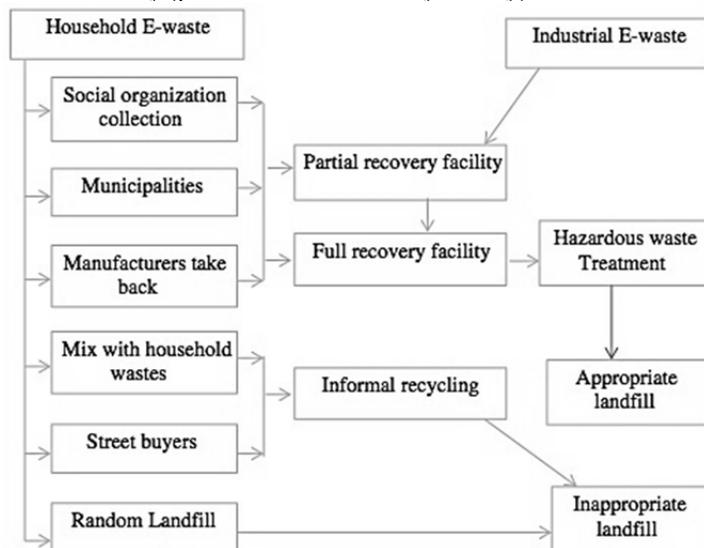

Figure 1 General Flow of Malaysian E-waste¹

Still on Figure 1, household e-waste is collected from different sources for example collection activities from non-governmental organization, municipal waste collection by local authorities, retailers and so on. E-waste collected from household is sent to three different treatment facilities, partial recovery, full recovery and informal recycling facilities. While industrial e-wastes are directly sent to partial and full recovery facilities which later sent to appropriate landfill, the informal recycling facilities do not have proper process to treat e-waste and are hazardous to human and the environment. Due to this improper treatment, the e-waste thrown into landfill site has contaminated the environment through leakage to watercourses underground. Next, after explaining the general flow of Malaysian e-waste, the authors will show an example of e-waste recovery flow in Malaysia as shown in Figure 2 below.

Challenges in making sure that the e-waste goes to appropriate recycling or treatment facilities are vital to the future of environmental protection in Malaysia. This is due to many useful and valuable materials that can be recovered from the e-waste such as shown the Figure 2.0 above. With the advancement of technology the recovery of the materials become more effective and efficient thus the recovery process becomes easier and productive (Shumon, M. R. H., et al,2014).

¹ Asia E-waste Project. The E-waste Inventory Project in Malaysia, 2009. Available from: http://www.env.go.jp/en/recycle/asian_net/Project_N_Research/E-wasteProject/06.pdf [Accessed 8 September, 2016].

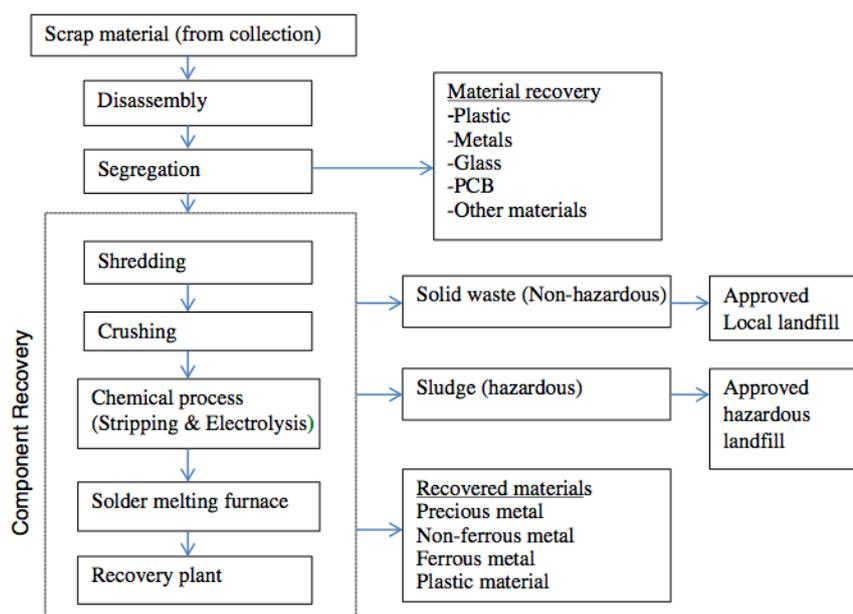

Figure 2 E-waste Recovery Process Flow in Malaysia ¹(Shumon, Ahmed, Islam, 2014)

Malaysian government should take the challenge to further promote to the community to recycle e-waste. Currently the percentage of e-waste recycling especially household e-waste is still very low due to low awareness about the importance of e-waste recycling². Many Malaysians currently just throw their e-waste into normal dustbins. An innovative methodology to promote the increase in the recycling rate is paramount to the future of environmental protection and resources recovery activities in Malaysia.

3 Innovation in E-Waste Recycling and Material Recovery

In this section, the authors will describe, in brief the process of e-waste recycling and material recovery as part of the challenges and innovation in e-waste management. Generally recycling process of e-waste is regarded as the processes of dismantling waste electrical and electronic products to recover the original reusable materials (Cui, J., & Forssberg, E.,2003). In detail e-waste recycling process is an intricate process that involves steps such as collection, testing, sorting, dismantling, shredding, crushing, melting to hone various materials so that the original material can be recovered such as shown in Figure 2(Hageluken, C.,2007).

Throughout the processes mentioned above, valuable materials such as gold, silver and copper can be recovered. A study done by Hageluken (Hageluken, C.,2007) for example, has found that most of the precious metals as mentioned previously are found in printed circuit boards (PCB). These valuable materials that can be found in PCB have attracted many informal recyclers to get involve in dismantling and recycling the e-waste. Unfortunately the process is normally done improperly with inadequate facilities. The PCBs contains hazardous and toxic materials and are harmful to human. This situation pose challenges to the authority to consider regulate the informal recyclers so as to reduce the risk to human health and also to the environment. Nevertheless the regulation shouldn't be too stiff, which in the end scare them away from the activities. Informal recyclers such as scavengers do play significant role in Malaysia's household e-waste collection.

Innovation in recycling technology now enable the process of recovery of up to 95% of useful materials from electrical and electronics equipment. The use of Plasma Waste Treatment technology for example, offers a very promising technology to treat hazardous waste in the near future (Tippayawong,

¹ Reclaimtek (M) Sdn Bhd. WEEE recycling technology in Malaysia. Asian Electrical and Electronics Green Society, 2009. Bangkok, Thailand. http://www.thaieei.com/eidownload/conference/PPT_Room%20A/7_WEEE%20RECYCLING_2003VER.pdf. Accessed on 31 August 2016.

² Asia E-waste Project. The E-waste Inventory Project in Malaysia, 2009. Available from: http://www.env.go.jp/en/recycle/asian_net/Project_N_Research/E-wasteProject/06.pdf [Accessed 8 September, 2016].

N.,2009). The innovation in using thermal plasma technology enable the e-waste to be converted to combustible gas with solid residues that can be use in other industrial processes. With this technology a massive loss of volume and weight of the e-waste can be achieve easily in a single set-up without involving any other third party processes. This is the type of innovation in recycling technology capable of contributing to significant savings in the future and capable to significantly acquire valuable and recyclable materials as well as energy generation from the e-waste. Table 1 presented the different percentage of energy savings by materials recycling.

Table 1 Energy Savings from Recycling and Recovery of Various Materials in E-Waste (Cui, J., & Forssberg, E.,2003)

Materials	Energy (savings in percentage %)
Aluminium	95
Copper	85
Iron and steel	74
Lead	65
Zinc	60
Paper	64
Plastic	>80

In developed countries, this process is carried out formally and supported by intense awareness in environmental protection among the community. In countries like Japan and Switzerland, recycling activities are done using high technology and are very save to the environment (Aizawa, H. ,2008; Andreola, F. ,2007). However the technology used by these countries involved high capital investment. Asian countries do not have much choice except to find ways to invest in high capital investment to manage waste in order to protect its environment in the future. A study has shown that in USA, the cost of e-waste recycling in the country is ten times more expensive than in Asia (Jain, A.,2008). This is due to the difference in terms of technology, processes and other related activities being used in both continents. However in less economically developed country, such as India and Malaysia, majority of the household e-waste recycling activities are being done by informal sector whereas in Japan and USA for example, it has been done in licensed recycling and recovery facilities. Among the reason why this scenario happened is because of the absence of legislation to control e-waste recycling that makes it compulsory for the community to segregate and recycle e-waste.

With the advancement of technology since late 1970s the popularity and usage of electrical and electronic devices is expected to increase significantly throughout the world (Ongondo, F. O. ,2011). With the increase in volume of electrical and electronic devices, the life cycle of these products becomes shorter due to competition among the manufacturers and the rapid technological changes that contribute to the increase in e-waste volume (Mallawarachchi, H.,2012). This phenomenon has alerted many countries around the world to take action, both in terms of how to protect the environment and recycle the waste (Osibanjo O.,2007). The incorporation of creative and innovative Design for Recycling method for the electrical and electronic product also needs to be taken into consideration. The government for example can offer incentives and introduce legislation onto products that are design with recycling in mind to further encourage manufacturing companies to adopt the method.

The approach to incorporate such innovative initiatives in dealing with e-waste is very important to ensure the sustainability of this effort in the long run. Furthermore, hazardous substances available in e-waste will eventually cause harm to the environment if action is not taken. Significant increase in terms of volume from electrical or electronic appliances being thrown to landfill site without proper treatment will bring disastrous impacts to the environment. Contaminated substances in e-waste components may leak into the soil through the watercourses, causing contamination of soil and water and is harmful to the human and animal health. Even small amount of e-waste disposed into the landfill sites may contain a relatively high amount of contaminated materials and has the potential to harm the environment (Janz, A.,2008). A study done by non-governmental bodies in USA, such as Basel Action Network (BAN) has proved that 70% of heavy or contaminated metals found in landfills site in USA mainly came from e-waste (Puckett, J.,2005).

Besides being thrown into landfill sites, e-waste was also being disposed of in waste treatment

facilities such as incinerators. Liquids such as flame retardants and chlorine elements which can be found in plastic casing, can caused the release of dangerous gaseous through combustion or pyrolysis processes such as dioxins, polycyclic aromatic hydrocarbons (PAHs), furans and polyhalogenated aromatic hydrocarbons (PHAHs) and hydrogen chloride which can contaminate the air through smoke and dust (Robinson, B.H. 2009). These hazardous substances may also affect human's system through consumption, breathing and physical contact (Robinson, B.H. 2009). In addition to the said situation, in a recent discussion in May 2016 between the authors and incinerator operators in Malaysia also revealed that water content in Malaysian municipal solid waste is very high, resulting the contamination to become even worst. Due the richness of water content in Malaysian municipal solid waste, the e-waste has to be segregated from other types of waste, which later resulted in the cost of recycling to become even higher. E-waste recycling provides opportunities for lucrative and profitable business for many people in this country. E-waste has become a sought after by-product of municipal solid waste. This has caused in the increase of informal e-waste collectors and recyclers in Malaysian waste management market.

An effective e-waste management system especially for household e-waste is very much needed for the country. There is already a system or act available for industrial e-waste but not for the household e-waste. This system needs to be establish even though it seems to be a complicated task due the high cost involved and difficulty in the implementation and enforcement for the system (Wath SB, Vaidya AN,2010). Domestically, the government through Department of Environment (DoE) is currently undergoing a comprehensive research to manage household e-waste. Internationally many countries have done research on how to manage e-waste such as in North Asia, Europe and North America. Liu et al. (Liu X, Tanaka M,2006), for example, has done research on progress of e-waste management in China, and the challenges that are to be overcome there. Taghipour et al. (Taghipour H,2012), studied e-waste management challenges in Iran, and discussed strategies to improve the activities involved. Terazono et al. Terazono, A,2006), documented a study on the status of e-waste and related issues in Asia. In Korea, Lee et al.(Lee J-c, Song HT,2007), studied the recycling of bulky e-waste equipment such as washing machines, refrigerators, air conditioners and televisions. The study reveals findings related to current issues in e-waste management and ways to solve it. Kahhat et al. Kahhat R, Kim J,2008), studied and compare e-waste management practices in developed countries in Asia, Europe and USA. There are many other significant researches that have been done with regards to this matter but the attention given to this research is very low. These academic researches and discussions should be use as guidance and possible roadmap to help improve and innovate new and better ways to manage e-waste in Malaysia.

4 Conclusions

With the increasing amount of e-waste being generated on a daily basis, managing e-waste has become a challenge to Malaysia. The country needs a formal legislation and system to manage its household e-waste. The system has to be an innovative system that is able to manage the recovery and treatment facilities available. Currently there are significant gaps in terms of the method and technology being used between the formal and informal players in this industry. The design of the electrical and electronic products also need to adopt a method that will make it easier and productive for the recyclers to recycle the product such as introducing Design for Recycling methodology in product design. Even tough technology has evolved and the method of recovery and recycling of e-waste has improved, the government and community still have to aggressively promote and support the recycling activities. The recycling rate in this country is still very low compared to other developed countries. Many studies on facing the challenges and innovation in e-waste management have been done throughout the world. Malaysia should use these studies to compare and guide the country to develop the best system in managing its household e-waste in the future.

Evaluation of PLM Technology Components Requirements: A Case Study in Automotive Components Manufacturing Company

Mee Yee Kow, Teck Loon Lim, Akbariah Mahdzir, Nooh Abu Bakar
Malaysia-Japan International Institute of Technology, University Teknologi Malaysia, Malaysia
(E-mail: kowmeeyee@gmail.com, teckloon88@gmail.com, arymahdzir@gmail.com,
noohab@gmail.com)

Abstract: Automotive industry is facing tough challenges due to economic downturns. Globalization and implementation of AFTA in this region had put Malaysia local automotive manufacturers into a much tougher situation where delivering better and quality products had become a must to ensure staying competition in the market. The chain impact has extended to automotive components suppliers whose must not only compete for lower product cost; they also have to meet the required quality and delivery lead-time. In order to fulfill more stringent requirements given by automotive manufacturers, automotive components manufacturing companies explore the PLM (Product lifecycle Management) solution adoption in order to improve productivity and efficiency. PLM defines as a strategic business approach that applies a consistent set of business solutions to support the collaborative creation, management, dissemination and use of product definition information across the enterprise from concept to end-of-life. Companies that successful in dealing with these PLM related issues report benefits such as increased innovative ability, shorter time-to-market, increased profits, less engineering changes late in the lifecycle, less product faults in the field and higher efficiency. PLM is a strategic approach driving organizational change that leads towards operational excellence. However, PLM adoption is not easy but rather complex. This qualitative research was conducted in a local automotive components manufacturing company that studied its PLM requirements in order to determine the suitable PLM technology components for adoption to improve production lead-time and product quality. The results of this case study showed that change control, improve communication, reduce error, meeting company policy and industry compliance and better decision making were the key challenges to be addressed by company using PLM. Researchers mapped those PLM requirements to the PLM solution in order to identify the suitable PLM technology components for implementation. The outcome of this research can be used as a reference case study for the automotive components manufacturing companies that having similar PLM requirements and challenges.

Key words: Product Lifecycle Management (PLM); PLM Technology; PLM implementation; Automotive industry

1 Introduction

Automotive industry is one of the most important industries in Malaysia. It has seen as the primary driving industry to bring the manufacturing sectors towards industrialize. Globalization and implementation of AFTA in this region had put Malaysia local automotive manufacturers into a much tougher situation where delivering with better quality products, lower product cost and shorten time to market had become a must to ensure staying competition in the market. MAI 2010 reported that the country has higher import than export of the automotive components. In order to close up the gap, the local component manufacturers are looking into sustaining their capability to meet the local demands, and at the same time improving their competency and to grow the export market. These have resulted the local automotive component manufacturers' start looking into technology adoption not only to compete with lower product cost but also to meet the product quality and delivery lead time.

PLM concept offers comprehensive solutions to help enterprises address their challenges and create competitive advantage. CIMdata, the global leader in PLM consulting, defines it as a strategic business approach that applies a consistent set of business solutions to support the collaborative creation, management, dissemination and use of product definition information across the extended enterprise from concept to end-of-life (Matteo, 2012). PLM allows the enterprise to create, capture and share the product-related requirements, expectations. Knowledge and "lessons learned" are captured for potential re-use in a process of continual innovation. Companies that are successful in dealing with these PLM related issues report benefits such as increased innovative ability, shorter time-to-market, increased profits, less engineering changes late in the lifecycle, less product faults in the field and higher efficiency (Ronald, 2005). In short with PLM adoption in placed it enables enterprise to achieve business goals related to costs reduction, quality improving and time to market shortening, during the

innovation of products, services and business operations (Matteo, 2012).

However, many companies struggle with adopting and implementing PLM (Ronald, 2005). A major reason is that PLM affects a wide range of processes within and outside the company. This makes PLM a complex organizational change effort (Ronald, 2005) and Grieves (2009) emphasizes that PLM implementation requires four aspects to be coordinated: people, processes, practices, and technology (Batenburg, 2006). The challenges of PLM implementation can be related to the technology on one hand and business strategy on knowledge information management on the other hand (Hannu, 2009). This instead led to the perception in most of the automotive component manufacturing companies where implementing PLM is huge and massive in identified the right solution along with its appropriate roadmap. They recognize the needs and the important but it is always time consuming for them to evaluate the right solutions that would mapped into their environment. They are looking at standard out of the box (OOTB) solutions which embedded with industry best practices as the reference guideline to shorten the pre-evaluation process in selecting the PLM technology components. Therefore the objectives of this paper is to identify the PLM requirements in local automotive component manufacturing and perform the solution mapping in order to determine the suitable PLM technology components for adoption that could address the needs in this industry.

There are many assessment in related to PLM adoption in evaluating its maturity state were discussed about business alignment for People & Culture, IT infrastructure, Management, Process and tools (Ronald, 2005; Batenburg, 2006; Hannu, 2009; Anneli, 2009; Anneli, 2011) prior to the PLM implementation. However there are not many research papers related to the evaluation of the PLM technology components especially in mapping to the PLM requirements. In this paper the researchers focused on assessing the PLM requirements in local automotive component manufacturer in order to determine the suitable PLM technology component for adoption. The objective of this research is to identify the typical challenges where the local automotive component manufacturer would like to improve and subsequently mapped the requirement with the related PLM technology component to provide as a guideline in PLM implementation. The outcome of this research can be used as a reference case study for the automotive components manufacturing companies that having similar PLM requirements and challenges.

The main research questions of this study are:

- 1) What are the most concerned business challenges in automotive component manufacturer?
- 2) What are the PLM technology components that would address the needs for automotive component manufacturer?

2 Literature Review

2.1 Industry background

Automotive industry is one of the most important industries in Malaysia. As reported by NAP (2014) (NAP, 2014), in 2012, automotive industry has contributed 3.2% to GDP, it is forecast that the industry will contribute 10 per cent to the country's GDP in 2020 where the vehicle production is expected to increase to 1.35 million units. There are more than 700 components parts manufacturers producing more than 5000 parts locally. In 2012, there are about 45 vendors in the automotive component industry who has the capabilities and competency to design and develop, source components and part and manufacturer the whole module/component both for the original equipment and replacement market.

Today apart from the radical process of consolidation and liberalization portraying the introduction of ASEAN Free Trade Agreement (AFTA) and World Trade Organization (WTO), the local automotive is also hit by the rapid technological changes, alliances and acquisitions (Talib, 2012). The inevitable rapid changes in the global landscape of automotive industry must not only be seen as challenges but also as opportunities because many of the major international manufacturers are actually outsourcing their component sectors (Talib, 2012). Given the opportunity of larger market for automotive part supplies, the Malaysian automotive components manufacturers ought to venture into gaining the competitive edge, aiming for larger market penetration and to play a serious role in the global automotive industry. The strategy to achieve these objectives is by producing high quality automotive parts at competitive cost. Having said these, the local car manufacturers need to enhance the quality of their processes, and the quality of their automotive parts so as to meet the demand for high quality supplies in both local and global marketplace (Talib, 2012).

Although, the Malaysian automotive industry expanded in terms of sales, production, employment and local content, however failed in industrial upgrading and international competitiveness. The failures

can be attributed to (a) lack of political promotion for high challenge-high support environment, (b) low technological and marketing capabilities and (c) limited participation in the global value chain (Wad, et al, 2011) NAP 2014 aimed to increase market access for the domestic automotive industry, promote product recognition and local branding in targeted countries while encouraging transfer of technology. In view of the dynamics in automotive technology development, it is necessary to develop a domestic automotive industry that is responsive to change and latest technology application. To ensure the sustainability of the domestic automotive industry, the focus will be on strategies to drive exports. This will include improvements in the (i) Quality management system; (ii) Operational management system; (iii) Business management system; (iv) Testing and validation capabilities (NAP, 2014).

2.2 PLM requirement

The automotive industry is facing new and pressing challenges. Globalization, individualization, digitalization and increasing competition are changing the face of the industry as we know it. In addition, increasing safety requirements and voluntary environmental commitments by the automotive industry will also contribute to the changes ahead. Size is no longer a guarantee of success. Only those companies that find new ways to create value will prosper in the future (Gallasch, 2004).

Automotive suppliers have responded to these pressures by seeking new ways to strictly contain costs without sacrificing innovative, feature-rich products and platforms. With the demands for faster innovation, higher quality and increased regulation, it becomes apparent that the winning automotive suppliers will be those that leverage product innovations to rapidly develop new platforms and win new programs (E. M. O, 2009).

PLM provides a measurable and tangible return in many areas for an automotive supplier. The following investment and potential return framework is based on a \$2.5 billion international automotive supplier with multiple divisions (E. M. O, 2009). This has led to the needs for the local automotive components manufacturers exploring the Product Lifecycle Management (PLM) to assist them in achieving product innovation and operation excellence. PLM enables companies to manage information about their products from initial concept through to manufacturing and after-market service within a single source of truth. Benefits of a PLM implementation can be seen throughout the new product development (NPD) value chain. They include: (i) Competitive advantage and faster time-to-market through streamlined global collaboration, automation and greater process efficiencies; (ii) Improved product quality at a lower cost through re-use of materials, components and product intellectual property (IP); (iii) Cost savings resulting from a consolidated supply base with fewer, more strategic suppliers and partners; (iv) Tracking, measurement and reporting of critical NPD process metrics; (v) Adoption and standardization of best practices for NPD processes; (vi) Systematic project and program management to ensure profitability (E. M. O, 2009).

Even though it is reported PLM will bring great values to the company however due to its magnitude of transformation a controlled and proper PLM implementation can be very challenging in practice (Batenburg, 2006; P. H. J, 2012. Baker (2002)(M. Bokinge, 2012; E. M. O, 2009; Gallasch, 2004) stated that “nobody could have foreseen how big, messy, and tough this project would turn out to be”. The reason is mainly due to lack of clear understanding of what PLM is and how it could fit with the needs and requirements of the companies in terms of product management. The key success of PLM implementation lies in the selection of right PLM tools that fits into the organization culture and processes. However, each organization's business requirements and objectives are different (Matteo, 2012). In this context, it is important to assess the PLM requirements to be addressed in automotive component companies in order to mapped its requirement and identify the right PLM technology components.

3 Research Methodology

The research model was structured as follows: the first section was to carry out the interview at the identified case study company. A set of semi-structured research questionnaires was prepared as a guideline prior to the interview. The content of questionnaires was related to the PLM requirements that identified through the literature reviews and researchers working experience in the related industry. These questions perspectives could be categorized into simple, yet most profound indicators such as, Quality, Cost and Time which needed to be monitored, controlled and optimized. The study was based on a case study research and the target focus group was a local automotive component manufacturing company. The study utilized an action-oriented approach. The target respondents were the company management who could provide insight view of the company vision. Subsequently, in the second section,

based on the interview result the researchers performed interpretive research methods to analyze the data using four-step procedure of gathering, categorizing, analyzing and finally mapping the data to the PLM components available in the PLM solution portfolio offered by the PLM solutions provider. The data collection was to achieve interpretation and organized the data to form a case description. Our research interest was to find out a PLM requirement in a local automotive component manufacturing company. In summary, the following Figure.1 was the research approach adopted by researchers:

Figure 1 Research Approach

4 Data Collection, Analysis and Results

4.1 The case company

The case company is an Engineering Company (EngCOM) specializing in designing, manufacturing and producing of automotive suspension components. The parts produced are supplied to both OEM and REM local and export marketing. The team is divided into research and design team who are focus on develop new and improve of the existing products, and product development team who will be stationed at plant to managed and coordinate daily operation at the plant. Currently the used IT systems include Enterprise Resource Planning (ERP), Multi CAD tools for 2D/3D Design, CAE tools, project and document management in excel as well as custom made RFQ software. One of the main challenges recognized is how to integrate the PLM with the existing data system. There are 3 respondents participated the interview. They are Head of R&D Department, Project Leader and Design Engineer. The respondents are having at least 3 years and above working experience in its related field. The identified respondents should be the key persons in the organization and they are representing the top management, middle management and executive level.

4.2 Research findings

The major concerns in EngCOM are (i) Past Project experience and configuration is known only to a few senior users. This does not allow for optimal IP re-use and capturing the lesson learned; (ii) Huge database for part/BOM and its related specification, the part/BOM management only known by the dedicated person. This make the search process difficult and time consuming; (iii) Document and Project management are under manual file based system, this does not provide audit trail in tracking project deliverables and document traceability across the project development from RFQ to Product design and development till Prototyping and Production; (iv) Manual SOP management in managing the Engineering Change. All changes will be documented in the amendment log and kept by respective department. This again information is not stored in centralized system and there is no governed workflow to automate the review and approval process; (v) The visibility of related dash-boarding on status report and progress for the management make the decision. In summary, the key mission for the case company that would like to achieve in adopting PLM are better quality control to meet customer requirement and achieve lead time in the project delivery. The respondent feedback has been transcript in the Figure 2 below in according to the research approach i.e. Gathering, Categorizing, Analyzing and finally Solution Mapping.

4.3 Results

Based on the feedback gathering, researchers categorized the PLM requirements into five main areas (i) Change Control in-placed (ii) Improve Communication (iii) Reduce Error (iv) Meeting Company Policy & Industry Compliances (v) Better Decision Making. Continuously, based on the analysis data above researcher mapped the PLM requirements in accordance to the PLM technology components as made available in the PLM solution portfolio (D. Systemes, 2016). In summary the PLM technology components which have identified here are summarized in Table 1.

Gathering	Categorizing	Analyzing	Mapping	
	PLM Requirements	Description		
Reduced cycle time to achieve earlier break even and higher profits	Change Control in-placed	<ul style="list-style-type: none"> ✓ Engineering Change ✓ Reduce manual work ✓ Govern Workflow for review/ approval 	<div style="display: flex; flex-direction: column; align-items: center;"> <div style="background-color: #92d050; padding: 5px; writing-mode: vertical-rl; transform: rotate(180deg);">Platform Collaboration</div> <div style="background-color: #4f81bd; padding: 5px; writing-mode: vertical-rl; transform: rotate(180deg);">Project/ Program Management</div> <div style="background-color: #ffd700; padding: 5px; writing-mode: vertical-rl; transform: rotate(180deg);">EBOM Management</div> <div style="background-color: #808080; padding: 5px; writing-mode: vertical-rl; transform: rotate(180deg);">Engineering Change</div> <div style="background-color: #404040; padding: 5px; writing-mode: vertical-rl; transform: rotate(180deg);">CADx Integration</div> </div>	
Effective collaboration to increase innovation resulting in higher product sales	Improve Communication	<ul style="list-style-type: none"> ✓ Centre data repository ✓ Notification ✓ Seamless data driven and information 		
Elimination of BOM errors to avoid unnecessary development costs and delays	Reduce Error	<ul style="list-style-type: none"> ✓ Reuse of data ✓ Knowledgebase for lesson learned ✓ Part library and classification for better part numbering control and organization ✓ Connectivity of part: part-Spec-CAD data, where-used ✓ EBOM synchronization 		
Higher productivity to get product to market more quickly	Meeting Company Policy & Industry Compliances	<ul style="list-style-type: none"> ✓ APQP Project Management ✓ ECR/ ECO 		
Better decision making to improve quality and shorter development time	Better Decision Making	<ul style="list-style-type: none"> ✓ Dash-boarding ✓ Search capability: Information tracking and traceability 		
				<div style="display: flex; flex-direction: column; align-items: center;"> <div style="background-color: #d3d3d3; padding: 5px; writing-mode: vertical-rl; transform: rotate(180deg);">PLM users</div> <div style="background-color: #d3d3d3; padding: 5px; writing-mode: vertical-rl; transform: rotate(180deg);">Project Manager/ members</div> <div style="background-color: #d3d3d3; padding: 5px; writing-mode: vertical-rl; transform: rotate(180deg);">Product Manager/ Engineer</div> <div style="background-color: #d3d3d3; padding: 5px; writing-mode: vertical-rl; transform: rotate(180deg);">Cross Functional team</div> <div style="background-color: #d3d3d3; padding: 5px; writing-mode: vertical-rl; transform: rotate(180deg);">Designers</div> </div>
				PLM Roles

Figure 2 Research Findings

Table 1 Summary of Required PLM Technology Components

No	PLM Technology Components	Descriptions
1	Platform Collaboration	Portability-online data access Data driven in single source of truth Dashboard: view the status update in real time
2	Project/ Program Management	Integrated Project Management
3	EBOM Management	Synchronize of CAD product structure with EBOM
4	Engineering Change	ECR/ECO integration-Change Management
5	CADx Integration:	Robust Multi-CAD integration

The solution portfolio is designed in such with role base for instance Project Manager/ member, Product Manager/engineer, Cross functional team and Designer. With the identified PLM technology components, it will help the organization in achieving the following goals:

- Improve user productivity and time-to-market through data-driven applications
- Securely provide design information to suppliers and customers
- Collaborate around real-time design information or other information related to design
- Manage work-in-progress data for design teams located throughout the world
- Manage collaborative projects involving internal and external teams of prospects, customers, suppliers and partners
 - Immersive user interface inside the CAD application allowing designers to get benefits of a PLM system without modifying their business processes
 - Drive a phased-base decision making process using process templates with predefined phases, gates and milestones
 - Provide real-time access to project status for rapid analysis and decision making

5 Discussion

This research was based on one local case study. The results might not be able to reflect the entire local automotive component industry. The researchers would suggest the identified PLM technology components in this paper could be served as an initial platform to be considered to kick-start the PLM implementation in the organization.

However, for today’s global automotive enterprise, the complexity of automotive product design and development continues to increase as advances in electrification, software and connectivity become integral to innovation. With increasing product complexity, automotive product development is no longer just about mechanical components. Manufacturers need a different approach for managing the

design, development and release of mechanical, electronics, software and hardware components (Aras Corp, 2015). This means that solutions for EBOMs and MBOMs, change management, requirements and configuration management, technical documents, application lifecycle management (ALM) and more can all be linked together across electrical, mechanical and software/firmware disciplines (Aras Corp, 2015). With the statement above, researchers recognize that others requirement which did not captured in this case study like requirement management, configuration management, sourcing management, bidding management, system integration and etc. can be seen as an add-on modules to consider in the next phase of project implementation upon the foundation of the mentioned PLM technology components has adopted.

Today's winning automotive manufacturers gain true value from a PLM platform and a complete set of capabilities for multi-disciplinary product development (Aras Corp, 2015). The current research paper is only covered the preliminary stage of PLM technology component identification and yet there are more to be considered subject to the organization direction. The future research could also investigate how to integrate the necessary business alignment in the later stage and the relationship or the precedence of each technology components along implementation process.

6 Conclusions

This research is a qualitative case study research to identify the typical challenges where the local automotive component manufacturer would like to improve and subsequently mapped the requirement with the related PLM technology component to provide as a guideline in PLM implementation. The research has achieved its objective to address the research questions below:

1) What are the most concerned business challenges in automotive component manufacturer?

Findings: Change control in-placed, Improve Communication, Reduce Error, Meeting Company Policy and & Industry Compliances and Better Decision.

2) What are the PLM technology components that would address the needs for automotive component manufacturer?

Findings: Platform Collaboration for data driven in single source of truth and real-time Dash-boarding status update for decision making; Project Management for online project team collaboration and improve communication, EBOM Management for better traceability in part relationship and improve search capability for IP re-used; Engineering Change with better control in audit trail for review and approval; and CADx Integration for better revision and version control as well as CAD product structure synchronization with EBOM.

The outcome of this research can be used as a reference case study for the automotive components manufacturing companies that having similar PLM requirements and challenges.

Abstract: housing is one of the most important issue for very one and often is the largest single household expenses. It is basically more than a shelter which combines environment and life style and facilitate people access to the services and work opportunities. Besides, housing is considered a major item in public budget and major public investment are needed to create, maintain and services residential areas (ARA,2011). This study focuses on affordable housing area which tries to provide shelter for low-income population of a society. The study tries to present a model to evaluate the satisfaction of three different stakeholders in affordable housing market as: society/ government, residents and company which provides affordable housing services. The model will be implemented later in three different countries: Finland, Poland (city of Warsaw) and China (city of Wuhan). Therefore this study also presents the current situation of affordable housing system in those mentioned countries.

Key words: Affordable housing; Stakeholders; Customer satisfaction; Sustainable competitive development

1 Introduction

There are two approaches towards housing market: first is to let market mechanism adjust by itself without considering guarantee for low income population to have a shelter. Therefore, this approach brings social problems in short time and forces some part of society to live below living standards. Second approach is to consider a responsibility for government to provide proper house for low-income population of society. Government and municipalities in different counties allocate tax revenue to support low-income people with decent shelter. So, they have suitable tools to subsidize low-income population to live in a house with a good living standard. This thought considers social safety net concept (Forss, T. 2013)¹.

One of the keys to sustainable development and economic growth in any countries is the access of different people to a decent houses and affordable housing ensures 'a decent home for every household as a price they could afford (Scanlon, K., Whitehead, C. & Fernandez Arrigoitia, 2014).

Apart from residents (customers) two other stakeholders play role in affordable housing project: government (municipality) and companies which provide affordable housing services. A successful AH model is the one in which all the need of different stakeholders is satisfied. In other world, in order to establish a successful AH project, the need of these three stakeholders should be identified and satisfied at the same time. Even though, sometimes these three stakeholders have different motivation and conflicting interest.

The AH studied once carried in Finland in 2012 in comparison with the same study in Chania and Thailand. In that study a triple helix model was proposed to evaluate the satisfaction of different players. However, the AH studies is a longitudinal studies and has to be carried out in specific period of time to evaluate how much AH project made progress towards its goal and what would be improvement priorities for the next coming planed period.

This study presents how different stakeholders could be evaluated in AH model. Later on, the AH situation in three countries (Finland, Poland and China) will be presented. The contribution of this paper is to demonstrate Finnish affordable housing as a good and advanced example and support other countries to follow the same way to success.

2 Sustainable Competitive Advantages

In today’s turbulent business environment, companies’ main goal is to establish a business to obtain sustainable competitive advantage rather than a temporary competitive advantage. One of the latest approaches towards sustainable competitive advantages is resource based view (RBV) which is introduced by Wernerfelt 1984. Wernerfelt believes that analyzing a company from the resource side has more benefit rather than from the product side. The key point in RBV is that the firms are different even within an industry. These differences among firms come from their resources and if a firm has advantages in something, should use it (Wernerfelt, 1984). As the resources and conditions of AH projects are different from one country to another, therefore RBV approaches could be useful to evaluate and improve AH in different areas.

3 Method to Measure the Performance of Three Different Stakeholders in AH Project

In the study which is conducted in Finland in 2012, three different stakeholders were identified: Government and Regional Policy, Company which provides AH services and tenants. For evaluation the satisfaction of these three different clients, three different tools will be used as follows:

- 1) Governments and regional policy will be evaluated by AHP Priorities analysis
- 2) Tenants satisfaction will be evaluated with customer satisfaction feedback and open question
- 3) Company which provides AH services will be evaluated by sense and respond method and critical factor index analysis

The AHP priorities for government and regional policy are:

Figure 1 AHP Priorities for Government and Regional Policy

For company performance evaluation, senses and responds questionnaire will be used to determine Critical factor index (CFI). The sample of questionnaire is as follows:

Table 1 Format of the Questionnaire (Ranta, Juha, Takala, 2007)

Performance attribute	Scale: 1=low, 10=high		Compared with competitors			Direction of development		
	Expectation (1-1)	Experience (1-10)	worse	same	better	worse	same	better
attribute 1								
attribute 2								

4 Introduction to Cases Studies and Expected Results

4.1 Finland

Finland is one of the first countries to provide affordable public housing. For example in 1909, wooden houses were built to provide shelter for city workers in Helsinki area. After Second World War, affordable housing policy in Finland faced a big challenge to provide shelter for about 400 000 immigrants who had lost their home during the war. Another important milestone in Finnish affordable housing policy is rapid urbanization which has started 60 years ago and is still continuing strongly (ARA, 2011).

There is some specification about housing policy in Finland. For example, Finnish housing system

is built on this assumption that household satisfy their need mainly by relying on other than of public housing. Also in Finland, AH is considered as a branch of social policy. Another characteristic of Finnish housing system is that it's a dualist system. In fact, in Finnish housing market both free market and regulated market works at the same time. In Finland, there is nonprofit social rental housing mainly owned by municipality rental housing companies and nonprofit developers. This housing sector offers 'welfare housing' for people suffering from different social problems (Forss, 2013).

In the studies which have been carried out 2012, the results showed that the human development index increases constantly in Finland from year 1980 to 2010. Also the urbanization tendency also grows constantly from 1960 till 2008. The following charts present the results in detail (Forss, T. 2013):

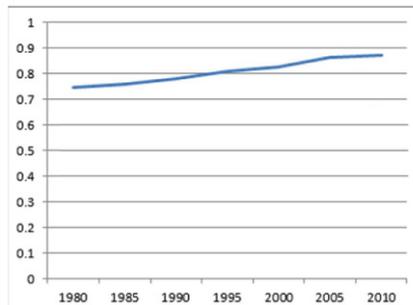

Figure 2 Human Development Index (HDI)

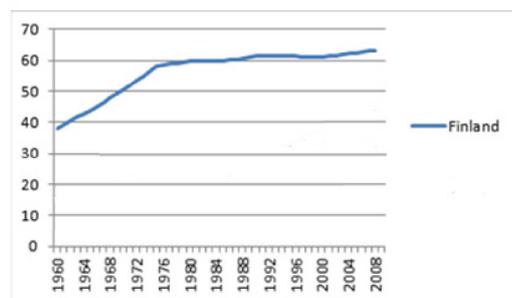

Figure 3 Urban Population Tendency

Also, AHP studies for evaluation national and regional policies showed that the criteria "Maintain and management" is the first priority for decision makers in Finland.

In 2014 the same studied has been started to conduct in Finland. The purpose is to have longitudinal studies to compare how priorities have changed during these years and how Finland succeeds to make progress in AH project. The questionnaire has been Finalized and distributed in Jun 2016 to get answer to analysis.

4.2 China

China has the largest population in the world and it has one of the most challenging Affordable Housing policy's. In most of western countries social welfare systems have been running for years and experience and knowledge from public housing system is strong. However in most of Asian countries the social welfare systems is still developing and are seen as inadequate compared to their large amount of low-income population (Forss, 2013).

In 2014 the same studied has been started to conduct in Finland. The purpose is to have longitudinal studies to compare how priorities have changed during these years and how Finland succeeds to make progress in AH project. The questionnaire has been Finalized and distributed in Jun 2016 to get answer to analysis.

Over the years China has gone through a change from a centrally planned public housing system to a market-oriented housing production industry (Deng, Lan & Shen, Qingyun & Wang, Lin,2009). Chinese government is monitoring the environment of provinces and cities centralized from Beijing. Objective is to ensure the development with urbanization, modernization of the infrastructure and economic growth. That is done by Chinese governments control over land, regulations and capital (Forss, T2013).

Under the old system Chines government institutions and state-owned enterprises provided housing to residents as part of social welfare system. The provision of housing was dealt like obligation. The old system caused housing shortage and the Chinese government launched the first economic reform 1979. In the agenda there was also a housing reform which aimed to adjust rents and to privatize the existing housing stock. The second wave of the housing reform was launched in 1994 when programs called Economical and Comfortable Housing (ECH) and Housing Provident Fund (HPF) was initiated. Aim of the program was to alleviate the progress of both supply-side and demand-side programs of a housing markets so that the gap between housing supply and demand would decrease. Short after the third wave of the reform was launched in 1998 where the housing production were strongly guided from government's institutions to private sectors (Deng, Lan & Shen, Qingyun & Wang, Lin,2009)¹.

As the ECH and HPF are homeownership programs, the Cheap Rental Housing Program (CRH)

¹ <http://citeseerx.ist.psu.edu/viewdoc/download?doi=10.1.1.455.8500&rep=rep1&type=pdf>

was focusing on expanding the affordable housing supply. The program was launched in 2004 by Chinese central government and it was supplemented with Cheap Rental Housing Guarantee Plan in 2009. The CRH program was created to target groups like seniors, people with disabilities and extremely low-income households and households that cannot afford to buy ECH unit or to rent a house form market. Urban poverty is seen as China's main housing problem (Deng, Lan & Shen, Qingyun & Wang, Lin, 2009).

Figure 4 The Framework of China Housing Policy (Forss,2013)

Both private and public capital are financing housing in China. The government controls housing markets development by controlling the guarantee needed for the bank loans. Also by supporting housing supply the rents are being decreased. China's housing supply system is comprised into two parts, commercial housing supply system and security housing system. The Government security housing supply system is targeted for the low-income group and the commercial housing supply system is targeted for the medium-income and high-income groups (Forss,2013).

With UVA cooperation the Affordable Housing studies have been executed in China in the city of Wuhan. The answers are being analyzed and the results will be published subsequently.

4.3 Poland

Since economic transformation in 1989 the housing market in Poland did not change rapidly. The privatization of housing market in Poland increases the importance in becoming an owner-user of an apartment or house. Renting an apartment in Poland is still identified with lower economic status, comparing to Western countries, where it is concerned with high mobility societies (Cesarski, M.2011). Therefore, since the mid-90's housing policy in Poland focused on individual construction of credits for the middle class. Government Housing Policy concerns on financing two programs: "Family on its own" 2007-2013, and "Housing for the Young" 2014-2018. These programs are mortgage-subsidy program that supports the first-time home buyers. The housing market in Poland still noticed housing shortage comparing to the number of households (Żelazowski, K, 2011. GUS, 2012)¹. Polish housing market could be divided into two parts that include free market (individual, commercial and cooperative housing) and regulated (affordable housing and social housing).

Affordable housing is not so popular in Poland, and generally play rather marginal role comparing to other individual and commercial housing. The investors of affordable housing in Poland are mainly: municipal, companies (mainly for their workers) and Social Buildings Societies.

In Poland existed two types of activities that support affordable housing market on varied scale. First type of support is available for municipalities, that receive support for social housing by direct investment in new construction and renovation of old resourced (since 1990). Second type of support include implemented by government a number of programs that use direct and indirect financial instruments that were supporting housing market in Poland (Salamon, M,2015). The example of these instruments is: 1993-2001 - tax relief for the personal income tax, since 2004 - preferential VAT rate on construction materials and services.

¹ This deficit is calculated according to data of Polish Central Statistical Office. More about that: http://stat.gov.pl/cps/rde/xbcr/gus/lud_raport_z_wynikow_NSP2011.pdf

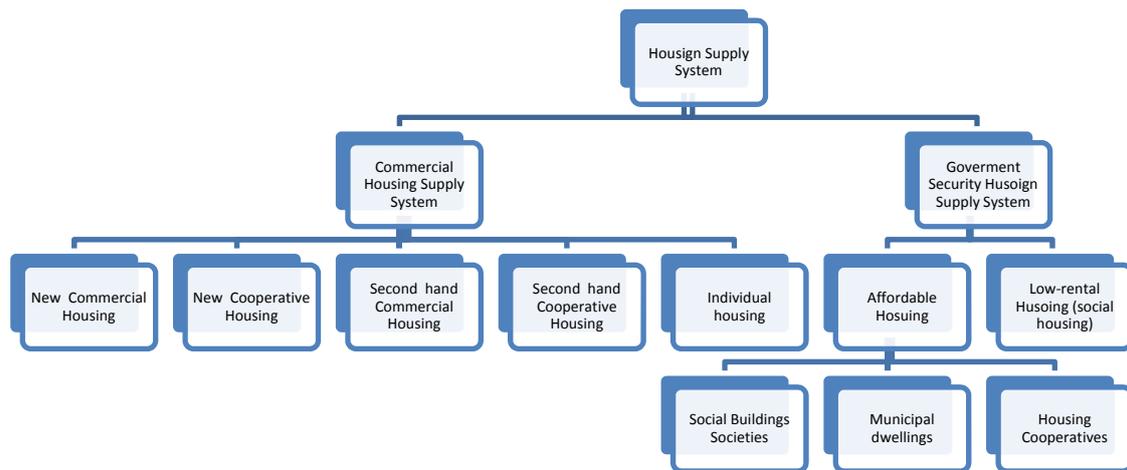

Figure 5 The Polish Housing Policy Supply System

Social Buildings Societies operate on the basis of the Act of 26 October 1995 concerning certain forms of support for housing construction (Ustawa z dnia 26. Października, 1995). Apartments for rent are financed up to 70% from credit and the rest by the natural or legal persons (30%) (Rozporządzenie Rady Ministrów z dnia 28 grudnia, 2001). In 1995 - 2009 functioned National Housing (Rozporządzenie rady Ministrów z dnia 4 lipca, 2000) Fund granting Social Buildings Societies and housing cooperatives preferential loans for social housing investments. Since 2009 Social Buildings Societies is not supported on large scale.

The development of affordable housing in Poland takes place in housing model that depend on the three types of government intervention: housing allowances, creating a new social rented housing sector (new program - announced by the government in 2016) and support households in obtaining the status of the owner-user. The new government perspective for affordable housing is "Apartment plus"¹ program with a scheme focused on stable, long-term rental, foresees building affordable housing on land owned by the state or state companies.

5 Conclusions

This paper describes that in AH project different stakeholders play role which have different and sometimes opposite interest. This paper presents a frame work to evaluate three different stakeholders in affordable housing project. In order to have a successful AH system, the need of these stakeholders should be satisfied at the same time. Main stakeholders in AH projects are: Government and regional policy, tenants and companies which provide AH services. For government and regional policy AHP priorities tools is suggested. To evaluate company performance, resources based view approaches is suggested using sense and respond tool and critical factor index. Finally to evaluate tenants needs, customer satisfaction questionnaire and open questionnaire is suggested. Affordable housing project was studied once in Finland in 2012 and this paper presents those results briefly. Besides, as the same studies have been started in different countries, therefore the paper also presents the AH situation in two of them: Poland and China.

As the tendency towards urbanization is growing rapidly and the conflict in different part of the world increases the number of immigrants and asylum seekers, therefore the AH studies has a curtail importance in any society. The paper tries to present a model towards a sustainable AH system in which the needs of all stakeholders can be fulfilled. This model can be used later on to compare how much AH achieve its goal in different societies. Above all, this model also suggests improvement plan for next step.

Open Data Innovation: Business Models, Taxonomies and Challenges: Insights from Existing Literature and Research Agenda

Wu Tong, Akbariah Mohd Mahdzir

Department of Management of Technology (MoT), Malaysia-Japan International Institute of Technology, Univeristy Teknologi Malaysia, Malaysia
(E-mail: wutong.cecilia@gmail.com, akbariah@utm.my)

Abstract: Open data is seen as a promising source of new businesses in the form of services, products and innovation solutions. Emerging opportunities for open data based business is broadly recognized and expected to generate large amount of social and economic value. However, the raw open data has little intrinsic value in itself, the economic value comes from a balanced combination of high quality data resources together with the right business model. As apparently marching of open data has brought so many aspects of the commercial development, the practice of constructing and implementing the right business model (BM) has proven to become an ever more important area of study in data based innovation. This paper is based on the state-of-the art knowledge explored from the literature, and aim to build up a “big picture” from the viewpoint of business models taxonomies, business model elements and combine with the related value network for open data businesses. The study also classified the enablers and barriers within an open data initiative that influence its commercial value.

Key words: Open data; Business model; Taxonomies; Barriers; Enablers

1 Introduction

The exponential growth of available and potentially valuable data have become an important parcel of modern digital economies. The increasingly use of technology and the subsequent generation and utilization of data compounded by Internet, social media, mobile devices have an embedded value that are encouraging us to re-think how social and economic value can be generated and appropriated (P. M. Hartmann ,2014). Recently, governmental and non-governmental organizations around world are increasingly opening up and publishing their data on the internet to allow everyone freely to use and reuse without restritions of copyrights, patents or other mechanisms of control, which often referred to as open data (A. Immonen, M. Palviainen, and E. Ovaska.2014). The benefits of open data are widely recognized towards greater government accountability, process improvement, operating costs reduction and business innovation in both government and commercial organizations (F. Ahmadi Zeleti,2014). In particular, the commercial re-use of open data has brought a promising economic potential to unlock more than \$3 trillion economic value across seven industrial domains (J. Manyika,2013).

While open data has little intrinsic value in itself, the main challenge in releasing social and commercial value is coming from the realization to the way that how open data can be reused from its “productization”, yet it becomes valuable when it is used (V. Dander ,2014; G. Magalhaes, et al ,2014; M. Janssen ,2012). Therefore, the open data industry requires the choice of the right business model as part of the innovation management to support open data companies to create and capture value. Yet, most business model concept covers only generic aspects without considering specific industrial characteristics. For instance, there are many impediments and challenges faced by organizations in the data economy should be identified as the adoption factors are ignored during the open data driven business model concept. In addition, there are no scholarly studies available that provide a sophisticated tool for open data businesses to describe, design and pivot those factors towards an open data business model. Hence, for many existing business model concepts will not be significant enough to carry out analyses, development and comparisons of open data business models, the question of what business models will be applicable remains (F. Ahmadi Zeleti,2014).

In this paper we attempt to answer the following research questions: *what types of business models are present among companies relying on open data as a resource, and what are enablers and barriers can be identified as important mechanisms in the processes of value creation?* With this research question we aim to address the niche in existing literature with regards to the business re-users who create value from open data. Hence, this paper builds up a comprehensive overview to identify the open data business model elements, taxonomies and related open data business value chains. Additionally, barriers and enablers have also been addressed towards the open data adoptions as the consequences for business model development. Some directions for further research have been outlined as well.

2 Open Data Business Value Network and Business Actors

A business ecosystem is a dynamic structure of organizations that work together as interconnecting and interacting parts, and the concept of value chains was coined to identify how value is created or co-created in order to achieve a product or service. The value chain model describes value-adding activities that connect an industry's supply side (e.g. raw materials) to its demand side (e.g. sales and marketing), which often carried out within traditional industries. While in more-tangible systems like data and information business environment, the original concept of value chain is becoming unsuitable to define. Thus in such data based business system, value is not created alone or not necessarily follow a linear model, but more accounts for the various interconnected network of actors that work together to co-produce value (J. Peppard and A. Rylander ,2006; L. Morgan, J. Feller, and P. Finnegan,2013). According to (A. Immonen, M. Palviainen, and E. Ovaska.2014), an open data based business ecosystem is formed by organizations that each has their own parts and know-how in the data-based business. The involving actors affect and are affected by the creation and delivery of the other business actors within the value network system.

Authors in (A. Immonen, M. Palviainen, and E. Ovaska.2014) defined five types of business model actors within the open data ecosystem (ODE). The five roles for the ODE's actors are data provider, service providers, application developer, infrastructure and tool providers and application user. Similarly, (J. Lindman, T. Kinnari, and M. Rossi, 2014) also investigates the merging open data value network structure and identify several business models actors. These value network participants are data analyzer, extract & transform, use experience provider, open data publisher, and support service and consultation. Researchers in (E. Ferro and M. Osella ,2013) identified four types of business model archetypal actors, namely core re-users, service advertisers, enablers and advertising factories (Deloitte, 2014) introduced the "open data marketplace" based on a network of independent organizations supplying and consuming open data services. The resulting five types of organizations are suppliers, aggregators, developers, enrichers, enablers and customers. Among these organizations, three of these belong to the group of intermediaries which between data suppliers and end customers to transform the raw data into a more useful format. The group of enablers provides support services to other organizations. In line with open data themes, (A. Latif, A. U. Saeed, et al,2009) focus on linked data and present the linked data value chain, a model that conceptualize the foundation for the development of business cases around the adoption of linked data. The identified participating business entities are: raw data provider, linked data provider, linked data application provider and end-user.

Whichever model it follows, the activities within the data driven environment do not follow a sequential structure, rather, activities can be executed in cycle and repeated on a data product/service. In addition, within the data value network, multiple actors can participate together of adding value to data for effective value creation and capture and result in a new data product.

3 Open Data Business Model Elements

A business model is a system of interconnected and interdependent activities that defines "how a firm does business" (R. Amit and C. Zott ,2012). In this study, we adopt the notion of business model provided by (A. Osterwalder ,2004), which consider a business model as a conceptual tool that contains a set of interrelated elements that allows a business to generate financial returns. Closely follows by the business model definitions is the extraction of compositional element (sometimes also named as component, building blocks) that describes what a business model is made of and supporting for the business conduction (A. Osterwalder ,2004; M. Morris, et al,2005; M. M. Al-Debei and D. Avison ,2010; H. Chesbrough,2002).

In the field of open data BM elements, (A. Immonen, M. Palviainen, and E. Ovaska.2014) formed a business model comprises eight elements, namely value proposition, key partners, co-creation, cost structure & revenue streams, customers/market, key channels, data structure and business development.(F. A. Zeleti, A. Ojo, and E. Curry,2016) have a rather generic view on open data business models. They derived a BM consisting of six categories, including value proposition, value adding process, value network, value in return, value capture, and value management, which named as 6V business model conceptual framework. Whereas it has little reflection towards open data industrial aspects (J. Lindman,et al,2014) borrowed a business model framework from software industry developed by (R. Rajala,2009) to consist of offering, revenue model, resources, relationships, and mind-set. Based on an exploratory case study, (G. Smith ,2016) identified four key elements of the marketplace has the potential to facilitate open data use, including: technical platform, websites, support

services, and knowledge sharing activities.

4 Open Data Business Model Taxonomies

Study in (E. Ferro and M. Osella ,2013) Identified four types of business model archetypal actors, namely core re-users, service advertisers, enablers and advertising factories as stated in the above section. On top of that, distinctive business model patterns emerged from each business model actors have been addressed. The resulting business model patterns are premium product/service, freemium product/service, open source like, infrastructural razor & blades, demand-oriented platform, supply-oriented platform, free as branded advertising and white-label development. Through case studies in understanding the diversity of open data utilization in the Netherland's context in (M. Janssen and A,2014) identified six business model taxonomies, including single-purpose apps, interactive apps, information aggregators, comparison models, open data repositories, and service platforms. Finally, grounded in the comprehensive data obtained from a sample of 500 firms that use open government data in U.S., (G. Magalhaes,et al ,2014) proposed a taxonomy that encompasses three business model archetypes in the context of the open government data ecosystem. These business model archetypes are enablers, facilitators, and integrators.

5 Enablers/Barriers of Open Data Value Creation

The process of utilizing data and creating value from the data is perceived as cumbersome and with challenges taking place on multiple levels to both the data publisher and data re-users (A. F. van Veenstra,2013). Within the data value network, value creation is both dependent on a number of perspectives and also results in impact on other dimensions (J. Cranefield ,2014). To this end, the identification of enablers and barriers is found critical to deal with in undertaking value creation efforts and more likely to help develop future open data business models as they control the extent how value is created(A. F. van Veenstra,2013; J. Cranefield ,2014; F. A. Zeleti and A. Ojo,2014).

5.1 Technical dimension

Technical issues mostly concern the data itself. As a practical matter, one significant challenge faced by open data users arise from working with poorly captured, maintained and described data of a generally low quality (M. Janssen ,2012; G. Smith ,2016; S. Martin,et al,2013). Since the open data is freely available from the data publisher, thus users and re-users have little or no control over the data they obtained. When the data does not meet sufficient levels of standards due to e.g. incomplete, missing information, unclear structure or trustless sources, efforts to develop services based on such data become fruitless. More problematically, data are often left scattered across a wide range of sources using inconsistent standards and formats (M. Janssen ,2012; G. Smith ,2016; M. A. Hossain,2015). For open data to be usable, compatibility is a serious concern as different parties may use incompatible dataset formats or platforms. Additionally, many data cannot be used due to language barriers (S. Martin ,2013). Furthermore, being able to use and make sense in large amount and structures of data remains a significant challenge which requires both technical facility and human skills and capabilities to access, link and interpret data from the available data (M. Janssen ,2012).

5.2 Organizational dimension

This dimension is concerned with the strategic aspects of the involved stakeholders. This is especially relevant for the data publishers. Due to the managerial barriers lack of awareness, knowledge and unwillingness to change of the leaders can severely impact data users by resulting in insufficient, poor quality and unsustainable data (G. Smith ,2016; M. A. Hossain,2015).

5.3 Governance and policy dimension

When data opened up, it become a common, shared resource, available for use to public and private stakeholders within an open network (T. Jetzek, et al,2014). Therefore, a lack of consistency and perseverance in public behaviors can also put risks for data re-users in case to sustainably rely on and use an open data. Many stakeholders expressed concerns about the willingness of the authorities to continue publish open data and establish policy to support the culture of open data growth. The government is the major player that regulates the open data market and data infrastructure that allows things to run continuously and sustainably. Making data and information resource accessible, discoverable, usable and reach to certain standardization can help fuel innovation, entrepreneurship and contribute to significant political, social and economical benefits. In order to let citizens and businesses be able to take full advantages of the information resources, governments should be promoting the openness and interoperability associated with open data to users or re-users in order to maximize its

value and deliver effective services.

The open government “ecosystem” will be essential dimension of the open data concept. The social, economical and technical infrastructures for creating, managing, sharing and maintaining data along with the governance structures and standards will be significant for the future open data development. In this way, supporting government policy can enable open data providers to profit from publishing data as well as to encourage re-users to coordinate the open data process.

5.4 Legal and license dimension

The issue here lies with the incompatibility of licenses and copyright for open data. In case of open government data, generally government initiatives strive towards publishing data in an open format and allowing the free access to use, re-use and distribution of data under open government license. However, some other public data might contain restrictions that prevent data with different licenses from being merged. A number of data products are based on multiple datasets mash-ups to create value. Thus, heterogeneous licenses across datasets for reuse are incompatible and raise challenges in managing the conditions of reuse open data.

5.5 Economic/financial dimension

Opening and using data both requires an extensive resource includes technical, human and financial resources that can be seen as major obstacles. New procedures and systems and business environment need to be established for processing, managing and maintaining data, and the benefits and financial return are unknown. In order to foster value creation and gain back commercial benefits, revenue should exceed the risks and costs.

5.6 Sustainable business model for the production of open data

Obtaining data for free on the Internet entails a risk that can weaken the data production process and jeopardize the data quality. In addition, the uncertainty on the extent and nature of the financial returns of the investment represents a clear risk for the sustainability of open data business development. Therefore, without clear addressed business models in the case of open data industry put risks regarding the commercial re-use of open data and turn it into meaningful and actionable product/services.

6 Conclusions and Future Work

In the digital economic society, value creation processes have the potential of extracting the maximum value from data through value mash ups. Open data initiatives introduced the possibility of sharing information between different entities and provide vast opportunities for the commercial development. All stakeholders of value creation can participate this openness of corporation through different roles to result in a data product. The major challenge in this public value is not open data itself, but how it become valuable through different other means.

This study has analyzed the existing business model taxonomies, business model elements and the open data business value network where various open data actors activated wherein. From there we can observe that the concepts of open data business model are increasingly raised attention but not well understood regarding a business model’s compositional elements. Most business model concepts applied cover generic business model aspects without considering the characteristics of open data industry. In contrast to the business model conceptualizations, the business model taxonomies and business model actors reflect the characteristics of the industry. It is clearly that in an open data business ecosystem, value is not created alone but more in a network of actors, where each has their own parts and know-how in the data-based business affect and are affected by the creation and delivery of the offerings of the other actors. This requires institutional environments to be cooperative and interactive thus to enhance resource and information exchange across intra- and inter-organizational boundaries in the context of creating business value.

With the identified barriers and enablers from different dimension as this study outlined, our research highlights the need for open data based organizations to take consideration of these factors as it affects the future of open data business models in value creation. In future research studies, researcher must take a holistic approach to re-think the processes that facilitate value creation and capture for open data based firms thus foster the implementation of the open data economy. A comprehensive business model framework is required that allow researchers and practitioners to design, describe, categorize, and analyze any kind of open data driven business model with consideration of both internal and external factors, and incorporating the characteristics of the open data industry.

Abstract: Most of the technical training providers in Malaysia offer hard skill training programs that designed to help increase and enhance knowledge and skills of participants. In conducting these programs, technical training providers use training modules designed by foreign writers as a primary source of instruction. It is important to evaluate the impact of training program as perceived by participant organizations and as measured by financial performance. The main objectives of this study was two-fold: (a) to discover the effectiveness of existing hard skill training program measurement model in Malaysia and (b) to formulate an integrated evaluation framework for hard skill training program in Malaysia. The effectiveness of existing hard skill training programs was determined based on whether or not the participants believed the hard skill training programs helped to increase and enhance their knowledge and skills. Hard skill training program effectiveness was further assessed by whether or not participants indicated they used the knowledge and skill in performing their duties.

Key words: Training effectiveness; Training evaluation; Hard skill training; Malaysia manufacturing industry

1 Introduction

The objective of this research was two-fold: (a) to discover the effectiveness of existing hard skill training program measurement model in Malaysia and (b) to formulate an integrated evaluation framework for hard skill training program in Malaysia.

For this study, the effectiveness of existing hard skill training programs was determined by assessing whether or not participants believed the hard skill training programs did assist in improving and enhancing their (a) understanding of program knowledge, (b) skills, and (c) attitudes.

Hard skill training effectiveness was further assessed by whether or not participants indicated they used the knowledge and skills gained from the hard skill training programs in performing their duties. The effectiveness of the hard skill training programs was evaluated by using an interview and observation.

1.1 Research questions

This research was addressed through the following research questions:

- 1) How did the hard skill training programs increase participant knowledge?
- 2) How did the hard skill training programs increase participant skills?
- 3) How did the hard skill training programs increase participant performance related attitudes?
- 4) How did the participants apply the acquired knowledge and skills in manufacturing industry?

1.2 Subjectivity statement

As a training manager in a training provider company, it is important for me to find out whether the training program conducted to participant has been effectively transferred the necessary knowledge. Most of the manufacturing company would like training provider to convince the human resource department that how the training provider can prove that the impact of training program from the training investments. The measurement of the either financial or non-financial will help to convince human resource department.

Therefore, it is important to develop a training program measurement model that can be adopted as framework for developing training programs and evaluating learning outcomes, which could benefit the manufacturing company. Further research need to be done by reviewing existing journal of what is the current research result on training evaluation related issue. The below section is the summary of the literature review on a few journals of the main topic covered. It is important to understand the latest development on the training evaluation that is still in research.

2 Literature Review

2.1 Training needs assessment

Needs assessment is considered to be part of the training program design process to improve the training effectiveness. The definition of needs assessment is “a systematic set of procedures undertaken for the purpose of setting priorities and making decisions about program or organizational improvement and allocation resources” (Witkin, B.R. & Altschuld, J. W ,1995). Training needs assessment is a process to collect raw data to identify training needs in order to develop a training program to achieve company vision and mission (Brown, J. ,2002).

2.2 Ways of conducting needs assessment

Normally, data gathering techniques are one of the common issues concern. Data gathering techniques consist of subject matter expertise’ consultants, survey questionnaires, observation, review of relevant documents, interview, tests, work samples and group discussion (Goldstein, I. L.,1993). Needs assessment data gathering methods can be divided into three data sources such as interview, archival data and analytical data (Witkin, B.R. & Altschuld, J. W ,1995). Currently, people use a specific model or analytical framework for training needs assessment compare to classical training needs assessment techniques mentioned earlier. Some of the latest specific models for training needs are fish boning, success mapping, human resource competency model and fault tree analysis (Witkin, B.R. & Altschuld, J. W,1995).

2.3 Roles of the training needs assessment

There are four major roles of training needs assessment (Brown, J. ,2002). The first role of training needs assessment is to identify specific problem in an organization to guide the training direction. The second roles of training needs assessment is to grant top management approval or interest for the training program. The third role of training needs assessment is the training needs assessment has to sets specific goals of the training programs which can be used as the criteria to evaluate the result of the training programs. The fourth role of training needs assessment is to capable of capturing the benefits from the training discrepancy analysis in result and the cost to have the training programs. The return of investment in training program will help the top management in making fast decision for approving the training programs (Gorman, P., et al,2003).

2.4 Training evaluation

Human resource development (HRD) scholars feel that the evaluation of training can be used to examine the impact of training on individual performance requirements and on organizational goals. The well-known evaluation framework is the Kirkpatrick model (Kirkpatrick, D.L. ,1996). The important of the Kirkpatrick model is the concentrate on the behavioral result of the learners from the training program (Mann, S. & Robertson, I.T. 1996). The Kirkpatrick model was introduced, a few approach of improvement of this model have been applied by different researchers to attempt to create an even realistic evaluation model.

2.5 Measures by evaluation level

Kirkpatrick’s evaluation model has been the famous applicable model in training evaluation. Many researchers have developed the new model base on the background of Kirkpatrick’s evaluation model (Alliger, G.M., et al,1997). From a research mentioned that not more than 10 percent of companies assess measure of behavioral change or organizational results (Van Burren,2002). Most of the company measure reaction level and second will be learning level. The most difficult measurement will be the business impact from the training program. Many researchers have started to identify the reliable measurements such as turnover rate, sales, cost, quality and productivity. The next section will be described the measurement has been identified to examine the fourth level of organizational result (Goldberg, M. & Ramos, L. 2003).

2.6 Measure of financial

Most of the time organizational used financial measures to examine impact of training to the company. Most of the research studied the impact of training based on individual returns from training (Jacobs, R.L. & Washington, C. 2003). The frequently use to measures training impact is the individual’s wage (Lynch, L. 1992). This measurement assumes that training will increase organizational performance and indirectly will improve the total wages of all employees. If company short term goal is to increase revenue, training impact related to growth will be the major criteria measurement for organizational performance (Kalleberg, A.L., & Van Burren, M.E. 1996).

Non-financial measure has been used by company in the recent study to assess training outcome (Leach, M.P. & Liu, A.H. 2003). Non-financial is used to measure such as turn-over rate, market share,

product quality, retention, employee satisfaction, organizational commitment and customer satisfaction (Leach, M.P. & Liu, A.H. 2003). There are not many reliable measures available to examine performance of participant on non-financial. These indicators of factor will be such as turnover rate, absenteeism, job satisfactory and organizational commitment (Leach, M.P. & Liu, A.H. 2003).

3 Methodology

The purpose of this research was two-fold: a) to discover the effectiveness of existing hard skill training programs in manufacturing industry of Malaysia and b) to formulate an integrated evaluation framework for hard skill training program in manufacturing industry of Malaysia.

This study focused on one of the in-plant hard skill training session for an iron ore manufacturing company in Sri Manjung, Perak. This is a three days in-plant hard skill training course for ten participants. All of the participants are mainly from maintenance department to learn about bearing technology and maintenance.

This study gathered information about hard skill training program and surveyed participants about their perceptions and views about the effectiveness of those hard skill training programs. The effectiveness of the programs was determined by whether or not participants believed, as indicated by the observation and sampling participant interview, that the hard skill training program did assist in improving and enhancing participants (a) knowledge, (b) skills, and (c) attitudes.

Procedures

The observation has been conducted during the hard skill training course is in progress. The observation is to monitoring the participants' reaction and learning attitude during the course.

Two participants were randomly selected from the ten participant based on individual's willingness to engage further. These interviews were conducted at the training classroom.

4 Results

The objective of this research was two-fold:(a) to discover the effectiveness of existing hard skill training programs in manufacturing industry of Malaysia and (b) to formulate an integrated evaluation framework for hard skill training program for participant in manufacturing industry of Malaysia. The effectiveness of existing hard skill training program was determined based on whether or not participants believed the hard skill training program did assist in improving and enhancing their (a) knowledge, (b) skill, and (c) attitudes. The effectiveness of hard skill training program was evaluated using an interview and observation.

In this chapter, the analysis of the data is reviewed. First discuss the participant for this hard skill training course and then the analysis of observation and interview data.

4.1 Participant demographics

All ten participants are male and responsible for the maintenance of the iron ore production line. All the participants have working experience ranging from 3 years until 16 years. All of them have been using the bearing but never have a formal training course related to the bearing. All the experience learned mainly through the on job training or from the senior.

Interview

Theme 1: Improve Knowledge

Both participants attended the training agreed that the hard skill training program did improve their knowledge.

Theme 2: Improve their Confidence in their work place

Both of the participants believed that after attended this class, they have confidence to handle the problem related to bearing issue.

Theme 3: Challenge of application of knowledge

Both of the participants have different idea on the application of knowledge in work place. Management support is important and the other one is team work among the colleague is the important factor.

4.2 Observation

This is a three full day in-plant hard skill training course to train participants about the bearing technology and maintenance. This hard skill training course will conduct through theoretical class about bearing and practical workshop on mounting and dismounting bearing with different method on different bearing type. The first day before the class start, there will be a pre-test with twenty objective questions of open book concept to answer within duration of one-hour time. The result from the

pre-test result showed that all of the participant score below ten correct answered and the highest score is seven correct and the lowest score is one correct. From the pre-test result, it showed that most of the participant has limited knowledge on the training program. At the last day of the training program, post-test has been conducted using the same question paper as pre-test, all of the participant score more than 10 with lowest score of 13 and highest score 17. This is the measuring learning due to training program as mentioned in the Kirkpatrick's level 2 learning. Participants willingness to improve their attitudes, their knowledge or their skill is the result of learning during the training program. Some common method of measuring learning is through course exam, tests, or survey measure this kind of change. At the end of this course, every participant will fill up an evaluation form mainly to measure the participants' reaction toward the training program. This evaluation form will collect data from the participant's reaction to the trainer, to the course content, and to the learning environment.

5 Summary, Conclusion, and Recommendations

Research question one. How did the hard skill training programs increase participant knowledge? The majority of participants believed that the hard skill training program increased and enhanced their knowledge.

Research question two. How did the hard skill training programs increase participant skills? The majority of the participants believed that the hard skill training program increased their skill.

Research question three. How did the hard skill training programs increase participant performance related attitudes? The majority of the participant believed that the hard skill training program enhanced their performance-related attitudes.

Research question four. How did the participants apply the acquired knowledge and skills in manufacturing industry? The majority of the participants will apply the knowledge and skill in their work place.

In conclusion, the hard skill training program was responsive to the individual needs and advanced their competencies and personal development. Therefore, participants were at ease in applying the knowledge and skill in their work place. The data is collected after the training program which might not be able to provide an ample time for them to apply in their work place. Therefore the Kirkpatrick level three measuring change in behavior due to the training that has taken place is much more complicated and costly.

A Discuss on Symbiotic Development of Financial Industry and Manufacturing Industry in Wuhan

Wang Zhenqiong

Institute of Strategies and Development in Manufacturing Industry in Wuhan, Jiangnan University,
Wuhan, P.R.China, 430056
(E-mail: 571179050@qq.com)

Abstract: Based on industrial symbiosis theory, with empirical analysis establishing regression model between GDP of Wuhan manufacturing industry and loan balance of financial institutions from 1998 to 2014, the work proved the symbiotic relationship between financial development and manufacturing industry in Wuhan. Through the data analysis, the result shows that the interaction and coordination between financial services and manufacturing industry in Wuhan is insufficient, mainly due to the insufficient financial support to manufacturing. Finally, the paper proposed the advice of optimizing and innovating financial services and promoting symbiotic development of financial and manufacturing in Wuhan.

Key words: Finance industry; Manufacturing industry; Symbiosis

1 Introduction

During the growth of modern economy, the highly development of manufacturing industry shows a new trend of "service". The border between manufacturing and service is becoming increasingly blurred, and the effect of service industry is growing in the value chain manufacturing industry. As a leading core of modern service industry, the financial industry is playing an increasingly important role in the development of the manufacturing industry.

Economic development of Wuhan depends greatly on the manufacturing industry. Although Wuhan has important manufacturing bases, the level of manufacturing industry is low in the global manufacturing chain. To enhance the core competitiveness of the manufacturing industry in Wuhan, promotion of symbiotic development and benign interaction between financial service and manufacturing of is needed.

"Symbiosis" is derived from biology, generally referring to relationship of living together, co-evolution or mutual inhibition between two or more different kinds of organisms (Yi Changjun, 2008). Symbiosis theory is introduced into the field of economics with its own development. Neusser and Kugler (1998) found an association between financial development and manufacturing through a study. Stiglitz (1998) creatively introduced the symbiosis theory into financial circles and opened a new road for the study of economic relations. The domestic research is mainly to test the theory based on Chinese situation, such as Bin Guoqiang (1999), which proved that finance can promote economic development by the method of measurement. Yuan Chunqing (2002) use biological symbiosis theory in academic research on finance for the first time, and the term "financial symbiosis" was born then. Hu Xiaopeng (2008) proposed a theory of the three characteristics in symbiosis when studying the symbiotic relationship between producer services and manufacturing industry, which are fusion, interaction and coordination.

This paper selects from GDP of Wuhan manufacturing industry and loan balance in financial institutions from 1998 to 2013, to test the symbiotic relationship between Wuhan financial and manufacturing industry using empirical analysis by establishing a regression model, and make recommendations with scientific basis in order to promote the symbiotic development of both.

2 Empirical Analysis of the Symbiotic Relationship Between Financial and Manufacturing Industry in Wuhan of China

2.1 Selection of variables and data processing

The data of output of manufacturing industry and the loan balance from financial institutions at current prices from 1998 to 2013 in Wuhan is got from the "Wuhan Statistical Yearbook". The reason of selecting the year 1998 as a start in the study is mainly due to that 1998 is a time when China's economy has entered a rapid development period and manufacturing grows fast, with the deepen of China's reform and opening and the introduction of foreign investment. The output of manufacturing industry(M) is summary GDP of 30 selected manufacturing sub-sectors (shown in Table 1 about the 30 sub-sectors in

manufacturing industry). In view of a bank-based financial system in China, and the main way of external financing is obtaining loans from banking sector, the loan balance of financial institutions in Wuhan over those years is selected as the financial development index (FN). Relevant data are shown in the following tables:

Table 1 List of Manufacturing Sub-Sectors

Agro-food processing	Food Manufacturing	Manufacturing	Tobacco	textiles	Textiles, clothings, shoes, hat
Leather, fur, feather products	Timber Processing, Bamboo, Cane, Palm, Straw Products	Manufacturing	Papermaking and paper products	Printing and copy of Recording Media	Education and sport articles
Petrochemical, coking and nuclear fuel processing	Chemical materials and products	Medicine	Fiber Manufacturing	Rubber products	Plastic products
Non-metallic mineral products	Ferrous metal smelting and rolling processing	Non-ferrous metal smelting and rolling processing	Metallic products	General equipment	Special equipment
Transportation Equipment	Electrical machinery and equipment manufacturing	Communication equipment, computers and other electronic equipment	Instrumentation and office machinery manufacturing	Crafts and other manufacturing	Waste resources and clothing waste processing

Source: Wuhan Statistical Yearbook

Table 2 Gross Output of Manufacturing Industry and Loan Balance in Financial Institutions from 1998 to 2013 of Wuhan (Unit: 100 million)

Year	Gross output manufacturing industry(M)	Loan balance in financial institutions(F)	Year	Gross output manufacturing industry(M)	Loan balance in financial institutions(F)
1998	654.08	495.78	2006	2548.19	3681.38
1999	703.65	574.81	2007	3149.28	4414.84

2.2 Scatter graph

We draw the scatter graph of the sample data using Eviews7.2 to get an intuitive linear relationship between Wuhan manufacturing industry and financial development, as shown in Figure1. By observing the scatter graph, we determine that there is a linear relationship between Wuhan manufacturing industry(M) and financial development (F). The econometric model can be built as: $M = \beta_1 + \beta_2 F + \mu$ (1) where β_1 is the constant term, β_2 is a coefficient, μ is the random error.

2.3 Parameter estimation

According to the data in Table 2, using OLS method, we obtained the regression function:

$$\hat{M}_i = -127.48 + 0.7385 \hat{F}_i \quad (2)$$

$$Se = (194.1975)(0.031334)$$

$$t = (-0.656442) (23.56730)$$

$$p = (0.5222) (0.0000)$$

$$R^2 = 0.975413 \quad DW = 1.634768$$

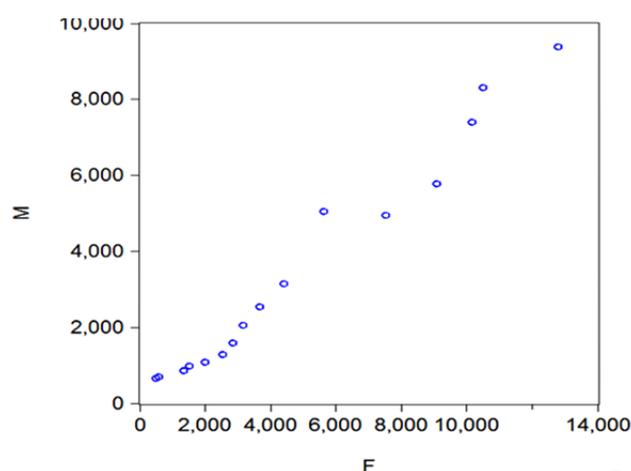

Figure 1 Scatter Graph of Manufacturing Industry and Financial Development of Wuhan

2.4 Evaluating and testing the regression analysis results

2.4.1 Evaluation of economic theory

According to the analysis about the relationship between financial development and manufacturing, we know the sizes and the signs of the parameters are consistent with theoretical analysis.

2.4.2 Statistical significance

Since β_1 and β_2 are deduced by the sample, even if their true value is zero, and we still cannot get an estimated value of zero due to fluctuations in the sample. Therefore, we determine the significance of the regression coefficients by t-test. In this analysis, the regression coefficient is statistically significantly different from 0, and the p -values are approximate to zero.

2.4.3 Fit goodness of regression model

To what extent the F-variables explains variation of variable M . In the above analysis, $R^2=0.9754$, which is a very good fit, shows that financial development explains 97.54% of the manufacturing industry in Wuhan.

2.4.4 Testing whether the regression model meets the Classic assumptions

Firstly, we make heteroscedasticity test using White test. The basic idea is that if there is heteroscedasticity, the variance σ_i^2 has some relationship with the explanatory variables, so we can determine heteroscedasticity through whether σ_i^2 is related to the explanatory variables. The calculated nR^2 is 3.239312 by the statistical software, given significance level $\alpha = 0.05$, checking X^2 -distribution table, we know $nR^2 \leq 5.991$, therefore, there is no heteroscedasticity.

Secondly, test the auto-correlation relationship. The results of the regression analysis shows that DW value is 1.634768, based on the sample size $n = 16$ and the number of explanatory variables k' , checking DW distribution table, the critical values are 1.10 d_L and $d_U = 1.37$, DW value is between the two, therefore, we cannot determine whether the serial correlation exists. Doing Lagrange multiplier test, we obtained $LM = nR^2 = 3.808057$, the corresponding P value equal to 0.1490, which is greater than the significance level 0.05, indicating that the model accepted the null hypothesis "there is no first-order autocorrelation".

Through the above results of regression test, we get the final regression model.

According to the above empirical test, we conclude that the symbiotic relationship between the financial sector and manufacturing in Wuhan exists.

3 Advice about Symbiosis Development Finance and Manufacturing Industry in Wuhan

Although symbiotic relationship between financial development and manufacturing in Wuhan exists, the interaction and coordination between the two is not enough, mainly support from financial service to manufacturing. In year 2014, traditional services in Hubei occupied 34.9% of the added value of total service industry, while the finance accounted for only 12.1%. Viewing from the implementation of funds invested in manufacturing, the self-financing accounted for more than 70%, indicating that support from finance to manufacturing industry is not enough. According to the financing needs of

private enterprises in the survey conducted by Wuhan Individual Association, a total of more than 800 private companies have expressed financing needs, the total amount needed is nearly 7.8 billion yuan, and mostly concentrated in the manufacturing sector. This shows that the loaning of small and medium manufacturing enterprises is difficult and the funding gap is large (Zhou Fang, 2011). Therefore, for the symbiosis and prosperity of financial and manufacturing industry in Wuhan, the financial service should be optimized and innovated.

3.1 Optimization of financial service

Reformation of credit management and improvement on credit financing system to manufacturing industry is demanded. Banks should establish the concept of co-development with the real economy, serve the real economy and the weakness of national economy; also they should change the credit marketing strategy, and place the financial business towards small and medium firms as a new strategy, make the appropriate mechanism innovation and system innovation. Banks even should segment market seriously, make differentiated development strategy, industry leading enterprises and good development prospects, offer preferential interest rates to the leading enterprises, as well as small and medium manufacturing enterprises with good economic indicators, reduce operating costs, provide financial support to transformation and upgrading of manufacturing industry, effectively solve the financing problem of the manufacturing sector.

3.2 Construction of multi-faceted financing channels for SMEs

Diversified financing channels should be opened up to solve the financing problem of SMEs in manufacturing industry chain. Also, we should encourage the development of local small and medium financial institutions, focusing on SME financing services, and develop financing companies, trust and investment companies, establish leasing companies, small loan companies, and diversified non-bank financial institutions such as various of professional loan companies, to meet financing needs for the development of manufacturing enterprises and create diversified financing channels. Establishing private banks and specialized loaning institutions by directing private capital is an effective way to solve the difficult loaning problem of small and medium private enterprises, while cutting down the lending rates by competition and improving banks' service form a virtuous cycle of manufacturing development and full use of private capital.

3.3 Innovation of financing method of manufacturing industry

New financing methods such as cluster financing and supply chain financing, should be explored.

Supply chain finance refers to a financing pattern in which the banks provide flexible financial products and services to the core and a plurality of upstream and downstream enterprises in an industry. This financing method exceeds the credit accessing requirement limits such as of traditional rating credit and mortgage guarantee, providing flexible financial products and services for its core and upstream and downstream enterprises in the supply chain, particularly solving the financing difficulties for small and medium enterprises. Wuhan should vigorously develop financial products and services focusing on manufacturing chain.

The phenomenon that SMEs in close contact with a large number of industries form a spatial cluster around a leading industry and they form a strongly sustainable competitive advantage through synergy is known as SME clusters. Practice has proved that the development of SME clusters promotes regional economic development, SME cluster has certain financial advantages. Wuhan should vigorously promote SME cluster development in manufacturing industry, implement and innovate SME cluster financing during their development.

4 Conclusions

This paper studies on two major aspects. On one hand, selecting the GDP from 1998 to 2013 manufacturing and loan balance of financial institutions in Wuhan, the paper makes empirical analysis on the symbiotic relationship between the financial industry and manufacturing in Wuhan based on the regression model, and proves the presence of the symbiotic relationship between the two. On the other hand, based on the status of financing difficulties for manufacturing enterprises in Hubei in recent years, puts forward that the financial support to manufacturing industry in Wuhan is not enough, and advances the advice that optimize and innovate financial services in Wuhan to promote symbiotic development of financial the manufacturing industries.

Abstract: With the rapid development of economy and shipping in the upper reaches of the Yangtze River basin, the transportation demand through the Three Gorges Dam will continue to increase. The ship backlog has become normal in front of the Three Gorges Dam. In order to alleviate the pressure of the Three Gorges ship lock, the strategy of emergency transshipment over dam is carried out. This paper takes Ro-Ro ships transshipment over the dam as an example, and establish a diversion port transportation system model in front of the Three Gorges Dam by using Arena simulation software, which simulates the future emergency shunt capability when the ships backlog occurred in front of the Three Gorges Dam port. The results indicate that, in the future, the demand of transshipment over the dam will continue to grow, while the capacity of the Three Gorges ship lock would be gradually saturate. As a result, there are excess emergency shunt capacities in the early time, but insufficient capacities later.

Key words: The three gorges dam hinge; Simulation; Transshipment; Emergency shunt capability

1 Introduction

Dam ship lock capacity has become a bottleneck restricting the development of the Yangtze River shipping. Ship backlog in front of dam has become normal. In order to avoid the backlog of ship, a large number of transshipment were passed over the dam. Therefore, it is extremely onerous and arduous to explore the emergency shunt capacity of the port in front of the Three Gorges dam, which is not only the need of improving the efficiency of the ship, but also the guarantee of the economic development of the Yangtze River Basin.

Port diversion system of the Three Gorges is a discrete system. At the same time, the transportation facilities and the activities of the port are driven by discrete events. It is difficult to realize the direct quantitative calculation or to establish the mathematical model, so the simulation model can be built by using the effective simulation technology.

In terms of the using simulation technology, the scholars such as Wang Yonghui developed the actual port operation process measurements simulation system based on simulation software Arena 3D player (Wang Yonghui, et al,2007). Liu Jingxian analyzed the characteristics of the port channel system and the ship traffic flow, established the port channel capacity model based on the characteristics of the ship's behavior (Liu Jingxian, 2009). Wu Dan used the theory of discrete time system simulation, established the channel through ability simulation calculation model, and used the simulation software Arena Rockwell to carry on the model realization (Wu Dan, et al, 2007). David Kelton W described the discrete system simulation theory in view of the simulation software Arena, and describe how to use Arena for discrete simulation modeling and optimization (W David Kelton,1998).

2 The Definition of Emergency Shunt Capacity in front of the Three Gorges Dam

In front of the Three Gorges Dam, there are three operating areas named Tai Ping River operating area, Mao Ping operation area and Jing Jiang River operating area, function as shunting capacity in front of the dam. These operation facilities are not only for the daily transport of dam, but also for maximizing the use of the remaining free resources to carry out the diversion of the Three Gorges Ship Lock's backlog of ships, the maximum throughput of these residual resources, that is, the emergency shunt capacity in front of the Three Gorges dam.

Consequently, the emergency shunt capacity in front of the Three Gorges Dam= Maximum throughput capacity of transshipment in front of the Three Gorges dam –the actual daily turning over dam throughput.

3 Simulation Modeling of Transferring in front of the Three Gorges Dam

3.1 Selection of simulation tools

This paper aims to draw the emergency capacity of the Three Gorges Dam on the ship's backlog. Furthermore, it is to simulate the normal port of the dam and the backlog of state, get the emergency diversion scheme and the freight volume under high load operation of port. Under this consideration, this paper chooses the Arena simulation software as the simulation tool.

Comparing to other simulation tools, Arena's simulation towards dam transshipment port of The Three Gorges can get a more specific result of whether the ability of dam-front ports' emergency transshipment satisfies the ships' dam-passing demands at critical moment, and judge whether the production ability of the port is insufficient or excess.

3.2 The hypothesis of the simulation system

At first, the model of the port transportation system of the Three Gorges project is established, and the model has two ship production events: The first ship production event simulates the ships turning over the dam in front of the Three Gorges Dam, input simulation parameter value; The second ship production event simulates the backlog of ship, by changing the input value, in the view of the different arrival time intervals, the utilization rate and queuing quantity of the quantity of the ship and the berth resources of the port are analyzed. We can calculate the port emergency capacity. Before the simulation by the following assumptions: 1) the arrival of the ship follows Poisson distribution; 2) port working, loading and unloading efficiency; 3) vessel operation without mutual interference; 4) good weather and no accidents; The idea and the steps of the simulation is shown in Figure 1.

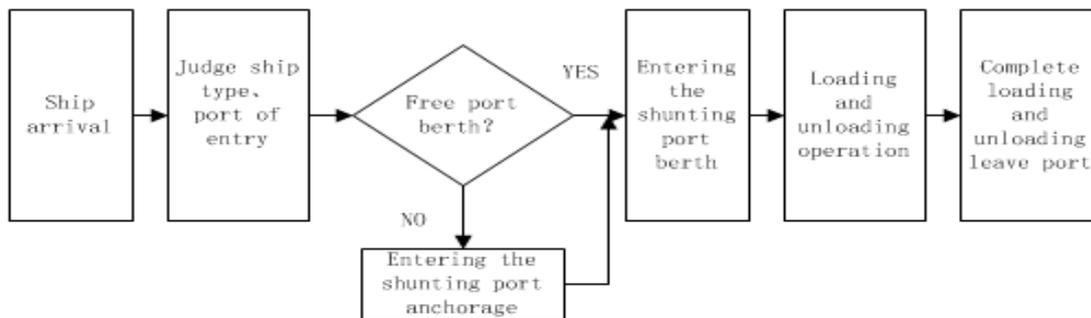

Figure 1 Ship Shunting Operation Logic Model

4 Defining the Simulation Parameters

Simulation models can be divided in to three sub-models according to their different positioning which are dam-transshipment demand sub-model, backlog of ship sub-model and diversion port sub-model with main input parameters of the law and amount of emergency diversion, the amount of quay berth, the proportion between diversion ships and ro-ro ships, the time of loading and unloading ro-ro ships, the carrying capacity of ships, the judgment variable of completing diversion, etc. Since there are so many variables, here only presents an example of emergency diversion to indicate.

According to the annual statistical yearbook and Yearbook, the combination of exponential smoothing method, grey model and correlation analysis are uses to predict the Ro-Ro terminal throughput in front of the Three Gorges Dam transshipment port, which are 2016, 2020, 2030 are 1310.73 million tons in 2016, 2103.73 million tons in 2020, and 5449.14 million tons in 2030.

5 Results Output and Verification

5.1 Simulation of the shunting capacities in the transshipment port

1) Simulation of the shunting capacities in the transshipment port in 2016

The input was obtained from the actual materials to the model. At the same time, simulation is to get the emergency shunt capacity of the transshipment port, so the ship production number of the backlog of ship model is changed, the parameter λ of the sub model of the backlog model is a variable. The record data are as shown in Table 1.

From Table 1, it can be seen that, when the time interval is 1 h, the system stranded ship number is 4, resource utilization rate is 0.9; when the time interval is shortened for 0.5h, system stranded ship number increased to 387 ships, terminal resources utilization rate also increased to 1. It is clear that the average time interval from 0.6h reduced to 0.5h, the stranded ship quantity, resource utilization rate is

increasing rapidly. The time interval continues to decreasing, resource utilization is still 1, while the average queuing time of the ship continued to rise, so need to find the critical point of the terminal resource utilization rate of 1 in the 0.5-0.6 time interval. The λ in 0.5-0.6 value, repeatedly operating model, that when λ is less than or equal to 0.55, resource utilization rate is 1, stranded ship and queuing time continued to increase. At this time, the backlog of vessel departure is the maximum ship emergency diversion Tai Ping River operation area of Ro-Ro Terminal number.

Table 1 Simulation Results of Ro-Ro Terminal in Tai Ping Operations Area

λ	Stranded ship in the system	Resource utilization	Average queuing time
1	4	0.903	5.57
0.9	1	0.910	5.72
0.8	15	0.917	6.38
0.7	7	0.936	7.03
0.6	20	0.948	8.18
0.5	387	1	8.76
0.4	319	1	10.34

When the time interval is 0.55 h, the backlog of Ro-Ro ship number is 14054, the completion of the operation of the rolling stock vehicles is 420.8thousands from the simulation report. According to the historical data, the load of each rolling truck is 35t, so it can be calculated that in 2016, the emergency shunting capacity of the Ro-Ro Terminal in the Tai Ping River operation area is 14728 thousand tons per year.

2) Simulation of the shunting capacities in the transshipment port in 2020

Compared with 2016, the simulation model of the pre dam transit port in 2020 is different from the module and the parameters of the working area in Tai Ping River, and the parameters are different. So this section only lists the different parts of the parameter input in 2016. Port simulation model parameters of the port before the dam in 2020 are as shown in table 2.

Table 2 Simulation Parameter Input of the Transshipment in 2020

Module		Meaning	Parameter	Parameter values
Ship production sub model	Create (Roll ship)	Number of ships produced	λ	0.45
	Create (cargo ship)	number of ships produced	λ	3.02
Shunting Port sub-model	Seize dam tpx1	number of ro-ro berths of Taiping operation area	dam tpx1	4
	Seize dam mp1	number of ro-ro berths of Maoping operation area	dam mp1	3
	Seize dam mp2	number of ro-ro berths of Maoping operation	dam mp1	2

The simulation results of the rolling loading dock in the Tai Ping River operation area are as shown in table 3.

Table 3 Simulation Results of Ro-Ro Terminal in Tai Ping Operations Area

λ	Stranded ship in the system	Resource utilization	Average queuing time
0.8	4	0.7365	0.3857
0.7	0	0.7602	0.4333
0.6	4	0.7999	0.5344
0.5	3	0.8413	0.6615
0.4	0	0.9089	0.9821
0.3	6	1	4.793
0.2	120	1	7.5211

It can be seen from table 3 that, when the time interval is shortened from 0.4h to 0.3h, the stranded

ship quantity, resource utilization rate is increasing rapidly. The time interval continues to decreasing, resource utilization is still 1, while the average queuing time of the ship continued to rise. When λ is less than or equal to 0.37, resource utilization rate is 1, stranded ship and queuing time continued to increase. At this time, the backlog of vessel departure is the maximum ship emergency diversion Tai Ping River operation area of Ro-Ro Terminal number. When the time interval is 0.37 h, the backlog of Ro-Ro ship number is 20960, the completion of the operation of the rolling stock vehicles is 641.4 thousand from the simulation report. According to the historical data, the load of each rolling truck is 35t, so it can be calculated that in 2020, the emergency shunting capacity of the Ro Ro Terminal in the Tai Ping River operation area is 22449 thousand tons per year.

3) Simulation of the shunting capacities in the transshipment port in 2030

According to the construction period, the simulation model of the diversion in the transshipment port in 2030 is basically the same as the simulation model in 2020.

When λ is less than or equal to 0.68, resource utilization rate is 1, stranded ship and queuing time continued to increase. When the time interval is 0.68 h, the backlog of Ro-Ro ship number is 11666, the completion of the operation of the rolling stock vehicles is 358.2 thousand from the simulation report. It can be calculated that in 2030, the emergency shunting capacity of the Ro-Ro Terminal in the Tai Ping River operation area is 12536.4 thousand tons per year.

Table 4 Emergency Capability of Ro-Ro Terminal in Tai Ping Operation Area

Year	2016	2020	2030
Roll vehicle (10 ⁴ vehicles)	42.08	64.14	35.82
Distributary ability (10 ⁴ tons/year)	1472.8	2244.9	1253.64

Compare the Three Gorges ship lockage freight demand with the Three Gorges ship lock through capacity, the transshipment demand over the Three Gorges ship lock will continue to grow, and the Three Gorges ship lock through capacity has reached saturation. The one-way freight capability gap has reached 680 million tons in 2016, 11.3 million tons in 2020, and 35.5 million tons in 2030 in Tai Ping River operation area through the, . As shown in table 5.

Table 5 Supply and Demand Balance Analysis of Ro-Ro Terminal in Tai Ping Operation Area

	2016	2020	2030
Unidirectional freight capacity gap of Ro-Ro terminal in Tai Ping operation area(10 ⁴ tons/year)	680	1130	3550
Emergency bypass capability of Ro-Ro terminal in Tai Ping operation area(10 ⁴ tons/year)	1472.8	2244.9	1253.64

6 Conclusions

From the simulation results of each operation area of the Three Gorges project, it can be seen that the emergency shunting capacity in transshipment port in front of the Three Gorges Dam is surplus in the early stage, but insufficient from 2020. As a result, the following Practical guidance are put forward:

1) Before 2020, the relevant departments for the new terminal construction project should be strict to check and build approval system.

2) From 2020 to 2030, the construction of the new terminal can enter the preparation and construction stage on the basis of the scientific prediction of the capacity and throughput of the port. . Reasonable layout of the port to avoid blind construction

3) After 2030, adjusting the structure of the port, optimization and integration to the port area to use them reasonable.

In addition, reasonable to improve the utilization rate of berth. Make a schedule to increase the number of berths in the future construction. In order to the problem of the ship backlog, it is suggested that the number of berths in the transshipment in front of the Three Gorges Dam should be planned step by step.

Research on the Evaluation Method of Logistics Service Innovation Based on the Perspective of Logistics Cost

Zhang Jianming

Wuhan Huaxia Institute of Technology, Wuhan, P.R.China, 430223

(E-mail: huozhetree@163.com)

Abstract: This paper puts forward that the logistics cost is one of the factors that affect the logistics service innovation. And hierarchical structure model of logistics service in the view of logistics cost is put forward based on the analysis of the relationship between logistics service and logistics cost. By using the value engineering analysis method, the relationship between design function of logistics service innovation and life cycle cost of logistics service is analyzed, and the value evaluation model of logistics service innovation is put forward, which provides a set of scientific evaluation method for enterprises to develop logistics service innovation.

Key words: Logistics cost; Logistics service; Service innovation; Evaluation method

1 Introduction

European scholars first launched research on service innovation. CIS (2007) following the view of technical school held that, for the enterprise, service innovation is the innovation of new or improved products, process and delivery. Some domestic scholars also define the connotation of service innovation. Lin Lei & Wu Guisheng (2007) held that the service innovation is a broad concept, and service innovation activities occur not only in the service sector but also in other industries and sectors. These scholars put forward that the generalized service innovation refers to all service innovation behavior and activity related to or aimed at service; the service innovation in narrow sense refers to the innovation behavior and activity occurring in the service industry. Therefore, it can be considered that logistics service innovation includes not only the service innovation occurring in the logistics enterprise, but also logistics service innovation occurring in production and trade enterprises. Specifically, logistics service innovation refers to the process in which enterprises under the guidance of the innovative strategy and to meet customers' demand, apply various new logistics technology which is mainly based on the modern information technology, innovate logistics management ideas and methods, improve or develop logistics service products and processes, innovate logistics service content, implement strategy of logistics differentiation, improve the logistics service quality, create value for customers and at the same time improve performance of the enterprises, and gradually form the core competitiveness of enterprises. Logistics service innovation is a systematic and complex project, and the factors that affect the innovation of logistics service are various.

2 Literature Review and the Influence Factors of Logistics Service Innovation

2.1 Knowledge factor

Kan-dampull (2002) held that the key of the service innovation lies in the knowledge, technology and relationship network. He believed that knowledge is very necessary in the exploration process of logistics service innovation, and pointed out that the technology and ability are the best representation of knowledge and the key of logistics service innovation is to carry out knowledge management within and between companies. Chapman et al (2003) discussed that the knowledge and other factors will affect the logistics service innovation, and discussed the contribution of logistics service innovation to enterprises. Flint et al (2005) through interviews with experienced senior logistics managers in the United States, Europe and Scandinavia, created a process model of logistics service innovation which is composed of four parts, including establishing contact with customers, collecting information of all the customers, discussing and exactly reflecting customers' information, and the mutual learning and mutual discussion among organizations.

2.2 Relationship network factors

Chapman et al. (2003) also pointed out that the relationship network will be able to lead to the innovation of logistics service. They thought that enterprises need to work together to understand customers' needs and meet customers' demand and potential demand, and the enterprise can form horizontal or vertical alliance with other enterprises, to acquire knowledge their own businesses cannot get. Hakansson, et al (2004) also found in the study that cooperation can lead to innovation.

2.3 Technical factors

Richey et al (2005) explained the importance of logistics service innovation in the field of reverse logistics in an empirical study on the reverse logistics by using "resource advantage" theory, and pointed out that the technical resources play a positive role in reverse logistics service innovation. Chapman et al (2003) pointed out that technology plays an important role in overcoming the inconvenience of time, space and communication; technology can provide more effective knowledge sharing for the enterprise; in order to adapt to the application of new technology tools, enterprise must carry out business process innovation.

2.4 Cost factor

Fu Guilin (2007) held that the logistics cost refers to various fees accompanied by the activities of enterprise logistics service, the monetary expression of materialized labor and living labor consumed in logistics service activities, the sum of manpower, financial power and material resources expended in the process of goods' physical movement, such as transportation, warehousing, loading and unloading handling, packaging, circulation processing, distribution and logistics information processing. As long as the logistics activities occur, expenditures of logistics costs will be generated. This paper will focus on the relationship between logistics service innovation and logistics cost, and construct the evaluation method of logistics service innovation.

3 Analysis of Logistics Service Innovation from the Perspective of Cost

3.1 Analysis of the relationship between logistics cost and logistics service

Logistics service is the results of enterprise's carrying out a series of logistics activities to meet the logistics demand of customers, including internal and external customers. The essence of logistics is service, and it itself does not create the form utility of commodity, but the space utility and time utility. Logistics service belongs to the category of customer service, and it is the main component of customer service. The logistics service here mainly includes the following three constitute elements: customers' expected commodity (stocking assurance); delivery of goods in customers' expected time (transport assurance); meeting customers' expectations of quality (quality assurance).

In the relationship between logistics cost and logistics service, the logistics cost control is the form, the logistics service is the content, and the coordinated development of the content and the form is the responsibility of modern enterprise logistics management. It is the essence of the logistics management theory of modern enterprise to achieve the service level which satisfies customer with the lowest logistics cost.

The relationship between logistics cost and logistics service is the trade-off relation. Logistics service of high level is guaranteed by logistics cost of high level. In the absence of a large technical progress, it is difficult for the enterprise to not only improve the level of logistics services, but also reduce the logistics cost. Logistics management is the process with the aim of meeting customer demand to the maximum, to organize with efficient and economical means the movement and storage of the raw materials, semi-finished goods, finished goods and related information from supply place to consumption place, and to implement solution, organization, command, coordination and control. Therefore, customer demand has become the driving force to lead the enterprise to carry out the strategic adjustment of logistics; customer service has become a strategic means of enterprise competition. There is no end to the logistics service innovation, and a key factor restricting the logistics service innovation is the logistics cost. How to coordinate the relationship between logistics service innovation and logistics cost is an important issue in logistics management?

3.2 Analysis of hierarchical structure of logistics service from the perspective of logistics cost

The two core elements of logistics capability, logistics service and logistics cost are contradictory and complex. To more accurately describe the present situation and the change range of logistics capability, with logistics cost level and logistics service level as the two axes, divide logistics cost level and logistics service level into high, medium and low gears, and form nine kinds of logistics capability section. The logistics capability status of each section is different and variable, and there are many kinds of changes. As shown in figure 1.

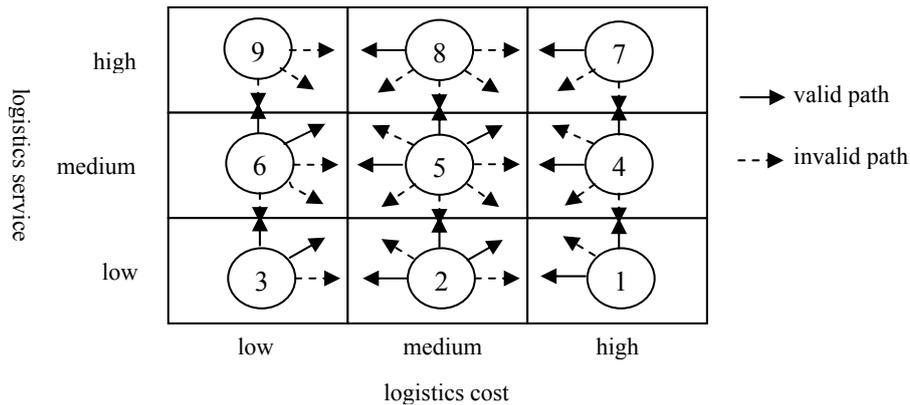

Figure 1 Hierarchical Structure Model of Logistics Service from the Perspective of Logistics Cost

4 Construction of Value Evaluation Model of Logistics Service Innovation

4.1 Theoretical basis

The value evaluation model of logistics service innovation in this paper is based on the value engineering analysis method. All the expenses of logistics costs are decided by logistics system design before the beginning of logistics service activities. Therefore, the decision-making of the logistics service innovation can choose the best program in the design stage of logistics innovation ability, through the value engineering analysis of logistics service innovation activities and logistics cost. Value engineering focuses on function analysis, so that all the tasks of logistics achieve the appropriate value, that is, to achieve and create the necessary functions of logistics services with the lowest cost.

1) Value engineering is to realize the necessary function of a logistics service activity with the lowest cost in order to achieve the best value of logistics service, in which the function is the function or the effect of a logistics service. Function first meets the needs of consumers as a precondition, and the improvement of the function is unlimited, but it is also subject to customer demand and cost constraints. Value engineering is to determine the necessary function of logistics service innovation, to avoid the phenomenon of excess function and insufficient function. Cost refers to the life cycle cost of logistics service, that is, the costs that occur to realize the necessary function of logistics service in the whole process of logistics service. Value engineering is to make the life cost lowest under the premise of ensuring the necessary functions of logistics services.

2) Value engineering is to find the best value according to the internal links of the logistics service costs and functions, and through scientific comparative analysis. Carrying out the logistics service innovation cannot be separated from the constraints of customer's cost, in one-sided pursuit of high function, but also cannot be separated from the customer's demand, in one-sided pursuit of low cost, resulting in the deficiency of necessary functions of logistics services. The real purpose of value engineering is to realize the necessary function of logistics service innovation, and to reduce the life cycle cost of logistics service, and to pursue the best value of logistics service innovation.

3) The core problem of value engineering is to analyze the function of logistics service activities. In the process of logistics service innovation, the analysis and research on the function of logistics service innovation is focused on, to determine the effective method to realize the necessary functional optimization. Through the functional analysis it can be discovered which function customers need, which function is unnecessary, which function is excess, and which function is insufficient, so that the function of logistics service innovation is more reasonable, to not only meet customers' needs, ensuring the necessary function, but also reduce the life cycle cost of logistics service innovation.

4.2 Value evaluation model of logistics service innovation

According to the value engineering analysis method, based on the relational adaptation degree between the design function of logistics service innovation and life cycle cost of logistics service, the value evaluation model of logistics service innovation is proposed: logistics service innovation value coefficient = logistics service function coefficient / logistics cost coefficient,

That is
$$FCR_i = FR_i / CR_i \tag{1}$$

In this equation,

FCR_i represents the logistics service innovation value coefficient;

FR_i represents the logistics service function coefficient;

CR_i represents the logistics cost coefficient;

C represents cost

F represents the various functions of logistics service innovation

According to the functional comprehensive average score of logistics service innovation solution, the function coefficient is calculated, that is, the proportion of the functional comprehensive average score of a solution in functional comprehensive average score of all solutions. Let F_i denote the functional comprehensive average score of a solution, then the function coefficient of the scheme is

$FR_i = F_i / \sum F_i$. According to the estimated total investment of service innovation program, the cost coefficient is calculated, that is, the proportion of the estimated investment of service innovation project in the total investment. Let C_i denote total investment of an innovative solution, then the cost coefficient

of the solution is $CR_i = C_i / \sum C_i$. The function coefficient and cost coefficient of an innovative solution is compared, and the ratio of function cost coefficient is calculated, to evaluate the adaptation degree of the investment and the function of the innovation solution. If FCR_i is close to 1, indicating that the design function of the service innovation solution roughly adapts to the expected investment, the solution is desirable; If FCR_i is more than 1, indicating that the function evaluation of service innovation solution is relatively high, while investment is insufficient, it is possible that the design function is difficult to achieve; if FCR_i is less than 1, indicating function evaluation of the service innovation solution is relatively low, but the investment is too high, it may result in excess function or waste of investment.

4.3 Value band analysis of logistics service innovation

The so-called value band of logistics service innovation is the value range of logistics service innovation. Generally speaking, the value range of logistics service innovation can be divided into two types, which are rational range and irrational range. Rational range is that the design capacity of logistics service innovation basically adapts to life cycle cost of the logistics service, that is, the value coefficient of the logistics service innovation is close to 1. Irrational range is that the design capability of logistics service innovation does not adapts to the life cycle cost of logistics service, that is, the value coefficient of logistics service innovation is far greater than 1, or far less than 1. As shown in Figure 2, the green value band is rational range, the red value band is irrational range, and the yellow value band is between the rational and irrational.

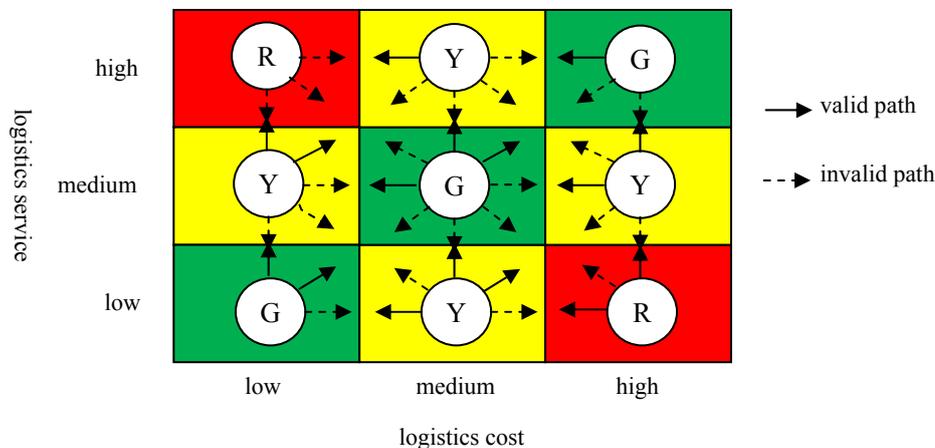

Figure 2 Distribution of Value Band of Logistics Service Innovation

Of course, this approach evaluates the innovative solutions only from the point of view that design function of the logistics service innovation adapts to investment costs. In addition, whether solution of logistics service innovation is feasible should be evaluated be based on the indicators such as payback period of investment, rate of income on investment, customer satisfaction and core competitiveness, which is not involved in this paper.

5 Conclusions

The research on logistics service innovation by scholars at home and abroad has formed a relatively completed system, including the theoretical basis and research perspective of logistics service innovation. However, the breadth and depth of logistics innovation research is still far from enough, and

there is little research on the mechanism of logistics service innovation and logistics service innovation management and other aspects. The influencing factors of logistics service innovation value include knowledge, network, technology and cost. For the first time from the perspective of logistics cost, this paper analyzes the relationship between logistics service and logistics cost and proposes the logistics service hierarchy model from the perspective of logistics cost; using the value engineering analysis method, analyzes the relationship between the design function of logistics service innovation and life cycle cost of logistics service, and puts forward a set of evaluation method for logistics service innovation value. The following research perspective will continuously focus on logistics cost, and will construct logistics service innovation system and establish management system of logistics service innovation.

A Critical Review of Cultural Approach to the Brand

Mahmoud Akbarieh Yazdi, Cheng Yanxia

School of Management, Wuhan University of Technology, Wuhan, P.R.China, 430070

(E-mail: Mahmoud_akbarieh@yahoo.com, chengyanxia221@126.com)

Abstract: Cultural branding is a new approach emerged in the early 2000s. Theoretical background of this approach rooted in customer culture theory. This approach by using hermeneutic methods considers how branding affects culture and how culture affects branding. In this research first we focused on literature and theoretical background of this approach. According to literature and related researches in marketing, social studies and psychology we presented a critical review of cultural approach in international branding. we extracted four weaknesses for cultural branding which are: needs, wants and demands are regarded same, Branding in this approach has two tools and don't use from all potentials and capabilities, Cultural branding doesn't consider culture as a multi-layer construct and Cultural approach is applicable in countries and societies which are in terms of physical, safety and belongingness needs are in good condition not in all countries.

Key words: Culture; Brand; Consumer culture theory

1 Introduction

There are two streams that have classified different approaches in branding and brand management. Heding extracted seven approaches encompassing: economic approach, identity approach, consumer-based approach, personality approach, relational approach, community approach and cultural approach.(Heding, Knudtzen & Bjerre, n.d., 2008) Cultural approach introduced by Holt's works. Holt through case study provided 4 models for managing brands: viral branding, emotional branding, mind-share branding and cultural branding (Holt,1998). Cultural branding focus on cultural layers behind brand and their interactions. This approach by focusing on iconic brands argue that how they create a stream that dictate a culture to the society. Introducing new elements to the culture that affect it, is the strategy of this approach to transfer the meaning to society. In fact, marketer should transfer meaning to the customer by utilizing advertisement and fashion system.

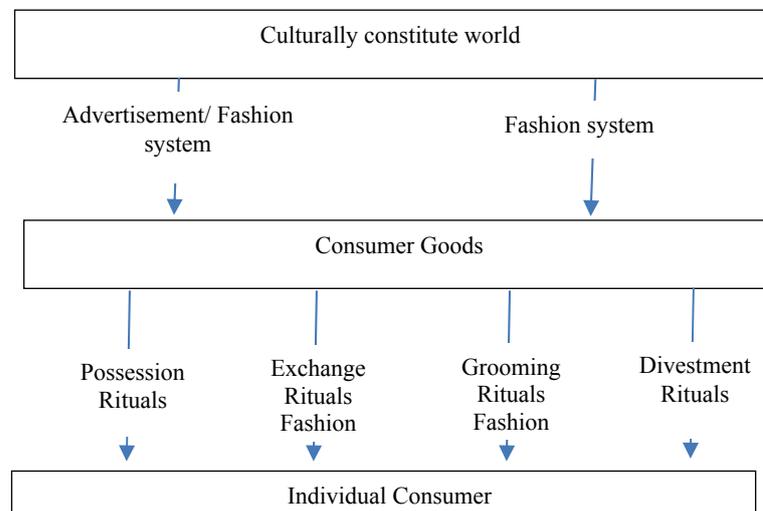

Figure 1 The Movement of Meaning

In this paper we are going to have a critical view to cultural approach. We will review this approach to highlight its flaws and explain that this approach is applicable in specific situations and has distinct requirements which related to environmental factors. Herein, we first review related literature and its theoretical background and then we will discuss about its flaws.

2 Cultural Approach

Cultural approach focus on the brand as a cultural artifact which can broaden the focus of analysis

from an individual consumer level to a macro level about the role brands play in consumer culture. This approach studies the effect of culture on brands and vice versa. Brand icons and the counter cultural anti-branding movements are the core of the cultural approach. Iconic brands are the ones that have managed to integrate themselves in culture more skillfully than others. At the same time, brand icons are also subjected to the greatest concerns regarding cultural imperialism, cultural standardization and globalization. Core to the cultural approach is the idea of the marketer deliberately endowing the brand with cultural meaning and through that playing an active role in consumer culture. The brand is seen as a storied product putting shared myths relating to cultural identity projects up for consumption. The cultural approach reveals the mechanisms behind brands becoming icons. At the same time, the approach also relates to a consumer culture increasingly concerned with the branded products, pressuring for changes in the way brands behave. (Heding, Knudtzen & Bjerre, N.D., 2008)

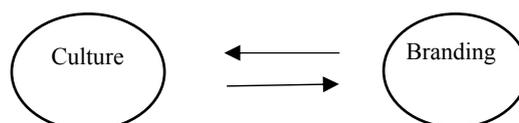

Figure 1 How Does Branding Affect Culture?

3 Consumer Culture Theory

Theoretical background of cultural approach rooted in consumer culture theory. Consumer culture theory is a marketing school of thought interested in studying consumption choices and behaviors from a social and cultural point of view, as opposed to an economic or psychological one. It does not offer a grand unifying theory but "refers to a family of theoretical perspectives that address the dynamic relationships between consumer actions, the marketplace, and cultural meanings". CCT has advanced consumer behavior knowledge by illuminating sociocultural processes and structures related to (1) consumer identity projects, (2) marketplace cultures, (3) the socio-historic patterning of consumption, and (4) mass-mediated marketplace ideologies and consumers' interpretive strategies. (Holt, 1997) (Holt, 2003a) (Holt, 2003b)

4 Discussion

We reviewed the cultural approach and how it has evolved. Now we discuss to criticize cultural branding approach.

4.1 Needs, wants and demands are not same

Needs wants and demands are a part of basic marketing principles. Though they are three simple words, they hold a very complex meaning behind them along with a huge differentiation factor. In fact, a product can be differentiated on the basis of whether it satisfies a customer's needs, wants or demands. (Kotler & Armstrong, 2001)

Needs – Human needs are the basic requirements and include food clothing and shelter. Without these humans cannot survive. An extended part of needs today has become education and healthcare. Generally, the products which fall under the needs category of products do not require a push. Instead the customer buys it themselves.

Wants – Wants are a step ahead of needs and are largely dependent on the needs of humans themselves. For example, taking a bath is a need but taking bath with the best soaps is not a need. Thus Wants are not mandatory part of life. For example, a good smelling soap is not a need but a want.

Demands – A step ahead of wants is demands. When an individual wants something which is premium, but he also has the ability to buy it, then these wants are converted to demands. The basic difference between wants and demands is desire. A customer may desire something but he may not be able to fulfill his desire. The needs want and demands are a very important component of marketing because they help the marketer decide the products which he needs to offer in the market.

It seems that in cultural approach need is forgotten. The focus of researchers is on want not need. So sometimes they forget that what is substantial and intrinsic is need. This approach focus on advertising that they should design an advertisement. Modern and postmodern techniques introduced by Holt is a review from all of these topic. Holt mentioned there are three principle techniques in modern branding paradigm: Cultural engineering, scientific branding and Freudian branding. In modern paradigm, consumer was assumed as a compelled person that brand by advertisements should seduce him/her to

buy service or product. In postmodern paradigm assumed consumer is free and can choose product/service. The company cannot force customers to buy specific product. Even they can show reaction and do against branding. Reflexive Resistance and Creative Resistance are some techniques which consumers use them to counteract branding. Holt counted 5 techniques for branding: Relevant and Authentic Cultural Resources, Ironic, Reflexive Brand Persona., Coat tailing on Cultural Epicenters, Life World Emplacement, and Stealth Branding. (Holt, 1998) The first pitfall of forgetting the need is marketing myopia. (Levitt, 1960)

4.2 Branding in this approach has just two tools: advertisement and fashion

But marketers have other instrument which can apply them in branding. Price, product, people and price are other tools that can be capable in cultural branding. The main theme of cultural branding is culture can transfer through branding. In fact, in this approach brand interact with culture in macro level. So advertising and fashion are bold. But we think other factors like people and price also can be affective.

4.3 Cultural branding doesn't consider culture as a multi-layer construct

Culture has three layers: Basic assumption, norms and values, artifacts and symbols. Branding can interact more with the third layer. In fact, brand can be a part of third layer- artifacts. But values and basic assumption are tough and change barely. Even acting unlike them may result in defect. For example, the logo of Nike that was like "Allah" means God in Arabic. Nike used this logo for shoes and carve it on the back of shoes. This was an insulting for Muslims so they boycotted Nike products. Honda Motor cycle is another example. In Unite states it was obscene a lady rides a motor cycle. Honda company design an advertisement shows a lady is riding a motor cycle. Through this they changed a norm in America society. So interacting with culture is so delicate. Wrong interaction may omit brand from market and right interaction can make the brand dominant. Basic assumption is so dangerous. Because they change hardly and very slowly. In Honda example, people accepted motor cycle as a vehicle for ladies because it was just a norm. The basic assumption in that case was that women should be chaste. people believed lady who rides motor cycle is not chaste. So it became a norm in society. Honda Company by that advertisement change this view to ladies who ride motor cycle.

4.4 Culturel approach is not applicable in all countries

Culturel approach is applicable in countries and societies which are in terms of physical, safety and belongingness needs are in good condition. According to maslow's hierarchy of needs humans have several needs. Physiological needs are the physical requirements for human survival. Physiological needs are thought to be the most important; they should be met first. With their physical needs relatively satisfied, the individual's safety needs take precedence and dominate behavior .Safety and Security needs include: personal security, financial security, health and well-being safety net against accidents/illness and their adverse impacts.

After physiological and safety needs are fulfilled, the third level of human needs is interpersonal and involves feelings of belongingness. According to Maslow, humans need to feel a sense of belonging and acceptance among their social groups, regardless if these groups are large or small.(Maslow,1943) For example, some large social groups may include clubs, co-workers, religious groups, professional organizations, sports teams, and gangs. Some examples of small social connections include family members, intimate partners, mentors, colleagues, and confidants. Humans need to love and be loved – both sexually and non-sexually – by others.

Herein, every country has a specific condition. International brands face various cultures and different conditions. Every country has its own special social, cultural and economic situations. One of key success fator in international space is local needs. Cultural approach is applicable just in advanced countries. It is not suitable in majority of third world countries. For example countries like Afghanistan or some of African countries are not in good situation in physical and security needs. So they want to fulfill their basic needs and other think is not imporant for them and maybe don't show any reaction. companies also don't spend a lot for attracting and retaining customer because aften in these markets the competition is low and customers more eager to satisfy basic needs.

5 Conclusions

Cultural branding is one cluster in branding literature and a model for managing a brand. The theoretical background of cultural branding rooted in consumer culture theory (CCT). Consumer culture theory is a marketing school of thought interested in studying consumption choices and behaviors from a social and cultural point of view, as opposed to an economic or psychological one. A group of

researchers by using qualitative methodologies, such as interviews, case studies and ethnographies focused on consumption contexts and studied the influence of brand and branding on culture and vice versa. Culture in these studies considered in macro level not micro. With the emergence of postmodernism, no logo movement formed. They presented some technique for counteract brands which try to seduce customers to choose them. On the opposite side communication specialist presented some technique for branding that they didn't promote directly without using exaggeration. Citizen-artist view developed in this space. Reviewing all the literature and other fields related to branding we extracted four points and weaknesses for cultural branding which are: 1) needs, wants and demands are regarded same 2) Branding in this approach has two tools and don't use from all potentials and Capabilities 3) Cultural branding doesn't consider culture as a multi-layer construct 4) Culturel approach is applicable in countries and societies which are in terms of physical, safety and belongness needs are in good condition not in all countries.

How Information Technology Reduce the Transaction Costs in Retail Industry: Taking Walmart as an Example

Peng Zhiping, Sun Zehou

School of Management, Wuhan University of Technology, Wuhan, P.R.China, 430070

(E-mail: 1519492368@qq.com, szh-63@163.com)

Abstract: Transaction costs are involved with the enterprise “production, supply, sales”, and the index is difficult to measure. However, information technology provides an effective solution for the reduction of the cost of enterprise macro transaction. Based on the basic theory of transaction cost, this paper expounds the operation mechanism of information technology to reduce the transaction cost of retail trade. That is a way, through the synergy and efficiency of information technology, to establish the enterprise’s information, electronic and network. Collecting information and processing information reduces the retail industry “macro” transaction costs ex ante and ex post, and brings low-cost competitive advantage for the retail, so as to obtain a sustained and healthy development in the situation.

Key words: Transaction cost; Information technology; Retail industry

1 Introduction

Ronald H. Coase (1937) firstly presented the economic concept— “transaction costs”, after that, the usage of this concept in economic life had been deepened and extended with the research by Alchian (1972), Williamson (1975), Cheung (1983,1998). According to their research, transaction cost which occurred in each link of the enterprise “production, supply, sales” was the most difficultly measurable index in corporation management. However, there was not a clear definition about transaction cost, and some academics (such as Kunxu Zhang, 2012) pointed out this indistinction would disturb the assessment of enterprise and impede the development of economic science. The cost of search, information, bargain, contract, etc. in a company is a “Hidden” opportunity cost. Because we could not measure the transaction cost in every items accurately, it is much more important to reduce this cost and enhance economic efficiency and effects, and on a macro-scale, to create low-cost advantages. This is why information technology need to be used in a company.

With the development of information technology revolution since the new century, a new tendency that firm boundary shrank gradually and firms made a deal via market occurred (Malone et al., 1987). In the internal and external enterprise environment, extensive utilization of information technology had made an increasing number of economic organizations, especially those in the retail industry which is closely related to national economy, rely different network techniques and communication technologies as well as equipment to complete changes from traditional industry economy age to information economy age (Chuhong Zeng, Danming Lin, 2006). So what kinds of important effects information technology has in a transaction process in retail industry, and what kind of mechanism it can apply to achieve the advantages of low-cost trade for retail industry?

2 Literature Review

2.1 Effects of information technology on transaction cost

Dewett and Jones (2001) concluded the effects that information technology has in transactions as two types: information efficiency effect and information coordination effect. Efficiency effect means that applying information technology can raise efficiency of collection, transfer, disposal and usage of enterprise information, and it can save the cost of time and material. Coordination effect represents that utilizing this technology across organizational boundaries to aggregate information and achieve information sharing. This “1+1>2” effect can be beneficial not only to cost saving in terms of production and coordination, but also to enterprise communication and exchanges across boundaries.

On the one hand, information technology can play an efficient role in transaction cost. Electrical network between organizations reduced the cost of search, assessment, supervision which are related to transaction (Malone, Yate, Benjamin, 1987). Meanwhile, information technology in an enterprise can played the role of five types such as auxiliary production, supervision and performance evaluation, decision support, transaction disposal, record and communication (Gurbaxani etc. 1991). The widespread use of information technology usually can be more attractive than hierarchy. It can effectively save the cost of commodity circulation, negotiation and decision-making, thereby increasing

efficiency of transactions.

On the other hand, information technology can play a coordinative role in transaction cost. Companies can utilize this technique to connect with business process, and set up barriers of conversion to customers (Fulk, DeSanctis, 1995). In this way, it allows various forms of strategic alliance, internet organization, and virtual enterprise emerge constantly. According to the discovery from Gang Fu (2008) etc., the cost of information flows can be displayed by three indexes (information integration, information sharing and classified index), which can reduce probability of information distortion, shorten the supply chain and save transaction cost outside the company. Apart from that, information technology benefits the balance of entire enterprise logistics, and promotes the development of enterprise networks and information exchange (Qin Zhao, 2011).

2.2 The use of information technology in retail industry

Si Wu and Jian Jiao (2005) considered that information technology refers to business information transfer, processing, analysis and appreciation in the retail industry. It can allow their competitors, suppliers, customers, replacers and themselves fulfill success together in this market. And it can also bring the advantages of inventory control, cost control, human resources and material control. Its impacts are shown primarily in five aspects including information processing, automated processing, order control, decision-making handling, monitoring and tracking, and make enterprise boundaries more extensive and indistinct (Huanzhou Yu, etc., 2006). Yang Liu realized that the emerge and development of information technology totally changed the traditional business pattern in retail industry, and promoted the development of newly-developing e-commerce model. In addition, information technology can be the basic condition for innovation of retail business, and conversely, it may be improved through the innovation of management, business state, management patterns (Rui Wang, 2014). Lun Zhang (2014) discovered that information technology created the business state pattern of online and offline integration, and many kinds of techniques including mobile internet, location service, online payment and etc. provided support for the development of retail industry.

Despite some risks brought by information technology, including risk factor, risk environment, risk result and risk mechanism (Bouchaib Bahli, Suzanne rivard, 2003), but Jeffrey James (2002) realized that information technology is the major mechanism of driving force for enterprise globalization. It reduced the transaction cost between economic agents, consumers, enterprises and governments in a certain extent.

2.3 Brief reviews

Applying of information technology in retail industry is a convenient way for information acquiring, processing, transferring and utilizing. This convenience came from information coordination and the control of enterprise macro level (Zaheer & Venkatraman, 1994). Therefore, information efficiency and information coordination provide the decrease of transaction cost with “two-fold tunnels”. The development of enterprise information promotes development of enterprise network, information processing and e-commerce, changes traditional business pattern in retail industry, and accelerate the pace of innovation in retail industry. More important thing is that development of information technology reduces significantly the difficulty in transactions, shrink scale of trade, strengthen market fluidity, facilitate information sharing, and reduce the reduces the retail industry ex-ante and ex-post transaction costs at macro level.

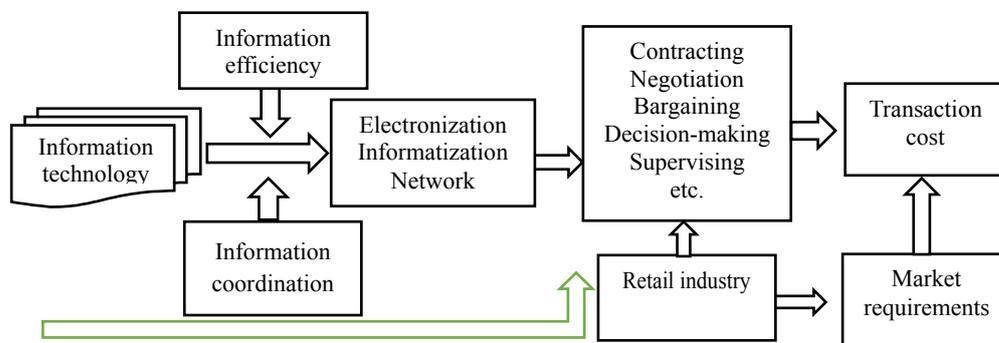

Figure 1 Operation Mechanism of Reducing Transaction Cost in Retail Industry

3 Case Analysis of Walmart

Walmart is the biggest retail chains company around the world. This company has different four

types of business models: Walmart shopping mall, Sam club stores, Walmart stores and Walmart neighborhood market. It has approximately 8500 branch stores in different 15 countries. Its operating profit reached to 16,002 million dollars during 2014, which was the top one around the world. However, the champion of sales in retail industry was Sears corp. for a very long time before 1992. At the same price level, why Walmart could beat Sears and keep the dominant status? Besides integrity, service, independent innovation that Walmart pursues, the more important factors are related to applying of information technology, which can reduce the cost in each link in terms of logistics, delivery, inventory, ordering. With this, Walmart is able to achieve the operating goal that makes its cost less than competitors and conducts profit sharing.

Walmart has a variety of goods and a wide range of customers, and their supply chain is long and their transaction cost covers extensive projects which are difficult to measure precisely. This cost can be classified as two types: ex-ante transaction cost (including contracting cost and negotiation cost, etc.) and ex-post transaction cost (including supervising cost and contract-breaking cost, etc.), the function of transaction cost is:

$$TC=Cb(C1, C2, \dots, Cn)+Ca(C1, C2, \dots, Cn) \tag{1}$$

Considering customers' practical requirements, Walmart utilize the management information system (MIS) and electronic data interchange system (EDI) to make a plan for transaction cost, reducing consumption of resources in every links and acquiring low-cost advantage.

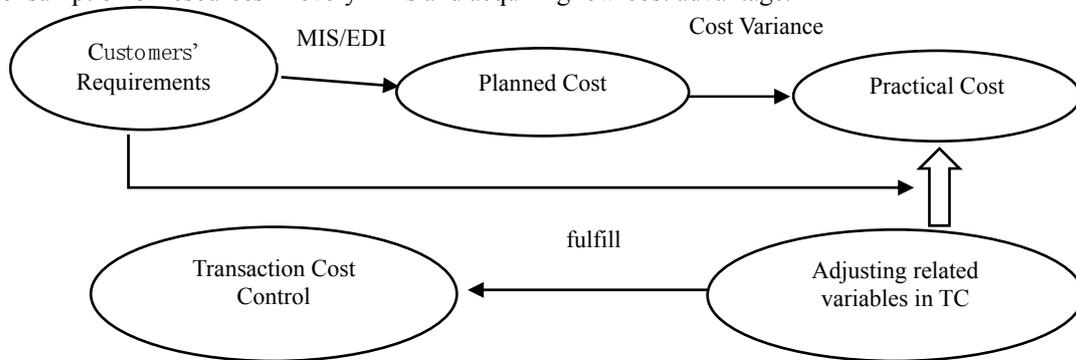

Figure 2 Control Process of Transaction Cost in Walmart

3.1 The control of ex-ante transaction cost in Walmart

The function of ex-ante transaction cost is:

$$Cb=f(C1, C2, \dots, Cn) \tag{2}$$

and this function mainly consists of ordering, contracting, negotiation, bargaining, information and decision-making cost. While there was no newly-developing information technology that acts as the support, dealing with orders, contracting matters, and the statistics about the number of goods delivery need to be done by manual work. After the 1970s, Walmart established the management information system and developed retail chains system. The automatic supply system, which had been established by using barcode scanner and satellite communication equipment as the basis, could automatically check the inventory and submit an application of purchase to suppliers. And then, it could acquire the receipt and transport list, so as to reduce the intermediate links and costs. After that, the automated information of orders would be transferred to delivery center via network system, and the delivery center could find the number and location of corresponding goods by checking barcode information. Finally, it can print the labels of related stores, make goods sent to transport vehicles and ensure cross distribution (CD). The approaches of handling significantly boost the efficiency and accuracy of purchasing, guarantee the quality of goods, extend the ways of purchase, shorten the processes of purchase, and obtain competitive advantages in ex-ante transaction cost. According to incomplete statistics, in many enterprises, the average purchasing and transport costs represent 10% of their sales incomes. Especially in the food industry, a few companies have larger costs which even account for 20% or 30%, while Walmart applies information technology to reduce the cost of purchasing and transport to 2% of sales.

As the inner management, cash desk could record the goods which have been sold through goods' barcode, and write automatically in a computer with the information of price and remaining inventory. Automated ordering system will submit purchasing information, when the number of inventory of a certain good is less than the optimum amount. In this way, an enterprise is able to increase the inventory

turnover ratio, increase the flow of money. By keeping inventory in an optimum amount, enterprises can efficiently, reasonably utilize room of storage, reduce storing cost and risks, and boost inventory turnover ratio. Dynamically improving information handling process can decrease the repeated, waiting, incorrect and speculative behavior of related company in cost control of supply chains, which can finally achieve optimal configuration of material and fund flow and reduce transaction costs in a company.

3.2 The control of ex-post transaction cost in Walmart

The function of ex-post transaction cost is:

$$C_3=f(C_1, C_2, \dots, C_n) \tag{3}$$

and the function mainly consists of supervising, customer service, and opportunity costs. Since Walmart has complete barcode valuation system and commodity management system, it can accept full refund if customers do not have reasons and even receipts after buying a product. Customer service office only need to scan the barcode of this product, then they can know whether the product is sold by their company and all information of it. Besides, by investigating customers' expectation and cases of sales return or change with these barcodes, managers can respond to the problems and correct them in time according to the collected information from computer information system, so as to create a comfortable environment for customers. This quality customer service will increase the level of satisfaction, thereby reducing the cost of customer service. And meanwhile, it can help develop the brand effect and create highly efficient customers' responses (ECR). According to the report from Europe supply chains management committee, since retail industry implemented "ECR", sales incomes increased by 5.4%, cost of storage reduced by 5.9%, the average inventory dropped about 13.1%, and sales in per meter rise 5.3%. It can be seen that complete barcode valuation system and commodity management system set a stable base for the platform of information sharing, decreasing information asymmetry, ensuring that the communications and exchanges between enterprises and distributors can be more timely and precise.

3.3 Brief summary

In a long term, Walmart's information technologies, including information management system, automated supply system, retail chains system and etc., are the most important support for its globally dominant status. By recording and controlling every transaction, Walmart has achieved to reduce the ex-ante and ex-post transaction cost, and further control the performance of company at macro level. The company can utilize information technology to record non-simulated data, such as contracting cost, ordering cost, delivery cost, sales quantity, operation cost, to a simulated system. Through the analysis of horizontal and vertical spanning and changed situations of different indexes, the company can simulate the cast measuring standard for performance management, which could reduce TC to the bottom line. The way that controls transaction cost must generate effective index system. That means it needs to not only reflect the conditions of cost control, but also present cost information in any single node. Apart from that, Walmart also needs to extend the range of performance measuring to cover the information of real-time operation, and needs to make ex-ante analysis well. Moreover, the process of transaction cost control is able to help enterprise find what kinds of shortages it has, and correct the deviation, encourage excellent departments and improve unhealthy departments.

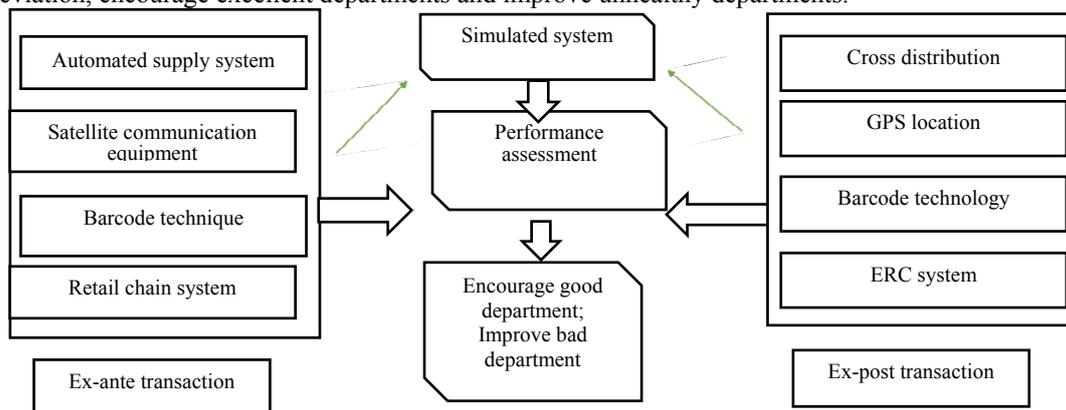

Figure 3 Control Process of Transaction Cost in Walmart

4 Conclusions

This study uses the basic theory of transaction cost, discussing the operation mechanism of information technology and how this technique reduce the transaction cost in retail industry (using

Walmart as an example). Modern retail industry makes the most of coordination and efficiency effects of information technology, promoting the development of information, networks and electronization. With that, it not only allows retail industry to hold the highly-efficient and highly-effective advantages in terms of information collecting, processing and using, but also brings itself advantages in decision-making, contracting, bargaining, supervising aspects. The advanced information technologies (including EDI, MIS, satellite communication equipment, retail chain system, etc.) of Walmart help it form a better performance assessment system, and cyclically decrease the ex-ante and ex-post transaction cost, ensuring that it can obtain low-cost competitive advantages around the world and keep a dominant status in global retail industry.

Consumer Acceptance of SMS Marketing: Evidence from Tanzania University Students

Salimu Abushiri Jinyevu, Cheng Yanxia
School of Management, Wuhan University of Technology, Wuhan, P.R. China, 430070
(E-mail: salb90@yahoo.com, chengyanxia221@126.com)

Abstract: The paper examines the consumer acceptance of short message service (SMS) Marketing as a tool for mobile marketing with Tanzania university students as a sample. The conceptual acceptance model was developed and empirically tested using data collected through online questionnaire. The findings show that the general consumer acceptance of SMS marketing is negative however it can be boosted up if permission, trust, control and privacy and consumer attachment to their mobile phones will be considered. The implication from these findings related to theories and managerial issues have also been drawn.

Key words: Acceptance; SMS marketing; Mobile marketing; Consumer

1 Introduction

SMS marketing become direct marketing communication vehicle for its nature as a one-on-one, one-to-many communication channel to reach the consumer but also as a new way that brand and consumers becomes well connected and integrated (Sultan, Rohm, & Gao, 2009; Watson, McCarthy, & Rowley, 2013).

According to recent report by Tanzania Communications Regulatory Authority September, 2015 reports shows that, there is an average of 4 billion SMS sent every month from July to September, 2015 which makes a grand total of 13,330,829,144 SMS both international and local for a period of 3 months from July to September, 2015. Therefore, the use of SMS by Tanzania consumers is of highest level and increased drastically.

1.1 SMS marketing

SMS marketing research is still at early stage (Watson et al., 2013). The evolvement of mobile marketing contributed to the advancement of electronic marketing innovation (Ndyali, 2014). SMS is among the mostly used approach globally (Leung, 2007 cited by (Alhrezat, 2013)). Marketers use SMS marketing as an effective direct marketing tool (Ndyali, 2014; Scharl, Dickinger, & Murphy, 2005; Watson et al. 2013)

1.2 Acceptance of SMS marketing

Several key factors that influence the acceptance of SMS marketing were discussed by various past studies.

1.2.1 Trust and irritation

According to (Awan & Hassan, 2015), trust hold a positive relationship with the attitude of the consumer, while irritation had a negative relationship with the attitude of the customer, this view was also supported by (Huq, Nekmahmud, Aktar, & Alam, 2015)

1.2.2 Permission, control and privacy

Consumer permission on receiving SMS marketing advertisement was considered as a key driver that affect acceptance of the consumer (Carroll, Barnes, & Scornavacca, 2005; Tsang, Ho, & Liang, 2004). Acceptance can be boosted up by permission based marketing (Watson et al., 2013). On the other hand consumers perceive their mobile device as only for their personal use, hence the highest preference is to have full control over any interaction with the organization or company sending SMS marketing advert (Watson et al., 2013).

On contrary other past researches found contradicting results out from what was discussed in other studies mentioned earlier in this discussion. (Barutcu, 2007) found that there is a positive attitude on acceptance of mobile marketing tools like advertisement among Turkish consumers, while (Izquierdoyusta, Olartepascual, & Reinareslara, 2012) found similar results among Spanish consumers. Therefore, considering this literature review discussion on past research studies the contradictions need to be cleared by doing more research.

2 Conceptual Frame Work and Hypothesis

2.1 Mobile Marketing

According to mobile marketing association (MMA) cited by (Sultan et al., 2009) defines mobile marketing as “The use of wireless media as an integrated content delivery and direct response vehicle within a cross-media or standalone marketing communication program”

2.2 Consumer acceptance of SMS marketing

Consumer acceptance of SMS marketing refers to an individual willingness to be involved different marketing activities operated by using mobile phone, these activities may include but not limited to promotion offers, receiving SMS via mobile phone(Sultan et al., 2009)

2.3 Research model

The paper aim at examining the acceptance of SMS marketing among University students in Tanzania, with reference to fore mentioned literature review, past studies and research objective, this study proposed the following research model.

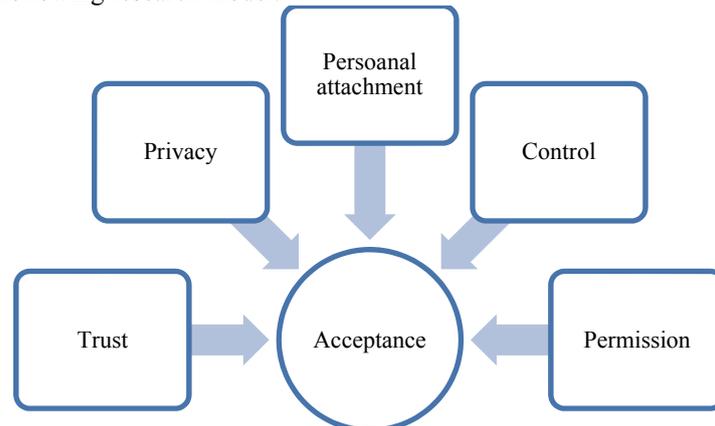

Figure 2 Research Model

2.4 Research hypothesis

H0: The acceptance of SMS marketing by consumers is negatives

H1: Permission has a positive relation towards acceptance of SMS marketing

H2: Trust has a positive relationship towards consumer acceptance of SMS marketing

H3: Control has positive relationship towards consumer acceptance of SMS marketing

H4: Privacy has a positive relation towards acceptance of SMS marketing

H5: Personal attachment has a positive relationship towards consumer acceptance of SMS marketing

3 Methodology

3.1 Data collection method

In viewing of the research Hypothesis, the paper employs both primary and secondary data. Secondary data were collected from different related literatures and past studies. Primary data were collected using a self-monitored questionnaire which found to be affordable as far as the cost is concern, but also as an easy way of data collection (Jinyevu & Mwashu, 2014). The questionnaire was adopted from (Watson et al., 2013) and adjusted to meet the objectives of the study. The questionnaire was divided into two sections. First section had three questionnaire constructed using 5-point Likert scale with the focus on measuring independent and dependent variables while the second section had 4 multiple choice questions dealt with Demographic data of the respondents. A total of 150 questionnaire links were distributed among the respondents but only 123 successfully filled in questionnaires were collected which makes 82% of the response rate which is valid since the validity of the response rate should be approximately equal or greater than 80% (Bernard, 2010 cited by (Ndyali, 2014)). Data collections process took a period of one month from January 20th- February 20th, 2016.

3.2 Population and sample selection

The population of this study involves Tanzania consumers. A convenience sample of Tanzania university students were selected from Tanzania consumers. Students selected were those who study in different Universities across Tanzania so as to widen the range of representation.

3.3 Test reliability

The paper employs Cronbach's Alpha Test to test the reliability coefficient. For the data to be reliable, Nunally, 1967 cited by (Ndyali, 2014) and (Bagozzi & Yi, 1988) clarified that the results of Cronbach's alpha should be more than 0.60 which is a minimum value. The Cronbach's alpha result for the total values of this paper is 0.683. This means that the reliability outcomes of this study are acceptable.

Table 1 Reliability Statistics

Cronbach's Alpha	N of Items
0.683	6

3.4 Data analysis technique

With the aid of SPSS software V.16, The research used different data analysis technique to carry out analysis.

Among the analysis techniques used include Cronbach's Alpha (α) to test scale validity of the data, Descriptive statics by computing frequency, mean, sum and percentage. Lastly, regression analysis was computed

4 Findings

4.1 Sample composition

Table 2 Demographic Details of Respondents

Characteristics	Frequency (f)	Percentage (%)
Age :		
A) 18-30	100	81.3
B) 31-40	20	16.3
C) 41- 50	2	1.6
D) Above 50	1	0.8
Total	123	100.0
Gender :		
A) Male	78	63.4
B) Female	45	36.6
Total	123	100.0
Level of education A)Undergraduate	88	71.5
B) postgraduate	32	26.0
C).Non-degree	3	2.4
Total	123	100.0
Marital status :		
A) Single	85	69.1
B)Married	38	30.9
Total	123	100.0

4.2 Mean results for independent and dependent variable

In order to have a clear understanding of the mean score interpretation, the paper adopted Walsh (1981) interpretive scale as cited by (Jonathan & Thibeli, 2013). The Walsh (1981) interpretive scale suggest that a mean scores of 1.5 or less = strongly disagree which interpreted as (very low), 1.51-2.50 = Disagree which interpreted as (low), 2.51-3.49 = Neutral/Moderate/Medium, 3.50-4.49 = Agree which interpreted as (high) and 4.5 or greater = strongly agree which interpreted as (very high). The mean score results of this study show that Permission has a mean score= 3.69 which interpreted as very high, this is to say that consumer permission has a very high acceptance of SMS marketing, which also support H1. Furthermore, Trust has a mean value of 4.17 which suggest that trust has a high influence on consumer acceptance of SMS marketing, which also support H2. Control has a mean value of 4.04 which indicates high influence on acceptance of SMS marketing. Moreover, privacy has a mean value of 3.53 which employs high influence in consumer acceptance of SMS marketing. Additionally, attachment has a mean value of 3.46 which indicates moderate acceptance of SMS marketing, hence H5 is supported. Lastly, Acceptance has a mean score of 4.64 which denotes that consumers strongly agree that there is negative acceptance of SMS marketing among consumers which support H0. Therefore, the general consumer acceptance of SMS marketing is negative.

Table 3 Mean for the Independent and Dependent Variable

		Acceptance	Permission	Trust	Control	Privacy	Attachment
N	Valid	123	123	123	123	123	123
	Missing	0	0	0	0	0	0
Mean		3.6423	3.6911	4.1707	4.0407	3.5285	3.4553

4.3 Correlation results

A simple correlation analysis was performed. In order to interpret the correlation results (from 0 to 1), the Cohen (1988) proposal as cited by (Jonathan & Thibeli, 2013) was adapted which propose that when $r = 0.1 - 0.29$ (small correlation), $r = 0.30 - 0.49$ (medium correlation) and $r = 0.50 - 1.0$ (large correlation). The inspection results of the correlation matrix of independent variables (permission, trust, control, privacy and attachment) and independent variable (Acceptance) show that permission has a significant and medium positive correlation with consumer acceptance of SMS marketing ($r=0.380, p \leq 0.01$), hence supporting H1. Trust had a significant and medium positive correlation with dependent variable ($r=0.30, p \leq 0.01$) hence supporting H2. Control had a significant and medium positive correlation with dependent variable ($r=0.36, p \leq 0.01$) hence H3 is supported. Privacy had a significant and small positive correlation with dependent variable ($r=0.12, p \leq 0.01$) hence supporting H4. Consumer attachment had a significant and small positive correlation with dependent variable ($r=0.28, p \leq 0.01$) hence H5 is supported.

Table 4 Correlation Analysis Results

Variables	Sig(1-tailed)
Acceptance	1
Permission	0.380*
Trust	0.297*
Control	0.355*
Privacy	0.117*
Attachment	0.277*
Correlation based on $n=123$ * $p < 0.01$	

5 Managerial Implication

The paper found that consumers have a negative acceptance of SMS marketing; it is the recommendation of this study that managers will take a consideration of the influencing factors (independent variables) in making a right decision as far as SMS marketing communication is concern. Since among other factors, permission found to be a great concern to customers, thus managers should establish opt- in-out strategy so as to make SMS marketing effective to their potential customers and profitable to their organizations.

The respondents' age also suggests that, SMS marketing could be more effective to youth than adults since youth are more exposed to mobile phone because most are perceived to have been grown up in mobile technology era. This will also help managers to make decision to which campaign best fit who when establishing their marketing business model.

6 Conclusions

The objective of this research was to examine the acceptability of SMS marketing among Tanzania University students. The results show that, generally consumers have negative acceptance of SMS Marketing while permission, trust and control show a significance medium positive correlation. Privacy and personal attachment shows significant small positive correlation with the acceptance of SMS marketing. The mean score interpretation found that consumers does not accept SMS mobile marketing unless other factors are considered such as permission, control, trust, privacy and personal attachment. Future research with a wider sample need to be done to investigate what kind of message content that customers would likely be willing to receive as far the consumer acceptance of SMS marketing is concern.

Analysis of Online Customer Behavior in Social Commerce: Case Study of Consumers in Jakarta, Indonesia

Evelyn Pertiwi¹, Liu Pingfeng², Nie Guihua^{1,2}

¹ School of Management, Wuhan University of Technology, Wuhan, P.R. China, 430070

² School of Economics, Wuhan University of Technology, Wuhan, P.R. China, 430070

(E-mail: evelyn_xiuling@yahoo.co.id, pingfengliu@hotmail.com, niegh@whut.edu.cn)

Abstract: Indonesia as an emerging country is having high growth of e-commerce and social media use. Online shoppers transactions increases significantly both through peer-to-peer or business-to-business platform. People and businesses have been gradually using social web services to reach wider range of customers, engage with customer and to assist online buying and selling activities. This phenomenon, also known as social commerce, is becoming increasingly popular in the country. This study aims to provide better understanding regarding social commerce in urban cities in Indonesia by capturing Indonesian customer online behavior in terms of social media uses for online transaction. The study used online questionnaire to survey 150 respondents in Jakarta, the capital of Indonesia. We used independent-samples t-test, Chi-square test and a Spearman rho correlation analysis in order to compute our data. Our results showed that customers age and gender directly influences the frequency of social media usage and online purchase. On the other hand, occupation and income have no influence in purchase pattern on social commerce. We also found that online shoppers in urban areas of Jakarta are considering transaction security as the most important factor affecting purchase decision-making among online shoppers and bank transfer still remain the main payment tool when purchasing online on social medias.

Key words: Customer online behavior; Social media; Social commerce

1 Introduction

Over the last five years, the usage of Internet has been rising rapidly in Indonesia (Nielsen, 2011). Social web services such as Facebook, Twitter, or YouTube has rapidly gain popularity. Millions of Indonesians, mainly in urban areas like Jakarta, embrace this new digital form of communication to collaborate, participate, and interact online with their friends, relatives or colleagues (Utuma, 2012).

Leveraging social media platform, small entrepreneurs and big enterprises make use of it for the benefit of the company. This phenomenon is known as social commerce. Social commerce can be defined as the use of social media channels allowing users and businesses to participate in the promotion, buying, selling, and sharing of products and services (Zhou, et al., 2013).

With the huge popularity of social media such as Facebook, many Indonesians have started taking advantage of the presence of millions of connected users and started displaying their sales items online. Furthermore, by social media, Indonesian customers have found new channels to talk about things that are both relevant and compelling to them.

By using digital technology, the power of electronic word of mouth (e-WOM) has completely expanded beyond physical barrier. They have now the ability to talk to each other, sharing their online or offline shopping experiences, criticizing or recommending products with people who trust them (Harvard Business Review, 2010).

This study aims to provide a better understanding on customers online behavior in terms of social media use for online transaction in Indonesia urban areas. We mainly focused our research on Jakarta because it is the capital of the country and the center of digital technology-based economic activities in Indonesia. The results of this study can provide information for Indonesian enterprises in increasing sales volume by giving attention to factors that influence sales via social media.

2 Literature Review

There are few existing studies to understand the transformation of e-commerce into social commerce.

Wang & Zhang (2012) try to describe the characteristics of social commerce and its potential future directions. They provided a chronological and detailed examination of social commerce practice evolution from 2005 to 2011 with a framework that contains four important dimensions (people, management, technology and information). Their analysis showed that social commerce is an emerging

global phenomenon that continue to develop and evolve.

Zhou, et al. (2013) revealed that social commerce evolves rapidly due to the increasing change in business practice, evolving consumers needs, development of advanced information technology, and information created from user-generated content.

Huang & Benyoucef (2012) argued that due to the growing demands for services and applications from customers and companies, the e-commerce industry is now facing new challenges about the way to engage customer participation and support company's development. There are huge prospects for companies in using social media as a leverage to ease social commerce transactions such as consumptions, payments, order fulfillment, marketing promotion and customers after sales services (Zhou, et al., 2013). From their researches, we are confident that the future of e-commerce is strongly correlated to the development of social commerce.

Another interesting study made by Leitner & Grechenig (2008) found that the innovative development of social web favored the development of a broad range of social media from social network sites to more complex forum communities and e-commerce platforms having fully implemented social media features.

Hajli (2012) argued that customers trust is the most important factor for companies when adopting social commerce. The role of social media in business has changed from marketing channels to reach broad into an fully online sales channel (Market Publishers, 2012). Never before companies had such opportunity to advertise, obtain feedback, and directly sales products and services to millions of consumers at a relatively low cost. And also the opportunity for millions of customers to share information, criticize and recommend products or services to each other (Evans, 2008). It is the power of electronic word of mouth (e-WOM) that companies are seeking ways to harness (Eastin, et al., 2011).

Indonesian customers are now looking for a conversation and relationship with their favorite brands, rather than one-way communication (Muchransyah & Iswardani, 2013). In order to take advantage of e-WOM, Zhou, et al. (2013) argues that companies should focus on developing social media marketing programs which will create messages that entices the attention of potential customers, and which encourage them in turn to spread it within their own social media channels.

3 Research Methodology

To perform our research, we used an online survey questionnaire through freeonlinesurvey.com. The survey investigates consumer's social media usage, online shopping experience, and online purchase behavior through social media.

The questionnaire had two parts, which consist of: demographic information and questions related patterns of social media usage and internet shopping behavior: the first part of the questionnaire measured respondents' demographic information asking for the participants' sex, age, current status, and monthly income; while the second part of the questionnaire had questions related patterns of using social media and actual internet shopping behavior. It also looked in detail at preferred products, most popular social media use by customers and where consumers search for information and inspiration before they buy.

An interval scale is used to collect data about the importance of 12 factors in their online purchase decision making. And a few questions had binomial responses to assess customers' trust on customers review in online shopping platform.

The data collection was initiated from June 2015 and terminated in December 2015 covering a period of 6 months. The link for the online questionnaire was distributed randomly through popular social networking (Facebook, Twitter), forum (Kaskus, Detikforum), instant messaging (BlackBerry Group). The study surveyed 150 respondents in the urban city of Jakarta, capital of Indonesia. However, during the data processing, we omitted 18 respondents questionnaires results because of the insuffisance of information, reducing the numbers of usable responses to 132 respondents. Among the respondents, 55 percent were female and 45 percent of male. The majority of respondents were aged between 17 to 34 years old (86 percent) with an important numbers of employees (39 percent) and students (31 percent).

4 Data Analysis

This study focused on finding out the patterns of social media usage and internet buying behavior in the urban areas of developing countries such as Indonesia. In order to sell anything over the internet, it is important to take into account about who are the customers, what are their spending habits are like

and the products and services they prefer (Richa, 2012). The following sections of this article summarize the results and discuss the implication of these results.

4.1 Age demography of social media users

The first research question assessed the age demography of social media users in Jakarta. Our survey showed that 89.1 percent of the respondents under 35 years old are using social media compare to 10.9 percent only for respondents above 35 years. From the result, we can estimate that the majority of social media users in urban area are young and middle age Internet users.

However, after having conducted an independent-samples t-test to compare the frequency of social media usage for young (below 35 years old) and older (above 35 years old) Indonesian citizens, our results showed that there are no noteworthy scores difference for young ($M=3.22$, $SD=1.011$) and older citizens ($M=2.94$, $SD=1.063$; $t(132)=1.025$, $p=307$, two-tailed). The difference of scale in the means (mean difference = .278, 95% CI: -.259 to .815) is small (eta squared = .008). This result indicates that older generations (above 35 years old) are increasingly adopting social media in their daily activities.

4.2 Gender demography of social media users

Based on our questionnaire, we found that the amount of males using Facebook is higher compare to women. This results are backed by the data provided by Facebook Audience Insights Tool.

However, after conducting an independent-samples t-test to assess the frequency of social media usage between male and female Indonesians, our results show that there is no important scores difference for males ($M = 3.18$, $SD = 1.049$) and females ($M=3.18$, $SD=.998$; $t(132)= -.016$, $p=.988$, two-tailed). The difference of scale in the means (mean difference = -.003, 95% CI: -.356 to .350) is small (eta squared = .000001). Although there is a higher number of male account registered on Facebook, it doesn't mean men are using more Facebook compare to women. Our result show no difference between the frequency of access and usage of Facebook between Indonesian man and women.

4.3 Age demography of customer shopping via social media

According to the results of our survey about the age demographic of online shoppers through social media, 87.1 percent of the respondents claimed of having already experienced online shopping. Among them, 88.7 percent of online shoppers in urban areas range below 35 years old, and only 11.3 percent for Indonesians above 35 years old.

To analyze the purchase trend between young and middle age citizens (below 35 years old) compare to older generation (above 35 years old), we runned an independent-samples t-test to compare their frequency of online shopping via social media. Our results show that there is a significant difference in scores for young ($M=2.61$, $SD=1.109$) and older Indonesian citizens ($M=2.13$, $SD=.806$; $t(132)=2.152$, $p=.042$, two-tailed). The magnitude of the differences in the means (mean difference = .487, 95% CI: .020 to .955) is small (eta squared = .034). The result reveal that young Indonesians citizens find more convenient to use the different social media channels such as Facebook and Twitter to purchase online. On the other side, Indonesians citizens age above 35 years old tend to be less responsive to advertisement or products sold via these channels.

4.4 Gender demography of customer shopping via social media

Our survey showed that among the 87.1 percent of the respondents already experienced using social media to purchase online, 58.3 percent are females and 41.7 percent are males. In order to assess the difference between man and women purchasing online, we ran a Chi-square test for independence (with Yates Continuity Correction) to test our hypothesis. The result indicated an important association between gender and online purchase experience, $\chi^2(1, n = 132) = 3.876$, $p = .49$, $\phi = .194$. We rejected the null hypothesis, thus confirming a statistical difference between gender and the propensity of buying online. Our result confirmed similar outcomes made by previous study on the gender impact on the frequency of online purchase indicating that female Indonesians tend to purchase more online compare to their male counterpart (Veritrans & DailySocial, 2012; Utomo, 2012).

4.5 Purchase power of online shoppers in Jakarta

It is estimated that higher income level is positively correlated with domestic consumption. Therefore, high earners among urban social media users in big cities will positively correlate with a high frequency of online transactions.

In order to verify the relation between the amount of income and frequency of online transactions through social media, we used a Spearman rho correlation analysis. The result showed that there is no correlation between the two variables, $r = .090$, $n = 132$, $p < .305$.

This result matched with a previous study made by Utomo (2012) demonstrating that the amount of income earned by an individual have little influence on the frequency of online purchases in Jakarta.

Compare to citizens in developed country like United States, England or Japan, the income of Indonesians citizens is not a major factor that affect their frequency of online purchase indicating that the tendency of buying through social media depend mainly of the products features and need of the customers.

4.6 Popular social media channels use for sales

Based on the survey, we found that Facebook is considered as the most popular social media among urban users with 43 percent of the respondents claims of using FaceBook to purchase online. For 2nd and 3rd positions, we have BlackBerry Group (40.5 percent) and Kaskus (31.3 percent).

As we can see, International social platform is still the most popular social media used by citizens, which is mainly due to the great features, and services that it provides to their customers (IBM, 2012b).

4.7 Categories of products purchased via internet

Based on our survey, we found that fashion represents the most popular category of products purchased via social media with 48.5 percent of the respondents declaring having purchased at least one product of this category. This category includes all different types of products related to fashion (cloths, shoes, bags etc.).

Our finding presents similarity with the result found by Yi-Sheng, Priambodo, & Meng-Dar (2012) when they analyzed the popular products purchased on ecommerce websites. The second most popular category of product among Indonesian shoppers is toys and hobbies (books, toys, flashlight, bicycle etc.) with 41.7 percent. The followings categories are electronics (video games, computers, phones etc.) and health & beauty (cosmetics, medicines, vitamins etc.).

4.8 Factors influencing urban online shoppers purchase decision-making on social media

In order to provide a deeper analysis on urban customers perception of the different factors influencing their online purchase decision, we based our model on the model proposed by Javernpaa and Todd (1997). This model demonstrates the shopping intent and behaviors towards online shopping which include: product value, shopping experience, quality of services received from the e-commerce sites, and finally the characteristics and severity of the risks associated with online retail shopping.

But in order to add the aspect of social commerce to the model, we added five factors: friends/family opinions, product review on blog, customers review, expert (scientist/doctor) and seller recommendation. These factors involve customers perception about the importance of source of information from others customers online or offline shopping experiences shared through social media, third party and seller recommendation.

From the result of the survey, our main concern is to test the reliability of our findings. To do so, the measurement model evaluation included the assessment of internal consistency for reliability, and the use of discriminant validity and tests of convergent for construct validity.

We used Cronbach's alpha to analyze the internal consistency. According to the results, the Cronbach's alpha coefficients is equal to .907 which indicates a strong reliability of the results obtained.

Based on our findings, we found that the majority of urban customers perceived that information from other customers experiences are somewhat important or important (59.1 percent for friends/family opinions, 72 percent for product review on blog, 73.5 percent for customers review) for their online purchase decision-making which correlate with our previous results.

In comparison, although 63.6 percent of urban customers attach importance to information from third party like expert (scientist/doctor), 41.7 percent of respondents are neutral about the importance of seller recommendations. The result show that urban customers tend to have a low degree of trust on online merchants which is due to the important numbers of frauders in the cyberspace.

An interesting fact is that the value of the product (45.5 percent for brands, 43.9 percent for the design/feature, 59.8 percent for the price, 63.6 percent for the quality of products), quality of service offered by the website (46.2 percent for convenience, 45.5 percent for purchase procedure) and the characteristics and severity of the risks associated with online retail shopping (75.8 percent for transaction security) are among the most important factors for Indonesian customers. The results obtained validated our assumptions that transaction security is considered as the most important factor affecting purchase decision-making among Indonesian urban online shoppers when buying on social medias.

4.9 Preferred types of payment

This study also analyzed the preferences in payment types used by social media users when purchasing online. Even though, over the past years, many new online payment gateways have been implemented in Jakarta with the sole purpose to provide secure online payment for urban digital customers (Sfenrianto, 2015), our results showed that 92 percent of the respondents are still using bank

fund transfer via Automatic Teller Machines (ATMs) as a payment tool for online transaction, and 8 percent are using mobile money services. Previous studies also showed that urban customers widely prefer to use non-Internet banking service such as ATM money transfer which are more popular and considered safer (Susanto, et al. 2011; Moertini, et al. 2011). Indonesian online shoppers still have a limited trust in Internet banking mainly due to the dimensionality of trust in mediating the use of technological system.

5 Discussion

The objective of our study is to analyze the different aspect of urban online shoppers behaviors when purchasing through social media.

In terms of age demography trend of social media users, two major reasons explain why older generations are also increasingly using social media despite their lack of digital literacy: the widespread of Internet-capable mobile phone and the collectivism aspect of Indonesians culture.

First, according to a study made by Abud (2012), Indonesians people suffer of a lack of digital literacy in general. However, people are increasingly using mobile phone and home Internet, and are capable to increase their level of digital literacy and use social media in a daily basis.

Secondly, with the collectivism of Indonesian people, they have the desire to be part of a digital community such as Facebook. Pushed by young ones, citizens above 35 years old are likely to create an account on social media which represent a cheaper and easier way of communication compare to call or mobile text message. Older generations are also adopting social media in order to continue to be able to communicate with younger generations.

In terms of online shopping among urban social media users, our results showed that those of age below 35 years old are getting more and more receptive to promotions on various social media platforms, while those above 35 years old are less/or not purchasing on social media.

This result can be explained by the lack of understanding about the processes system of buying online for some older age consumers not used with using PCs or online payments. On the other side, young middle class consumers are eager to emulate trend in developed markets such as the US, Europe or Japan which affect their desire of experiencing online purchase. In order to show their status, purchasing online is becoming a new way for young people to differentiate themselves with normal peoples. Furthermore, since younger generations tend to be more easily able to improve their digital literacy by faster assimilating information about Internet-based technology, it become easier for them to learn how to purchase online.

When it comes to gender and their tendency to online purchasing, we have seen that although there was more social media accounts created by men compare to women, there was no difference in terms of social media use frequency. The results can be explained by the Javanese social structure which is focusing more on the strong desire to integrate the social network communities such as Facebook groups rather than the desire to build friendship communication. However, when it comes to online purchase via social media, women have an higher tendency to purchase online compare to men. This result is directly correlated to the fact that fashion is the most popular product category which is women preferred category.

Similar with previous study, our results also showed that the most popular website where Indonesian online shoppers go purchasing is Facebook, followed by Kaskus, BlackBerry Group, Twitter and Instagram. With more than 78 millions Facebook users in Indonesia, it is quite understandable that this social media platform is the most used to sell and purchase online.

Finally, when it comes to the main concern for Indonesian urban shoppers when it comes to purchasing online, we found that transaction security was the most mentioned. The lack of trust between Indonesian sellers and consumers can be explained by two main reasons: the huge number of scammer cases in social media registered over the last few years and the lack of familiarity with the online purchase processes. The concern over transaction security also have a direct impact on the development of online payment methods in Indonesia. Money transferred via ATM remains the most popular payment tool as it is assumed to be the best payment method to avoid scam and frauds.

6 Conclusions

An important reason why social commerce is developing so fast in big cities like Jakarta is due to the astounding growth of the social media usage. The fact that millions of consumers are using social media every day has revolutionized the way customers are experiencing online purchase and firms and

entrepreneurs to do e-business.

Our study is focusing on the analysis of Indonesian urban customer online behavior in terms of social media uses for online transaction. Our results showed that the age and gender of Indonesian citizens have little influence on their use of social media but have a direct influence on consumers tendency to purchase online. Occupation and level of income have not much influence to purchase in social commerce. Facebook and BlackBerry group are the most popular social media in the country. Fashion and toys & hobbies represent the most popular categories of products among Indonesian consumers shopping online on social media. Finally, we found that the most important challenges of social commerce development in Jakarta were transaction security and the limitation of the bank transfer via ATM as main payment tool for online transactions.

Based on these results, we can provide recommendations for vendors willing to tape into the growing Indonesian social commerce market. For instance, vendors who want to reach the biggest segment of consumers should focus on targeting women online shoppers and adapt their marketing strategies around transaction security and accurate products information.

It is important for them to gain consumers trust and ensure the reliability of both their products and services otherwise it will hinder consumer from purchasing online. Finally, because social media in Indonesia is mostly about sharing information, vendors need to form an active social expression around their brands, which will result to the development of a social reputation, and competitive opportunities compare to traditionally organized and managed firm.

Abstract: It's significant for people trapped to evacuate outside to a safe place when disaster occurs inside a building. The way to survive is to wait for others' rescue, and traditional rescue way is searching for each place to find victims which wastes a lot of time and resources. We propose a method to locate and monitor trapped victims, technical feasibility in this paper analysis indicated this method is realizable. Then we design a system to apply this method to real rescue based on RFID and GIS. At last, we conclude that the operation of this system will be high efficient among rescue.

Key words: Rescue instruction; Location monitoring; RFID; GIS

1 Introduction

With the fast development of economy and society, more and more large-scale buildings appear, such as superstore, hospital, stadium and railway station, etc. Comparing with traditional architecture, these buildings are higher and larger, and more crowds can be contained. Obviously, large-scale building brings people more comfortable space, but once disaster happens in such places, it is possible to cause mass death and casualty, as the potential high density of crowd.

It is common sense that people should escape from the inside of building to the outside safety area when disaster occurs such as fire. While people may be stranded inside because of route blocking and panic emotion, for whom the only way to survive may be waiting for help of the rescue team. As the uncertainty of the accurate position of victims, rescue process usually has to waste much time to search them. Therefore, method or technology which can locate and track people is positively important for improving rescue efficiency, which is also the goal of most emergency researchers.

In order to achieve such a goal, some scholars have conducted studies and proposed relevant theories and method in system development or application level. A preliminary plan was proposed to design and develop emergency rescue system for underground space based on GIS technology, and describe the fundamental structure, content, realization approach of system module (Liu Wenjie, 2012). The key problem was analyzed in emergency rescue of transportable hazards, and designed the principles for coordinating work among emergency rescue institution (Yuan Xuliang, 2009). The author explained the structure of the accident disaster emergency rescue system, and analyzed the content of the emergency management in accident disaster, meanwhile constructed the man-machine-environment response procedures of accident disaster emergency rescue (Yang Jing, 2010). The author analyzed the impact factors and defined their relationship through network topology model, as a result, it was believed that three factors are crucial to improve the reliability of emergency system, i.e. reaction ability of affected people, reaction ability of emergency commander and management mechanism (He Xuan, 2013). A system was designed of fire evacuation and emergency rescue based on the laser-guided technology, which solved the defect that the current disorder placed and low efficient evacuation signs of fire system often identify mistaken (Yang Jun and Shi Xiaolu, 2012). A method was proposed to realize evacuation guide in case of power failure with RFID technology, in the guide system, the mobile terminal communication and RFID system realize collaboration of safety and dangerous routes among evacuees to share information of the routes (Ishii et al., 2011). The author proposed an accurate algorithm and a three-dimensional RFID based indoor identification system (Reza et al., 2012).

Although above studies have presented theories to establish emergency rescue system and related technology to implement rescue instruct, however, locating and tracking people overall process when they are inside the building is lack of consideration. While real-time locating and tracking of people can provides more accurate position information for rescue. In this paper, we will propose a design of information guide system considering location monitoring based on RFID technology, which may be

helpful and practical for the emergency rescue.

2 RFID Technology

RFID is short for radio frequency identification, it's a communication technology. It can identify specific target and read and write related data through radio signal, without any mechanical or optical contact between identification system and specific target. Figure 1 shows a RFID reader and a kind of RFID tag.

2.1 Principle of RFID technology

The basic principle of RFID technology is not complicated: after the label enters into the magnetic field, it receives RF signals emitted by the reader, sending out product information stored in the chip by obtaining energy from induced current, or transmitting a signal with specific frequency actively. The reader reads the information and decodes it, then sends it to a central information system for related data processing. Figure 2 represents the data transformation in a RFID system.

RFID consists of three parts: RFID reader, RFID tag, control center. Every tag has a unique identity code, when a tag passes through a reader, it can identify the code and feedback to the control center.

The reader is controlled by the control center to achieve two-way communication with the label, read or write tag information, the main function is as follows:

- 1) The communication between the reader and the tag, between computers;
- 2) Encoding, decoding, encryption the data transmitted between reader and tag;
- 3) Simultaneous reading and testing multiple tags within the sensing range and anti-collision feature.

The tag is not only convenient but multifunctional, it has following features:

- 1) Tag data can be changed dynamically: Using the programmer can write data to the tag, giving the RFID tag function portable interactive data file, and write less time compared to print bar codes;
 - 2) Better security: not only can be embedded in or attached to the different shapes, types of products, but also to read and write tag data can be password protected, so as to have higher security;
- Dynamic real-time communication: Label with the 50 to 100 times per-second, the frequency of communication with the reader, so long as the RFID tag is attached to identify the object appears in the effective range of readers, you can dynamically track and monitor its position.

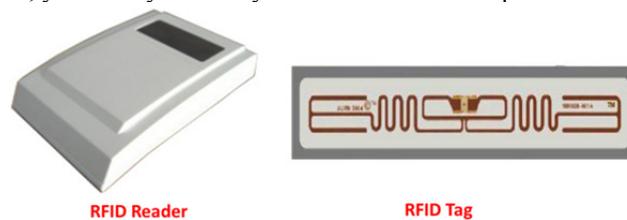

Figure 1 RFID Reader & a Kind of RFID Tag

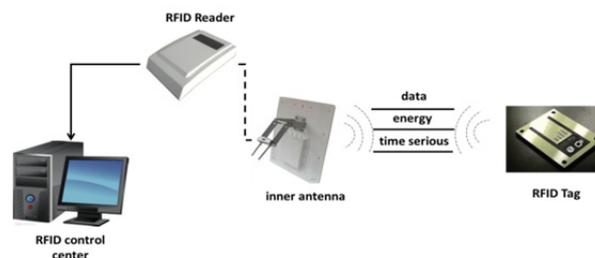

Figure 2 RFID Working Principle

2.2 Application of RFID technology

RFID is mainly applied in access control system and food traceability. Access control system can realize no-parking traffic for which are attached with RFID tag. Meanwhile, the system can implement real-time monitoring on passing cars and verify whether the driver and the vehicle are matching in case of car thieves. In the food traceability system, each food is attached with a RFID tag containing

information of country of origin, logistics information, this technology can realize a whole-process monitoring and tracing on food, thus, identifying the wrong step when food quality problem happens.

3 Location and Monitoring Method

Location and monitoring technology become more popular in safety area, including searching missing person and tracking vehicles. With the large market demand, there appear kinds of location and monitoring technologies.

3.1 Traditional method

The most popular location method in building is the GIS location method, it combines geographical spatial information figure of building in the system with GPS. The GPS terminal sends signal to 4 satellites of which the position is known according to the ephemeris. Then the satellites compute the 3-dimensional position based on each of their position, then feedback the information to the console. The GIS map the coordinate to the spatial information figure building. Then we can see the position of people in a building.

A typical method to monitor is video surveillance video surveillance consists of 5 function modules: camera shooting, transmission, control, display, record. The camera transmits video images to control host computer through coaxial video cable. The control host computer distributes video signal to each monitor and video equipment, and records synchronized voice signal in the VCR (Video Cassette Recorder). With video surveillance system, rescue team can tell the position, physical condition, crowd density and any other information about people trapped. So they can implement better rescue.

3.2 Feasibility and advantage of RFID technology

While, traditional location and monitoring method has a few defect in practical application. Considering the GIS location method, when people are trapped in the building of which building materials is concrete, it will weaken signal strength, as a result, the location accuracy will be erroneous. This will mislead rescue team to a wrong place. There exist disadvantages in video surveillance, on the one hand, the hardware facilities are vulnerable that will be broken under disaster, on the other hand, the distribution of camera is not full covering, and each camera has a limited monitoring range, there will be a lot blind areas in this system, which will influence rescue efficiency.

RFID technology has advantage over them on several aspects. RFID is a non-contact automatic identification technology, it can recognize target and access to relevant data automatically and identify work without human intervention through RF signal, and it can also work in harsh environments. It's a NFC (near field communication), so the signal is rarely influenced by external factors and the location is more accurate. The reader is installed in the wall so it's secure from destroy. And, since the location and tracking people trapped is similar to food traceability, so we can use this technology in rescue instruction.

4 System Design

When disasters occur in public buildings, people trapped by their own, they will try to evacuate himself. Central control room use RFID-based networking technology to locate and track personnel trapped, and send trapped personnel spatial location, basic information and other related information to rescue workers, available to the implementation of rescue, avoiding untargeted "blanket search" to achieve "efficient rescue", and minimize the loss of property and personnel.

4.1 System composition

Basically, this system has three function modules: the first is construction geographic information subsystem; the second is location monitoring subsystem; the third is rescue instruction subsystem.

The main function of construction geographic information system is storing 3-D spatial map, including building vector diagram and layout for each floor. The target of the second function module is to locate people trapped and monitor their trend and crowd density. The last function module is to provide outside rescue team the position information of trapped people.

4.2 System structure

The structure of this system and information flow is shown as Figure 3:

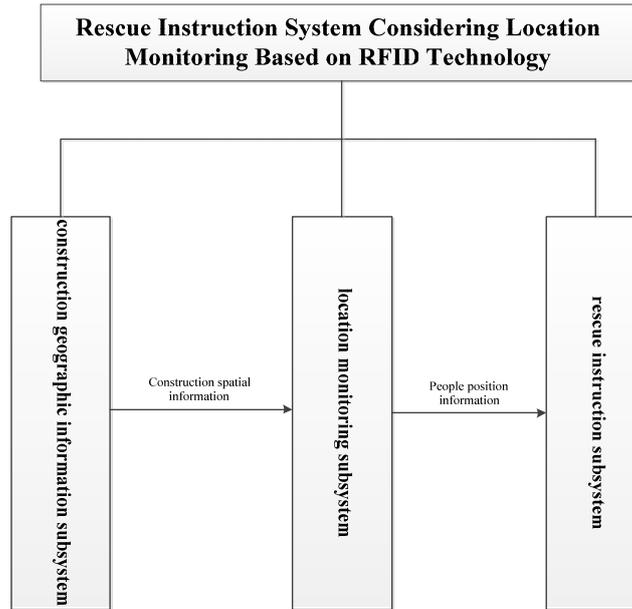

Figure 3 System Structure

The construction geographic information subsystem collects construction spatial information and sends it to location monitoring subsystem, this message combined with information of people position results from location monitoring subsystem, are transmitted to rescue information subsystem, then this subsystem sends information including information about position of people trapped in the building to fire command system for rescue instruction.

4.3 System application

4.3.1 Construction geographic information subsystem

This is the basic component of entire system. The main function of this subsystem is to store construction spatial information and the position of each RFID reader as reference substance to locate people trapped.

This subsystem needs following formation settings:

- 1) Import geographic information

To get people from their current position in the building, the subsystem must have detailed information on the construction of the building. So we can import 3-D map of building to the control center's database using GIS technology. The main geographic information concludes each floor's number and aisle distribution in a single floor. Basic principle of GIS is building a space coordinates system and locating an objective with a 3-D coordinate(x,y,h).The distance between two objectives can be calculated by distance metric formula. The actual movement of people can be also represented through continuous dots in the coordinates system. The following is an instance of transmission from building layout to roadmap in the coordinates system.

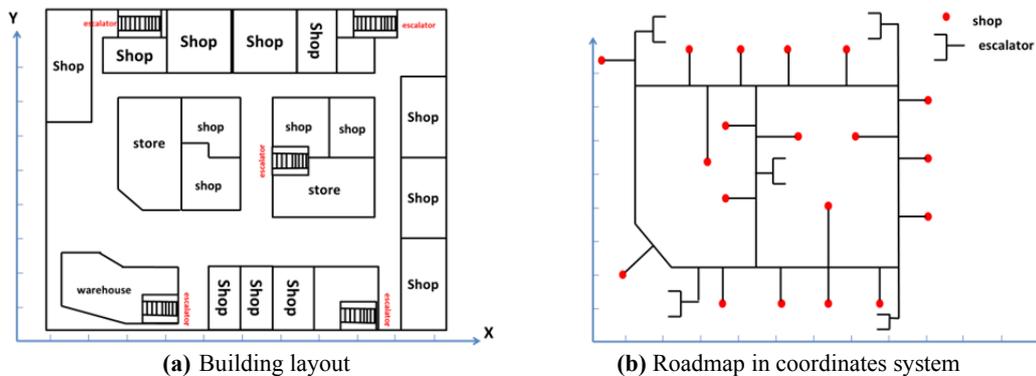

Figure 4 Transmission from Building Layout to Roadmap in the Coordinates System

Figure 4(a) is $G(x,y,h)$ represents layout in a single floor, once given the floor, h is confirmed. There is the distribution of each shop and what it looks like. But considering that each of them is an area, it's not convenient for computing. In the Figure 4(b) $G'(x',y',h')$, each room is conceptualized as a dot, and each road becomes a line. Their position is confirmed according to a plotting scale from G . GIS stores both of these two types of graph for better calculation and location.

2) Install RFID readers

In each floor, we should install RFID readers on the walls of aisles. Every reader is 3-5m far from another. At the same time, we should identify effective read range of the reader. As a result, several readers can locate a label together. Then, we should mark readers on the GIS map according to their relative positions. Figure 5 is the distribution of RFID reader in an assumptive superstore.

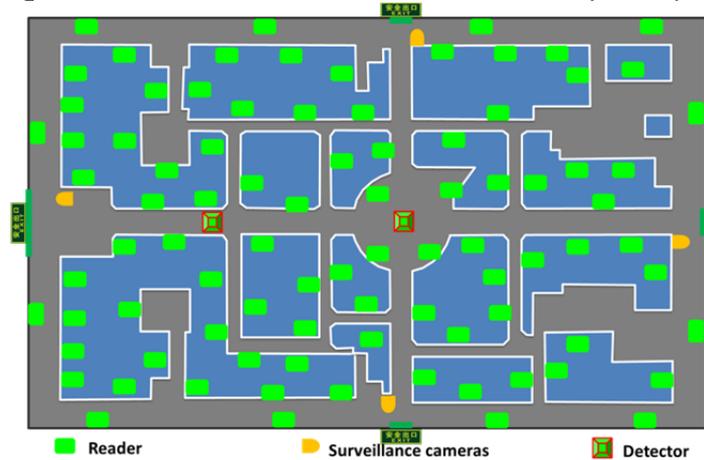

Figure 5 Map of RFID Reader'S Distribution

4.3.2 Location monitoring subsystem

This subsystem aims to monitor victims' location inside the building, to achieve this goal, we use a IOT (Internet of Things) technology ---- RFID Tags.

There is someone who raised an algorithm to locate electronic tag. Reza, who proposed using a network covering algorithm to estimate the position of the electronic tag under the conditions of the two-dimensional electron label positioning, that coverage is the ring, when conditions will be converted into three-dimensional space in two-dimensional electronic label positioning, covering area from the ring into a sphere. Either positioning methods are ultimately obtaining the coordinates of the location information of the electronic tags to study these locating method is applied in the evacuation of personnel to implement precise positioning have practical significance.

When a person enters into the building, he is required to wear a RFID tag. The information written into it concludes the man's age, sex, Physical characteristics, the floor's number he is. In Figure 6 every tag's code must be different from others. When disaster occurs and there are victims trapped in somewhere, the RFID readers on the wall can detect the tag on his body, and read the information stored in the chip, if he transferred to another floor, then the reader on that floor will update the information to change the floor number. On the GIS map, there will be a signal that the reader has caught a tag. Then we can mark the victim according to the reader's position on the map. Finally, we can find where he is inside the building relatively.

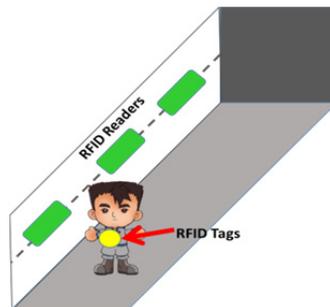

Figure 6 Installation of RFID Readers and People Wearing RFID Tag

4.3.3 Rescue instruction subsystem

This subsystem doesn't work alone, it works with fire system. To put it simply, it receives information from location monitoring subsystem and output information to fire system, realizing cooperation with fire system.

RFID background control center receives the information that electronic tag reader sends and feedback it to fire system, then fire system sends specific location information of trapped personnel to rescue workers through voice communication or video communication. Because it contains everyone's personal information, such as sex and age, so the rescue workers can determine the priority of rescue, then implement targeted search and personal rescue for trapped people based on the information, thereby avoiding the "blanket search" carried out within the buildings to improve aid efficiency. Since the trapped people in the face of sudden disasters panic, blindly following, etc., the position of staff is dynamic, rescue workers should take advantage of related communication equipment to receive victims' real-time position provided by the fire system to find that sleepy staff.

In the Figure 7, the top half shows where the people trapped actually are, the bottom half represent rescue instruction rescue workers received.

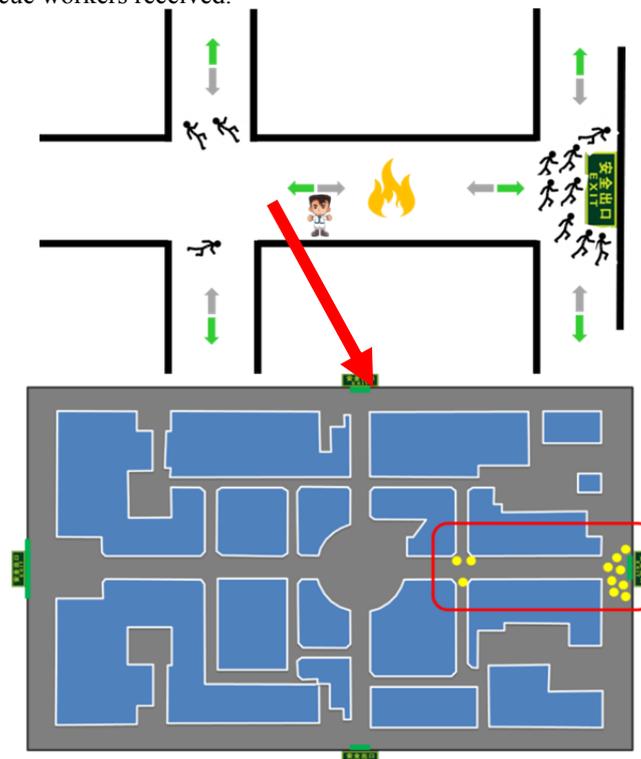

Figure 7 Rescue Instruction Rescue Workers Received

This system imports emerging technology (such as RFID and GIS) into evacuation system and rescue activities for the first time. The collaboration between these subsystems among this can clearly describe each step and task during system operation and solve inconvenient information interaction problem which firefighters are always faced while rescuing.

5 Conclusions

In this paper, we applied a new technology to location and monitoring method, and presented the design proposal of a new rescue instruction system involving this method. In the system, RFID technology was used to obtain the real-time information of people's position as well as regional crowd density, GIS transform the absolute location into relative position in the map of the building, and instruction subsystem transmit such useful information to rescue team. Compared with traditional single direction evacuation indicator sign, this more intelligent system could provide rescue team accurate action target, which is meaningful for promoting emergency rescue efficiency and save a lot of time and resources at the same time. In the future, we will focus on detail implementation plan of this system and the integration of with the firefighting system.

An Empirical Study of Regional Differences of Express Logistics Services Capabilities

Zhang Yinxia, Liu Mingfei, Chen Bingxue

School of Management, Wuhan University of Technology, Wuhan, P.R.China, 430070
(E-mail: zhangxyforever01@163.com, liumingfei5223@163.com, 374752316@qq.com)

Abstract: Express logistics plays a more and more important role in the development of regional economy. There are obvious differences in the express logistics service capabilities in different areas. Taking the Yangtze River Economic Belt of China as a sample, this paper utilizes grey correlation analysis and factor analysis to evaluate the express logistics service capabilities in 11 provinces of the Yangtze River Economic Belt in China. We screen out the comprehensive influence factors of regional express logistics service capabilities: the supply capacity of express logistics, the express logistics development potential, the supportability of information system and the infrastructure supporting capabilities. Fuzzy clustering analysis is utilized to divide the express logistics service capabilities of the Yangtze River Economic Belt of China into 5 levels. The results show that the express logistics service capabilities are stronger in the east region, at general level in midland and weaker in the western region in the Yangtze River Economic Belt.

Key words: Express logistics; Service capabilities; Evaluation system; Regional differences

1 Introduction

As a modern logistics industry, express logistics plays an increasingly important role in China's economy and social development. According to data released by the China Post Office, in 2015, the national express volume totaled 20.67 billion, and the express business volume ratio of east, middle and west was 82%, 11.2% and 6.8% respectively. This shows that express logistics service capabilities of China have obvious differences in different region. The differences of regional express logistics service capabilities will not only aggravate the imbalance of regional economic development, but also affect the stability of the entire region economy.

The logistics service capability is the ability to supply the required logistics service to the demand subject through the effective organization of all kinds of resources in the logistics system. The studies examined the composition of logistics service capability. Zhou Tai et al (2008) constructed the indicator system of logistics service capability, which contains the infrastructure supporting capabilities, the supporting capabilities of information system, the operation and management capabilities, and the support ability of development environment. Ma Shihua et al (2011) divided the logistics capabilities into the logistics element ability and the logistics operation ability, and had established the supply chain competition model based on these two kinds of ability. Michael Wang et al (2015) suggested logistics capabilities can be divided into flexible operation ability, innovation ability and process optimization ability. In terms of difference and evaluation of regional logistics service capabilities, Qi Shengda et al (2016) suggested the regional logistics service capabilities differed greatly, and which had a positive correlation with the level of economic development. Zhou Tai, et al (2016) regarded the regional logistics capabilities system as a gray system and used the method of grey clustering analysis to evaluate the logistics capabilities of the 12 provinces in Western China. In summary, in the research of logistics capabilities, the scholars lacked the study on the regional difference of express logistics service ability and the using of comprehensive evaluation method.

Based on the above views of scholars at home and abroad, with the Yangtze River Economic Belt of China as a sample, this paper intends to use grey correlation analysis to establish the key influence indicator system of regional express service logistics capabilities, and use factor analysis to screen out the comprehensive indicators of express logistics service capabilities. Then by means of fuzzy clustering method, we divide the area whose express logistics service capabilities are at the same level. This will help managers to understand the current situation and the difference of the express logistics service capabilities, and they can take effective measures to improve the express logistics service capabilities.

2 Construction of Express Logistics Services Capabilities Evaluation System

Though there are lots of indicators to measure express logistics service capabilities. Express volume is one of the major determinants, and can reflect regional express logistics supply ability.

According to relevant study results (Zhou Tai et al, 2008. Michael Wang et al, 2015. Zhou Tai et al, 2016. Liu Mingfei et al, 2011), this paper believes that the factors which affect the quantity of express including the development level of regional economic, the development level of regional logistics, the level of information and the level of infrastructure construction. In accordance with the scientific, operational and comprehensive principles, taking into account the reliability and availability of indicators, the indicators will be further decomposed into 15 secondary indicators. Specific indicators are as follows: First, the level of regional economic development contains GDP X_1 , growth rate of local GDP X_2 , gross industrial output X_3 , total sales of wholesale and retail X_4 , total retail sales of consumer goods X_5 , disposable income of urban residents X_6 (Liu Mingfei et al, 2011). Second, the development level of regional logistics contains number of express outlets X_7 , volume of railway freight X_8 , volume of highway freight X_9 , volume of air freight X_{10} (Qi Shengda et al, 2016). Third, level of information contains number of internet users X_{11} , number of mobile phone users X_{12} (Zhou Tai et al, 2008). Fourth, level of infrastructure construction contains highway mileage X_{13} , railway mileage X_{14} , number of trucks X_{15} (Zhou Tai et al, 2016).

3 Evaluation Method of Express Logistics Service Capabilities Regional Difference

3.1 The application of grey correlation analysis to evaluation system

According to "Iceberg Theory", express logistics system is a gray system, and it is obvious uncertainty. Besides, many factors influence the capabilities of express service, whose relationship is complicated. Therefore, if we want to figure out the relationship between different indicators in this system and identify the key factors, we need to use the grey correlation analysis. Specific steps are as follows (Liu Sifeng et al, 2010): First, choosing the volume of express as the reference sequence, the influence factors are the comparative sequence. Due to the unit of index is different, we need to standardized the initial data. Second, reference sequence and comparative sequence which are standardized can be marked as $X_0(t), X_i(k)$. When $t=k$, the correlation coefficient between reference

sequence $X_0(k)$ and comparative sequence $X_i(k)$ is as formula $L_{0i}(k) = \frac{\Delta_{\min} + \Delta_{\max}}{|X_0(k) - X_i(k)| + \rho \Delta_{\max}}$, Δ_{\max} and Δ_{\min} respectively represent maximum and minimum values in all kinds of individual moments of absolute difference in comparative sequences, ρ is resolution factor, normally ρ is (0.1, 0.5). Third, correlation analysis is to compare the geometry relation of time series data. Calculating formula is $r_{0i} = \frac{1}{N} \sum_{k=1}^N L_{0i}(k)$, r_{0i} represents the correlation of comparative sequence i and reference sequence 0 , N represents the length of comparative sequence.

3.2 Getting comprehensive factor by analyzing factors

By studying the internal dependence of the correlation matrix of multiple variables, the factor analysis is to find out a few of random variables which contain the main information of all the variables. In this paper, we use SPSS20.0 to analysis the predetermined indicator. Firstly, we take KMO test and Bartlett spherical test on the collected data to determine the suitability of factor analysis. Secondly, we will determine the correlation coefficient matrix and calculate the characteristic values of the variables, the contribution rate and the cumulative contribution rate. Finally, in order to get comprehensive influence factor of express service capabilities, we use the method of principal component analysis.

3.3 Fuzzy clustering analysis

In the express logistics service capabilities system, there is fuzziness in the capacity variance of different regions, which is suitable for using fuzzy clustering analysis method. Based on the grey correlation standardization data, each line of the normalized matrix is regarded as the fuzzy set of each object in the index set $X_i = \{\bar{x}_{i1}, \bar{x}_{i2}, \dots, \bar{x}_{in}\}$, and \bar{x}_{ij} indicates the membership degree of the index which belongs to X_i , and the similarity degree r_{ij} can be determined by Euclidean distance. The fuzzy similarity

matrix can be calculated by the formula $r_{ij}(x_i, x_j) = 1 - c^{-1} \sqrt{\sum_{k=1}^n (x_{ik} - x_{jk})^2}$, In which, $c = \max \sqrt{\sum_{k=1}^n (x_{ik} - x_{jk})^2}$, so

we can get the similarity matrix R . The transitive closure method is used to transform R into a transitive matrix R^* , clustering fuzzy equivalent matrix R^* which meets the delivery. Given different confidence intervals $\lambda \in (0, 1)$, when $r_{ij} \geq \lambda$, Sample x_i and x_j can be classified into one class, and different values correspond to different categories, then making the dynamic graph of fuzzy clustering.

4 Express Logistics Services Capabilities Regional Differences of Yangtze River Economic Belt of China

4.1 Perfecting evaluation indicator system by grey correlation analysis

The Yangtze River Economic Belt of China is the important support of the implementing the strategic of China's economic restructuring and development, including 9 provinces and 2 municipalities. In this paper, we collected the data of the Yangtze River Economic Belt provinces, and choose express volume as reference sequence and other indicators as comparative sequences with DPS15.0 for the data processing.

According to the formula, the grey correlation coefficient and degree are calculated, and the ranking is carried out. The results of grey correlation analysis are shown in Table 1.

Table 1 Results of Grey Correlation Analysis

Indicator Code	Index name	Correlation coefficient	Sort
X ₄	Total sales of wholesale and retail	0.9440	1
X ₁₁	Number of Internet users	0.9152	2
X ₁	GDP	0.9123	3
X ₆	Disposable income of urban residents	0.9097	4
X ₉	Volume of highway freight transport	0.8987	5
X ₅	Total retail sales of consumer goods	0.8974	6
X ₁₃	Highway mileage	0.8846	7
X ₁₅	Number of trucks	0.8516	8
X ₁₂	Number of mobile phone users	0.8503	9
X ₃	Gross industrial output	0.7452	10
X ₁₄	Railway mileage	0.6845	11
X ₇	Number of express outlets	0.6807	12
X ₂	Growth rate of local GDP	0.5642	13
X ₁₀	Volume of air freight	0.5479	14
X ₈	Volume of railway freight	0.5074	15

From Table 1, we can see that total sales of wholesale and retail and express volume associated with maximum degree, indicating that wholesale and retail size can largely affect the express logistics service capabilities. Followed is the number of Internet users, GDP, disposable income of urban residents, highway freight volume, total retail sales of consumer goods, highway mileage, number of truck, number of mobile phone users at the end of year, gross industrial output. The correlation degree of these factors is more than 0.7, indicating that these factors affect the express business volume greatly, which play a promoting role in the regional express logistics capability. And there are 5 factors whose correlation degree is relatively small, including railways mileage, volume of air freight, volume of railway freight, the number of express outlets and growth rate of local GDP. In the express logistics service capabilities evaluation of Yangtze River Economic Belt of China, these factors are all positive correlation with the express business volume, thus we can choose them for evaluation system to make decision.

4.2 Comprehensive influence factor

In this paper, we select the ten indicators whose gray correlation degree is greater than 0.7 as the evaluation indicators system of regional express logistics capability. To screen out the Comprehensive influence factor, we chose Yangtze River Economic Belt of China as the sample and collected data in 2014.

Factor analysis requires a large sample size. We can use KMO test and Bartlett spherical test to judge whether the samples are suitable for factor analysis. When the KMO value is lower than 0.5, it indicates that factor analysis method is not suitable (Zhang Wentong, 2013). In this sample, the KMO value is 0.655, the Bartlett spherical test value is 0.000, less than 0.05, which indicates that it is suitable for factor analysis. According to the principle of cumulative variance is greater than 85%, it selected three common factors to explain the original variables, the cumulative variance contribution rate is 87.585%, as it is shown in Table 2.

Table 2 Variance and Variance Accumulation Contribution Rate

Factor	Extraction Sums of Squared Loadings			Rotation Sums of Squared Loading		
	Total	% of Variance	accumulation %	Total	% of Variance	accumulation %
1	4.926	49.261	49.261	3.121	31.211	31.211
2	2.803	28.033	77.294	2.847	28.469	59.680
3	1.029	10.292	87.585	2.791	27.905	87.585

The original factor loading matrix was established with the 3 main factor components F_1, F_2, F_3 . In order to make the common factor have a significant meaning, the orthogonal rotation designed with varimax and the initial factor loading matrix is obtained, as shown in Table 3.

Table 3 The Rotated Factor Loadings

Indicator Code	Indicator name	Main factor loading		
		1	2	3
X_1	Gross Regional Product	.940	.304	-.087
X_5	Total retail sales of consumer goods	.884	.447	-.031
X_{12}	Number of mobile phone user	.772	.561	.205
X_{11}	Number of Internet users	.175	.887	-.060
X_3	Gross industrial output	.372	.831	-.210
X_{15}	Number of trucks	.380	.752	.447
X_{13}	Highway mileage	.075	-.058	.915
X_6	Disposable income of urban residents	.309	.386	-.823
X_9	Volume of highway freight transport	.064	.142	.707
X_4	Total sales of wholesale and retail	.664	-.154	-.693

Extraction Method: Principal Component.
Rotation Method: Varimax with Kaiser Normalization
a. Rotation converged in 4 iterations

The higher factor loading is, the higher the degree of interpretation of the principal component is. The results show that the main factor F_1 has larger loading in the level of regional economic development. So it can be named as express logistics development potential. The main factor F_2 has larger loading in the information level. So this ability can be named as supportability of information system. The main factor F_3 has larger loading in the infrastructure factor. Therefore, this ability can be named as the infrastructure supporting capabilities. In summary, the regional express logistics service capabilities contain express logistics supply capabilities, express logistics development potential, supportability of information system and infrastructure supporting capabilities.

4.3 Fuzzy clustering analysis

In order to compare the regional differences of express logistics service capabilities of the Yangtze River economic belt of China, this paper use the fuzzy clustering analysis method with DPS15.0 software to analyze the logistics capabilities of each province based on the results of factor analysis. Fuzzy clustering is used to deal with the fuzzy equivalent matrix, and the dynamic graph of fuzzy clustering is obtained by using the component connection method, as shown in Figure 1.

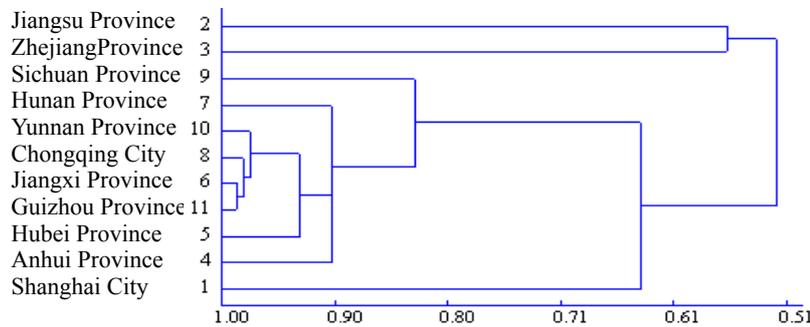

Figure 1 Dynamic Graph of Fuzzy Clustering

The logistics service capabilities differential distribution of the Yangtze River Economic Belt of China can be summarized through the fuzzy clustering graph, as shown in Table 4, the Yangtze River Economic Belt of China express logistics service capabilities can be classified into 5 types from the

strong to the weak. The express logistics service capabilities are relatively strong in type I and type II regions, including Jiangsu Province, Zhejiang Province and Shanghai city, and they are at general level in type III region, including Sichuan Province, Hubei Province, Hunan Province and Anhui Province. While, IV and V regions' express logistics service capabilities are relatively poor, including Chongqing city, Yunnan Province, Jiangxi Province, and Guizhou Province.

Table 4 Yangtze River Economic Belt of China Express Logistics Service Capabilities Differences

Capabilities	Type	Quantities	Regions
Stronger	I	2	Jiangsu Province, Zhejiang Province
Strong	II	1	Shanghai City
General	III	4	Sichuan Province, Hubei Province, Hunan Province, Anhui Province
Poor	IV	2	Chongqing city, Yunnan Province
Poorer	V	2	Jiangxi Province, Guizhou Province

5 Conclusions

This paper studied the express logistics capabilities regional differences of the Yangtze River Economic Belt of China through gray correlation analysis, factor analysis, and fuzzy clustering analysis. The results of the study show that its express logistics service capabilities difference is obvious from the east to west regions. Jiangsu Province, Zhejiang Province and Shanghai city's express logistics service capabilities are strong. Sichuan Province, Hubei Province, Hunan Province and Anhui Province's express logistics service capabilities are at general level. Chongqing City, Yunnan Province, Jiangxi Province and Guizhou Province's express logistics service capabilities are poor.

This paper examined the regional logistics service capabilities used comprehensive methods, and can provide a reference for future related research. It also has good practice meaning. Firstly, this study will contribute to the regional managers' understanding the influence factors of express logistics service capabilities and the differences with other regions and taking effective measures to improve the capabilities of express logistics services. Secondly, in order to promote the balanced development of logistics capability in all areas of China, the government should pay attention to the coordination of regional logistics development, and combine the logistics capability and the specific factors of regional logistics construction.

Acknowledgement

This paper is supported by open subject of security warning and emergency linkage technology cooperation innovation center of Hubei Province(NO.JD20160215).

Analysis and Suggestion of Factors Restricting the International Competitiveness of China's Publishing Industry

Wang Zhaoguo

Wuhan University of Technology Press, Wuhan, P.R.China, 430070

(E-mail: wangzhg027@126.com)

Abstract: Although the international competitiveness of China's publishing industry has improved greatly, it is undeniable that although China's share of global publishing market has increased slightly in the increasingly fierce international competition environment, its overall development situation is still not optimistic. This paper analyzes the factors that restrict the international competitiveness of China's publishing industry from the aspects of industrial structure, policy environment, publishing enterprises and content products, and put forward some feasible measures for improvement accordingly.

Key words: Publishing industry; International competitiveness; Restricting factors; Suggestions

1 Introduction

According to the overall development of the current international publishing industry, the world publishing pattern is still dominated by the United States, the United Kingdom and Germany. Those major countries lead the basic trend and future direction of global publishing industry development. Especially in the increasingly competitive digital era of the global digital publishing market, they are showing a strong competitive edge and rapid development momentum, and are grabbing resources in the international market, by taking advantages of their influence and monopoly status (Andi Sporkin, 2013).

In recent years, although the international competitiveness of China's publishing industry has improved greatly, it is undeniable that although China's share of global publishing market has increased slightly in the increasingly fierce international competition environment, its overall development situation is still not optimistic. Compared with the developed countries, such as the United States, Britain and Germany, China's publishing industry still has the problems of limited scale, insufficient talent team building, low degree of marketization, low industrial concentration, enterprise structure and management level that need to be optimized, and a lack of competitive strength.

2 Factors Restricting the International Competitiveness of China's Publishing industry

2.1 Imperfect policy environment

Industrial development cannot be realized without a strong guarantee from the government to provide a good industrial policy environment, legal environment, institutional environment and other macro external environment. At present, the industrial policy, legal and institutional environment are not perfect, and the efficiency needs to be optimized. To be more specific, firstly, the construction and soundness of the industrial policy system is still inadequate. The implementation of specific policies, overall executions and supervisions need to be further strengthened. Secondly, imperfect industrial laws and regulations, a lack of implementation and supervision will hinder the healthy and stable development of market order, as well as deter standardization and order of production and operation. Thirdly, government's methods and actions to achieve industrial management still need to be optimized. Especially compared with the developed countries, apart from administrative measures, fiscal, taxation, investment, credit, finance, prices and other economic and legal means adopted by Chinese government are not adequate enough to achieve macro-control and indirect supervision of the whole industry, and there is a shortage of industry self-regulatory mechanism (Xu Chunsheng, 2008).

2.2 A lack of scale economy

With the deepening transformation of enterprises and the formation of the publishing groups, the structure and competitive situation of the publishing industry in China have somewhat improved, and the industrial resources have been optimized and utilized to a certain degree, starting to show the effects of scale economy. However, in general, concentration of China's publishing industry is low. The industrial organization structure immature, and the enterprises in the industry are still developing and competing in intensive and decentralized way, which will to a great extent restrict scale operation of the industry and intensive growth.

First of all, China's publishing enterprises upstream and downstream enterprises as well as relevant

industries face aggregation of low degree, and immature industrial organization structure. Compared with foreign large-scale publishing groups and media groups, the main business of our publishing enterprises is of single constitution, lacking in a clear grasp of industrial integration trends (Fang Qing, 2008). This indicates that China's publishing industry has not yet established a reasonable industrial network system, which largely restricts the effective application of industrial cluster effect and will hinder complementarities of resources as well as the upgrading of the industrial value chain.

Secondly, from the geographical distribution, China's current industrial base (park) are mainly located in Beijing, Shanghai, Tianjin and other eastern coastal areas like Zhejiang, Jiangsu and Guangdong. Industrial agglomeration in small and medium-sized cities as well as remote provinces is quite low. The industrial distribution global-wide and division of labor in core value link are far from optimistic. Regional distribution is clearly inconsistent.

2.3 Corporate management transformation is lagging behind

Although the transformation of the publishing industry has been completed in 2012, the overall management level of publishing enterprises in our country is still limited. This is mainly reflected in the following: First, enterprises generally have not yet formed a complete, efficient, scientific and sound corporate management system, including production management, product development, cost management, financial management, risk control, system construction, personnel, performance management and strategic management. Also, modern management mode of participating in international capital operation and overseas marketing management has not been established. Second, the enterprise does not actually establish a modern enterprise system.

Consequently, the scientific and maturity of the construction of the enterprise legal person system and the internal organization and management system is inadequate; the performance evaluation and incentive & restraint mechanisms are poor; headquarters of enterprises are still managed in a centralized and extensive way. Third, the market main body consciousness and management concept of enterprises' independently participating in the management mechanism system reform and innovation, system, technology, and product content innovation are obviously weak. Management information, technology, digital construction efforts are far from enough to support full integration and convergence of publishing resources and each value links within and between the whole industry.

2.4 Weak overall product competitiveness

Product strength directly determines the survival and development of enterprises. It is one of the core components of international competitiveness in the industry. As a knowledge-intensive and intelligence-intensive industry, the obvious weaknesses and relatively poor level of international competitiveness of China's publishing industry largely reflect on many problems: knowledge content of China's publishing products are generally low; there is a lack of content innovation; production efficiency and production technology level is limited.

To be more specific, firstly, the originality of product content is insufficient, as a large number of enterprises are blindly pursuing publication quantity and short-term economic benefits. The existence of China's copyright trade deficit also reflects the reality that China's purchase of copyright from foreign countries is more than the output and that published products are lacking in originality. Secondly, the digitized degree of products is limited. Lacking of full integration of digital content, form, technology innovation and marketing channels from aspects of production, management and distribution, the industry's digital transformation and development is largely restrained.

3 Strategy of Improving International Competitiveness of China's Publishing Industry

Since the goal of building a strong socialist country was clearly put forward by the 18th National Congress of the Communist Party of China, the cultural industry and the publishing industry which is embedded in it should shoulder the responsibility of going global, enhancing the overall strength of culture, improving the international influence of Chinese culture. Therefore, it is undoubtedly of great significance to effectively strengthen the international competitiveness of China's publishing industry.

The development of the industry cannot be achieved without investment from capital, manpower, knowledge, technology and other resources. Whether these resources can be used efficiently, optimized and upgraded to ensure the successful delivery of products lies in three major industrial entities, namely the government departments, industry associations and publishing enterprises. To be specific to China's publishing industry, the above three entities need to effectively achieve the optimization of product, industry and environment through content, technology, systems, management and other aspects of

innovation. Specific strategy recommendations are shown in Figure 1.

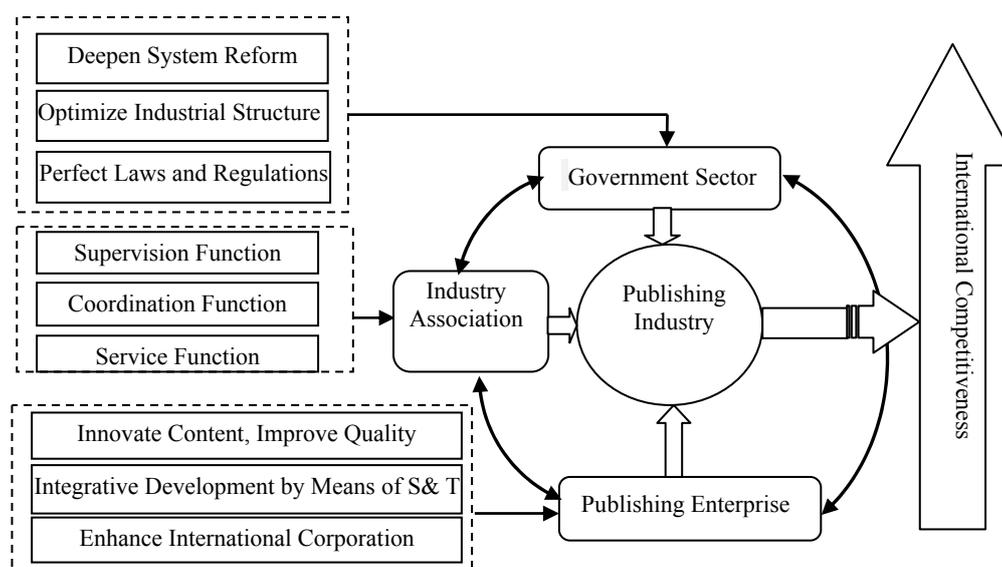

Figure 1 Strategy of Improving International Competitiveness of China's Publishing Industry

3.1 The improving direction of the government

The improvement of international competitiveness of the publishing industry is made by effective intervention and support from the government. In recent years, China has introduced a variety of cultural industry policies, publishing industry policies and regulations and departmental regulations. From the perspective of overall implementation, guidance and support on the publishing industry is gradually strengthened. It has created a good environment for the improvement of overall capacity and efficiency of international industry development, greatly boosting the dynamic upgrading of international competitiveness of China's publishing industry.

3.1.1 Deepen institutional reform

For government departments, the first step is to further deepen reform, continue to step up efforts to loosen constraints on the publishing industry, weaken our own management and intervention measures, so as to enhance market vitality in an all-round way. Specifically, the government should gradually realize and optimize its monitoring, regulation, support, and driving functions and improve the act of government by deepening institutional reform, strengthening the legal system, improving the policy system and improving the level of cultural opening. Therefore, it can provide a good external environment and the potential power for international development around the world.

3.1.2 Further optimize industrial structure

The current policies are conducive to improving the publishing industry's capital structure and investment and financing capacity. Along this line of thought, to overallly improve the international competitiveness of our publishing industry, government must further perfect our basic management, content management and industry management, conduct in-depth exploration, promote special management unit system to encourage mergers and reorganizations of publishing enterprises across regions, industries and ownership to promote the cultivation of large-scale major publishing enterprises, improve the scale, intensive, professional level of the publishing industry, and provide a good external environment and potential power for the international development of publishing industry.

3.1.3 Perfect publishing laws and regulations

Relevant government should learn from the advanced experience of the publishing industry in the United States and the United Kingdom, accelerate the establishment and improvement of laws and regulations, strengthen the construction of legal system so as to realize the effective standardization and unification of the market act of publishing enterprises. Government also should accelerate the improvement of copyright legislation and the construction of related systems, industrial laws and regulations, and intensify against piracy infringement to create a good legal environment for the healthy development of industry and fair and orderly competition among enterprises (Yu Min, 2004).

3.2 Function transformation of the industry association

Compared with the foreign trade associations, China's publishing industry associations have not really become the representatives of industry interests and cannot effectively play the role of self-regulation. Therefore, the publishing industry association's focus is to take active measures to strengthen self-regulation of the industry, reinforce the communication between government and enterprises, so as to play a role of good supervisor, coordinator, service provider and to make efforts to improve international competitiveness of the publishing industry.

3.2.1 Supervision functions

To achieve sustainable and international development, the publishing industry requires a good industrial development environment - fair, standardized, stable and orderly market. The construction of this market order calls for not only the government's macro-control and the enterprise's own efforts, but also supervision and regulation of the associations.

Industry associations should give full play to their own self-regulation and control functions, play the role of a good industry monitor to create a good environment and order (He Jianfeng, 2002). At the same time, associations should study the industry market, digital, international development status, development trends and problems, formulate development goals and plans in accordance with national policies and plans, guide the industry into a healthy and orderly development in an all-round way.

3.2.2 Coordinating functions

Industry association plays a major role in industry development. It is generally composed of enterprises within the industry, and it is closer to the industry and industry enterprises than government at macro level (Zhang Shilan, 2010). The long-term absence of China's publishing industry associations results in the lack of effective platform and communication mechanism between the government and the publishing enterprises, which leads to the dis-junction of the policy and enterprise demand, a waste of resources and weak management.

First of all, relevant trade associations should strictly follow provisions of the law and its own rules and regulations to optimize competition and cooperation order of publishing enterprises. Second, associations should increase business communication and contact between publishing industry and other industries, especially with the associated industries, intensify strategic alliances among enterprises so as to comprehensively optimize the industrial network system, achieve the optimal allocation of resources and the maximum interests of all enterprises.

3.2.3 Service functions

Most foreign trade associations have dialogues with government on behalf of interests of the industry. They are also directly involved in legislation, serving the industry from the legal perspective to maximize benefits and create a good industrial environment (Zhang Shilan, 2010). The publishing industry association of China should optimize its service level through the effective integration of information resources, talents, channels, platforms and other industries from home and abroad as soon as possible. Specific measures are the following two aspects: First, through organizing business seminars, business training courses, organizations, vocational training for qualification examination, specialized training schools, lectures for popularizing the latest laws and regulations, exchange of experience of outstanding entrepreneurs, etc. Second, through organizing industry advocacy, planning exhibitions of superior products.

3.3 Self-improvement of publishing enterprises

Enterprise is the core force to enhance the international competitiveness of industry. Its competitiveness level will directly determine the strength of the industry's international competitiveness and it is also the major component of international competitiveness of industry.

3.3.1 Content innovation and quality improvement

As an important part of cultural industry, publishing enterprises should pay attention to their own cultural functions and social responsibilities. And build the correct ethical value standard with the help of the cultural function and thought transmission function which it carries, so as to create a good development atmosphere for the society, and make every effort to the shareholders, the consumers, the content providers, the technology developers, the natural environment and so on.

1) Improve product quality

Product quality concerns the life of enterprises. Publishing enterprises should give full attention to the optimization of product quality, strengthening awareness of product quality and innovation, enhancing cultural mission and social responsibility of cultural accumulation, dissemination and heritage, and continuously optimizing product quality to display cultural content, cultural taste, and to improve their content originality (Grantham, Bill, 2000).

2) Integrate excellent publishing resources

Although China has a long history of cultural essence and a wealth of knowledge resources, those advantages have not been efficiently exploited nor utilized. The degree of utilization of knowledge resources needs to be strengthened. As a knowledge-intensive industry, the development of publishing industry is inseparable from the efficient use as well as fully grasp of author resources and cultural resources by enterprises in the industry. Therefore, enterprises should effectively integrate domestic and foreign author resources and excellent knowledge and cultural resources from the international perspective, and protect product quality and originality from the source.

3.3.2 Utilize technology and achieve integrated development

With the constantly updated computer technology, modern communication technology, digital printing technology, network technology, streaming media technology and other high-tech, there are new changes taking place that are closely related to the publishing industry, including reading habits, creative methods, editing methods, production methods, distribution models and management tools, and these changes are also the future inevitable trend of international publishing industry. Publishing enterprises should realize the strategic role of technology on their own development and industrial transformation, increase investment in science and technology and R & D efforts, so as to achieve their upgrading and transformation with the huge driving force of technology.

3.3.3 Enhance international cooperation

International cooperation is an effective way, essential pass and important channel to enhance the international competitiveness of enterprises and the industry as a whole. As China's publishing industry have obvious deficiencies in the resource base, product quality, enterprise size, business management and industrial policy environment, China's publishing enterprises and their products are difficult to effectively enter the international market. Therefore, enterprises should extensively carry out international cooperation and exchanges, expand the scope and areas of cooperation, fully utilize international platform to integrate international resources to improve their international influence.

4 Conclusions

To enhance the international competitiveness of China's publishing industry is not only an urgent and important task, but also a long-term and complex system project. Only when the government departments, trade associations and publishing companies work together in a targeted way can they find their own priorities and eventually achieve the effective improvement of international competitiveness of publishing industry

Research on Equity Concentration Influence to Operation Performance in Textile Industry Listed Companies

Hou Yuwei

School of Management, Wuhan University of Technology, Wuhan, P. R. China, 430070

(E-mail: 328672560@qq.com)

Abstract: Whether or not equity concentration impacts company's operating performance, is always a hot topic of for both domestic and abroad economists, this article conducts a bunch of quantitative analysis tools to the actual financial data from the 62 listed companies in past three years in textile industry. A linear model has been setup between the data of concentration of shares, supported by combination of first big shareholder's data, top five shareholders' stock data, Z coefficient as well as HeErFen DE index and data of return on net asset which represents the business performance. It concludes there is a positive correlation between the concentration equity and business performance: the higher the ownership concentration, the better operating performance. Some Suggestions and countermeasures are also put forward.

Key words: Textile industry; Equity concentration; Business performance; Quantitative analysis

1 Introduction

The relationship between the equity structure and operation performance is always catching attention of both domestic and abroad economist, among which the equity structure plays a critical role compared to the capital structure. In equity structure, concentration of shareholder is an importation indicator---it shows not only the first shareholder's percentage, but also the other big holder's situation, which will provide a solid database to decision makers

In recent years, with the continuous development of the economy, stock market becomes more and more active which calls economists attention to the relationship between equity concentration and corporate performance. In the recent disclosure of 2015 annual report, a trend of decrease of shareholders in public company is appearing, which means an increase of equity concentration and. The data showed that among 2827 listed companies, 800 decrease the number of shareholders, among which textile industry takes the first 3. Therefore, this article will use the data of textile industry companies to explore the correlation between equity concentration and operation performance

2 Overview of Current Existing Research

According to the previous research documents, there are 3 different views of the relationship between equity concentration and business positive correlation, negative correlation, u-shaped relationship.

Liu Mei (2016), who selected 50 companies in each area of competitive and monopoly company, draws the conclusion that equity concentration plays a positive impact to company performance in GEB. The higher concentration of shares, the better the business performance. While as Long Yudan (2015) and Ren Wei (2016), with a focus on family-owned public company, stated due to the natural big shareholder has a weakness of making decision, the concentration of equity decrease the company's performance. This is consistent with Laporta's conclusion also, a negative correlation existing between these two factors

In the point view of a u-shaped relationship, it can be also divided into U related and inverted u-shaped(n), Bai Chong'en (2005), as well as foreign scholar Morcketal (1988), is the representative of U-shape, which means positive impact to performance with higher concentration while. While on the other hand, Sun Yongxiang (1999), with Mcconnell and Servaes (1990), holds the opposite idea--they believe inverted U relationship is existing between the equity concentration and business performance.

The reason why people hold different conclusions of these two relationship is because different industry and companies will vary a lot. This article will focus on Textile industry and seeks the relationship between equity concentration and business performance, with more

suggestions being put forward in the end.

3 Research Design

3.1 Research Hypothesis

In above studies with different views on the relationship between the both, this article is based on the characteristics of the textile industry, with high competitiveness and labor-intensiveness as well big liquidity. The big shareholder will conduct very strict supervision over management team to maximize their own interest and improve the business performance This also helps to improve the whole profitability of company.

Hypothesis 1: the first big shareholder shareholding relationship with enterprise's business performance are positively correlated;

hypothesis 2: the top five shareholders and corporate business performance are positively correlated.

According to the present situation of the textile industry and relevant information of the market economy, the balance of equity shareholder is positively correlated with operating performance It is also consistent with previous scholars and economist's conclusion. In order to avoid damage, the interests of small shareholders, the higher the enterprise's equity balance degree, the better control of business risk and better business performance.

Therefore, hypothesis 3: equity balance degree and enterprise operating performance were positively correlated.

3.2 Sample selection and the design of variable

According to the Taian database, as of late 2015, among 75 listed textile companies excluding ST type, and those without continuous data in past 3 years, finally leaves 62 active listed companies in the year of 2013,2014 and 2015 This article will use the tool of descriptive analysis firstly on the three years of data, and correlation and regression analysis use of ownership concentration index and profitability index, to draw the corresponding conclusions.

Table 1 Variable Description

explained variable	Return on equity	ROE	Net/net worth
Explanatory variables	The first big shareholder	CR1	The total amount of the first largest shareholder/equity
	The top five shareholders	CR5	The total amount of the top five shareholders/equity
	Z index	Z	The first big shareholders number of shares/the second largest number of shares
	H5 index	H5	The sum of the squares of the other top five shareholders
Control variables	The company size	SIZE	Total assets of the natural logarithm
	Asset-liability ratio	DAR	The total debt/total assets

3.3 Model establish

This article will adopt the method of least squares regression analysis and correlation, to study the relationship between the two. According to the above description, return on equity, as explained variable, will indicate the degree of equity concentration CR1, Z coefficient, H5, H10 as explanatory variables, using SPSS software to analyze the collected data processing. The result is consistent with hypothesis, with following model:

$$\text{Model 1: ROE} = C(1) + C(2) * \text{CR1} + C(3) * \text{SIZE} + C(4) * \text{DAR}$$

$$\text{Model 2: ROE} = C(1) + C(2) * \text{CR5} + C(3) * \text{SIZE} + C(4) * \text{DAR}$$

$$\text{Model 3: ROE} = C(1) + C(2) * Z + C(3) * \text{SIZE} + C(4) * \text{DAR}$$

$$\text{Model 4: ROE} = C(1) + C(2) * \text{H5} + C(3) * \text{SIZE} + C(4) * \text{DAR}$$

4 Empirical Analysis

4.1 Descriptive analysis

For 2013 to 2015, This article use spss22.0 software descriptive analysis tool on 186 companies' data from 2013 to 2015, with 62 on average each year. The results are shown in the

following table:

Table 2 Descriptive Analysis

Years sample size		2013	2014	2015
		62	62	62
CR1	minimum	0.063829	0.062831	0.005210
	maximum	0.802352	0.831791	0.873140
	average	0.375465	0.378715	0.385284
	standard deviation	0.172610	0.152183	0.158786
CR5	minimum	0.171304	0.184214	0.167192
	maximum	0.953241	0.952171	0.976311
	average	0.570149	0.571904	0.573781
	standard deviation	0.182304	0.174919	0.163893
Z	minimum	0.026382	0.016800	0.016800
	maximum	0.542379	0.571131	0.637100
	average	0.274931	0.263915	0.260430
	standard deviation	0.128934	0.127331	0.129811
H5	minimum	0.036188	0.030718	0.025738
	maximum	0.824321	0.624329	0.824329
	average	0.369216	0.328761	0.325761
	standard deviation	0.143707	0.129619	0.120619

The above three tables respectively describe the textile industry 62 listed companies in 2013, 2014 and 2015 of each variable count. Compared three years of data, you can see, the first big shareholder's stake in a slow upward trend, from 2013 to 37.5464% in the last 2014 years of 37.8715% to 38.5284% of 2015 years. The top five shareholders' shareholding number also on the rise, from 2013 to 57.0149% in the last 2014 years of 57.1904% to 57.3781% of 15 years. As you can see, although each year the magnitude of the change is not big, but the overall trend is also on the rise. Return on equity from 13 to 15 years, it can be seen that as the growth of the year its return on equity shows ascendant trend. The coefficient of equity in rising year by year, from 0.3692 in 13 to 14 years of 0.3286 to 0.325761 the last 15 years,; In recent three years, the scale of the company in an upward trend, the scale has widened.

4.2 Regression analysis

Table 3 Regression Analysis

	Model 1			Model 2			Model 3			Model 4		
	B	t	Sig	B	t	Sig	B	t	Sig	B	t	Sig
constant	-13.71	-2.05	0.04	-14.84	-2.37	0.03	-3.31	-2.05	0.04	-3.31	-2.35	0.00
CR1	0.04	2.42	0.01									
CR5				0.04	2.41	0.02						
Z							0.04	2.02	0.01			
H5										0.24	2.12	0.03
DAR	-0.15	-10.00	0.000	-0.42	-9.80	0.00	-0.45	-7.00	0.00	-0.48	-8.04	0.00
SIZE	1.031	3.18	0.001	0.18	3.32	0.00	0.23	2.11	0.00	0.20	3.02	0.00

Table 4 Regression Analysis

	Model 1	Model 2	Model 3	Model 4
R ²	0.713	0.723	0.603	0.621
F	35.008	34.98	34.408	35.418

Model one, t value equal to 2.427, indicating that there was a positive correlation between the CR1 and ROE, and under the significance level of 0.05 the adjusted R2 is 0.713, F value is 35.008,

higher goodness of fit.

Model 2, the t value is equal to 2.407, indicating that there was a positive correlation between the CR5 and ROE, and under the significance level of 0.05 the adjusted R2 is 0.723, F value is 34.98, higher goodness of fit.

Model 3, t value equal to 2.02, shows that there is positive correlation between Z and ROE, and under the significance level of 0.05, the adjusted R2 is 0.603, F value is 34.408, higher goodness of fit.

Model 4, t value equal to 2.12, indicating that there was a positive correlation between the H5 and ROE, and under the significance level of 0.05 the adjusted R2 is 0.621, F value is 35.418, higher goodness of fit.

5 Conclusions

Textile industry is a very important part of manufacturing in China. The below suggestions will be put forward to improve its operation performance:

1) Based on previous data analysis, a positive correlation exists between the share concentration and business performance. Therefore, we shall improve the concert ration into a reasonable ratio to have a positive impact to its operation performance.

2) Balance of shareholders structure shall be advocated at the same time of increasing concentration. The reason for that is to avoid monopoly shareholder to manipulate the reports and abuse company's capital in some other personal area. Without supervision from the other parties, a risk of destroying the company's interest could happen. A restructure of shareholder to have more impacts from medium-minor shareholders will definitely help to improve business performance and efficient decision.

3) Introducing more outsiders, especially the organizational investors to join the board of directors in the company will also help to ameliorate the shareholders' structure. Compared to the traditional company who has its leadership as biggest shareholder, these organizational investors will take in more advanced management system and more resources to benefit the business operation. As of today's open financial environment, the textile industry shall take advantage of the policy to import more outside organizational investors.

The Relationship among the Service Recovery, Self-Esteem and Satisfaction after Service Recovery in Online Shopping Environment

Sun Wei

College of Management, Wuhan University of Science and Technology, Wuhan, P.R. China, 430081
School of Economics and Management, Beijing University of Posts and Telecommunications,
Beijing, P.R. China, 100876
(E-mail: sunwei@wust.edu.cn)

Abstract: Due to the physical separation of buyer and seller, the physical separation of buyer and merchandise, and the perceived insecurity of the Internet in online shopping environment, different service recovery types may lead to different satisfaction especially facing different individuals. This proposed research wants to discuss the relationship among service recovery, individual's self-esteem and satisfaction after service recovery in online shopping environment.

Key words: Service recovery; Self-esteem; Satisfaction; Online shopping

1 Introduction

When different people purchase a product on the biggest shopping website "TAOBAO" in China, confronting the same product, the same service failure such as forgot to send a part and the same service recovery strategy, people's response is so different to believe. Even though someone has got the compensation, he still felt cheated and didn't trust the merchant anymore. But someone received the product's flaw and compensation pleasantly, and he still choose to trust the merchant based on his own knowledge and experience. So what factor causes this difference? The online shopping environment is different from the traditional face-to-face shopping, maybe it is more real or maybe it is more mendacious. Some scholar contributes the difference to the individual's emotion, some scholar contributes the difference to perceptions of procedural and interactional fairness, this proposal wants to discuss if the individual's self-esteem influence the satisfaction after service recovery and how?

Although the enterprise tries it's best to provide high quality service in the service delivery, it's difficult to avoid the service failure completely (Goodwin and Ross, 1992; Aurier and Siadou-Martin, 2007). According to service failure, western scholars put forward the conception "service recovery" and it becomes an important research area in service management. Actually when confronting the service failure, most of the customers won't go away easily and on the contrary they are looking forward to get compensation from the merchant (Berry and Parasuraman, 1991; Goodwin and Ross, 1992; Blodgett et al., 1997; Holloway and Beatty, 2003).

Although service failure and recovery issues have received considerable attention in the literature, these topics have received only limited attention in the context of online retailing. Specifically, we lack an understanding of the types of online service failures occurring, the success with which firms are recovering from these failures, and consumer reactions to the service failure/recovery encounters they are experiencing (Holloway and Beatty, 2003).

The existing research on the relationship between the service recovery and satisfaction mainly study from the perspective of perception, few from emotion, seldom from the self-esteem. Del Rio Lanza (2009) put forward that distributive justice, procedural justice and interactional justice all affect satisfaction, with procedural justice showing the strongest relative influence, as well as being the only dimension affecting the emotions. Negative emotions mediate the effects of justice on satisfaction with service recovery.

2 The Theoretical Development

2.1 Service recovery and online service recovery

Scholars have two opinions about the service recovery: on the one hand, service recovery is the response and the reaction after service failure (Bell and Zemke, 1987); on the other hand, service recovery is the response and the reaction when service failure happens (Johnston, 1995; Jinglun and FuXiang, 2001). ZhongWei Chen (2005) made the definition including the two aspects above: service recovery means the correction to possible failure or existed fault in service system and the compensation to the customer with the efforts of all the members in the organization in order to maintain the long term relationship with the customers and promote the service system.

Since the adoption of the Internet, we have witnessed an impressive stream of research addressing online consumer attitudes and behaviors and how the online service encounter may differ from the traditional offline encounter (Betsy, 2003). Preliminary research emphasizes that trust is especially crucial to establishing customer relationships in the online environment (Hoffman, et al., 1999; Milne and Boza, 1999; Urban, et al., 2000). In fact, some argue that trust may be even more important online due to the physical separation of buyer and seller, the physical separation of buyer and merchandise, and the perceived insecurity of the Internet (Warrington, et al., 2000).

The recovery activities undertaken during the immediate and follow-up recovery phases take two forms: psychological and tangible (Miller, et al., 2000). Psychological recovery efforts make a direct attempt to ameliorate the situation by showing concern for the customer's needs. Two psychological techniques are recommended in every instance of service recovery: empathizing and apologizing. Tangible recovery efforts offer compensation for real and perceived damages. The primary intent is to provide fair restitution for the costs and inconveniences caused by the service failure such as the product for free, refund, discounts, coupons and so on.

2.2 Satisfaction after service recovery

Kotler (2010) suggest that customer's satisfaction means a satisfied or disappoint feeling status when the customer compare the perceptual performance with the expectations. The most widely used model within the consumer satisfaction/dissatisfaction (CS/D) literature is the disconfirmation paradigm. Disconfirmation also has been advanced as a model for understanding customers' reaction to recovery. The disconfirmation paradigm holds that customers compare perceived product performance to expectations. Michael A. McCollough (2000) holds that satisfaction is a function of initial disconfirmation and recovery disconfirmation. Recovery disconfirmation is defined as the discrepancy between recovery expectations (expectations by the consumer regarding what the service provider will do given failure) and recovery performance (perceptions regarding steps taken by the service provider in response to failure). So the satisfaction after service recovery could be defined as the whole degree on satisfaction after the failure service and the enterprise's compensation. This satisfaction is different from the first time satisfaction when the customer receives the service firstly, and was called "the second time satisfaction" (Smith et al., 1999; McCollough et al., 2000; Harris et al., 2006).

According to Goodwin and Ross (1992), the satisfaction after service recovery is measured by three aspects: (1) the customer give a positive evaluation on the website's response to the service failure as a whole (2) the customer was satisfied with the method the website uses to the service failure (3) the customer was satisfied with the compensation the website provides to the service failure.

2.3 Service recovery and satisfaction after service recovery

Previous studies have investigated the impact of a proper service recovery on customer satisfaction (Blodgett et al., 1997, Smith et al., 1999 and Tax et al., 1998). Research suggests that satisfaction with complaint handling is strongly associated with both trust and commitment (Kelley and Davis, 1994) and can serve as an important mediator linking perceptions of fairness to post complaint behaviors and attitudes. Moreover, satisfaction with complaint handling can improve the evaluation of a service experience and increase customer retention (Technical Assistance Research Program, 1986). Effective management of customer problems and relationship marketing are interrelated in terms of their focus on customer satisfaction, trust, and commitment (Achrol, 1991; Morgan and Hunt, 1994). Thus we put forward the hypotheses as follows:

H1a. Service recovery positively affects the customer's satisfaction after service recovery;

H1b. Tangible recovery efforts positively affect the customer's satisfaction after service recovery;

H1c. Psychological recovery efforts positively affect the customer's satisfaction after service recovery.

2.4 Self-esteem as a moderator between service recovery and recovery satisfaction

The existing research on the relationship between the service recovery and satisfaction mainly study from the perspective of perception, few from emotion. Del Río Lanza (2009) put forward that distributive justice, procedural justice and interactional justice all affect satisfaction, with procedural justice being the only dimension affecting the emotions. Negative emotions mediate the effects of justice on satisfaction with service recovery (Del Río Lanza, 2009).

Seldom scholars study the relationship from the perspective of self-esteem. Xiting and Xiong (1998) put forward that self-esteem also means self-worth. It is a term used in psychology to reflect a person's overall emotional evaluation of his or her own worth. It is a judgment of oneself as well as an attitude toward the self. Self-esteem is also known as the evaluative dimension of the self that includes feelings of worthiness, prides and discouragement. Nathaniel Branden (1971) defined self-esteem as "the

experience of being competent to cope with the basic challenges of life and being worthy of happiness." According to Branden (1971), self-esteem is the sum of self-confidence (a feeling of personal capacity) and self-respect (a feeling of personal worth).

By Orth (2012) suggested that self-esteem has medium-sized effects on life-span trajectories of affect and depression, small to medium-sized effects on trajectories of relationship and job satisfaction, a very small effect on the trajectory of health, and no effect on the trajectory of occupational status. He also suggested that self-esteem has a significant prospective impact on real-world life experiences and that high and low self-esteem is not mere epiphenomena of success and failure in important life domains.

Most scholars agree with this classification: High self-esteem and Low self-esteem.

People with high self-esteem believe "I am me. In all the world, there is no one else like me. There are persons who have some parts like me, but no one adds up exactly like me" (Satir and Watson,1975). People with high self-esteem believe "Are able to act according to what they think to be the best choice, trusting their own judgment, and not feeling guilty when others do not like their choice" and "Consider themselves equal in dignity to others, rather than inferior or superior, while accepting differences in certain talents, personal prestige or financial standing" (José-Vicente Bonet,1997)

A person with low self-esteem may show some of the following characteristics: "Heavy self-criticism and dissatisfaction" and "Hypersensitivity to criticism with resentment against critics and feelings of being attacked" (José-Vicente Bonet,1997). When given negative feedback, individuals with low self-esteem often take it personally, and can be devastated by it (Baldwin, M. W,1996).

Self-esteem is typically assessed using a self-report inventory yielding a score on a continuous scale from low to high self-esteem. Among the most widely used instruments, self-esteem scale (SES) scores each item on a ten- field's response system that requires participants to indicate their level of agreement with a series of statements about themselves(Rosenberg,1965). This study will adopt SES to measure participants' self-esteem. Based on above we put forward the hypotheses as follows:

H2a.If the customer has high self-esteem, tangible recovery efforts positively affect the customer's satisfaction after service recovery;

H2b. If the customer has high self-esteem, psychological recovery efforts negatively affect the customer's satisfaction after service recovery;

H3a.If the customer has low self-esteem, tangible recovery efforts negatively affect the customer's satisfaction after service recovery;

H3b. If the customer has low self-esteem, psychological recovery efforts positively affect the customer's satisfaction after service recovery.

The whole research model as figure 1.

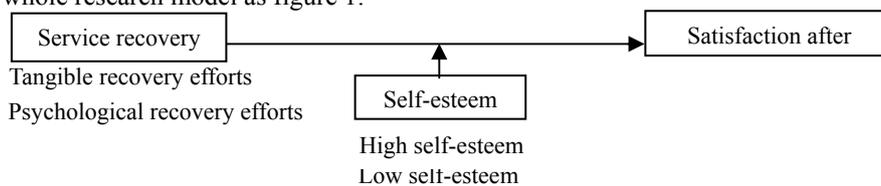

Figure 1 Research Model

3 Research Design

3.1 Measurement of variables

Trough related literature at home and abroad, we found out the most widely-used instruments to measure the moderator variable and the independent variable. What's more we will translate the scale into Chinese and modify it in keeping with Chinese language habit and the online shopping environment.

Service recovery strategy contains tangible recovery efforts and psychological recovery efforts, we will design it according to actual experiment and test in advance to justify.

The moderator variable "self-esteem" was measured as follow based on SES. It is a widely used 10-item self-report questionnaire assessing feelings and judgments about the self-rated on a 4-point scale.

If you strongly agree, circle SA. If you agree with the statement, circle A. If you disagree, circle D. If you strongly disagree, circle SD.

Scoring: SA=3, A=2, D=1, SD=0. Items with an asterisk are reverse scored, that is, SA=0, A=1, D=2, SD=3. Sum the scores for the 10 items. The higher the score, the higher the self-esteem.

Table 1 Measurement Scale

1	On the whole, I am satisfied with myself.	SA	A	D	SD
2 *	At times, I think I am no good at all.	SA	A	D	SD
3	I feel that I have a number of good qualities.	SA	A	D	SD
4	I am able to do things as well as most other people.	SA	A	D	SD
5*	I feel I do not have much to be proud of.	SA	A	D	SD
6*	I certainly feel useless at times.	SA	A	D	SD
7	I feel that I'm a person of worth, at least on an equal plane with others.	SA	A	D	SD
8 *	I wish I could have more respect for myself.	SA	A	D	SD
9*	All in all, I am inclined to feel that I am a failure.	SA	A	D	SD
10	I take a positive attitude toward myself.	SA	A	D	SD

The independent variable “satisfaction after service recovery” was measured as follow according to Goodwin and Ross (1992): 1) the customer give a positive evaluation on the website’s response to the service failure as a whole; 2) the customer was satisfied with the method the website uses to the service failure; 3) the customer was satisfied with the compensation the website provides to the service failure.

3.2 Experimental design

3.2.1 Experiment 1

We select a merchant on TAOBAO website which supplies the e-books for kindle or other electronic reading tools. The reason for this chooses lies on two points: one is the merchant on TAOBAO website has the lowest operating costs and it is relatively easy to do experiment on the consumer and won’t bring great influence to the business. The other is that the e-books have the lowest cost in China and the product’s cost won’t change with sales.

We will provide a famous e-book which its cover is perfect but its content is short intentionally. We will choose 100 consumers to do the experiment. After the consumer has got the e-book from the internet, we select 1/3 consumers randomly to give him a tangible recovery or psychological recovery or no respond. Tangible recovery contains the perfect e-book with its cover and content, what’s more a coupons or refund. Psychological recovery refers to apologize for his mistake and sorry for the consumer’s inconvenience taken by his error. No respond stands for nothing, neither answer the consumer nor give compensation. When all the recovery has been done, we give the satisfaction scale to the consumer to fill in and pay the consumer for coupons. We tell the consumers we just want to do a satisfaction survey, find out the problem and improve the service level. This experiment is to test the hypotheses H1a, H1b and H1c.

3.2.2 Experiment 2

We also select a merchant on TAOBAO website which supplies the e-books for kindle or other electronic reading tools. The reason for this chooses lies on two points: one is the merchant on TAOBAO website has the lowest operating costs and it is relatively easy to do experiment on the consumer and won’t bring great influence to the business. The other is that the e-books have the lowest cost in China and the product’s cost won’t change with sales.

We will provide a famous e-book which its cover is perfect but its content is short intentionally. We will choose 200 consumers to do the experiment. After the consumer has got the e-book from the internet, we select 1/2 consumers randomly to give him a tangible recovery or psychological recovery. Tangible recovery contains the perfect e-book with its cover and content, what’s more a coupons or refund. Psychological recovery refers to apologize for his mistake and sorry for the consumer’s inconvenience taken by his error. When all the recovery has been done, we give them a questionnaire containing the satisfaction scale and the SES to fill in and pay them for coupons. The SES is just on the questionnaires’ behind. We tell the consumers we just want to do a satisfaction survey, find out the problem and improve the service level. This experiment is to test the hypotheses H2a, H2b and H3a, H3b.

4 Analysis Plan

After we get the consumer’s feedback, we would check the data’s effectiveness and clean the unqualified questionnaires such as short of answer, or the answer is inconsistent and so on.

1) The reliability analysis, validity analysis and factor analysis. We will conduct the reliability analysis, validity analysis and factor analysis using the data from the two experiments. From the value of Cronbach’s α , we could conclude the scale’s internal consistency. Before the factor analysis, we

would conduct the test of Bartlett and KMO. We use factor analysis to test convergent validity.

2) The descriptive analysis. We will conduct the descriptive analysis based on experiment1's data and divide the data into three groups: the tangible recovery group, the psychological recovery group and the no respond group. We compare the three group's percentile values, central tendency and distribution.

3) The correlation analysis. We will conduct the correlation analysis based on experiment2's data. We would conclude the correlation between different variables according to the value of Pearson and N.

4) The regression analysis. We will conduct the regression analysis based on experiment2's data. We would conclude the regression effect according to the value of T and P.

5 Conclusions

This research aims to discuss the relationship among service recovery, individual's self-esteem and satisfaction after service recovery in online shopping environment. We develop the theoretical model, put forward the hypotheses, design 2 experiments to test the hypotheses, and put forward the data statistics and analysis plan. The likely contributions of the research lie on two points: one is that we research the relationship between the service recovery and satisfaction after service recovery in online shopping environment, not the offline shopping environment; another is that self-esteem as a moderator between the service recovery and satisfaction after service recovery.

Abstract: With the waves of Industry 4.0 sweeping the modern industry, manufacturing enterprises are facing greater opportunities as well as more challenges. How to innovate in management has become a major concern for modern manufacturing. To improve the management in manufacturing enterprises, informational softwares emerge in response to the needs of time. Whereas what still perplex enterprises managers are the appropriate selection and highly-effective usage of that. This paper is based on the method of MA-OWA and Rader graphs. A two-steps method is proposed to help manufacturing enterprises in informational management software and to ultimately improve the management innovation power.

Key words: Management innovation; Manufacturing innovation; Management informatization; Rader map

1 Introduction

As is known that no innovation will make the enterprise be eliminated by the market. Management innovation can be known as one of the latest management practices, process, or invention and application of skills, which is intended for helping obtain the objectives of the organization. (Xue Jie, 2011)

With the development and popularization of computer network technology, enterprise management is increasingly relying on informatization. In order to respond quickly to changes in the internal and external environment, the flexibility of adjusting production to marketing plan should ensure the smooth operation of capital flow, and improving economic efficiency and market competitiveness. On the other hand, the progress of management innovation also gives IT greater use of space, as well as more powerful processing capability. Enterprise informatization and management innovation are in a kind of dialectical relationship, closely related and indispensable. In the enterprise informatization construction, strengthening the management innovation of core significance is to achieve the perfect unity of efficiency and effectiveness. Informatization helps a lot in business efficiency whereas management innovation is mainly for the results. (Zheng Rong, 2004)

The last five years of the National Enterprise Management Innovation Conference has emphasis the promotion and practice of the integration of enterprise informatization and management innovation. Apparently informatization has become the only way for manufacturing management innovation.

In the construction of the "Eleventh Five-Year Plan", "Twelfth Five-Year Plan" manufacturing informatization, China manufacturing industry informatization construction has gone through "Introduction and Enlightenment" stage, and then entered a new stage called "steady progress, in-depth application". And in "Thirteenth Five-Year Plan", informatization will be more and more important. Integration of industrialization and information technology are moving toward a medium-high level of development. Advanced manufacturing industry will be developed a lot, and it will promote the production to be more flexible, intelligent, refinement.

Nowadays there are many informational software to help enterprise to obtain informatization thus achieve the management innovation. ERP is the abbreviation of Enterprise Resource Planning. It is based on the information technology combined with advanced management ideas. It breaks the accustomed boundaries existed between enterprises, as well as optimizes enterprises' internal resources in the supply chain, so as to consummate the operation mode in modern enterprises eventually. ERP system reflects rational requirements of resource allocation through the invisible hand of marketing. At the same time, ERP system can undoubtedly improve the business processes and promote the competitiveness of enterprises effectively. Obviously ERP system, if used wisely, will bring revolutionary changes to manufacturing management.

However, many enterprises made the mistake in choosing these own informational softwares. They do not have a deep analysis of the enterprise, so they cannot choose their own enterprise informatization software in accordance with their own requirement. They mistakenly believe that after buying the software, a lot of problems of enterprises can be smoothly and easily solved. But what they do not know is how to choose informatization software correctly. If so, it will only increase the cost of the enterprise, and cannot achieve the goal of income at the same time.

Many scholars have made a lot of research in terms of enterprise informatization software selection, and came up with some promising results. Some of them have proposed software evaluation matrix, Fuzzy Theory, TOPSIS, MA-OWA and other solutions. They emphasize more on theories rather than practical use, which leads to the tremendous numerous operation target, thus perplex the operation process. They need a team of experts to evaluate and screen repeatedly, therefore, this article embarks from the business point of view. On the basis of previous research, we select pattern step-by-step by using MA-OWA and Radar Chart to provide a convenient and flexible evaluation method for enterprise informatization innovation.

2 Optimization of Software Selection

2.1 Comparison of the enterprise management software

Existing information management software shows different features and advantages. In choosing their own software, manufacturing enterprises should start from the inner situation to make a rational choice. Some examples and characteristics of domestic ERP (Enterprise Resources Planning) soft wares are shown in Table 1.

Table 1 Examples of ERP

Software name	Development company	Development country	characteristic
SAP	SAP company	Walldorf, Germany	Integration, advanced nature, unity, integrity, openness
IBM	International Business Machines Corporation	New York, American	Strong database products, Complete solution, Comprehensive data management
QAD	QAD company	California, American	Flexible database configuration, build a virtual factory
Kingdee	Kingdee international software group	Shenzhen, China	Socialization, mobility, personalization
Inspur	Inspur company Limited	Jinan, China	High efficiency, low risk, internal control conveniently
Sunlike	Sunlike software group	Taiwan	Powerful function, high information integration, convenient operation

2.2 Optimization of software selection

Choosing a comprehensive and reasonable software or vendor is significant for enterprises as it can meet the practical demands and reduce the risk of projects during the process to some extent. Therefore, a wise selection of the software is considerably vital for enterprises to achieve success.

As mentioned, many related scholars have made a great contribution in the selection of information management software and put forward quite a few comprehensive programs. The study is based on a MA-OWA multi-weight analysis method and radar, which will be more intuitive to illustrate the performance of various ERP software and it is matching with the companies in practical application, in this way, this research will help the enterprise to achieve better economic benefits. MA-OWA is proposed by the American scholar Vager in 1988, which means a decision-making method is between the largest operator and the minimum. It is widely used in expert systems, fuzzy control and mathematical planning. (TORRA V., 1997; FILEV D, YAGER RR., 1998)

MA-OWA is defined as:

$$\text{Assume } F: R^a \rightarrow R, \text{ if } F(a_1, a_2, \dots, a_n) = \sum_{j=1}^n \omega_j \cdot b_j \quad (1)$$

F is called the operator of n-dimensional OWA.

$\omega = (\omega_1, \omega_2, \dots, \omega_n)^T$, is weight vector associated with F ;

$$\omega_j \in [0,1], \sum_{j=1}^n \omega_j = 1, b_j \text{ ranks } j \text{ in the array } (a_1, a_2, \dots, a_n).$$

Array (b_1, b_2, \dots, b_n) is ranked from small to large, then weighted by ω and get integration. It is noticed that there is no connection between b_j and ω_j , ω_j is only determined by the position j in the array. The major difference between OWA operator weights and ordinary weight lies in that the front one is based on the majority sets, which will avoid the result from severe influences of maximum or minimum value. (Cao Jie, etc, 2011)

Radar diagram is a widely used method in qualitative analysis of financial management, its greatest feature is intuitive, strong visibility. If is used in software selection analysis, it will help get a clearer judgment for the manufacturing enterprises.

The research divides the selection into two steps, including initial screening and precise selection.

Initial screening means selecting candidates from every single part of the software, which is in order to facilitate the following precise selection.

Manufacturing Category (divided by Product) is illustrated in Table 2.

Table 2 Manufacturing Category (divided by product)

01 Agricultural and sideline food processing industry	12 Education, art, sports and entertainment products manufacturing industry	23 Special equipment manufacturing industry
02 Food manufacturing industry	13 Petroleum processing, nuclear fuel processing industry	24 Automobile manufacturing industry
03 Wine, beverages and refined tea manufacturing industry	14 Chemical products industry	25 Transportation equipment manufacturing industry
04 Tobacco products industry	15 Pharmaceutical manufacturing industry	26 Electrical machinery and equipment manufacturing industry
05 Textile industry	16 Chemical fiber manufacturing industry	27 Electronic equipment manufacturing industry
06 Apparel industry	17 Rubber and plastic products industry	28 Instrument and meter manufacturing industry
07 Leather and footwear Industry	18 Nonmetallic mineral products industry	29 Other manufacturing industry
08 Wood processing industry	19 Ferrous metal smelting and rolling processing industry	30 Comprehensive utilization of waste resources industry
09 Furniture manufacturing industry	20 Non-ferrous metal smelting and rolling processing industry	31 Metal products, machinery and equipment repair industry
10 Paper industry	21 Metal products industry	
11 Printing Industry	22 General equipment manufacturing industry	

Manufacturing category (divided by production) is shown as Table 3.

Table 3 Manufacturing Category (divided by production)

1	Engineer To Project
2	Make To Order
3	Make To Stock
4	Repetitive
5	Batch
6	Continuous

In addition to these two classifications, manufacturing enterprises also have to take its size into consideration. According to the latest "Chinese Small and medium-sized enterprises designated standards "SME (small and medium enterprise) is divided as Table 4.

By the way of the three categories above, business executives and experts on information technology software respectively match score. The following equation is obtained according to Formula 1.

Table 4 Chinese Small and Medium-Sized Industry Enterprises Designated Standards

Trade name	Index name	large	medium	Small	microscopic
Industry	number of people employed	≥ 1000	300-1000	20-300	<20
	business income	≥400 million RMB	20-400 million RMB	3-20million RMB	<3million RMB

$$f(a_1, a_2, \dots, a_n)_i = \sum_{j=1}^n \omega_j \cdot b_j \tag{2}$$

$$F = \sum_{i=1}^3 f(a_1, a_2, \dots, a_n)_i \tag{3}$$

Letters meaning:

$i=1,2,3$: Represents three classifications;

$j=1,2,\dots,n$: Represents numbers of evaluation staff;

b_j : Represents j-bit evaluators under the classification of the Match ratings;

ω_i : Represents the weighting factor corresponding to b_j ;

F : Represents the total score under three classifications of the software.

According to software scores, we choose the top 20% software to conduct the following precise evaluation.

Precise evaluation includes five aspects, which are suitability, system functionality, vendor characteristics, investment and project cycle time. (Qi Ershi, SongLi fu, 2011)

Suitability Evaluation: The suitability of the software is evaluated by the software system functional status, system software technology, supplier qualification and strength.

The systematic function evaluation: Including the evaluation of the completeness of features, operator-friendly software, operational stability, customization capabilities, reporting, extensions, system stability, system integration, easy maintenance.

Supplier evaluation: Including success stories, corporate foundation strength, service training capacity and technical support capabilities.

Investment Project Evaluation: It includes acquisition costs and maintenance costs.

Evaluation of the project cycle: How much times did it takes to effect the software project.

Precise screening can also be calculated according to Formula 1 MA-OWA.

When it comes to the practical applications, we can use radar map as an evaluation tool, in order to obtain more comprehensive data intuitive and improve the comparability of the degree of match.

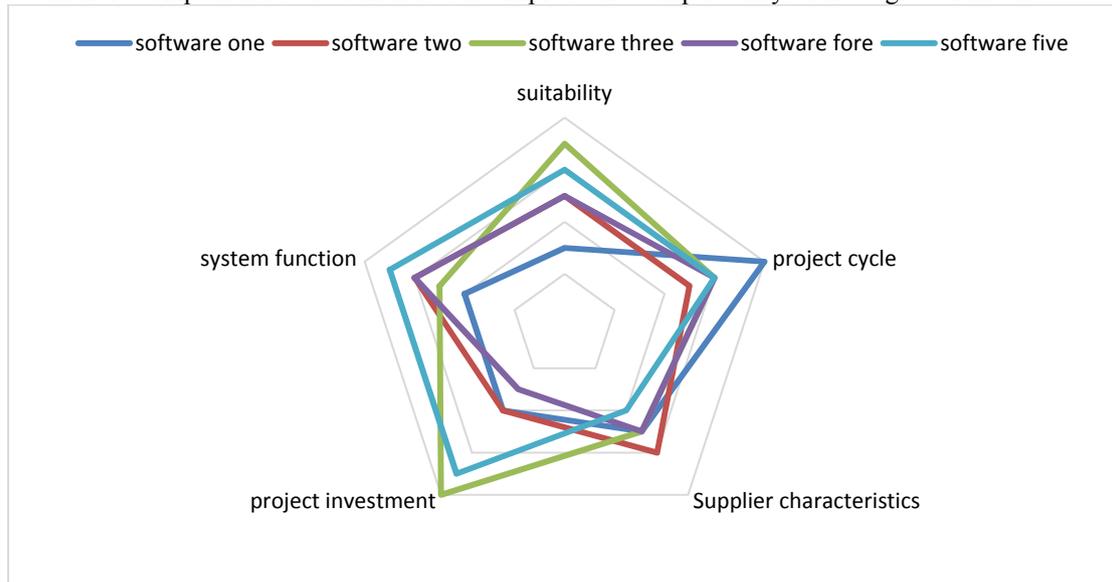

Figure 1 Rader Map of Enterprise Management Software Selection

As what we can see from Figure 1, the advantages and disadvantages of each software are distributed separately in this case, companies need to refer to the actual situation to adjust weighting coefficient, so that the model fit the enterprises more perfectly, ultimately in order to choose the most suitable software at an early stage.

3 Conclusions

The informatization of manufacturing management is not only the worldwide fashion trend, but also the requirement of the market. Because modern manufacturing requires more than the further liberation of the productive forces, the management mode tools to keep up with changing times also matter. This study starts from the enterprises management innovation achieved by the appropriate utilization of information software. But we have to understand that software cannot replace enterprise managers completely, and it is nothing but a highly-effective tool of the manager. That means if you want to do things so well, first make everything ready for you. Meanwhile it also gives some guidance in the selection of information software in manufacturing enterprises. Furthermore it proposes specific solutions based on the fuzzy theory and MA-OWA and adds more intuitive radar chart in solving practical problems of the enterprises, which is fairly consultative. If the enterprise is a canoe in the turbulent trend of marketing, the information software is a plus, which, if used properly, can steer the boat thousands of miles away safe and sound to success.

(E-mail: evelyn_xiuling@yahoo.co.id, pingfengliu@hotmail.com, niegh@whut.edu.cn)

Abstract: Omni-channel retailing is the newest business model, and it is fast getting its grasp in both national and international front. Omni-channel retail is commonly described as an entrepreneurial model that allows better customer experience from the online to offline (O2O) channels and where different enterprise channels are integrated. Small and Medium Sized Enterprises (SMEs) in developing nations have started picking up the modern business model to ensure a competitive advantage and Indonesia has not been left behind. The paper seeks to introduce the transition of the business from traditional perceptive to modern perceptive with a keen focus on the multi-channel to omni-channel retail in SMEs. The paper employs a research model to present the trends and challenges of omni-channel retailing in SMEs, which sets up a discussion platform for the success of SMEs in omni-channel retail in Indonesia. From previous researches carried out through qualitative methods, the article reveals the digital transformation of consumers' needs and expectations which challenges the Indonesian traditional brick-and-mortar business models and will indubitably force SMEs to improve their digital O2O capabilities.

Key words: Omni-channel retailing; Online to offline; Mobile technologies; Social media; Indonesian SMEs

1 Introduction

E-commerce has taken the sales and marketing industry by surprise due to its explosive and dynamic growth. The current consumer has evolved in taste and preference influencing the marketer to devise ways to meet the evolving need. The current change in taste and preference has been attributed to the availability of information, communication and technology (ICT) infrastructures that are fast replacing the traditional means of buying and selling. Traditionally, the business trade required both the buyer and the seller to be in the same geographic location to exchange goods or services. The traditional business model also emphasized on creating business avenues with familiar agencies, a concept that has changed enabling business companies to share their profile through the internet and the interested parties are able to indulge in business. E-commerce has also grown in terms of retail business where consumers can find goods and products in online shops whereby they purchase through online bank accounts and have the goods delivered at their place of picking.

A report by Deloitte (2015) indicates that current consumers prefer buying products from online platforms because of the affordable prices and the convenience provided by the sellers. The online products are considered affordable because the middleman has been eliminated and the consumer can deal directly with the manufacturer or the prime marketer. Similarly, the convenience afforded by the access to products through mobile phones and other digital gadgets as well as simultaneous access to different stores eliminates the burden of carrying out physical shopping. In Indonesia, consumers in urban areas are increasingly adopting a digital lifestyle characterized by quick research and access to information, communication and collaboration, and a variety of ways to learn (Tabor & Yoon, 2015). Despite the various limitations faced by the country such as lower connectivity speed and inequality of Internet accessibility and development across region, ATSI (2015) reported around 278 million mobile subscribers which exceed the 250 millions population. These data demonstrate the importance of the telecommunication industry and the increased connectivity across the country.

Omni-channel retailing has currently emerged from the consumers' need of extensive shopping experience that allows for integrated shopping across all marketing channels. According to Leijnse, Brams, Kentridge & Van Der Oeve (2014), consumers all over the globe have modified their marketing behavior and have grown more adept at using the available technology to compare prices and quality of a product by browsing through the internet. This has influenced majority of the stores to open online websites and develop a platform where similar products can be viewed giving the consumer the power to choose a single product from a variety of similar products.

Omni-channel retailing, therefore, enables the customer to move from online shops to physical stores with

the help of a mobile device, laptop or a tablet in a single transaction. The concept of omni-channel retailing has developed from the multichannel retailing where the online stores were divided from the physical stores limiting access to both simultaneously. The omni-channel retailing involves comparing the markets offered through traditional marketing which includes catalogs, the web stores, social media and the offline avenues which include the brick-and-mortar marketing (Verheef, Nerslin & Vroomen, 2007). Eventually, consumer can browse through all the channels and buy offline or where they feel the prices, and the quality matches their preference. The action of going through different websites with the aim of shopping has been referred to as web rooming as an opposite term for show rooming which was a term used for the traditional visit to the showrooms (Nerslin, Grewal & Leghorn 2006).

To catch up with more developed country, Indonesia also seek to digitize companies' business models to ensure that they target and maintain the customers. The digitization process has been made possible by the availability of updated technology and the need for creating sales and distribution networks that are available online. Redwing Asia (2016) supports the sudden growth in e-commerce by Indonesia by indicating the major principles the nation has taken to merge in with the growth. Indonesia is striving to create a fully integrated business model that accommodates brick-and-mortar physical stores, web marketing, and mobile marketing. Secondly, the Indonesian markets are looking for ways to connect the in-store shopping with the online shopping trends to ensure that they have provided the consumer with adequate avenues to access product details and can easily make purchases. Redwing (2016) explains that majority of the SMEs retail companies in Indonesia have engaged with e-commerce specialists to ensure that they meet the multi-channeling process. The third principle that has been adopted by Indonesia markets is enhancing community engagement where the local retailers have opened chat apps and social media accounts to interact with consumers who want to engage directly with the retailers. This has promoted the business ideology of Indonesia markets where retailers are able to understand the consumer preference and behaviors (Blázquez, 2014).

2 Literature Review

2.1 Review of Indonesian SMEs

The concept of e-commerce is not only affecting large firms with extensive range of products and services, but its effects are felt and affecting the small and medium-sized enterprises (SMEs). Over the last decades, the growth of SMEs has been significant in improving the economic status of the local communities and the government in any given region. The European Commission defined Small and Medium sized enterprises as business firm that has a few staff and personnel numbers as compared to other big companies (Airaksinen, Luomaranta, Alajääskö & Roodhuijzen, 2015). SMEs can be classified by size of the enterprise, staff headcount, and financial turnover. The SMEs have the ability to expand and prevail in conditions that may seem fragile for larger enterprises because they are most times considered for financial grants and do not require expensive innovation. The primary focus of encouraging the creation of multiple SMEs is so that they can provide chances for employment promote economic growth and innovation and provide a platform for social integration (Airaksinen, Luomaranta, Alajääskö & Roodhuijzen, 2015).

In Indonesia, the presence of SMEs has increased over the past two decades with the majority of the population converting their financial assets to small enterprises. SMEs Indonesia are described as those businesses with staff headcount of 5-19 individuals and have a financial turnover of less than RP 200 Million (Kartiwi, 2006). The government and other relevant bodies in the nation have encouraged the growth and development of SMEs because they aim at reducing poverty and improving the economic crisis that has weighed down the country since 1997. According to Triandini, Djunaidy & Siahaan (2013), all three categories of SMEs represented 99% businesses in Indonesia and have employed above 95% individuals thus providing the largest labor force in the country. SMEs in the country also contribute significantly to the Gross Domestic Product (GDP) of the country from its revenue in exports. Therefore, the current standing of the SMEs in Indonesia makes e-commerce a crucial topic of discussion in analyzing both its positive and the negative impacts.

E-commerce is directly intertwined with omni-channel retailing where the use of internet through the web and social media is a critical requirement in ensuring sales. A majority of nations in South East Asia continent are still struggling to adopt the marketing technology. This is mostly due to high poverty levels and lack of adequate infrastructure that facilitates the availability of internet use. Indonesia is among the nations in South East Asia that are struggling to rise above the known trends of delay in adopting information systems in the organizations. This is because the majority of citizens lack

computers and laptops. However, a wider population have direct access to mobile phones which they constantly use to research for products in the online market. Using the mobile devices, the consumers in Indonesia are able to analyze the quality of a product and the variety of a product before buying it in stores.

The Indonesian retailers, who are mainly segregated in different SMEs, have discovered this fact and are now more than ever striving to ensure that the consumer can have direct access to their products both in stores (offline) and online (Martlay & Addis, 2005). Studies indicate that a significant percent of the SMEs in Indonesia are family owned and therefore run by family members (Li, She, Chin, David & Mei, 2011). A study carried out by Triandini, Djunaidy & Siahaan (2013) explain that the most appropriate models to study the SMEs retailers behavior towards e-commerce and omni-channel retailing is the Technology Acceptance Model (TAM) followed by theories like Innovation Diffusion Theory (IDT) and Theory of Planned Behavior (TPB). TAM provides system values that explain the users, in this case, retailers acceptance of technology as part of their life, while analyzing the behavior towards the technology as well as the attitudes (Pantano, 2015). IDT applies where the retailer analyzes the complexity, compatibility, trialability, relative advantages and observability of the omni-channel model that is likely to work (Long, Lan & Duong, 2011). The TPB is closely related to technology acceptance model where behavior and intentions influence the success of adaptation of information systems.

2.2 From multi-channel to omni-channel retailing

Nerslin, Grewal and Leghorn (2006) explain multi-channel retailing as avenues where firms and customers interact with a defined design that involves coordination, deployment and evaluation of the communication channels. The interaction between the business and the customers occurs with an aim of enhancing the customer experience by incorporation consumer retention, deployment and acquisition strategies. Multichannel retailing is highly influenced by the customer through their experiences, preferences and perceptives. These factors affect how multi-channel retail operates and how it strategizes its objectives and marketing milestones.

The omni-channel retailing scope is faced with major factors that influence its success and influence its implementation. These factors include understanding the consumer behavior and channel allocation in order to tap into the sites that the consumer is most likely to indulge in while shopping and therefore avail the products and resources that meet the customer standards. This is particularly true due to the need of identifying the shopping experience of the consumers. The challenge in omni-channel retail comes when the retailer is unable to identify the complete shopping experience especially in brick-and-mortar stores where the consumer is not obliged to provide personal information (Ridgby & Leidingham, 2005). Finally, coordinating channel strategies includes managing the design, objectives, and deployment of the channels to create synergies. This involves strategizing whether the available channels can be integrated to enhance the shopper experience as well deciding whether to segregate the shopping experience making the buyer stick to a single channel throughout the shopping activity (Peter, Verheof & Kannan, 2015).

Multi-channel retailing has provided an excellent and advanced avenue for shoppers to enjoy their searching experience and has also influenced the advancement of shopping experience according to the customers' preference. This has given birth to omni-channel retailing where retailers are attempting to synchronize all channels by integrating the concepts. The omni-channel retailers have over the decade sought to make the shopping experience for the shoppers short and easy to maneuver in order to increase sales and credibility (Fenwick, et al. 2013). Omni-channel requires that the five most common factors work seamlessly to promote the success of retailing. The factors include store fulfillment, warehouse inventory management, order management and network inventory management, workforce management and channel agnostic return management (Fenwick, et al. 2013).

Store fulfillment requires that the retailer is able to reach the consumer through convenient means and that the consumer has a direct remote access to the warehouse. Its success is guided by having a framework that involves pick-up from store capabilities, online buying, and purchases, store to store transfers shipment claims and available return policy. Store inventory management expects that a consumer will get what they purchased through online means once they come for pick up. This is managed by constantly updating the store inventory to ensure everything sold online is in stock. Channel integration requires that the omni-channel has an available workforce that is integrated into all its activities to provide a smooth running for the products once an order is placed especially during promotions and peak seasons. Finally, having a credible and reliable return policy ensures greater success for the omni-channel business trend. Retailers on the omni-channel should always ensure that

they meet the consumer need and this also applies where the consumer is not satisfied with the order goods or products upon delivery. An easy and fast return policy ensures that the customer is happy and increases the chances of positive reviews.

3 Omni-Channel Retail Necessity for Indonesian SMEs

3.1 Evolving Indonesian consumers

Indonesian consumers are fast changing their shopping perspective by engaging more in ICT models through spending more time on the internet. Digitization is taking the place of old traditional means of communicating, living and shopping. Majority of the citizens in Indonesia have focused on acquiring news from online platforms since the digitization of the media, and this has fueled more traffic to the websites where commercial advertisements appearing as pop-ups are frequent (Kuskridho, 2014). The digitization of the news has created a platform where the citizens can start discussions and raise the issues that appear to be of concern through social media. Current studies indicate that majority of young people are immersed in the practice of using smartphones as a means of keeping in touch with the world. The other population of older people and people with lower income use phones that have limited or no access to the Internet. Majority of the population in Indonesia depends on phones to acquire the information they need and therefore hardly require a PC to access the internet (UNICEF, 2012; Puspitasari & Ishii, 2015).

Through the advancement in mobile networks, cloud infrastructure, social media, and specialized websites, consumers are increasingly gaining access to more channels and flexibility of information, and having more power on how they want to engage with the companies they do business with. However, the concept of web accessibility between the poor and the affluent, as well as the educated and the less educated, creates a digital divide. Such a digital divide can be translated in the trends in online shopping as well as the ability to create offline to online channels. Currently, the changing ethics in ICT and the influence of digital divide has led to clustering of a consuming class that is ready to indulge in shopping because they have a higher purchasing power (Razdan, et al. 2013). According the McKinsey report (2013), the Indonesian consuming class accounted for 55 million in 2013, and expected to grow to 85 million in 2020, adding about 5 million new consumers each year. However, while urban consuming class have higher expectations for the services and products they receive from companies such as more personalized shopping experiences or the speed of response to their query or issues, lower income consumers are still relying on traditional retailers stores.

This has led to the need for retailers to increase their supply capabilities in order to tap into the upcoming class of shoppers. The change requires the retailer to modify the business practices to allow for better and engaging shopping experience thus the need to convert from brick-and-mortar to digital and online stores. Razdan, Das and Sohoni (2013) points out that majority of urban shoppers in big cities like Jakarta prefer to use multiple channels while shopping where they get a variety of products from different stores. Furthermore, in their research, Patrali & Archana (2016) reveals consumers' preferences to online store when it comes to expressive and functional goods compare to physical retail stores. Therefore, the traditional retailers are expected to upgrade the buying experience by creating omni-channels that enable the customers to acquire maximum benefits of shopping from a single point or location.

3.2 Digital transformation of brick-and-mortar Indonesian retail stores

The omni-channel retail requires that consumers have continued access to different channels despite using different gadgets. This calls for various channels and SMEs to adopt an information system that accommodates consumer needs that come by when shopping and making comparisons. Nugroho (2015) explains that the adoption of technology in Indonesia is affected by four main factors which include optimism, innovativeness, discomfort and insecurity. The factors of discomfort and insecurity come into play when they inhibit the level of readiness towards adopting technology in business. The other factors of innovativeness and optimism affect the business platform by contributing to the measure of readiness in the use of technology. However, despite the emphasis on the importance of technology, the majority of the SMEs in Indonesia find the emphasis irrelevant and fail to recognize the need of adopting or upgrading to online channels. The lack of conviction to upgrade engraves a risk factor for business loss of competitiveness and a notable decline in markets, especially when the consumers fail to acquire a defined and modern taste of technology in business. It is noted that 66% of SMEs business owners view technology as a less valuable tool for business while only 18% acknowledge the impacts of integrating technology and business (Nugroho, 2015).

The risks associated with modern and online shopping seem to be another contributor to the delay in adopting omni-channel retail. As much as Indonesians appear among the top nations in the world to use social media and online shops, there are grave concerns on engaging the internet by providing private details. Therefore, the Indonesian shoppers are always weary of carrying online shopping especially when it comes to questioning the quality of the product and payment methods. Such concerns force the retailers to adopt highly integrated programs that are difficult to hack and ensure that the goods advertised are of high quality (Razdan, et al. 2013). The SMEs can also engage in the social media platforms to address the consumer concerns about the channels being used and the quality.

The online to offline (O2O) business concept is fast taking roots in Indonesian business models. The upcoming businesses and SMEs prefer to have strategically placed warehouses and an online team that responds to client requests, questions, and orders. Retailers in Indonesia have discovered that the current active shopper prefers browsing for products through online platforms and purchase through the same platform. It is, therefore, essential that the retailers understand the need for reliable business channels that promote more business opportunities, ensure consumer privacy and have adequate supply to consumers throughout the nation. Despite the slow growth among Indonesians concerning use of technology, there is hope among the retailers who have decided to embrace technology and information system. The offline or the brick-and-mortar shopping may never end but the integration of both online to offline is likely to displace some value in the traditional shopping.

Omni-channel retailing in Indonesia SMEs is slowly picking its pace from the consumers' needs to be connected to different channels without traditional difficulties. This has influenced the change of decision-making strategies employed by SMEs in order to incorporate the new changes in the marketing fronts. Samiaji (2012) explains that use of the internet is crucial in ensuring successful set up of omni-channel retail avenues. This is because majority of consumers check the product description on the web before making actual purchases and most times rely on the information gathered from the website to make the final decision. The online avenues also indicate the availability of the product and which stores have the product in their inventory. To make the omni-channel experience complete the consumer needs to have access to both the online and offline stores at hand before making the final purchase decision. The purchase decision needs to be available in both the online and offline avenues where the customer can make an order and pay through online access or book an item and pay for it using offline means and ultimately have the product delivered (DEPKOP, 2005). The idea of encouraging omni-channel retailing is to ensure that the customer does not have trouble moving from one retail channel to another, rather can access all the channels simultaneously (Shia, Chen, Ramdanyah & Wang, 2015).

Omni-channel retailing, therefore, influences the success, development and growth of SMEs as well as online and offline operations in various ways. The following context hopes to discuss different areas in which the omni-channel retail affects the operations of SMEs.

3.2.1 Technological factors

The success of omni-channel is dependent on the availability and use of technology. The use of technology is translated to organization and individual uses which are influenced by perception, experience, and attitude. Therefore, a positive outlook to the adoption of technology among the management team makes it possible for the organization to set aside financial, managerial and technical resources to aid in adoption of omni-channel. This includes setting aside employees who are tech savvy and who are able to monitor the consumer searches and relay the information to the in-store management (Morteza, et al. 2011). The presence of technology in Indonesia markets has influenced the SMEs to learn and integrate their activities to meet consumer demands.

3.2.2 Environmental factors

The current trend of business ensures that business platforms around the globe are linked, and therefore the consumer preferences are influenced by different factors. The environmental factors include competitors, customers, suppliers, external support systems. The mentioned environmental factors influence Omni-channel retailing and thus, its adoption requires consideration of all the factors individually. SMEs need to be aware of the suppliers' expectations and returns in order to establish direct links that will enable the consumer to access their products with ease both online and offline. Similarly, the existing SME markets need to analyze the actions taken by their competitors to ensure they are on the same level without the risk of losing the markets. Therefore, omni-channel retail has modified the traditional concepts of trade and incorporated it to the global view making the current small sized business to aim for better and extensive markets (Duan, et al. 2012).

3.2.3 Organization factors

These are the characteristics of the enterprise that influence how measure and practices are adopted. The omni-channel retail requires availability of technology, human resources, skills, financial resources and firm size (Creswell, 2003). All these pointers need to be synchronized to achieve a successful business model that is likely to boost profits and keep up with the competition. The integration of the mentioned factors ensures that the SME has adequate staff members who are able to monitor sales and demand, appropriate technology model that runs throughout and can be easily updated when the customers increase, viable business links that ensure product stock and proficient customer services that aim to retain and attract more customers.

3.2.4 Individual factors

A majority of SMEs are run by a single manager who oversees and allows for the activities taking place within the firm. Therefore, the success of attaining profitable omni-channel retail entirely depends on the manager's perception, attitude, culture, and behavior. The fact that omni-channel requires a direct link across different channels requires the manager to be flexible to the risk of sharing information and bending to meet the customers' demands as influenced by season and preference. The business owner also has to be innovative and willing to learn more about information systems and technology in order to guide and lead his or her team towards successful omni-channel retail. The individual factors are critical since they influence how the employees perceive change or customer experience, and they affect the success of the SMEs (Nguyen & Waring, 2013). Most of the SMEs in Indonesia and other developing nations have been declared almost bankrupt in situations where the owner is stiff to change and has led to loss of customers.

4 Conclusions

It is clearly noted that majority of the developing nations are struggling to keep up with the developed countries when it comes to technology and business advancement. Indonesian consuming class is evolving with the introduction of cheaper and developed digital technologies that allow them access and share information faster, and seek for more modern channels and customized shopping experience. However, strategic efforts to improve the business trade have enabled some of the flexible small and medium sized businesses to proliferate on the global markets. Despite the SMEs not reaching some international platforms, the ones that have incorporated technology in their day-to-day activities have had some success in integrating various channels that have enabled to tap in to more customers across the regional and national scales. Omni-channel retailing is not an easy project to take up especially for micro to small firms because it requires expertise that most times increases expenditure and increases the firm size. Therefore, the SMEs are often advised to ensure they use adequate strategies instead of trial and error methods that may cost the enterprise unnecessary expenses and losses.

It is advisable for the SMEs to adopt practices that have been declared successful by other firms in developing nations in order to minimize the strain caused by adopting strategies of the companies in the advanced countries. This is because both regions serve different bases of customers and the customer taste of the individuals in the developing nations may not have evolved as that of the customers in developed nations. Similarly, adopting strategies used in developing nations may cause a firm to spend more finances than necessary when trying to imitate the complex models and this can ultimately lead to business closure. The growth of Indonesian SMEs is noted to increase as influenced by the increasing numbers of internet users and this places the nation and other companies in a position to incorporate omni-channel retailing as the consumer shopping preference is expected to change.

Research on Marketing Strategy Innovation of Health & Medical APP under the Background of the Mobile Internet

Li Yanqiu, Feng Jun

School of Management, Wuhan University of Technology, Wuhan, P.R.China, 430070

(E-mail: lyqjobmail@163.com, fj6799@sina.com)

Abstract: With the rapid development of mobile Internet, Health & Medical APP provides more convenient services for consumers' medical treatment, health care and so on. Compared with other mobile phone software, Health & Medical APP is unique and related to the safety of consumers. The existing internet marketing strategy cannot satisfy the needs of survival and development of enterprise better. Combined with health & Medical APP marketing status and characteristic, this paper explores Health & Medical APP existing Marketing problems and proposes the corresponding marketing innovation strategies.

Key words: Mobile internet; Health & Medical APP; Marketing problems; Innovation strategies

1 Introduction

The rapid development of mobile Internet is changing people the way of manage health behaviors as well as communicate with others and entertainment habits. Mobile health is the future trend of medical information, it will be more rapid, efficient, reliable and accurate. Health & Medical APP main functions focused on helping the patients' health self-management, disease prevention and chronic disease management.

Now the development of medical App in China is still in the start stage, Chunyu Doctor, Quickly Asked the Doctor and Fitness, etc already have achieved a better development, they all become more well-known with accurate positioning in the Chinese market. In addition, due to environmental, smog, water quality and other factors, human pay more and more attention on their own health problems, plus with the increasing pressure of life, eating disorders, staying up late, lack of exercise and other habits make most of us in the state of sub-health. The development of health & medical APP has prompted more and more people start moving up. Different health & medical App has different marketing, this article is about to explore and analysis how to make full use of this kinds App and the problems related to the application to make more people know and use health & medical App, and also to provide reliable direction for the APP marketing staff and then to meet users' wide demand of health and medical care.

2 Literature Review

Mobile Application (also called Mobile App, App) refers to the design and application software used in smart phones, tablet computers and other mobile devices. Most of them are free, some other are not (Liu Feng,2014). APP Marketing refers to the application of marketing, in this article, especially means that through platforms like smart phones, computers and other mobile devices to be oriented and accurately transmit individual and instant information to the target customer, then through interaction with consumers to achieve the purpose of marketing communication.

Mobile marketing has powerful data as its support, it can convey the information to the consumers quickly and accurately and achieve the goal of one-to-one Marketing. Compared with the traditional marketing, mobile marketing has lower cost, sustainability, without the limitations of time and space, precise marketing, interactive and comprehensive, etc.

Different kinds of mobile software have different models, according to the products and services, the mobile phone APP marketing modes are also different. APP marketing mainly include three kinds of models: advertising, user participation and shopping website transplantation (Wang Ning,2015). The advertising mode and user mode are now more mature and familiar. Advertising refers to through clicking on the ads automatically entered into the default link and then to achieve the effect of marketing. User participation model is positioning itself in line with the business applications published to the App Store for users to download, user-friendly and intuitive understanding of the business or product information. This marketing model not only has strong practical value but also includes interactive features.

Some authors considered that mobile medical technical support and training have no effect on the users' expectations and desired ease of users, mobile APP should focus on restrictive privacy and

security, system and source quality and the mobile device factor (Jen-Her Wua,b, Shu-Ching Wanga, Li-Min Lin ,2007). Health & medical APP can be divided into two main features "Health- Home Care" and "Safety-Information flow"(Lourdes Martina,2011). Health& medical APP should be more humane and character, especially considering older habits. For example, adding "personal preference", "learning and re-education", using presentations and demonstrations; perfect APP laws regulate and pricing other factors. L.H. Iwaya thought that although the development of mobile medical development rapidly,there are still many untapped areas such as medical companionship, medical knowledge self-improvement and decision support systems (L.H. Iwaya ,2013).The improvement of mobile technology would have a significant impact on health care mobile , it need to be improved in two ways: 1) improve the ability of information processing and information diagnosis technology; 2) the communication of medical specialist information. These two aspects of the technology play an important influence in improving the user's consciousness of monitoring and alert their medical health (Upkar Varshney,2014). At present, the research about health & medical APP in china is less, only few scholars have studied the mobile medical. Health & medical APP consumer can be segmented into two groups: preventive care and medical cure, founded out that preventive consumers are more concerned about APP preventive ability and the characteristics of APP, and medical healed consumers concern treatment, service and reliability of sources of information of APP (Wang Lei, 2015). Health &medical APP also can be classified into three categories: fitness classes APP, health tools APP and mobile medical APP (Gong Qiong ,2014).

As mentioned in the literature review above, the article study Health &Medical APP is less, the current also has no research specializes in Health &Medical APP marketing strategy. Most have explored Health &Medical App consumers' use condition and behavior or just explored the marketing strategies of mobile APP. From the perspective of marketing this article study health & medical APP features, effect, existing problems and future development strategies, So the main innovation of this article is specializing in Health &Medical APP analyze the existing problems and the future development of innovation strategies.

3 Development Situation of the Health & Medical APP

3.1 The status of the health & medical APP

With the development of mobile Internet, the demand for health care is no longer confined to the sick seeking treatment stage, but tend to use mobile devices to monitor their own health status whenever and wherever they want. Health & medical APP show rapid growth in the state. More and more users expect widespread use of mobile medical technology to improve their own overall health management methods in the future. At present, China's health & medical APP market is still in the start stage, there are only few part that can really create value, most applications have become useless. In contrast, the health & medical APP markets in other countries are more developed, they have more than 100,000 kinds of mobile medical APP approved to enter the commercialization stage. Currently the most profitable APP is related to medical service and target users which are mainly used by the patients with chronic diseases.

3.2 The degree of specialization of health &medical App is low

Health & Medical APP are different from the social entertainment APP, they are related to human life and health so we should put their authenticity and professionalism in the first place, it is necessary to ensure the needs of the users of the software. It can rely on doctors, pharmaceutical industry professionals to ensure its content, also can offer the function to communicate with national quality hospital or medical professionals face to face. At present, most of the health & medical APP users' motivation in China is low, the main reasons are the following: they lack of trained medical professionals so the users just can use a few simple, routine basic functions, they have no appropriate supporting program interventions for the complex issues and users are too confused to try some existing programs.

3.3 The range of customer is limited

The users of currently health & medical APP main are young, there are two main reasons: Firstly, young people use their smartphones frequently more than the old, which are not yet familiar with the smartphones. secondly, the professionalization of the current health & medical APP should be improved, the elderly disease is usually complex and the cause hard to find out so that the APP function cannot meet their needs. In addition, different health & medical mobile software classification is relatively

simple, for example slimming, healthy eating, pregnancy, diabetes, stroke detection and so on, they all classified by a series of problems existing phenomena.

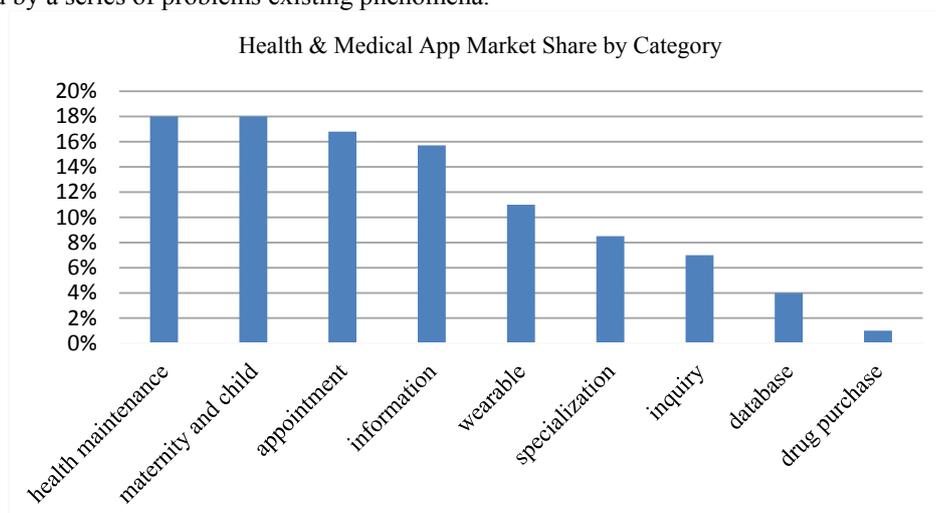

Figure 1 The Market Share by Category of Health & Medical App

It can be seen from the figure above, the market shares of three categories of health maintenance, maternity and child and appointment are larger, these three together accounted for more than half of the total share. Therefore, "heavy vertical" applications are much more favored by customers than similar applications, it is one of the directions of all kinds of APP applications' efforts to form a closed loop online and offline through market segmentation and customer segmentation.

3.4 The way health & medical APP diagnose is single

In the past few years, health & medical APP mainly provide advice via chat, pictures, etc, there are certain problems in this way. First of all, ordinary users lack knowledge so their description may exist problems or incomplete. On the other hand, it is not sufficient to establish a good relationship of trust between professionals and users through the mobile phone inquiry.

3.5 Mess environment and without helpful supervision

At present, health & medical APP not included in the scope of government oversight, there was no effective legal means to monitor the health & medical APP development either. Now the health medical market in China was confused, it explores answers about difficult questions through online search, the quality and authenticity of the content of their answers are not guaranteed. For some obscure areas of professional research, some criminals use APP set up false rumors, which greatly limits the future development of the APP in China.

4 Suggestions for Health & Medical APP Marketing Strategy Innovation

4.1 Professionalization and reliability are two basic factors for the health & medical APP

Professionalization and reliability are two important factors for the health & medical APP. Unlike others APP, health & medical APP relates to the major issues of life and physical safety, so in the marketing process it should pay more attention to these two points. It should devote itself to enhance the professional guides and professional guidance tools, and actively cooperate with the large specialized hospitals, pharmacies and other institutions to establish a good doctor credit system and comprehensive intelligent mobile search databases. Such as: ensuring guidance professional, Health Tap's latterly invite 65000 good reputation practitioners to review, organize, classify and rank the relevant health APP content; different doctors can answer and certify the same question so to avoid single specialist making mistakes; make full use of modern high-tech means, such as: video, infrared, VR (that is virtual reality) and other test means to increase contact time between guidance personnel and consulting personnel to make guidance people better understand the specific situation and give right advice.

In addition, health & medical APP has broad market prospects, there exists great difference among consumers, APP marketing should subdivide its customers, explicit the position of their products and services, dig customers' needs and act according to actual circumstances and precise localization then can achieve success.

4.2 The adoption of the viral marketing

Viral marketing can also be referred to as one kind of Word of Mouth Marketing, which spread among groups mainly relies on the user's reputation, it is a method frequently used in network marketing. Consumer's trust is the initial premise for the health & medical APP so health & medical APP marketing should pay more attention to word of mouth marketing. When public recognize the applicability and advantages of the software they will introduce it to their loved, friends, colleagues and so on. Thus through communication and interaction between users, information will spread rapidly and health & medical APP can quickly be extended to obtain more trust and attention.

4.3 The creation of product image

The core of App marketing is making sure users to establish an effective emotional association with the product, especially for the internet virtualization products, they need much more user's emotion and trust than other products. Now the problem of homogenization about health & medical APP is serious, plus with the intense competition in the market, marketers should focus on the uniqueness of products to attract the attention of customers, health & medical APP can also offer some free activities, free checking and other public welfare activities to broadcast themselves then to improve product visibility and reputation. Such as providing free physical examination for the elderly over the age of 60, explaining knowledge freely to community resident and offering knowledge lectures through the network for the obese or pregnant mothers and so on.

4.4 The expansion of marketing channels

In the process of Marketing we should integrate different kinds of marketing methods to maximize the marketing effect. Traditional marketing and internet marketing they all have their own advantages, so we should combine with traditional marketing methods such as television, newspapers, magazines and so on in health & medical APP marketing process, we can also give full play to its own features: targeted, interesting and richness to use pictures, music, video and many other ways as well as high-tech technologies, such as the popular fingerprint to unlock, IRIS, Voice Print and Holographic Projection technology to enrich the health & medical App. In this way not only can bring users a breakthrough experience, but also can enhance product image and promote product promotion.

4.5 The multiple safeguards for the health & medical APP

The development of health & medical APP in American has already become quite mature, the US Food and Drug Administration had included health & medical App into the control range. While the development of health & medical APP in China is just starting, China should strengthen social and self-monitoring mechanism and punishment mechanism in both government and law to protect the rights of consumers. For example, when errors in App leading to consumer misdiagnosis or harm, it should be compensated according to the actual situation. It can also establish user rights forum center so customers can exchange their experience with the professionals or give their feedback online.

5 Conclusions

With the rapid development of mobile Internet, mobile marketing is becoming mainstream model of business development. Meanwhile its development is still facing many opportunities and challenges. If health & medical App want their marketing and marketing value to be accepted by complex consumer and achieve their marketing goals, they should combine online and offline together reasonably, develop appropriate marketing strategies, focus on brand establishment and consumer demand, make the development of mobile products much more personal and function diversified, what's more, it's important to enhance the according software safeguards measures. The innovation of this paper is exploratory study the innovative marketing strategies of health & medical App, which provide advance reference for the health & medical App development and broaden its development prospects. After all, health & medical APP is a tool for people's health and medical services, and its future development is inseparable from the human demand. The development of health & medical APP in China is just starting, there are many influence factors in the process of future development and marketing, which can do some further exploration.

Abstract: Franchising industry at Malaysia since the early 1990s has been widely accepted as an effective means to start and expand businesses. The franchise system, however, is not a guarantee for success in business, as it nonetheless depends on a cordial relationship between both parties namely, the franchisor and the franchisee. The success and failure of any franchise business are closely related to both the franchisor and franchisee. Frustration with franchisor could be considered as a factor that contributes to franchise failure, such as problem in fulfilling and following rules and regulation from the franchisor. This paper attempts to explore frustration towards franchisee community within an academic setting and examine the key factors and intention in franchising network at Malaysia. The success and failure of any franchise businesses are closely related to how far both, the franchisee and franchisor, fulfil their responsibilities in maintaining a good trust in franchising business community. The study utilized a qualitative research approach that comprised to focus group, face to face interview and semi-structured interview to gain better understanding of the study contact. The respondent local franchisor franchisee and from Malaysia Franchisor Association (MFA). About 20 selected which involved observation and interview sessions. This study is limited to the Malaysia retail franchisor sector. Future research can expand the framework to examine the services, franchising industry or to include additional factors that affect the franchisor's competences.

Key words: Franchisee; Franchisor; Franchising industry; Frustration of franchisee; Face-to face interview; Semi-structure interview

1 Introduction

Business has been one of the most interesting and economical jobs in the world. The world had witnessed that with business, it can conquer the economy and the world. It has been affecting our lives such in lifestyle, family economy, our routines and social. Business is a wide aspect to be considered in this paper. We should understand that in business it has entrepreneurship which make business is a serious job. With entrepreneurship activity going wild all around the world, born entrepreneurs that running down the business.

In entrepreneurship, franchising business is one of its kind in a business world. In the business, exist franchisor and franchisee. This term has its own typical system format, Franchisor refer to a company or an individual who give chances to the Franchisee to engage in their developed business but followed their own regulations such as trademark, brand names, regulations and the provision of intangible assets (Dant, et al,2013). In a bigger vision, Franchisor had the authorities to eliminate its franchisee as they had the right. Franchisor also manage the standards, decide the performance level, economic efficiencies of the company and misuse royalties (Baucus, et al,1996; Lussier, et al,1995)

Franchisor-Franchisee relationship plays a major role in entrepreneurship business. The system required a successful relationship to lead to a well-being business that the two sides were doing. These individuals relationship is construct while acting on the franchising industry and effect the company growth outcomes. It also shows a relationship, trust and improved business quality between this two sides, franchisor and franchisee (Abdullah, et al, 2008; Dent, et al, 2013; Dant, et al, 2013; Hizam-Hanafiah, et al,2014; Weaven, et al, 2009)

As franchising industry required a high level of trust and commitment in the individual. A good relationship between individuals can sustain a long term in aspect of business relationship. To conceptualize this two term, relationship commitment is defining as a much hardwork required to comply the business by ongoing relationship between individuals, franchisor and franchisee, seems

important (Harmon, et al, 2008; Hizam-Hanafiah, et al, 2014). A bad decision-making process between these two sides can bring frustration either by franchisor or franchisee. Much literature has been doing research on the failure of these two individuals and the factors that contribute to it without considering the aspects of frustration between these two individuals (Scott Weaven, et al, 2010).

So, in this paper, research has been done to determine the frustration level of franchisee community towards the franchisor in many aspects. It also discussed on the decision-making process between the franchisor and franchisee in attend and make a business relationship commitment as a successful business.

2 Literature Review

The news agency, Bernama in Malaysia reported on the 8th September 2015 mentioned that 30 franchisees were facing problem in franchising industry mostly having problem in financing and faced bankruptcy due do not being able to service and pay their loan between RM100,000 to RM400,000. From the articles also mentioned that the franchisees became victims of the franchisors involved. To answer the research question, the commitment and the aspect of motivation, personality relationship and trust of entrepreneurs ethics should be recognized. The relationship perceived within franchisee and franchisor by these two parties has also been done research and review through some journals. Therefore, a review on the personality, motivation, relationship and commitment of entrepreneur has been done to made a wide view for this paper (Abdullah, et al, 2008).

Recent research has classified failure and frustration of franchisee business in Malaysia are 8 factors which are: 1) poor service of franchisee, 2) attitude, 3) greed of franchisee, 4) mismanagement in cash flow, 5) conflict with franchisor, 6) choosing bad location, 7) financial problem and 8) problem in pay back to franchisor. Furthermore it was also found that franchisees failed due to lack of entrepreneurial skills and mismanagement. (Mohd Amy Azhar 2011) identified that bumiputra entrepreneurs lack of business networking among business community compared to non bumiputra franchisees (Harif M.A, et al, 2011).

According to many in the field mentioned that, the Agency Theory was used as an inspiration to the franchising system. Agency theory examines the relationship between franchisor and franchisees in the franchising industry. The franchisor (one party) was involves in the relationship of an agency to assigning work to franchisee (third party) and the researcher (Eisenhardt, 1989) added that franchisee delivered different way to work. In this situation, a good relationship within franchisor and franchisees especially franchisees must not forget that the franchisee business that they started is their business using franchisor trade marks and business plan. Therefore franchisees need to be accountable for what has happened in the business that they will run for it (Lafontaine, et al, 1997; Lafontaine, 1992)

The franchisors' effort necessity support sakes with the level of incentive and assurance delivered (Lafontaine, et al, 1997). The bunch of researchers highlighted that, the context of this study, good relationship and trust within franchisee and franchisor are needed and evident to success (Harmon, et al, 2008; Prince, et al, 2009; Davies, et al, 2011; Davis, et al, 2004). Furthermore, faith and satisfaction is a major factors achieving business strategies concerning the achievement of reaching franchisee confidence level, aim similarity and subsequent pleasure in the franchise rapport. It is also supported from Screening Theory that explanation the royalties, fees and specific investment attracting competence towards franchising system (Dnes, 1992; Dnes, 1993)

This discrepancy could be attributed and found that 80 per cent of franchisees failure was caused by a failure to adhere to operating systems (Frazer, 2012; Frazer, 2007; Frazer, et al, 2007). The daily news "Harian", (2009) reported a total of 30 entrepreneurs under the bumiputera franchise financing might be bankrupt due to the occurrence of disputes and injustices by the franchisor. Yet another statement in the franchisor deny the situation and is of the opinion that the weakness of franchisees more contributes to business failure rather than due to the weakness of franchisor (Frazer, 2007).

3 Theoretical Development

Franchising has been determined to be a change agent such as social and economic development of infrastructure in term of human resource, market structure, competition and service quality (Alon L, et al, 2015; Anwar S.T, et al, 2011; Tuunanen, M., & Hoy, 2006). As many franchisee communities are owned by independent franchisees as small entrepreneurial business units. (Paswan, et al, 2004; Hompson, et al, 2006). It is also highlighted that, the further finding discusses the relationship of franchisee as a dependent, lawfully, carefully and operationally (Davies et al, 2011).

Franchising primarily as a strategy for extending distribution channels through increase outlet or branches in various demographic (Julian, et al,1995; Justis,et al,1986) . Thus, franchisors theoretically, there are four reasons why people engage in franchising industry. The first is to become owner of a new business and accomplish objectively. According to the researchers (Hodge,et al,2013; Hoffman,2004; Stokes,et al,2010; Thompson,1992; Tsang, S.,et al,2013; Vinturella,1999) mentioned that, the aspect which measured as a vital aim is to encourage the individual to begin the business by using the other parties business strategy and knowledge .At the same time save time, money and what business do they wants to be operate. Supported by other researchers described that, this reason was play an important rules than money for franchisee community to take over the business in the method where they want (Altinay,et al,2014; Altinay,et al,2005; Anwar,2011)

The following area is related with financial and monetary substances. The evidence from this study supported by some researchers mentioned that, the key inspiration of fresh franchisee is the chance to earn more money, (Hizam-Hanafiah,2014; Klein,2016), but other researchers added that, this encouragement is a minor aim for franchisee. Self –satisfaction is a following aim in the field. The fresh franchisee assumed that the self- satisfaction which gain by their experience is more important and the scholar added that, satisfaction and liberation are more important than money(Moore,2004).

Family is one of the aim in this field. The scholars added that, family substances is playing an important in business field(Surinder Tikoo,2005). Research articles generally clarified that, of the following components mentioned that, there are benefit to become a businessman because each family members will get an opportunity to work in the company and can increase the financial (Hodge,et al,2013; Hoffman,2004; Tikoo,2005; Weaven,2009).

The other aims are measured as minor than the previous four franchisee aims mentioned by the number of authors above. A bunch of researchers are making differences such as involment with public, tax benefits, responsible with own self and find a chance to make an achievement (Scarborough,2003; Hodge,2013; Hoffman,2004; Tikoo,2005; Thompson,1992).

The four main aims (authonomy, financial and monetary substances, intrinsic rewards/self-satisfaction and family) are occur in both theoretical and observed discussion in franchising community aims. These four aims are selected as an aim for the franchisees to accomplish in their business understaking. There are other aspects also involved in the study likes “push motivations”, “role” and other aspects as entrepreneur’s aims but the observation studies show these aims are not a main in the field. (Scott Weaven, et al,2010)

4 Methodology

Exploratory research is undertaken to identify the major causes of franchising conflict Face –to-face interviews are conducted at Malaysian Franchise Association (MFA) and PNS (Perbadanan Nasional Berhad) including franchisor and franchisee with 20 participation owners in various industry ,to draw upon their considerable experience in the sector. The main objective from the interview to find are:

- To examine a deeper insight and understanding into issues (frustration) toward franchising system among franchising industry in Malaysia
- To identify and provide a better understanding about franchisor competencies among franchisee’s
- To determine HOW franchising industry leaders overcome the confident level towards the system.

Taken together, these results suggest, the sampling design for the interview should be reliable with the objectives of the research study, semi structure interview and non-probability sampling may give a better alternative from the participate (Davis,2004). A few researchers described that, the finding was stess on a non- probability employee as a sampling technique, the individual of the population didn’t provide equal opportunities or predetermined option of being designated as a members of the sample. These results would seem to suggest that with some supported evidence that, “the inability to specify a sampling frame may dictate the use of one or a number of non-probability sampling techniques” (Jackson,2008; Sekaran,2003).

Three factors need to determine through the selected respondents. The primary factors are the respondent of this finding should be the proprietor or one of the owner of the franchise companies. The second factor are franchisor and franchisee should be active in the business not a sleeping partners ([8], [9]). Other researchers also mentioned that, the following aspects was focusing by franchisee where spend minimum one year to run the business (Morrison,1996; Strutton,et al,1995)

5 Finding and Discussion

Profiles of successful in franchising industry arguably help to bridge the perceived gap between franchisor and franchisee (Margarita Fernández Monroy Lucía Melián Alzola,2005). Franchisees communicated “a lot less stressful” the business differences are always connected with the business. In addition, the central study was “it is better having a good relationship with them (franchisor) than not”. When asked about issues on frustration on both side, almost they answer: my brand is too young, not so established to be franchises out, do not have quality people to take over franchisor business, franchisee fees or ongoing royalty, franchisor confident level to franchisee shall be able to generate sufficient income, franchisor afraid of the legalities and shall lose their reputation if franchisees unable to operate their original business.

One of the factors in increasing the frustration level of franchisee towards the franchisor is lack of trust in franchisor-franchisee relationships. The business rapport was giving difficult commitment to the franchisee and to communicate with the franchisor through lack of trust. One franchisee said that, “There probably would be an element of trust if there was a relationship, but there is no relationship.”

Furthermore, the faith and respect are the most important which apply in all the relationship, in the further investigation, the application said that “too much at the beginning”, and also too much of the faith in the context. However, the faith will gradually reduce, because of that the franchisor was use some opportunities for further undertaking and followed by the franchisee opinion that hey belief “they don’t care” (Md. Isa,2012).Franchisors must not over-sell their promises during the marketing of their franchise business. Otherwise, it would be difficult for the franchisor to honor every service that is documented within the franchise agreement. Another important factor is that franchisor’s policies must be fair and take into account franchisees interests(Hodge,et al,2013).

6 Recommendation for Future Research

Here are few recommendations for the further research, through the current study and their implications based on the insights and experiences. There are some franchisee findings was applying in other countries and respondents with the same type of questionnaire. This can broaden the space of the current study, enhance the overview of the outcomes and it improve the validity and reliability of from respondent. Next, new research in the future would be on the effects in increasing frustration level of the franchisee towards the franchisor. If the sampling frame can be established in the future, probability sampling is chosen, as it imitates the features of the population and it is harmless to simplify from that sample to that population. The future finding should be employ a larger sample frame to simplify the study finding and if it is impossible to establish the sampling frame. The qualitative data was suggested for the further study. The positivist method and social constructionism method are deliver original information on the similar topic substance and it also involve the ontology, epistemology and axiological in the matter too.

7 Conclusions

This paper explores the factors in increasing the frustration level of franchisee towards franchisor. This issue emerges because the franchisor does not ‘take care’ their franchisee well. One of the ways to solve this issue is the franchisor needs to treat their franchisee well because franchisee is a person or individual who purchased a business from the franchisor. This franchisee is the person who could help the franchisor to expand their business. Other than that, the franchisor needs to help the franchisee in developing their business by helping them in negotiating deals with the supplier. This can reduce the operating cost and to provide ideas and system for enhancing productivity. This also could help the franchisee to build a trustworthy relationship with their own franchisor.

Abstract: Businesses today are operating in truly global environment and global supply chain management has become a strategic tool to be competitive. With increasing awareness of environmental protection across the world the green trend of conservation of the resources and protecting the environment is overwhelming and these drivers have exerted pressure on organizations to improve their environmental performance. Successful participation in global markets requires MNCs to organize domestic green supply chain management practices. This paper has employed a case study approach with an institutional theory perspective to identify driving forces for MNCs in South Asian developing countries like Pakistan to adopt and implement green supply chain management practices. Detailed interviews from 14 employees of two different MNCs revealed identical results. In Pakistani environment normative pressures from customers, suppliers and consumer pressure groups have significance impact on decision making regarding green supply chain management while no importance given to coercive and mimetic pressures. It is also revealed that MNC's could be a major source of diffusion of green practices into less aware and resourced local suppliers from a global supply chain perspective. Some limitations and future research directions has also been presented.

Key words: Globalization; Multinational corporations; Green supply chain management; Pakistan

1 Introduction

Technology has converted this world into a global village in reality. This global environment for business has created a lot of opportunities along with many challenges for multinational corporations (MNC's). They have to consider whole world while taking any strategic level decisions, as they are the major beneficiaries (Márquez, 2014). Environment degradation in high manufacturing countries has become a matter of highest concern and MNC's are under special scrutiny in this regard. MNC's cannot ignore the external factors such as economic trends, technological innovation and competitive situation in other countries but now they also have to handle environment friendly concerns as their top priority. They also need to take care of government legislations, non-government organizations (NGO's) and consumer pressure groups. Companies are going truly global with increasingly focus on improving their supply chain management (SCM). Companies have changed the ways in which they manage their operations and logistics activities. Changes in trade, the spread of modernization of transport infrastructure and intensification of competition have elevated the importance of global supply chain management for MNCs (Wu, Dunn, 2012).

Along with globalization becoming a reality we are also witnessing now a day that instead of companies these are supply chains which are competing with each other. SCM has evolved as a true strategic tool to compete in highly intense global competition of reduced cost, time to delivery and high quality for almost any type of product (Dubey, Gunasekaran, 2016). The biggest challenge for top managers is to design and operate these globally dispersed but highly connected networks of suppliers and customer to be truly sustainable with respect to environment. Many stack holders are raising their concerns with respect to environmental erosion due to increasingly high manufacturing levels and they demand environment friendly business decision making at all levels (Khor, Udin, 2016).

With increasing awareness of environmental protection across the world the green trend of conservation of the resources and protecting the environment is overwhelming and these drivers have exerted pressure on organizations to improve their environmental performance (Zhu and Sarkis, 2006). In developing countries this globalization factor has increased the awareness about improve environmental performance instead of local pressures (Hervani, Helms, 2005). Successful participation in global markets requires MNCs to organize domestic green supply chain management (GSCM) practices.

Finding ways to become more efficient supply chain members is becoming the basis for improved green industries in developing countries (Tiwari, 2013).

To understand how to make socially constructed and accepted business decisions we need strong theoretical support. Institutional theory can be the best choice to explore external influences on organizations for making decisions regarding GSCM (Sarkis, Zhu, 2011). From a GSCM perspective, institutional theory can help explain why organizations are motivated to adopt GSCM practices. Thus, the objective of this study is to use institutional theory to understand what drives MNC's to engage in GSCM practices.

To achieve this objective this study is presented as follows. First, relevant literature for globalization and MNC's, GSCM, Institutional Theory and environmental initiatives of MNC's in developing countries is reviewed. Next, research method and profile of case companies is presented. Then discussion on case findings along with future implications and conclusions is discussed. This study's contributions include:

- Respond to the call for research on theory building for supply chain management in general and green supply chain management in particular by using some theoretical lens (Jabbour and de Sousa Jabbour, 2016).
- Use of case study research in operations management and supply chain management field to explore areas with in depth knowledge (Eisenhardt and Graebner, 2007).
- Use of institutional theory to understand and implement green supply chain management (Sarkis, Zhu, 2011).
- Find out what are the driving forces for MNCs in South Asian developing countries like Pakistan to adopt and implement various green supply chain management practices?

2 Literature Review

2.1 Globalization, MNCs and environment

Present business environment is truly global in nature. From small new start-ups to large MNC's everyone is directly involved and facing challenges of different cultural, financial and technological dimensions. This high speed bandwagon of globalization has created another biggest challenge of environmental degradation and MNC's are the prime suspect for this. Manufacturing activities of large corporations are considered to be source of environmental degradation and depletion of natural resources (Kumar, Jain, 2014). The environment is one of the key elements for MNC's as it provides energy resources and raw materials for their industrial activities. Therefore, these are MNC's who can impact negatively by producing greenhouse gases, emission of hazardous and toxic substances or they also can impact positively by financing research and producing new environment friendly technologies and management practices and making sure their diffusion to less resourced global supply chain partners. In this way MNC's through their state of the art technologies and R&D capabilities are in a better position to improve environmental conditions (Márquez, 2014).

Globalization has increased the influence of regulation and customers in countries from which foreign investment is originating or that are destinations of exports from developing countries. Empirical evidence shows that MNCs in developing countries are motivated by regulatory and market pressures from customers, investors and NGOs in countries where their major markets are located (Khanna and Liao, 2014). International trade also strengthens the rate at which economic growth contributes to environmental improvements (Frankel and Rose, 2005). Globalization is not only creating incentives for MNCs to be more environmentally responsible but it is also creating pressure within the vertical supply chain for upstream manufacturing firms to be environmentally responsible.

2.2 Green supply chain management (GSCM)

Green or sustainable supply chain management is defined as the strategic, transparent, integration and achievement of an organization's social, economic and environmental objectives in the systematic coordination of key inter-organizational business processes for improving the long term performance of the firm and its supply chain partners (Ageron, 2011). In other words responsible environmental and social behavior must be promoted for the benefit of the entire supply chain (Testa, 2010). Previous research highlights the importance of purchasing function, material choices, vendor certification, transportation and warehousing process affecting the environment negatively or positively (Pagell, 2010; Tan, 2010; Varma, 2010). Today's global supply chains are independent but highly connected, so any individual practice harming the environment can have huge effects at global level. At the same time more sustainable supply chain could be a source of high benefits for all global partners in the supply chain (Wu, Dunn, 2012).

2.3 Institutional theory

Organizations need a trigger to initiate some sort of change process. Institutional theory is one of the tools to understand different types of external factors that force any organization to initiate or adopt any new set of activities or processes (FIELDS, Dimaggio, 1983). Organizations are part of a social system with its own specific culture and values other than having system for production. Organizational decisions are based upon a set pattern of cultural values, norms and behaviors under the influence of external environment which ultimately shapes an institutionalized way of doing business under certain conditions. When all organizations within the same industry adopted same kind of institutionalized practices, it leads to an attempt of being legitimize them (Glenn Richey Jr, Williams, 2009).

Environmental standards force organizations to be just like each other in their routine business activities and this process of becoming same is called isomorphism and this process made them legitimized in the eyes of society. Organizations achieved this isomorphism due to the three kinds of external pressures normative, coercive and mimetic (FIELDS, Dimaggio, 1983).

Normative pressures have their roots in cultural values and norms. Organizational decision making is based upon ethical and moral obligations towards society. Different sources creates such pressures including but not limited to educational institutes, trade associations, industry groups, NGO's and consumer groups which can guide and force the organization to adopt specific norms and behaviors (Glenn Richey Jr, Williams, 2009; Scott, 1987). Competitors, customers and suppliers are some of the examples in creating pressures to focus on green manufacturing practices. Demand for greening of overall processes from customers and other supply chain partners become so obvious to MNC's in developed countries that it is becoming an order qualifier instead of an order winner.

In today's global supply chains every organization is dependent upon other business partners as well on government regulating agencies as well. Coercive pressures can be exerted through formal and informal ways by those organizations holding power (Delmas, 2002). Environmental regulating agencies of government are prime example of powerful groups which can exert pressure on the organization to change their way of doing business (FIELDS, Dimaggio, 1983). These pressures could be to self-regulate through the platform of trade unions, offering some incentives by joining or applying some environment related processes or enforcing certain penalties for not fulfilling the regulatory requirements. Developed countries have high level of such pressures and a proper mechanism to enforce environmental laws but in south Asian developing countries like Pakistan regulatory laws are not up to international standards and their enforcement is even in weaker state.

Benchmarking other organizations in the same industry and following the footsteps of successful companies by mimicking their processes or practices are the basis of mimetic pressures (Sarkis, Zhu, 2011; FIELDS, Dimaggio, 1983). Highly uncertain environment, lack of cutting edge technologies and absence of clear strategic path to achieve organizational goals is the root cause of such pressures. Companies do not pursuing innovative products and ways of doing business mostly comes under the unforeseen situations and when they don't feel themselves competitive enough to devise some dynamic strategy, they look into outside environment and try to copy those policies of successful companies which they though legitimate and good enough to lead them out of the crisis (Glenn Richey Jr, Williams, 2009). Globalization has created many opportunities for the firms to learn from experiences of other organizations operating in some other parts of the world. MNC's are the best source of transferring such environmental experiences to those partnering in supply chain especially in the developing countries.

2.4 Environmental initiatives of MNCs in developing countries

Role of MNC's with respect to environment in developing countries is litigious in nature. Some believe that MNC's have used the developing countries land and atmosphere to pollute and make products for developed countries. These companies have used their money and power to get benefit of non-existent environmental legislation and moved all of their plants to such locations (Christmann and Taylor, 2001). On the other hand, there are arguments in favor of MNC's that they have the technology and resources to mitigate environmental issues. By moving to those developing countries they not only increased employment opportunities but also transferred technologies, process and even introduced self-regulated green initiatives which were much above the levels of local legal requirements. MNC's not only transferred technology and environmental knowledge to their subsidiaries but also educated to their local suppliers and customers. (Khanna and Liao, 2014). Moreover the role of MNCs in diffusing proactive environmental management system in developing countries is mixed as some of the studies provide evidence of this and other studies show little role of MNCs in such initiatives (Qi, Zeng, 2011).

3 Research Methodology

In order to understand how GSCM practices are implemented by MNCs operating in global supply chains, a case study approach has been adopted. According to Eisenhardt and Graebner (Eisenhardt, K.M. M.E. Graebner , 2007), case research is a theory building approach that is deeply embedded in rich empirical descriptions of particular instances of phenomenon of interest based on variety of data sources. Case study approach typically answers research questions that address how and why in unexplored research areas. The results from case study research cannot be subject to statistical generalization or theory testing, but rather case studies can be used to generate theoretical constructs, propositions or midrange theories(Eisenhardt, 1989; Yin, 2003).

The case companies were approached by establishing contact with persons responsible for managing the supply chain. A semi-structured interview guide was used for in-person interviews. The guide contained a number of topics that each included a number of related questions. Each question in the interview guide had been formulated as broadly as possible to allow the interviewees to tell what they had observed, felt and done in relation to the research topic. In each interview there was also room for discussing issues that were not covered by the interview guide but which the interviewees found relevant.

Company A is a multinational food and beverage corporation involved in the manufacturing, marketing and the distribution of grain based snack foods, beverages, and other products. The company is considered as primary competitor in the beverages market and in business in more than 190 countries. On worldwide basis the company's current product line includes several hundred brands generating \$108 billion in cumulative annual retail sales. Company B is a manufacturer of paint and related products. The company is having its production facilities and suppliers in many countries across the globe. The company has diverse and comprehensive range of products and is dealing with local as well as international suppliers and customers.

4 Findings and Discussion

Semi structured interviews were conducted by the team of researchers. A total of 14 interviews conducted where respondents include supply chain head, operations, logistics and marketing managers along with randomly selected three workers from the plant in both case companies. Workers were chosen to check the alignment between management claims and their actual application. Each interview lasted from 30 to 60 minutes.

The organization A feels responsible toward the creation of a healthy society as well as serving its customers in the best possible manner. The business decisions are made keeping in view the real challenges of climate change, resource depletion and water shortages. The company considers a healthy, secure and sustainable agricultural supply chain to be critical to protecting the well-being of the communities and meeting the expectations of its stakeholders. The company's global strategy on environmental sustainability is to minimize the use of energy and water, to minimize the packaging and waste, and to reduce the carbon foot prints.

For company B, sustainability is a part of corporate mission and vision of the company. The imports of the company are nearly 80%, therefore the company is a part of different agreements related to quality and environmental issues. International standards apply while importing materials. Company is also having technical collaboration with some international customers regarding sustainability and the customers of the company do sustainability checks for certain products. Local corporate customers also require high level of environmental checks in which certain certifications are the basic criteria to be a supplier.

With respect to institutional pressures both companies have almost identical responses. Both companies especially company B are following very strict environment protection mechanism which is much above the government regulatory requirements. Similarly, they are the market leaders in their respective industries and instead of copying others they are the benchmark for rest of the industry. Their competitors both local and multinational companies are trying to mimic them. It is the normative pressure which they feel to some extent in their own domains. Company A having presence in almost every country of the world cannot afford to link its name with any environment harming activity. As in today's highly active social media, the news will be circulated around the globe within no time. A malpractice in Pakistan can harm their business in the developed world though might not hurt them in Pakistan. Similarly to fulfill the requirements of some local and international customers and suppliers company B feels pressure to streamline all of its processes with respect to environment.

Problems these companies are facing in transforming whole supply chain into a green one is the lack of awareness, resources and willingness of many of the suppliers. Many SME owners in the supply chain are not properly educated to understand and disseminate further to their employees about the safety processes and guideline provided by these companies. Poor road infrastructure also a big hurdle to achieve their environmental targets as trucks needs to spend more time on roads, spending higher amount of fuel and increased wastage of raw material and fresh goods. Lack of regulations and poor implementation of those laws due to corruption and negligence is another area of concern. Many local suppliers are working without proper environmental safety equipment and processes but they can produce all government bodies approved certificates and documentary evidences which actually they have not earned but purchased. Above all even some times management in these companies also focus more on cost savings than any other thing. As one of the supply chain head stated "although we are a multinational company with a highest focus on environment but still people working here are locals and they do sometimes put everything on the backside and pressurized us to save cost". For some long term initiatives top management commitment to stick with environment friendliness is also required in these MNC's in Pakistan.

5 Conclusions

This study was an attempt to find out what are the driving forces for MNCs in Pakistan to adopt and implement GSCM practices. For this a case study approach and institutional theory perspective was adopted. Both companies have revealed almost identical results which show that in Pakistani environment it's the normative pressures from customers, suppliers and consumer pressure groups are of highest concern. Coercive and mimetic pressures are not of that much importance for them. In the absence of up to mark local legislations its moral obligation of MNC's to not only use higher standards for themselves but also diffuse the learning and technology to their supply chain partners, if they have to export their products to some developed countries.

Also on global market economy stock listed responsible companies are expected to be transparent and manage their reputation. Transparency calls for responsibility and cooperation of all players in supply chain. Environmental standards apply for all operations everywhere and throughout the supply chain. The most uniformly successful way to promote improved environmental performance is through the supply chain. This study of MNCs has demonstrated that buyer- supplier collaboration on environmental issues results in better economic and environment incentives for both. Lessons from these experiences should be examined and disseminated to improve business and environmental management practices.

As this study involves only two MNC's from different industries, so results cannot be generalizable. In future, a comparative study of MNC's from same industry and a longitudinal approach can also be applied to study short and long term effects of applying GSCM practices. Also, case studies of same companies or same industries from different developing countries can be conducted to get more in depth knowledge and make results more generalizable.

Modeling the Optimization of Vehicles Allocation for Synergistic Operation of Multiple Freight Transportation

Li Ping, Yang Jiaqi, Zhang Qingnian, Zhang Wenfen

School of Transportation, Wuhan University of Technology, Wuhan, R.P. China, 430063
(E-mail: zzjtlp401@sina.com, styjq@whut.edu.cn, zqnwhut@163.com, cicizhangwenfen@126.com)

Abstract: For the coordinated development of national comprehensive transportation, the effectively vehicles integration of multiple transportation modes becomes especially important. This paper analyzes the synergistic ways of multiple transportation modes. The core problems in vehicles allocation optimization are discussed. For the synergistic way of multimodal transportation, a vehicles allocation optimization model is proposed. For the synergistic way of multi-mode combination transportation, a selection model based on LOGIT-Entropy method is proposed. The models raised in this study provide a theoretical basis and decision making for vehicles allocation optimization of multiple synergistic freight transportation modes.

Key words: Vehicles; Allocation optimization; Multiple; Transportation modes

1 Introduction

For a mature freight transportation system of multiple synergistic freight transportation modes, reasonable division of labor between the various modes of transport, balance of capacity allocation is particularly important. More and more experts focus on vehicles allocation optimization for multiple synergistic freight transportation modes.

Yasaman (Yasaman Kazemi, Joseph Szmerekovsky, 2015) proposes a deterministic mixed integer linear programming (MILP) model for downstream petroleum supply chain (PSC) network to determine the optimal distribution center (DC) locations, capacities, transportation modes, and transfer volumes Lei and Church (2011). incorporate the greedy-like behavior of drayage companies in designing their network. Meng and Wang (2012) include different stakeholders and investment budget limits, and suggest a joint U-shaped transportation cost function. Vasconcelos, Nassi, and Lopes (2011) study the cost reduction of adding a hub to the existing network, which they calculate by the percentage of loads moving through the new hub. Lin and Lee (2010) incorporate competition in their hub location problem, and maximize profit of all carriers. Gelareh, Nickel, and Pisinger (Gelareh, S., & Nickel, S., 2011; Gelareh, S., Nickel, S., & Pisinger, D., 2010; Gelareh, S., & Pisinger, D., 2011) address the competition between an existing dominating operator and a newcomer liner service provider which tries to locate their hub in a way to maximize the number of attracted customers. Inclusion of cooperation and competition, and studying the role of individual decision makers merit more attention in the network design and its cost calculations. Bektas, Chouman, and Crainic (Bektas, T., Chouman, M., & Crainic, T., 2010; Bektas, T., & Crainic, T., 2008) compare arc-based and flow-based decomposition methods in solving small sizes of their non-linear problem, and show that despite the fact that the arc decomposition has a better convergence, it takes more time compared to flow-based decomposition. Zhu, Crainic, and Gendreau (2011) compare the performance of their hybrid algorithm with a state-of-the-art solver for small to medium sizes of a randomly generated data set. They show that their algorithm outperforms in computational time and even solution quality when instance size grows. Sarkar and Majumder (2013) studied a two echelon facility location model and added product types and transportation modes as dimensions to the model and developed a separate objective function in each step. They investigated the variations between each of the objective functions and showed that the increment or reduction of costs depends on the type of dimension used. a full review of recent literature in multimodal transportation considering all levels of decision making can be found in Steadied Seifi (2014).

2 The Synergistic Ways of Multiple Transportation Modes

In the freight services network of multiple transportation modes, in order to meet the freight transportation demand and to achieve the coordinated development for multiple transportation modes, the distribution of vehicles is unbalance, that is the vehicle numbers for each transportation mode are different. vehicles allocation optimization for multiple synergistic freight transportation modes can improve the quality of transport services of goods, avoid vehicles' excess or shortage.

The synergistic ways of multiple transportation modes including multimodal transportation and multi-mode combination transportation. In multimodal transportation, several transportation modes participate in a freight transport route, with one transportation mode connecting with other mode. As is shown in figure 1 a). The multi-mode combination transportation refers to a combination of a plurality of single-mode direct transportations. As is shown in figure 1 b).

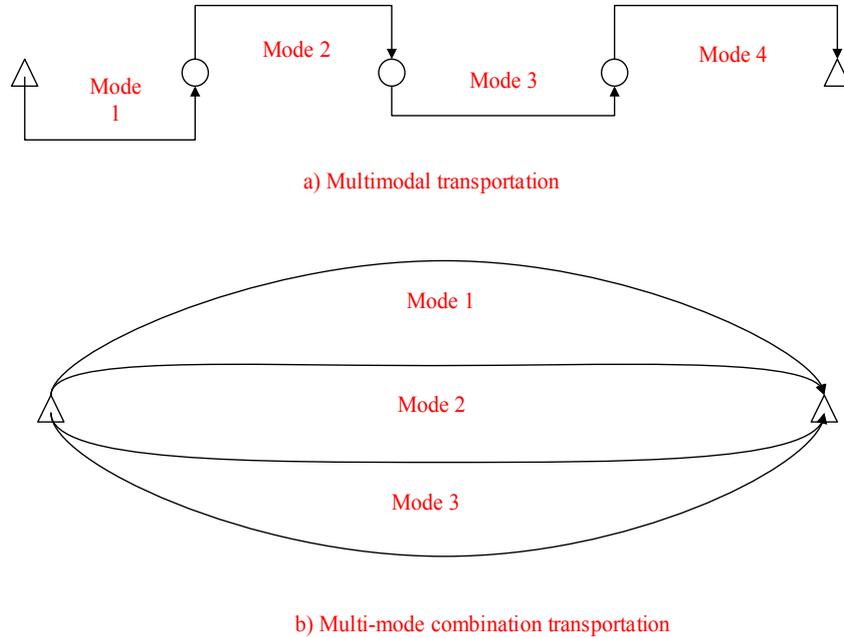

Figure 1 The Collaborative Ways of Multiple Transportation Modes

The core problem for vehicles allocation optimization in multimodal transportation is the connection between different transportation modes; the core problem for vehicles allocation optimization in multi-mode combination transportation is the selection of transportation mode. Thus, different vehicles allocation optimization models are proposed. This paper proposes a synergistic optimization model for multimodal transportation and a transportation mode selection model based on LOGIT-entropy method for multi-mode combination transportation.

3 Vehicles Allocation Optimization for Multimodal Transportation

3.1 The synergistic requirement of vehicles allocation for multimodal transportation

The synergistic requirement of vehicles allocation for multimodal transportation includes the departure interval matching requirement of connected vehicles, transport capacity matching requirement of connected vehicles, and the requirements of vehicle loading rates.

3.1.1 Vehicles' departure interval matching requirement

In multimodal transportation network, the freight flow and the vehicle capacity is different by transportation mode. In the same freight transport route, the departure intervals for different transportation mode have large difference. The great difference of vehicles departure interval will lead to long residence time and cargo accumulation. In order to ensure the departure interval synergistic for multimodal transportation, we hope the vehicles departure interval the closer the better. Suppose G_i is the vehicle's nominal capacity of the its transportation mode; G_j is the vehicle's nominal capacity of the jth transportation mode; h_i^l is the vehicle's departure interval of the ith transportation mode; h_j^l is the vehicle's departure interval of the jth transportation mode which connected with the ith

transportation mode. Usually, $\frac{G_j}{2G_i} < \frac{h_i^l}{h_j^l} < 2 \frac{G_j}{G_i}$.

3.1.2 Vehicles' capacity matching requirement

Operational plan is made based on the transportation mode's freight demand. In the premise of the

same or similar vehicles' departure interval, affected by transit node split and new cargo flows generated, the vehicle's capacity of different transportation modes may be inconsistent. Thus, vehicles' capacity matching is also very important. Suppose a_{ij}^{lk} is the freight transportation demand on route l in direction of k from the i th transportation mode to j th transportation mode; b_j^{lk} is the residual transportation capacity on route l in direction of k of the j th transportation mode, and $b_j^{lk} \geq a_{ij}^{lk}$, the surplus capacity to respond to the emergence of a new temporary freight flow, so $b_j^{lk} \geq a_{ij}^{lk} + \alpha$.

3.1.3 Vehicle loading rates requirement

Vehicle loading rates η are relevant to vehicles' departure interval, which is determined by numbers of vehicles. Usually, the local governments or vehicle operating companies would make a lowest criterion of vehicles' departure interval to satisfy the freight service level. However, low vehicle loading rates will lead to high operating costs. Thus, the vehicle loading rates should be within a reasonable range $[\eta_{\min}, \eta_{\max}]$, η_{\max} refers to the maximum load level.

3.2 Modeling the optimization of vehicles allocation for multimodal transportation

In making vehicles allocation optimization programs for multimodal transportation, the operating costs must be considered as an important indicator. To simplify the research, minimizing vehicle number can be regarded as optimization objective. Suppose n_i^l is the vehicle number of the i th transportation mode in route l ; $m_{i-section}^l$ is the maximization freight flow; $t_{criterion}^l$ is the lowest criterion of vehicles' departure interval. The vehicles allocation optimization model for multimodal transportation can be established as follows.

$$\begin{aligned} \min f &= \sum_i n_i^l \\ \text{s.t.} &\left\{ \begin{aligned} n_i^l &\geq \frac{m_{i-section}^l}{G_i} \\ \Pr \left\{ \frac{G_j}{2G_i} < \frac{h_i^l}{h_j^l} < 2 \frac{G_j}{G_i} \right\} &\geq \delta \\ b_j^{lk} &\geq a_{ij}^{lk} + \alpha \\ \max(h_i^l = \frac{60}{n_i^l}) &\leq t_{criterion}^l \\ \eta_{\min} &\leq \eta_i^l \leq \eta_{\max} \end{aligned} \right. \end{aligned}$$

the first constraint represents the vehicle capacity of the i th transportation mode must meet freight transportation demand; The second constraint represents the probability to meet the vehicles' departure interval matching requirement should be more than δ ; The third constraint represents that when any vehicle transit in direction k on route l , the transportation capacity can meet the transportation needs; the fourth constraint represents the vehicles' departure interval can meet the lowest criterion; the fifth constraint represents the loading rates to meet the requirements of the vehicle loading rate.

4 Modeling the Transportation Mode Selection Based on LOGIT-Entropy Method for Multi-Mode Combination Transportation

In transportation mode selection for multi-mode combination transportation, the main factors affecting freight transportation mode selection should be take full account of, including transport costs, transport time, transport convenient, transportation safety. Based on random utility theory, the transportation mode selection behavior can be analyzed. Single LOGIT model does not reflect the weight difference which affect freight transportation mode selection, therefore, this paper established a

transportation mode selection model based on LOGIT-entropy method for multi-mode combination transportation. The entropy method is integrated into LOGIT model, which can reflect the weights difference of factors.

4.1 The transportation properties weight based on entropy method

Entropy method is an objective method of empowerment, to avoid human interference factors. Each transportation property’s weight is calculated by information entropy depending on the degree of indicator variation. For a transportation property, the larger of the value of information entropy the larger of the variation degree, the greater weight in the comprehensive assessment. Thus, the entropy method can be used to determine the weight of transportation properties. The procedures are as follows:

4.1.1 Standardized of evaluation indicators

Suppose there are n transportation properties, m evaluation indicators. Using the formula

$p_{jk} = r_{jk} / \sum_{j=1}^n r_{jk}$ to standardized evaluation indicators, the transportation properties evaluation matrix is $P = (p_{jk})_{m \times n}$, in which r_{ij} refers to the k th evaluation indicator of j th transportation property, p_{jk} refers to the evaluation value after standardized.

4.1.2 Calculate the entropy value of the k th evaluation indicator e_k

The entropy value of k th evaluation indicator is $e_k = -\ln(n)^{-1} \sum_{j=1}^n p_{jk} \ln p_{jk}$.

4.1.3 Calculate the entropy weight of the k th evaluation indicator w_k

The entropy weight of k th evaluation indicator is $w_k = \frac{1 - e_k}{\sum_{k=1}^m (1 - e_k)}$.

4.1.4 Calculate the j th transportation property weight W_j

For a transportation property, accumulate all the indicators value, the j th transportation property weight is $W_j = \sum_{k=1}^m w_k p_{jk}$.

4.2 Modeling Transportation mode selection: LOGIT

LOGIT model is simple and practical, which is widely used in economic, transportation and other fields. The LOGIT model for multi-mode combination transportation is as follows:

$$P_i = \frac{e^{V(i)}}{\sum_{i=1}^N e^{V(i)}}$$

Where:

P_i : refers to the probability of the i th transportation mode

N : the number of transportation modes

$V(i)$: utility function, composed by a variety of service features, service features here include cheap, fast, convenience and safety.

$$V(i) = -\ln(\sum_{j=1}^M W_j S_{ij})$$

Where:

S_{ij} : refers to the j th transportation property value of the i th transportation mode.

W_j : the weight of the j th transportation property.

5 Conclusions

This paper analyzes the synergistic ways of multiple transportation modes and the core problem in vehicles allocation optimization for each way. This paper proposes a vehicles allocation optimization

model for multimodal transportation and a transportation mode selection model based on LOGIT-Entropy method for multi-mode combination transportation. In the future we plan to develop some scheduling algorithms as well as to extend this model to cover other real-world situations.

Acknowledgement

The paper is supported by Science and Technology Project of Jilin Province Transportation Department named Research on the cooperating operation and management in the multi-mode transportation.

A Study on Evaluation of Monitor and Line Monitor's Management Training Effect Based on the Theories of Six Sigma Management

Xiao Jie

School of Management, Wuhan University of Technology, Wuhan, P.R. China, 430070
(E-mail: whutxiaojie2011@163.com)

Abstract: Based on the theories of six sigma management and evaluation of employee's training effect, this thesis aims at studying the evaluation system of line monitor's management training effect in W company by DMAIC process analysis. On account of the company's status quo and through the method of SIPOC diagram, the thesis redefines the problems, evaluation process and overall goal of the existing system in the first place. Data collection is made by the logical tree analysis and internal questionnaire, then it calculates the process ability of critical processes in Minitab. In combination with the calculation outcomes and process matrix analysis, it confirms the key factors which impact the assessment system, namely the multi-level evaluation index system and the obvious evaluation methods which takes the production task into account. In conclusion, in consideration of all the factors, the system is redesigned from the point of evaluation goals, index system, evaluation methods and results application.

Key words: Six sigma management; DMAIC process; Evaluation of employee's training effect; Monitor; Line monitor

1 Introduction

In each link of enterprise staff training, training effect evaluation is an important part and can provide guidance and reference for the development of the follow-up training and application of results. The general evaluation process includes the establishment of evaluation system, the implementation of feedback, the application of results, etc. After China joins WTO, the automobile manufacturing industry develops in a high speed. Economic globalization has made China face with lots of competitors from the automobile manufacturers around the world. Therefore, it is important for domestic automobile manufacturing enterprises to attract outstanding talents, training and develop their human resources value so as to face fierce competition for talents.

A lot of researches on Six Sigma have been carried out in China. The DMAIC model of Six Sigma management has been used to analyze the training problems of human resources management (Matao, 2007). There is also research on the relationship between six sigma management and staff training (Xiefei, 2007). The Publication of vision of Six Sigma (M-Harry, 1998) recommended Six Sigma management methods to the people. Over the years, many foreign researchers have conducted in-depth research about the model in aspects of the organizational structure, cultural change, and the implementation (Liufeng, 2010).

The first time that Six Sigma Theory had been used in human resource management is the beginning of the end of the last century, it was Motorola that had innovated the theory. At present, six sigma management has been applied from the electronic industry and the general manufacturing industry, into the service industries such as banking, insurance and e-commerce and so on. Although six sigma management has already been utilized in China, its application in the evaluation of enterprise training effect is still less.

For the enterprise, training effect evaluation based on six sigma management can improve the quality of enterprise's training effect, the internal and external customer's satisfaction and the quality management in primary level. For the employees, the use of six sigma management tools facilitates the effectiveness of enterprise's training evaluation, maintain the actual benefits and help to promote the skills of employees.

2 Theoretical Background

2.1 Monitor and line monitor

For the current studies, there is no exact definition of the monitor or line monitor in the production line and workshop. Combined the concept of managers in primary level and the characteristics of production manufacturing enterprises, this paper define the monitor or line monitor as a kind of primary managers who undertake the tasks of management in the workshop or production line, they directly command and supervise the employees, materials, equipment, operating methods, production

environment and other factors of production line, thus help achieve management objectives of the enterprise. However, monitor or line monitor are different from the primary managers, their level is lower. They directly command and supervise the staff of production line, so their management level in the enterprise is relatively low, but their importance cannot be ignored.

2.2 Six sigma

Sigma (σ) is a Greek letter used in statistics, it is the standard deviation of mean value and aims at reducing the number of defects in products and production processes, thus to prevent product variation and improve product quality (Alexandra Tenera, 2014). The six sigma means "six times the standard deviation", it represents the number of non-good parts per million (Parts per million, PPM) is less than 3.4 (Yu K.Ueng R,2012).

2.3 Six sigma management

In order to reduce the operating costs and improve the internal and external satisfaction of customers, six sigma management is focused on the pursuit of zero defect in the production process and lower product risks so as to reduce the cost and improve the productivity and market share (Guo Yi,2011). As a statistical evaluation method, six sigma management emphasizes the management of the enterprise which considers

3 DMAIC Process

3.1 Define

3.1.1 Problem definition

As for the monitor and line monitor’s management training effectiveness evaluation in W company, this paper defined the problems to be solved as follows, lack of systematic training effect evaluation; the evaluation indicators are not scientific nor targeted; evaluation methods are monotonous and usually cause conflicts with production tasks when put into practice; the motivation of results application is not strong enough.

3.1.2 Process definition

As is shown in Figure 1, this paper definite the management training effectiveness evaluation process in W company through SIPOC diagram. The key elements of this process are input variables, output variables and the range of process (Tang Jiawen,2014).

3.1.3 Target Definition

Once the objects are determined, we need to ascertain targets for improvement. The improvement objectives generally include qualitative and quantitative targets. In long term, qualitative objectives will promote the evaluation of training effect for enterprises through affirming what kind of measures are to be taken, which contributes to better organizational outcomes. Quantitative targets are often shown as quantitative indicators. Compared to the current evaluation level of W company at present stage, it is an expected level.

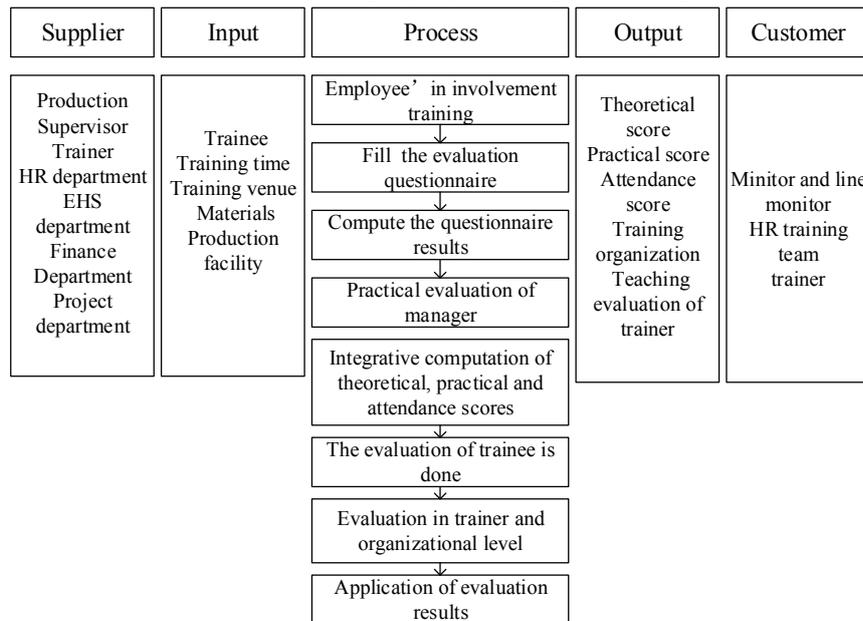

Figure 1 The SIPOC Process

Based on the preliminary investigation and analysis in definition stage, this paper identified the main targets, namely assessing the effect of monitor and line monitor’s management training in W company: evaluation system must be reconstructed; constructing multi-level training effect evaluation index system; select the appropriate evaluation method to evaluate, and apply the evaluation results reasonably.

3.2 Measure

3.2.1 Decomposition of training effect evaluation

As is known to all, the training effect evaluation is comprehensive and includes many aspects. Therefore, for further refinement and analysis of the evaluation, this study chooses logic tree (Xie Fei,2007) method to export little Y that affects the evaluation process, namely evaluation index selection, evaluation method options, implementations and application of evaluation results.

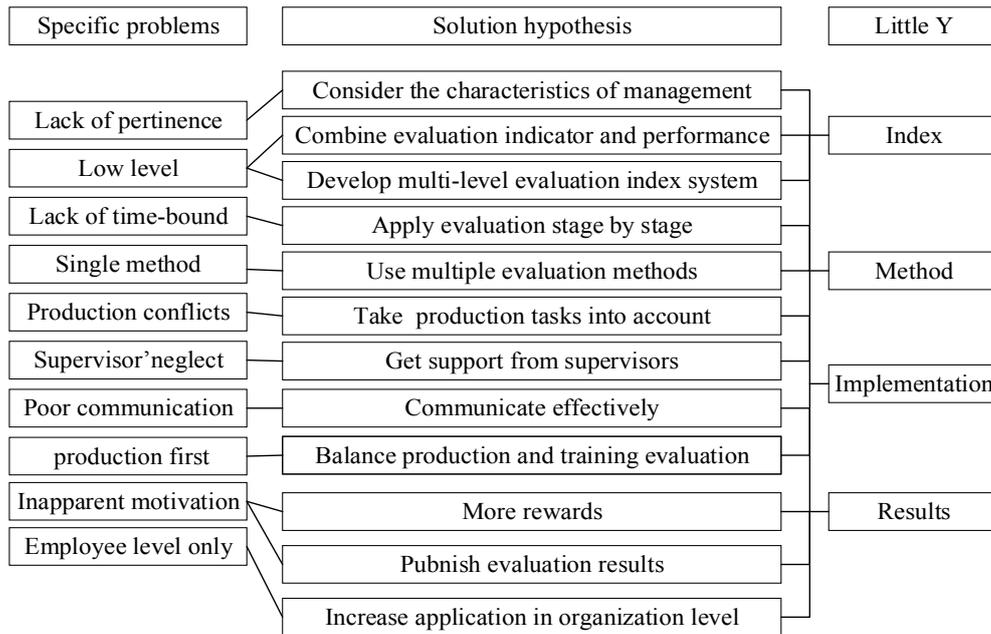

Figure 2 The Logic Tree Analysis

3.2.2 Assess current levels

When little Y are determined, we need to survey the current level of Little Y in W company. Targeted questionnaires were conducted and this study measured the current level of each little Y through Minitab software. Results are shown below and reports are displayed in Fig 3 to Fig 6.

Table 1 Current Level of Little Y in W Company

Main KPI	Sub KPI	Current Level
Evaluation effects	Index	1.64
	Method	0.87
	Implementation	0.94
	Results application	0.88

3.2.3 Set target levels

This paper selected Cp as the process capability of little Y and the target level of each little Y for W company is exhibited below.

Table 2 Target Level of Little Y in W Company

Main KPI	Sub KPI	Current	Target
Evaluation effects	Index	1.64	2.46
	Methods	0.87	1.305
	Implementation	0.94	1.41
	Results application	0.88	1.32

What is more, the target level is 1.5 times the current level. Overall, the higher the value of C_p is, the higher the level of process capability is, as is shown in Table 3.

Table 3 Explanation of C_p

Value Range	Explanation
$C_p < 1$	Lack of process capability
$1 \leq C_p < 1.33$	Process capability is not enough
$1.33 \leq C_p < 1.67$	Adequate process capability
$C_p \geq 1.67$	Surplus of process capability

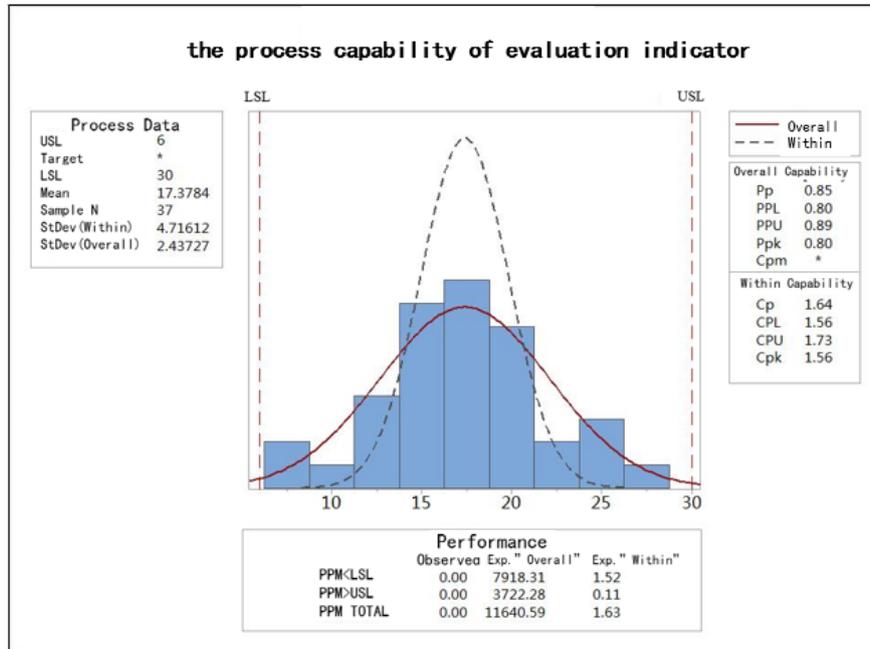

Figure 3 The Process Capability of Evaluation Indicator

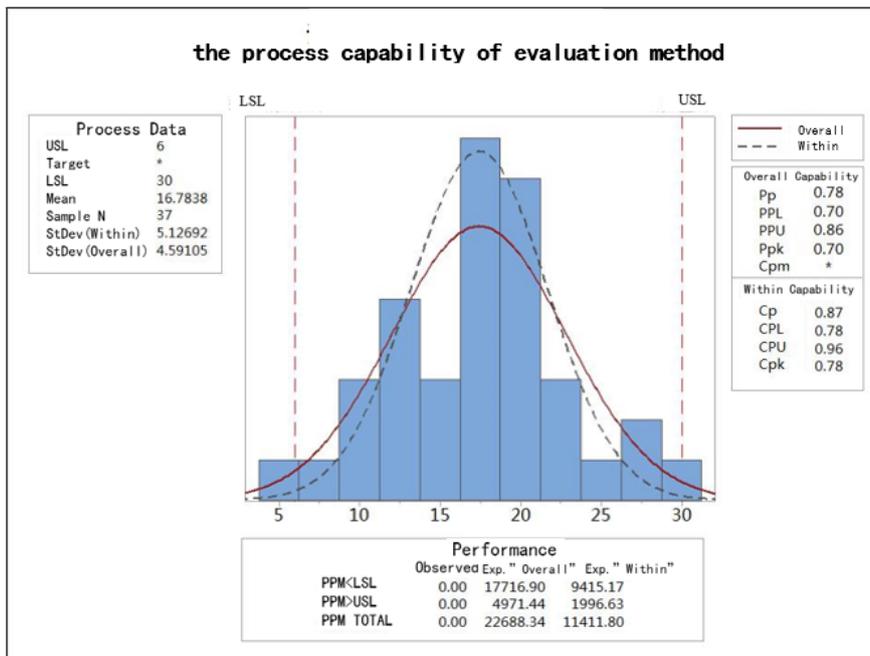

Figure 4 The Process Capability of Evaluation Method

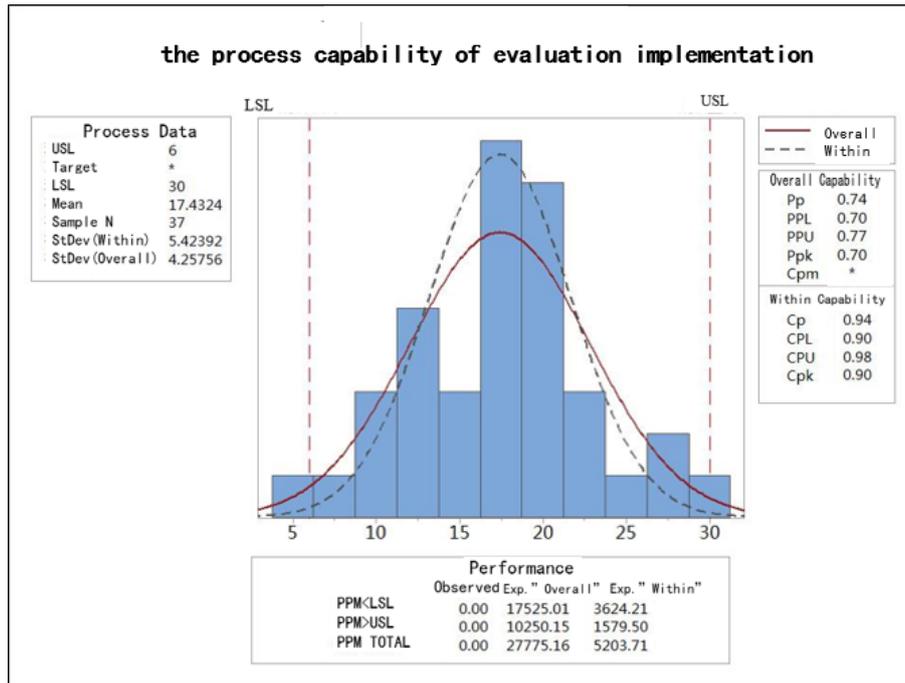

Figure 5 The Process Capability of Evaluation Implementation

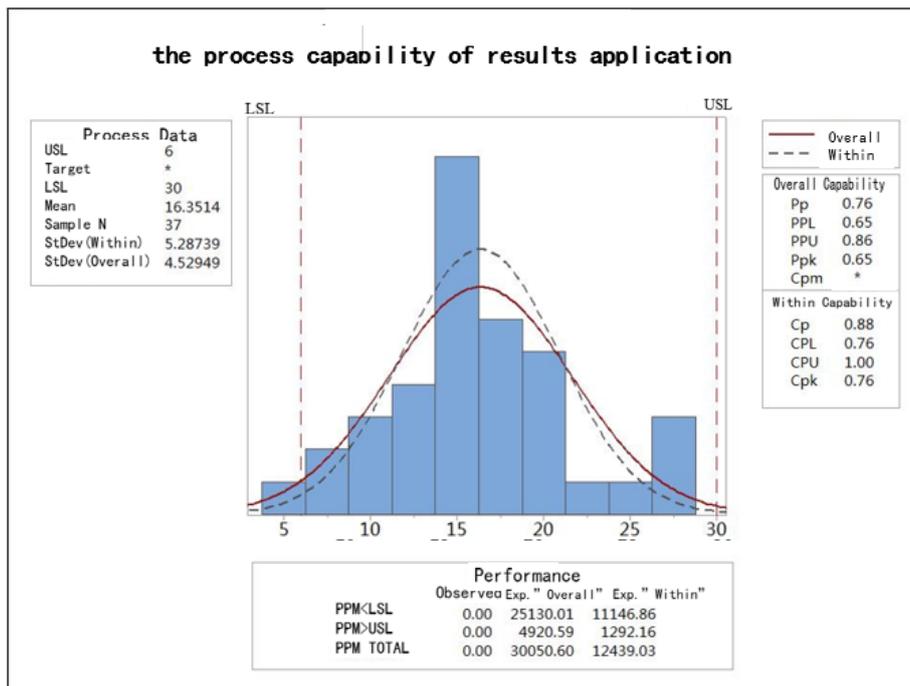

Figure 6 The Process Capability of Results Application

Through the analysis of logic tree, we obtain nine factors that affect the effectiveness of the training evaluation which are shown as follows: targeted evaluation indicators, multi-level evaluation indicator system, time of evaluation; diversified evaluation methods, balance the evaluation and production task, supervisor's attention and support, effective process communication, the application of the evaluation results is high motivated, wide application level of evaluation results.

Based on the method of Matrix analysis (Yang Bing, 2015), this paper found out the correlations between each process factor and selected the lethal factors according to the Pareto principle, the analysis process is shown below.

Table 4 Matrix Process Analysis

Factor Process	F1	F2	F3	F4	F5	F6	F7	F8	F9	Total
P1	3	9	1	1	9	3	1	3	9	39
P2	3	3	1	3	3	3	1	9	3	29
P3	9	9	9	3	9	3	1	3	3	49
P4	9	9	3	9	9	1	3	1	1	45
P5	3	9	9	9	9	9	9	3	1	61
P6	1	1	3	1	3	9	9	3	1	31
P7	1	1	9	1	3	3	3	3	1	23
P8	1	9	1	3	1	1	1	3	3	23
P9	1	3	1	3	3	1	9	9	9	37
P10	31	53	37	33	50	33	37	35	31	338
Rate	9.2%	15.9%	10.9%	9.8%	14.8%	9.8%	9.5%	10.9%	9.2%	100%

In this table, P1 to P10 represents the process of the evaluation, F1 to F10 are the factors that affect the process mentioned before. Moreover, if the relationship between process and factors are highly related, then it will be given 9 scores, 3 points is given if less related and the low correlation will only get 1 point.

Therefore, this study found that F2 (multi-level evaluation indicator) and F5 (balance the evaluation and production task) are the lethal factors.

3.3 Improve

According to the analysis results mentioned above, the main task of improve stage is to improve the training effect evaluation system and formulate implementation plan.

3.4 Control

The main task of control stage is to maintain the improving, and keep training effect evaluation process in a stable state (Kun-Tzu YuR, Ren-Gen Ueng, 2012; Wang Fang, 2012; ChiaJou Lin, et al, 2013; Roxanne M, 2011; Lateef Ur Rehman Ateekh-ur-Rehman, 2012), which includes establishing the evaluation process control plan, namely evaluating the process of training effect evaluation system after the implementation of the improved scheme is done. In the process, trainers should firstly make establish the process control plan and accumulate enough experience in different management training effect evaluation cycle, thus they will find further improvement opportunities. In addition, continuous process monitoring is also needed. Training organizers must develop contingency plans as well as improvement measures, set up a working group to deal with sudden variations and carry out continuous process monitoring when facing with the emergency.

4 Conclusions

4.1 Practical implications

The findings of the present study have several practical implications for W company as well as companies that are similar to W company. On the one hand, trainers must construct a multi-level evaluation indicators system according to the characteristics of monitor and line monitor in W company.

On the other hand, considering that monitor and line monitor are primary supervisors, thus the evaluation methods and implementation measures mustn't conflict with production task. Therefore, the study suggests trainers nimbly select the time and place of evaluation, seek support from their superiors actively and determine the person among monitors who are responsible for the evaluation task.

4.2 Limitations

Firstly, the research conclusion is not widely used. As for the analysis of the training effect evaluation process, this paper only made the internal investigation in W Company. Therefore, the conclusion can only be applied to W company's training management.

Secondly, the subjective factors of qualitative analysis are difficult to avoid. In this paper, many qualitative analysis processes such as SIPOC process analysis, logic tree analysis and matrix analysis are done by individuals. Limited to the personal experiences and knowledge accumulation, the objectivity of the study needs to be improved.

Cyberspace and the Identity Matter

Shabnam Dadparvar, Shen Laijin

School of Marxism, Wuhan University of Technology, Wuhan, P.R. China, 430070
(E-mail: shabnamd53@gmail.com, shenlaijin@263.net)

Abstract: Cyberspace is a new stage of technological evolution and science production in human life which has gone along with human civilization evolution and has created specific cultural and civilizational structure. This space has provided new and pristine areas for human and has affected all aspect of his life and social interactions. Cyberspace actually contains online computer networks in which users exchange with each other at the moment. Internet is the founder of this new World Wide Web development. Internet as a post-modern media has created a new territory in which certainty and integrity has replaced by fragmentation and diversity. The authors have explained the impact of cyberspace on identity by descriptive and analytical approaches in this paper. From this perspective, cyberspace has proposed a new path to the plurality of identity within society and even more within individual identity by creating multiple identification references.

Key words: Communication; Internet; Cyberspace; Identity; Post-Modernism; Plurality of identity

1 Introduction

Nowadays the world has taken a new shape based on technological development and expansion. The impact of this development is visible in each social aspect. Today technology by creating changes in communities has caused ease in one hand and made complexity in the life of human society on the other hand. Human access to the modern communication and information technologies that initiates the age of Globalization is the founder of this change in its strict sense. This new system observes the rise of community system by which the transmission and distribution of information from one point to another is possible. These systems have been able to overcome the space and time factors by their capabilities. Media are not simply the communicational tool in the sphere of social relations. They even affect the public knowledge and understanding of the world. It means that Media are the creator of expand individual knowledge and social structure and also that of the content. Media do not work as a mirror to reflect reality anymore. They rather affect the social construction of reality.

Thus, these are media which form our image of reality in the present age. Media affect the human interpretation of reality by a system of visual, written, and oral signs. Image, speech and writing had been the center of philosophical disputes during twentieth century. Components also have affected the human understanding of time and space both in print media and on radio and television. This condition has become more complex by appearance of global data network or Internet and consequently space and time has been redefined. The main achievement and outcome of internet for the social interactions area is the rise of cyberspace. The appearance of this modern space has given a new definition to communication and created transformation in social relations. Overcoming the locational factor of space and time in this new geography has led to the disruption of discipline and traditional proportion of location to the space and time. Connecting and communicating in a space beyond the specific geographical area and location has become possible. There is no certainty and integrity in this new space while it is full of fragmentation, diversity and rupture. This new area is called as a post-modern territory. In this perspective cyberspace is a tool to create a space which is different from the real space in which as castells says we face the space of flows timeless time. In this new situation we are witnessing an ontological rotation of the total supposed knowledge to the realization of data dispersion. This new area is the area of possibilities in which we are facing the plurality of sources in social interactions. This paper will discuss about the effect of internet and cyberspace on identity construction.

2 Theoretical Principles

The theoretical principles of this paper are derived from Douglas Kellner, Jacques Lacan, and Stuart Hall theories respectively.

Douglas Kellner in his article “popular culture and the construction of postmodern identities” argues about three transition process in identity issue. These three stages are:

1) Pre-modern identity: in pre-modern communities, the identity has a social nature, but uncertainty and conflict do not affect it. Individual identity is stable since the ancient myths and systems of pre-defined roles define and describe this identity. You are the member of an ancient kinship system.

Your thought and behavior is surrounded by a worldview framework and your destiny is more or less specified. Therefore, there is no need to doubt about your position in the world. The identity is basically not in question.

2) Modern identity: identity faces crisis in the modern era for the first time. The individual identity likewise pre-modern cultures remain based on personal relationship with others. This identity holds its stability to the certain extent, but its trends and impacts starts proliferating. In pre-modern communities your position in tribe was clear, while in modern communities you take a wider set of social roles. Thereupon you can gradually choose your identity rather than being born with it. You may anguish about your real identity and ask about your responsibilities in life step by step. You will require achieving an approved and stable identity based on this new self-awareness about who you are, who you can be, or who you should be. You may be concern that your identity is unstable, fragile, or wrong. In short, the identity is in question.

3) Post-modern identity: social life becomes more complex and faster compared to modern era and its requirements increase. More possible identities are presented. Since the community fragments gradually we should undertake several roles which are expanding rapidly.

Some theorists note that how the “ego” has been lost by the modernism impact, following the consumerism, mass culture, and further bureaucratization of life. Some other theorists like Foucault state that the stable and integrated ego has been an illusion. Lacan believes that identity is relative because it is constructed by interaction of person with his surrounding environment which reflects him. This approach involves the idea of difference in the process of identity formation. If identity has a relative nature, then a structure that we live within it, will determine our identities. Since the social and individual structures are changing and evolving, so the identity could not be a stable and constant subject. It is a process that never reaches the perfection. Thus, not only it is changing permanently, but also it can never be integrated.

According to Stuart Hall, post-modern discourse argues that the identity is not stable necessarily or constantly. It is variable and dynamic carnivals that always form and reform by surrender cultural systems in which we are representatives or audiences. In the sphere of this discourse, the identity is seen historically rather than biologically. Human is the subject of several identities in different times (Hall, 1996).

As it is mentioned the identity is not integrated in post-modern era anymore, it is even fragmented and multiple. What makes this above mentioned theoretical principles applicable in this paper is that the identity gets plurality in cyberspace. This function is described in below.

3 Globalization and Internet

The use of word “Globalization” began since 1944, but its term was used in two books which were published in 1970. The first book was “War and Peace in The Global Village” by Marshall McLuhan and the second one was written by Brzezinski the former head of the American National Security Council during the presidency of Reagan. The first book discussed about the development of communication means and focused on their role in conversion of universe into the unique global village, while the second book discussed about the role of United States in world headship and its presentation of comprehensive sample of modernism. Most of the political and economic agreements after two world wars which were performed among the countries and were the ground for the international integration and cooperation, were the forefront of a phenomenon which is called “Globalization” nowadays. However amazing growth of technology in some issues like transportation, telecommunication, and moreover in informatics revolution in the 1980s which made a high position for computer industry and consequently the development of internet and information explosion represented the “Globalization” as the inevitable process to everyone more than all reasons.

Although Globalization is a common concept in scientific, pseudoscientific, and political fields and is the important part of remaining heritage for the new millennium, but still does not have any clear definition. There are different and even antithetic definitions about this process in various and numerous literature relative to culture, economy and politic in the contemporary world and there are no hopeful signs in achieving relative consensus about the conceptualization and definition of this word.

There is no Consensus on the exact definition of Globalization or the effects on our life and behavior among scientists. There is a blank paper instead of the first part about the nature of Globalization in the book “Global Social Change: Historical and Comparative Perspectives’ (Chase 2006).

This ambiguity, difference, and additional contradiction in Globalization definition have rooted in several factors. One of these factors is multi-dimensional quiddity of this phenomenon or process.

David Harvey believes that time and space becomes more common based on some developments and inventions, so that a process began which is still ongoing. He called this process as “time-space compression” in which the time could be organized in such a way that increase or decrease space restrictions. In fact, the time-space compression is about reducing time and lowering space (Waters, 1995).

In Wallerstein opinion the modern world system is the first social system with global range. The economic logic of this system turns the worldwide to the place of endless accumulation of capital and creates an international division of labor gradually. This globalization of capitalism is associated with a kind of universal inequality. The modern world system includes three points: center, Periphery, and semi-periphery.

Thus today we can distinguish between two types of definitions about Globalization. One type considers globalization as the blossoming of global communications based on the developments of technology and Telecommunication infrastructures. Fore features and basic concepts could be identified in this type:

- 1) Time- space compression
- 2) The increase of information’s speed and volume.
- 3) Free and uncontrollable exchange of information.
- 4) More interdependency.

In other type of definition which is based on economic and commercial view to the process of Globalization, the economic interdependence is highlighted. By the abovementioned types, the author considers Globalization in its modern sense as the product of information revolution. In this regard the impact of Internet is important in present process of Globalization. The main reason to choose this subject for the paper is that nowadays Internet and cyberspace are as global phenomena. Internet and Globalization are concurrent more than any other words. Among the several impacts of Internet its influence on creation of cyberspace and its relationship with the identity is important in this paper (Kennedy, 2001).

4 Internet as a Post-Modern Media

The second half of the twentieth century witnessed the emergence of a new kind at least in appearance. At first it was about the world government and then it turns to global village rapidly. After visualization of a world leading machine the time of informatics Revolution arrived in which whole society must be changed. Then World Wide Web was discussed in order to change the life. Communicational highway replaced by Internet. Finally, the cyberspace namely visual world emerged that was against the real. The origin of the Internet is essentially rooted in the Cold War era. In 1960th the concept of decentralized computer network was raised among the United States of America's military strategies and its allies. That idea argued the computer network could act as supporter for telecom infrastructures in terms of nuclear attack. In 1968 the Council of American Survey Research Organizations (CASRO) decided to use this network in a project related to the Pentagon. The Internet has been changed and experienced several transformations since fifty years ago. Nowadays Internet is turned to the world web which passes the geographical borders and creates new spaces in which the traditional concepts of time and space are pointless. The advent of the World Wide Web as one of the most prominent information and communication technologies shows the technological progress of modern man who his role in creation of social changes and especially in value changes is unavoidable. In order to these changes we are witnessing the emergence of symbolic realities in this new cyberspace.4Nowadays modern information-communication technologies have given speed and depth to the social changes to the extent that they have conquered the most stable areas of human life namely culture and have put the communities in exposure of serious cultural changes. A change that is known as the most serious cultural change in Barlow’s opinion (Whittle, 1997).

By this introduction the authors consider Internet as a post-modern media. Studying the effects and outcomes of Internet within society, culture, and politic is a way to verify this theory. In modern perspective Internet is just a tool for communication and information publication globally, while in post-modern perspective it is an opportunity to create a different space compared to real world, namely cyberspace. As it is mentioned post-modernism is a state of knowledge distribution. This situation includes an ontological rotation of the total supposed knowledge to the realization of data dispersion.

Internet makes it possible for people to face with experiences which regularly have been removed from the routine cycle of life order. It also provides people by new experiences through the exchange of experiences, challenging on many of the concepts and interpretations of life, and mutual questioning. In this regard it creates a placeless social relationship, has opened customs and several ways of life in front of our cultural horizons, and provides a new understanding of the world as a significant social, cultural, and moral.

Internet converts the cyberspace to the area of mere possibility by online browses. Wisdom which is the motto of enlightenment age becomes as a possible space. Vertical hierarchical order is broken and horizontal one is emphasized. This is a rotation to the decentralized network of communications.

Internet provides a space for people who are not able to create a space in order to communicate socially and culturally, or have problems in production and creation of these spaces. Internet as a virtual sphere is a mixture of three different elements: material, symbolic and individual experience. So it is not just an electronic tool with new capabilities to make digital messages, but beyond that cyberspace is the product of digital revolution that provides a modern image of universe, changes social values, and establishes possibilities in order to show oneself against another.

5 Cyberspace

What we have today of cybernetic space is because of the emergence and spread of interface computer communications as one of the most important achievements of the new information - communication technologies. These achievements give a new definition to the communications and change the social interactions. Physical presence was considered the characteristic spot of interaction and relation until now, relationship implicitly showed interpersonal relationship that could be continued despite the physical distance. While undoubtedly both sides of the conversation in telecommunications which is the previous generation of today computer technology communicate without any visitation. This subject is applied to the even rarer case of physical communication like cybernetic spaces as a product of interface computer communications (Riva,1998).

Nowadays any related matter to the lifestyle and thought of new information technology is considered as “cyber industry” and the computer space that creates a virtual geographic area is called cybernetic space or cyberspace. Cyberspace is a subjective world of information and electronic networks which is accessible through the Internet. This space is often compared with endless border spaces. Cyberspace is not an unknown and borderless area, but it is a defined, bounded one which contains certain components. David Bell defines cyberspace in a different way: we can define cyberspace by hardware perspective. For instance, {it could be defined as} a global network of computers that are connected by telecommunication infrastructures and provides various forms of interaction between distant actors. Cyberspace is the total of all those nodes and networks (what is it?). In other words, based on a definition with symbolic metaphor, cyberspace is an imaginary space between computers in which people can create new identities and new words (what does it mean?). The ways through which we experience cyberspace show the intersection between the material and symbolic elements which have different values based on experience type (what does it do?) For Benedikt cyberspace is a subjective common geography which is made in around consensus, transformation, law, and Experience. It is a land of data and lies, subjective materials and memories, millions of voices and silent eyes, invisible concert of search, sharing dreams and observing simplicities (Benedikt, 1991).

Virtual or cyberspace depicts virtual words that are raised from science fiction. However, this space has become as a part of the most people’s daily life.

Cyberspace in fact is an area which includes online computer networks in which users exchange information at the moment. This space has its own culture that is created among its users. This communication not only forms social relationships, but also provides an area for social relationship to hold; an information system in which reality itself (material and symbolic presence) has been overwhelmed in virtual context and realistic world. The things that appear on the screen are not just images that reflex the experiences, but they are becoming experiences themselves (Turkle, 1996).

Cyberspace has a unique and distinctive characteristic such as placeless, timeless, pure industrial, no limitations to civil law based on the nation-states, having a post-modern epistemology, simultaneously accessible, being over the space and having new cultural, ideological, commercial and political aspects.

6 Identity

The old question of ‘who am I?’ shows the basic need: the need to know about identity that never

leaves human. The social institution which is responsible to answer this question is one of the main issues of sociology. This eternal and even everlasting question is called identity by western modern sociologists, while it is denied by post-modern scholar (Eliot, 2005).

Identity refers to characteristics that identify the person. The word "Identity" is obtained from Latin word "Identity" and its root is "Idem" which means similar or identical. This word is equal to "howa" in Arabic language which means he. It is actually about considering or applying itself. Thus the identity of everything expresses the essence of its identity and. However, the identity shows both the Uniqueness and individuality and also fundamental differences that distinguish one person from all others. Therefore, the word "Identity" is used in two apparently different meanings: 1- absolute consistency and uniformity; 2- the distinction which includes stability and continuity over time. So this concept is necessarily defined by two opposites: Similarities and differences. The claim that something or someone has special identity means that thing or person like others has character and it also has its own distinct identity and character. To put it more clearly identity means to have the same quality in nature, composition, and essence and also similarity in all times and all situations. However, having identity or being unique has two different dimensions: being the same as others in its level and being the same as itself during the time (Hekman, 1999).

Identity is negotiable from both psychological and sociological perspectives. Erik Erikson was the first psychologist who considered identity as the most important factor in personal development in adolescence and introduced it as a vital step towards a happy and productive life. Erikson believed that successes in life and achieving the goals and human ideals in adulthood are related to identity formation which is formed in adolescence and young ages. In psychological perspective of many characters' theorists identity is initially made by individual and personal emotions and desires. Based on this idea, identity is a sense of personal distinction, personal continuity, and personal independence. Therefore, the subject of identity is the same as personality in one sense. So identity is the sense of human about the continuity of his mental life and the sense of unity in the face of changing external circumstances which he always feels in his mental state. On the other side social psychologists and sociologists emphasize on this reality that the sense of personal identity is formed by the dialectic between the individual and society. They more or less accept that identity regularly appears in attitudes and feelings of people, but its formational context is social environment. Social identity which appears in personality is meaningless without the consideration of individuals' social world. People are unique and varied, but their personalities are socially made by different stages of socialization and interaction through social community. Generally, identity must be recognized as a social and cultural phenomenon, because a newborn baby knows himself and becomes aware of his presence from the beginning through the education and the social and cultural environment he lives within. Perhaps it can be said that a child experiences the world for the first time from his family perspective and consequently the culture which he was born in. since there is no other people, ego could not be established. Thus identity is a social issue which means that a person finds the definition of himself in social environment whether in small circle of family or later in friendship, professional, and etc. groups. He becomes aware of himself by contacting with others and learning from them and he also forms his identity within interaction with people. In fact, as Durkheim believes no child is born in a vacuum, so his roles and responsibilities will be transferred to him through education, habits, and beliefs from the start by being in a social environment.

In George Herbert Mead sight as the pioneer of social identity theory everyone forms his identity or his own self through the organization of personal attitudes of others in the form of organized social and group attitudes. In other words, Self-image that is made by a person and the sense that he feels about himself reflexes the attitude that people have towards him. Tajfel joins social identity with group membership and considers this recent item to have three elements: cognitive element (being aware of belonging to a group), Value element (assumptions about the positive or negative consequences of group membership), and emotional element (sentiment towards the group and towards other people who have special relationship with the group). Accordingly, in Tajfel perspective social identity is that part of a person's perception of self-awareness which comes from his awareness about the membership in social groups along with value and emotional significance attached to that membership (Tajfel, 1979).

Therefore identity is not restricted to natural, intrinsic, and biological aspects. It is also a historical issue which is made by dialectic of the individual and society. Thus identity is not an inherent and predetermined subject, but it is a subjective historical reality that is always determined in the context of the social and cultural relations. Hence there is a mutual interaction between identity and social life. The processes of forming social identity are determined based on social structure in one hand, while identity

which is affected by social relationship responds to the social structure on the other hand.

Therefore all identities are fabricated. Since we believe that identities are established as subjective realities through the historical processes, then there should be the interests to make and process it. In other words, because identities are developed in social context and framework, then every society has to provide interests for its members in order to enable them in creating their own social identity and personality and also making a meaningful life.

The most effective and significant resource that enforces this special action and enables the member of a complex to give meaning to their lives and establish their own dignity is the location aspect of space and time. Both space and time are dominated by location.

As it mentioned above, having identity primarily defined as being unique and different, stable and constant, and belonging to community. Everybody knows himself as an identical person when is sure about his uniqueness, continuity, stability, and belonging to community. Location is the most essential factor that provides the human identity requirements.

Location simultaneously provides the need of social distinction by making possible objective boundaries through the geographical features such as rivers, mountains, sea, etc. and facilitates identification by strengthening the natural, social, and cultural boundaries. These borders were more or less the same in traditional societies and they reinforced each other. Even the political and national borders which were consistent with Location and territorial borders achieve more ability of identification.

Location is not only limited to borders and renewable, but also stable and durable. Hence, by providing the need of stability and continuity it is considered as a vital base in supplying identity. Several ideologists argue that human senses stability and continuity during the time when he has stable and sustainable references and resources. Location and land are the best providers of such references and grounds. Location creates a stable world by its certain aspects of fixed components, while space and time provides an indeterminate and without center for people.

Thus location- based space by its differentiation and renewal in one hand and location -based time by its creation of constancy are the main sources of identity forming.

7 Cyberspace and the Identity Matter

As it is mentioned before, identity does not have just natural, intrinsic, and biological aspects, but also it is a historical issue which is made over time and then it is stabilized. This stability is not certainty, so the national identity is fabricated. Several sources are used to create national identity in each society. The capability of space to be restricted in borders provides the possibility for all members of a complex to understand their identity significantly by the sense of differentiation, stability, and belonging to the determined geography. Time also causes members to be sure about the Continuation of their social identity. Identity is based on continuity and continuity is defined in time frame. Thus location- based space by its differentiation and renewal in one hand and location -based time by its creation of constancy are the main sources of identity forming. Therefore identity is placed in such a place-based and context -based time and space.

In the nature of this location character the solidarity and cohesiveness are evident but not in the sense of certainty and integration. The location is important because the inside-outside interaction which creates identity is placed in a land or location frame. On the other hand, time is also framed and located. The importance of time is because of its role in continues of identity. Social continuance required an assumed significant past. The past is an essential source in interpretation of here and present and anticipation of future. The past individually is defined as memory and collectively as history. But none of these definitions are real and both of them are fictitious. Accordingly, in traditional communities the past was respectable and symbols were valuable because they contained the experiences of generations, immortalized them and were the tools to manipulate time and space in order to put the specific action or experience in continual frame of past, present, and future. The importance of location in space is based on its restriction function. Space means everywhere, but location is a determined place. The imagination of everywhere is harder than that of specific place. Location has content, while space is a kind of vacuum. So an empty space like a geometric concept can easily be imagined. The location has two dimensions, while space has three dimensions. Location is restricted to borders, but space is endless and without center. Thereupon the restricted character of location makes stability and continuity. The capability of restriction in borders creates the sense of belonging by itself. Restriction to borders provides coherence and internal consistency by means of distinction between different "us". Space was

not districted from location in traditional communities, but it was consistent with location. That was because the location aspect of social life was under the control of “presence” or local activities for most of the people and in most. Psychologically the sense of continuity is linked to the time. This individual identical need is provided when the person feels the stability during his life time despite environmental changes and personal growth.

Factually the unity of person depends on the unity of the time and having identity in one aspect means a sense of continuity in time. Identity requires continuity. This continuity is reproduced over the time. There is change and evolution in the nature of this continuity. Thus when we face with changes we should find an instrument in order to form these changes and time is the best instrument in this regard. Time is a subjective concept. This is a thing that is discovered by our mind to determine the chain of developments and changes. So the human understanding of events relies on the subjective phenomenon, namely time. Time is occurred in location, because events should happen in a place and that place is location. So we could not distinguish between time and location. Time was consistent with location in traditional communities. Calculating the time was limited to its relationship with location for many people. Until the invention and wide dissemination of mechanical clock it was impossible to determine the time of a day without reference to the location context and specifically the natural place-time signs. Accordingly, for example determining sunrise, sunset, and evening or the time according to sundial not only were inaccurate signs, but also have intrinsic link with the place where they were used in. In this kind of situations people could easily recognized their past and connected it to the present in order to achieve a sense of continuity, individual stability, and collective stability. Location-based time was a linear time that the person and society consciously and jointly experience its passage. Therefore, that was not hard to ensure about continuity and existence of common past in traditional communities based on location character of time. Time well did its special activity of identification.

So under these terms, both space and time were located-based because of the Link and conformity between space and time based on location. Thus space and time were not considered without the location. The author believes that pre-globalization world relatively was a stable and sustainable reference by these characteristics since it provided the sense of distinction, continues, and belonging to an identity for the members of a group.

Nevertheless, cyberspace has broken the traditional order and the proportion of location to the space and time furthermore; a cyberspace which represents post-modern status. In this virtual situation we are facing with the time-space compression as Harvey defined. In this new space nothing is predetermined and certain, everything is unstable and changing. Time and space are separated from location in cyberspace and creates a new synthesis. In this regard an image of time is formed that does not have any relation with location. We have mixture of times in here in which genres combine together and timely become Simultaneous in a flat horizon that has no first or end point nor order. When space is evacuated of location, then all areas lost their cultural, historical, and geographical meanings and are included in functional network or visual collages which create the space of streams instead of locations' space. In this new communicational system by which the programming of the past, present, and future within the united connection message is possible, time has no more meaning. Streams' space and timeless time are material foundations of a new culture.

This phenomenological compactness and evolution turns the time from a linear and chronological issue to the endless present. The world is compressed in a flat and undifferentiated space structure and a momentary world is emerged. The link between a common past and common present disappears and the traditional order which is based on exclusive locations, signifying, and identity maker continuities is destroyed. In such a world neither space can provide the human need of distinction and continues nor can time. If the theme of identity is formed by collective memory, then this collective memory will be continuously based on the time. If the cyberspace process creates a timeless world, it will destroy one of the main sources and instruments of identification. Thus there are facilities for individuals in cyberspace that open a path to the plurality of identity in society and within the individual by weakening the stable references of identification.

Cyberspace and the possibility of simultaneous and countless communication is the origin of instantaneous cultures and consequently leads to the rise of heterogenetic identities which are created in limited periods and disappear quickly by the emergence of new identities. Electronic communication's features of the virtual space provide a different condition from real and face-to-face contacts for users. Speed, anonymity, and fluidity establish a same and similar space regardless of the identity requirements that is prone to different experiences for its users.

Previous identities which are created by real world in interaction with virtual space found new

identities that will have the capabilities of extensive contradictions between the life, culture, and identity in the real and virtual world.

Cyberspace makes it possible for people to face with experiences which regularly have been removed from the routine cycle of life order. It also allows people to change their lifestyle and achieve new experiences through exchanging experiences, challenging main concepts and interpretations of life, and mutual questioning. In this regard it provides customs and several means and methods for cultural horizons of people and creates a new understanding of the world as a meaningful social, cultural, and moral structure along with location removal from social relations.

Cyberspace creates a situation which is called “cultural supermarket” in “Gordon Mathews” literature. He compares the function of digital communication equipment with supermarket. Just like a person who fills his trolley by several products in supermarket, internet networks and the like offers to its customers several packages which include all sorts of cultural values and trends.

The side effect of this cultural supermarket immediately is reflected in the emergence of multiple identities. Diversity and multiplicity of identity is growing. This trend in its most acute form appears as a patch which is the product of human uses of the non-restricted sources provided by cultural communication.

8 Conclusions

The authors have studied the effects of cyberspace on the identity by Conceptualization and framing virtual space in this paper. The realization of cyberspace or virtual space is the main and crowning achievement of internet for social interaction arena.

Cyberspace is an environment in which users exchange with each other at the moment through the online computer networks. This space has its own culture that is created among the users. This communication constructs social relationships and provides a ground for social relation to be held; an information system in which the reality itself is drawn in virtual context and realistic world. The things that appear on the screen are not just images that reflex the experiences, but they are becoming experiences themselves.

This new territory which is presented by internet is a post-modern territory. It is because that internet is a post-modern instrument itself. This new field is the field of pure possibilities. Vertical hierarchical order is broken and horizontal one is emphasized. The person becomes decentralized and multilayered. Disruption of discipline and traditional proportion of location to the space and time are the most important characteristic of this new space. Time-space compression makes the interactions possible beyond the geographic area and specific location in this space. By this features Internet has conquered the most stable areas of human life. One of these areas which is strongly affected by Internet is “Identity”.

The author believes that the identity is a historical and fabricated issue. Located-based time and space are the most important factors and resources of identification for this phenomenon. Space by its capability to restrict in borders provides the sense of distinction in one hand and time ensures people about the continuity of their national identity on the other hand.

However, this paper claims that cyberspace challenges the traditional order of identity that was based on local-based time and space and their compliance to each other by evacuating the space and time from location and creating momentary world. Thus it has undermined one of the main sources of identification. This new space creates the status of plurality of identity through the creation of new identification references and sources. This leads to the plurality of present identities in society and movement of community to the cultural pluralism. It also makes individuals to experience plural and multiple identities inside themselves.

Abstract: This study is intended to evaluate the profile of publications in renowned Brazilian journals on the subject "Drawback", a special customs regime that encourages exports in the national territory. For this purpose, a bibliometric research was carried out, without specifying time, in renowned journals within CAPES, distributed in classifications ranging from Qualis A1 to C. For the conclusion of the data analysis, the quantitative and descriptive method was applied, by monitoring data obtained from a longitudinal range, for an indefinite period. Our results evidenced the low availability of Brazilian publications consistent with the topic Drawback, being most of them specific to a particular niche market (capital goods or case studies), with qualitative and quantitative approach, without detailing what is this about or how to apply it. This study suggests an opening for new academic works that address the relevance of the Drawback regime, to stimulate domestic companies to adhere, also in view of the drop of 9.5% of Brazilian exports under the regime in 2015.

Key words: Drawback; Export; Internationalization

1 Introduction

Drawback represents a special customs regime which encourages exports, applied to import of raw materials, inputs, parts or components of products that may be exported.

The purpose of this exporting operation is to ensure the lowest cost of the goods to be sold to the international market, improving the standards of quality, reliability and safety required by international purchasers, while allowing more competitive markets, companies with more modern and improved products and advantages from tax benefits in export arrangements.

According to Castro, the Drawback regime, established at first by Decree-Law No. 37, in 1966, for characterization and encouraging of exports, is accepted by international trade rules, and should not be understood as allowance from its general scope nature, not discriminating industrial segments, qualification of favored party or the destination of the final product (Castro, J.A, 2003).

It is internationally known as "improvement", according to the Simplification and Harmonization of Customs Procedures – the Kyoto Convention, of 1974 – and the Amendment Protocol, from 1999, the revised Convention (Assumpção, R.M, 2007).

The term "Drawback" is used abroad only for purposes of return of taxes on imported goods, incorporated into the exported product when its manufacturer had originally collected the corresponding taxes. In Brazil there are three Drawback modes, that will be detailed in this study. Namely: Integrated Suspension Drawback (Integrado Suspensão), Exemption Drawback (Isenção) and Restitution Drawback (Restituição).

Brazil, although has exponentially increased its export operations over the last decade, is still considered a relatively deficient country in business development for international trade, either from the lack of knowledge of the Drawback regime or lack of government initiative to encourage this practice to Brazilian companies, so as to develop top quality products and high technology globally.

In this context, this study aims to investigate the profile of Brazilian journals regarding the Drawback regime, in order to encourage the Brazilian academy to disseminate more studies on this topic in Brazil, an issue significantly widespread in other countries.

The reason for this study is to encourage the Brazilian academy to promote more research that emphasize the application of Drawback on exports, so as to stimulate national and multinational companies to take advantage of this benefit and leverage their sales, becoming internationally present, acquiring inputs at competitive prices and promoting exports with an attractive margin of sales.

Exports under the Drawback regime had a decrease of 9.5% by comparing 2015 to 2014, totaling an annual amount of US\$ 48.3 bi (Ministério do Desenvolvimento da Indústria e Comércio Exterior).

2 Theoretical Reference

2.1 Structure of the Brazilian foreign trade

Currently we can say that the word "decentralization" is the basis of the Structure of the Brazilian Foreign Trade. That is to say that there is no specific body for such activity. Its shape, in turn, is given by areas of expertise such as Financial Policy and Foreign Trade Policy, among others.

Assumpção sets a new administrative structure of the Brazilian foreign trade:

The new structure consists of a range of institutions that take part in the whole process of international trade. Each institution operates differently from the others: some of them would play a normative function, others an executive and supervisory function, while others would just ensure the stability of the system. Regardless of the goal, all institutions are part of the same project, influencing the structure of the Brazilian foreign trade. (Assumpção, R.M., 2007)

As the most relevant body, since closely related to the Brazilian Presidency, we can highlight the Chamber of Foreign Trade – CAMEX. This organ was created due to the events outside Brazil, which demanded quick, decisive responses. In addition, no measure can be taken without the consent of this organ. CAMEX is composed of the following Ministries: MDIC (Ministry of Development, Industry and Foreign Trade), Civil House, Foreign Affairs, Finance, Agriculture, Planning and Land Development.

In this sense, our study is directed to the Foreign Trade Secretariat – SECEX, which assists the Ministry of Development, Industry and Foreign Trade – MDIC. This office is responsible for standardization, supervision and management of foreign trade activities. SECEX is structured on the following departments: DECEX (Department of Foreign Trade), DEINT (Department of International Negotiation), DECOM (Department of Commercial Defense) and DEPLA (Department of Planning and Development of Foreign Trade).

DECEX is responsible for implementation of regulatory procedures, such as licensing of goods, imported or exported, as well as management of the SISCOMEX – Brazilian Foreign Trade System. This Department conducts all Drawback activities.

2.2 On the customs regime - drawback

Drawback can be defined as a special customs regime, mainly intended to allow exemption, suspension or refund of import taxes. This regime aims to make domestic goods more competitive for export through reduction of its final price (Ashikaga, C.E.G., 2006).

“Drawback can be defined as an advantage to export, initially presented as an import benefit” (Bock, C., 2014).

The Drawback regime is backed by the Ordinance SECEX No. 10, of May 24th 2010, which grants benefits on:

- 1) Transformation: changes in raw material or intermediary product, or a new product.
- 2) Enhancement: improvement, amendment or finishing of the product.
- 3) Assembly: combination of products, parts or components, resulting in a new product, with similar tax classification.
- 4) Renovation or Reconditioning: reuse of used product and/or reusable part of a discarded product intended to restoration/renovation.
- 5) Packaging or Reconditioning: Change in the appearance of the product through its packaging.

It is worth mentioning that the Drawback Regime may be also granted to goods for processing within the Country; raw material and semi-processed products; parts, components, devices or machinery; animals; other products exclusively intended to export.

Since the regime aims to boost exports, the Ordinance No. 10, of 5/24/2010, states that all goods imported under the Drawback regime are not subjected to similarity examination or obligation of transport by ship with the Brazilian flag.

On the other hand, the Drawback incentives include:

- 1) Import Taxes (II): Taxes on foreign goods, that is, of external origin, travelers luggage and goods sent as gifts or samples. Nationalized goods exported, as well as domestic products returning to the country are also classified as foreign goods, and so, taxable.
- 2) Tax on Industrialized Products (IPI): Tax on industrialized products, of foreign origin.
- 3) PIS: Social Integration Program, from which most legal entities pay the PIS according to their presumed profit. The PIS may be cumulative or non-cumulative.
- 4) COFINS: the Tax for Social Security Funding, likewise PIS, can be either cumulative or non-cumulative.
- 5) Tax on Goods and Services of Transportation and Communication (ICMS): Tax on trading of goods and services.

6) Additional to Freight for Renewal of the Merchant Marine (AFRMM): tax on cargo unloaded in a Brazilian port, with the percentage of 25% on the freight value. Charging, in turn, is made by the Merchant System.

For Castro (2003), the advantages for companies that benefit from the Drawback regime can be listed in five key points: i) tax aspect – reduction of tax charges; ii) financial aspect – reduction of financial costs; iii) final price aspect – comparison of prices in the domestic and external market; iv) quality aspect – comparison of domestic and external qualities and; v) international negotiation – requirements of the importer.

According to Posseti (2005), the Drawback regime is related to suspension, exemption or reimbursement of taxes on goods intended to an exportable (or exported) product. The purpose, in turn, is the same, based on the reduction of charges on goods that will be exported.

Application, reduction or increase of costs:

Luz (2005) assigns to the Drawback regime the following special operations which allow combination of multiple operations or specific operations for certain sectors (Luz, R, 2007):

- Integrated Suspension Drawback: This mode is intended to suspend the following taxes: IPI, PIS and COFINS (domestic market) or II, IPI, ICMS, PIS, COFINS and AFRMM (import). In this sense, the beneficiary is allowed to use domestic inputs, or even imported goods for the manufacture of a new product, since this product is intended to export. These goods may be raw materials, supplies, agricultural products, parts or components to be integrated to products intended to the foreign market.

Also, according to the Ordinance No. 10, the Suspension mode includes the use of these goods in repair, creation, cultivation or extractive activity for the product to be exported. Other application would be the so called “intermediate manufacturer”. That means suspension of taxes for the manufacture of intermediate products, since they are to be directly supplied to the exporting industries with the sole purpose of export.

In Suspension mode, the maximum period for the imported good to remain in the country without taxation is two (2) years, except in case of goods intended to production of capital goods with long manufacturing cycle, for which the maximum period is five (5) years.

In addition, all taxes on import are suspended until proof of export committed in the Concessionary Act. Partial or total default of this commitment will lead the importer to payment of taxes, with monetary correction and interests, from the date of the taxable event proportional to unproven amount (Araújo, A.C.M.S. & Sartori, A, 2004).

Both for imports and for enjoyment of national purchases intended to export, they should not be shipped before the granting of the Concessionary Act. The Concessionary Act is similar to a “bar code” issued on behalf of the company, either commercial or industrial, which characterizes or implies that a given batch/quantity grants the beneficiary acquisition of imported and/or domestic products, with all advantages of the Drawback regime, according to its mode. This Concessionary Act may be regulated/determined on the Internet, in the MDIC website (Ministério do Desenvolvimento da Indústria e Comércio Exterior).

In case of import of good, the benefit of the Concessionary Act should be clearly described in the LI (import license), and the DI (import declaration). At the end of this phase, the good is ready to be exported.

For purposes of internal control, a DANFE or NF (local invoice) is issued, and the number of the Concessionary Act should be included in the corresponding form, as well as the veracity of the CFOP. Once the export process for the good is started, both the RE (export registration) and the DE (export statement) should be formalized.

We can consider that the Drawback regime demands special designations from different bodies. Namely:

1) Foreign Trade Secretariat (SECEX): assignments on concession and closing of processes (concession, monitoring and closing of concessionary act)

2) Secretariat of the Federal Revenue of Brazil (SRF): responsible for suspension of imports and authorization of exports. It also takes part in the concessionary act process, after its closing, by conducting checking and assessment.

3) State Treasury: Applies suspension and confirms the closing by DECEX.

4) Merchant Marine (AFRMM): Applies suspension of taxes and follows the closing by DECEX.

Exemption Drawback: This mode is mainly intended to Inventory Replenishment. That is, allows the beneficiary to skip import taxes, since this replenishment is intended to processing, manufacturing, complementation or packaging, in quantity and quality similar to the previous one, in export. The

beneficiary may be exempted from: II, IPI, PIS, COFINS and AFRMM.

For this exemption to be applied, the beneficiary shall evidence that the new good has similar purpose of the acquired one, in which the total value of the "current good" is limited to the previous good.

To apply for the Exemption Drawback, the applicant should submit a form, that will be confirmed through the "proof report". Then, the next phase is the approval of the Concessionary Act, which is sent by Banco do Brasil S/A. For imports in the Exemption Drawback mode, this benefit should be clearly presented, both for the LI (import license) and the DI (import clearance).

Restitution Drawback: In this mode the beneficiary may refund the taxes on import of goods. For this restitution, the beneficiary should evidence that the goods imported were actually integrated to exported products. The following taxes may be refunded: IPI, PIS COFINS and AFRMM, and the Secretariat of the Federal Revenue of Brazil will be responsible for granting the tax credit.

Assumpção comments on small businesses:

Micro-companies and small companies which opt for the Simple Tax Regime shall not benefit from the export tax Drawback regime. For the other cases, the Drawback can be requested in one of the three modes – Suspension, Exemption and Restitution. (Assumpção, R.M ,2007)

3 Methodological Procedures

This research can be classified as descriptive and bibliometric, obtained from a longitudinal range for data collection, for an indefinite period. Only national publications were included, selected from the journals Qualis between A1 and C, through SPELL and SCIELO.

Source: Research data (2016)

Bibliometrics is a quantitative methodology that uses statistical and mathematical elements for findings based on numerical indicators.

As conceptualized by Pritchard (1969), bibliometrics reflects the sum of numerical studies that, together, aim to quantify the processes of written communication (Pritchard, A, 1969).

The use of bibliometrics in this study resulted from the need to measure the impact of publications on the subject Drawback, for dissemination of academic information.

The search for articles was through the keywords Drawback, Internalization and Export, presented in the title of the publications selected.

After the research in the abovementioned journals, 12 articles addressing the subject were found. The publications were read thoroughly, with the purpose of determining the year when the articles were created, the authors' names and universities, types of study and ultimately their methodologies.

Both the survey and the analysis of the data were developed over May and June, 2016, by means of the Microsoft® Excel 2013 Software, which held the quantitative and qualitative analysis of this study.

4 Analysis and Discussion of Results

The first investigation of the data sampling, which resulted in 12 articles, was the analysis of related titles, year of publication and their authors.

Table 2 List of Articles Studied

Title	Year	Author
The decision to internationalize	2011	Nadia Wacila Hanania Vianna, Sheila Regina Almeida
The influence of Drawback in logistics activities in companies of mechanical capital goods	2012	Roberto Giro Moori, Sussumo Tatenauti Konda, Odair Oliva de Farias, Tatiana Mayumi Moori
Learning and adapting operations to implement export strategies in micro and small enterprises	2011	Teodoro Malta Campos, Edmilson de Oliveira Lima.
Developing an evaluation system to improve efficiency, effectiveness and governance in the public sector: the case of the grants program for exporting companies in Brazil	2014	Frederico Lustosa da Costa, José Cezar Castanhar, Daniela Gomes Castanhar Reyes, Gustavo de Oliveira Almeida
Brazilian exports: benefits and barriers in the business perception	2016	Jorge Carneiro, Constanza Bianchi, Renata Maria Gomes
Factors influencing the export firm strategies	2015	Caroline Mendonça Nogueira Paiva, Juciara Nunes de Alcântara, Evandro Marcus Cintra, Cristina Lelis Leal Calegario.
Corporate governance and internalization: an analysis of the effects on Brazilian companies	2014	Luzélia Calegari Santos Moizinho, Rogério Borges Borsato, Fernanda Maciel Peixoto, Vinícius Silva Pereira
Made in Brazil: the impact of the Brazilian logistics infrastructure in export operations	2011	Flavia Braga Chinelato, Diogo Batista de Freitas Cruz, Fabrício Ziviani
Learning as an explanation of export development	2011	Ângela França Versia, Sérgio Fernando Loureiro Rezende
The level of internationalization of Brazilian companies: a study on export markets and the size of the export companies	2014	Lúcia de Fátima Lúcio Gomes da Costa, Miguel Eduardo Moreno Añez, Max Leandro de Araújo Brito, Cândida Barreto
The Drawback in international logistics operations	2012	Roberto Giro Moori, Mauricio Henrique Benedetti, Sussumo Tatenauti Konda
Drawback for capital goods companies	2011	Roberto Giro Moori, Sussumo Tatenauti Konda, Roberto Gardesani

Source: Research data (2016)

Board 2 shows that the Drawback matter in exportation practices is a relatively new topic of research with limited spread, that is, few studies aiming at applying the regime to Brazilian exports have been made.

The number of articles published each year is presented in Table 1, since the establishment of

Ordinance SECEX No. 10, May 24th, 2010, which governs the regime.

Table 3 Number of Publications

Year of Publication	Number of Articles	Frequency
2011	5	41.7%
2012	2	16.7%
2014	3	25.0%
2015	1	8.35%
2016	1	8.35%
Total	12	100%

Source: Research data (2016)

It can be noted that there was no study addressing Drawback effectiveness in Brazilian exports in the year when Ordinance SECEX No. 10 was established, i.e. May 24th, 2010. This topic was more broadly and thoroughly investigated in the following year, after the publication of 10 articles between 2011 and 2014. On the other hand, from 2015 to 2016, there was an exponential decrease of articles on the subject as only 2 articles regarding this matter were published. This can be explained by the increase of exports from 2011 to 2014 and the sharp decline of exported goods under Drawback regime in 2015, according to information disclosed by the Brazilian Ministry of Development, Industry and Foreign Trade in 2016.

Table 2 shows in details the names of the journals regarding the 12 articles selected, the number of articles published by each magazine and their frequencies.

Table 4 Magazines x Frequency List

Magazine	Number of Articles	Frequency
BBR - Brazilian Business Review	1	8.3334%
Desenvolvimento em Questão	1	8.3334%
Gestão & Regionalidade	1	8.3334%
RAI	1	8.3334%
RAUSP	1	8.3334%
Revista Administração em Diálogo - RAD	1	8.3334%
Revista de Ciências da Administração	1	8.3334%
Revista Eletrônica de Negócios Internacionais ESPM	1	8.3334%
Revista Ibero-Americana	1	8.3334%
Revista Interface	1	8.3334%
Revista Pretexto	1	8.3334%
TAC - Tecnologias de Administração e Contabilidade	1	8.3334%
Total	12	100%

Source: Research data (2016)

Table 5 data shows that there are no articles on such topic over 2011 to 2016. The participation of the 12 articles selected was respectively 8.3334% in 12 different journals.

Table 6 shows the distribution of articles rated by Qualis and their frequencies.

Table 5 Paper Title x Qualis List

Paper Title	Qualis	Number of Articles	Frequency
Learning and adapting operations to implement export strategies in micro and small enterprises			
Factors influencing the export firm strategies	B2	4	33.3%
Corporate governance and internalization: an analysis of the effects on Brazilian companies			
Learning as an explanation of export development			
The decision to internationalize			
The Drawback in international logistics operations	B3	3	25.0%
Drawback for capital goods companies			
The influence of Drawback in logistics activities in companies of mechanical capital goods	A2	2	16.7%

Made in Brazil: the impact of the Brazilian logistics infrastructure in export operations			
Developing an evaluation system to improve efficiency, effectiveness and governance in the public sector: the case of the grants program for exporting companies in Brazil	B1	2	16.7%
The level of internationalization of Brazilian companies: a study on export markets and the size of the export companies			
Brazilian exports: benefits and barriers in the business perception	C	1	8.3%
Total		12	100%

Source: Research data (2016)

It can be noted a prevalence of published articles on the Drawback subject in Qualis B2 journals, making up 33.3% of the publications. In the second place, the articles were rated in Qualis B3 journals, making up 25.0% of the articles; in the third place, Qualis A2 and B1 were listed, making up 16.7% of frequency respectively. In turn, one single Qualis C article appeared in the list.

Table 6 displays an analysis of the articles regarding their methodologies.

Table 6 Type of Research x Frequency

Type of Research	Number of Articles	Frequency
Qualitative	2	16.7%
Quantitative	10	83.3%
TOTAL	12	100%

Source: Research data (2016)

Table 6 data shows that 83.3% of the publications investigated are concentrated in the quantitative methodology category, and only 16.7% were listed as qualitative research. While selecting the articles, no mixed-method research, i.e. quantitative and qualitative research, was found.

5 Conclusions

This article aimed at verifying how Drawback is addressed in Brazilian publications as well as determining the profile of Qualis A1 and C publications in domestic journals which cover the Drawback matter.

The relevance of this study to the growth of the Brazilian international trade, economy boost, creation of new employment opportunities and greater visibility for national products worldwide is positively summarized by the Brazilian Ministry of Development, Industry and Foreign Trade, which recognizes the Drawback regime as a means of preserving companies cash, insofar as, upon the export of the final product, the suspension of taxes turns into exemption, thus avoiding the payment of taxes which creates further right to credit (Ministério do Desenvolvimento da Indústria e Comércio Exterior).

"For each dollar imported under the regime, Brazilian companies export six dollars. This information alone shows the relevance of Drawback to aggregate value and increase Brazilian export competitiveness"(Ministério do Desenvolvimento da Indústria e Comércio Exterior).

The purpose of this study has been achieved as this bibliometric research demonstrated a great lack of publications aimed at the Drawback subject in the Brazilian academy from 2011 to 2016; in addition, the few authors and magazines which developed articles about the regime were listed in details in this research with information regarding time, Qualis, approach of the subject, frequency and the methodology applied.

According to the results of the research, the articles on Drawback were mostly intended to capital assets and had a quantitative approach. The few Brazilian articles on the subject over the past five years have confirmed the need for studies in this matter.

It is therefore suggested further articles that thoroughly address the subject and the ways of applying the regime, as an encouragement to companies seeking to stand out and make profits in the foreign market, thus increasing the representation of Brazilian exports to over eleven per cent of the Gross Domestic Product (GPD).

Furthermore, in view of the information disclosed by MDIC about the 9.25% decrease of exports under Drawback regime in 2015 compared to 2014, new publications addressing the effectiveness of Drawback in Brazilian exports would produce material results to Brazil from academic, social and professional perspectives.

Comparing and Identifying the Similarities and Differences of Global Project Management Philosophies

Chew Chu Yao¹, Low Foon Siang¹, Chong Heap Yih²

1 LKS Faculty of Engineering and Science, University Tunku Abdul Rahman, Malaysia

2 School of Built Environment, Curtin University, Australia

(E-mail: lowfs@utar.edu.my)

Abstract: All projects need management to achieve project goals. This research aims to review global project management philosophies and find out the similarities and differences of global project management philosophies. Various modern types of project management standards are being reviewed namely Project and Program Management (P2M), Association for Project Management Body of Knowledge (APMBOK) and Project Management Body of Knowledge (PMBOK), International Project Management Association (IPMA), Projects in Controlled Environments (PRINCE2) and Australian Institute of Project Management Standards (AIPM). The three approaches that used to determine the similarities and the similarities are critical review, interview visitation and questionnaire analysis. The research proved that most of the companies have more than one project management philosophy methods.

Key words: Project management similarities; Project management differences; Critical review; Interview visitation; Questionnaire analysis

1 Introduction

In traditional project management, the long partnership and trust are the strengths of project management. It is the common basic practice to clearly state the contractors' roles. The difference between the traditional type project management and contemporary type project management is that, contemporary type applicants have to plan by themselves not only the total lifecycle plan, but the solution itself by following the instructions.

There are several of project management standards widely used globally. The most common and well-established United States (US) method, the Project Management Body of Knowledge (PMBOK), has been adopted in many organizations around the world, including in Japanese organizations. The Japanese has also generated their own approach to project management, namely Project & Program Management (P2M) and Kaikaku Project Management (KPM). Japanese companies have started investing overseas especially in Asia, particularly in Malaysia, because of lower start-up costs and cheaper manpower resources. Some of the organizations are subsidiaries of their parent companies in Japan, while others are joint ventures with local companies. It is of interest to find out whether these overseas-based Japanese companies are being managed according to the original Japanese system, or whether the management has been localized to fit in with the country's culture with non-Japanese management practices. Different organizations apply different project management methods.

This research is intended with an objective to review global project management philosophies and find out the similarities and differences of global project management philosophies in Malaysia-based Japanese companies and those Japanese-Malaysia joint ventured companies. There are three methods used for this research study, namely, critical review, interview visitation and questionnaire survey. Throughout the process of analysis, the effect/output on the applied philosophies was identified. The comparison among the global project management philosophies is shown in table form, which can be easily understood.

2 Methodology

2.1 Framework of methodology

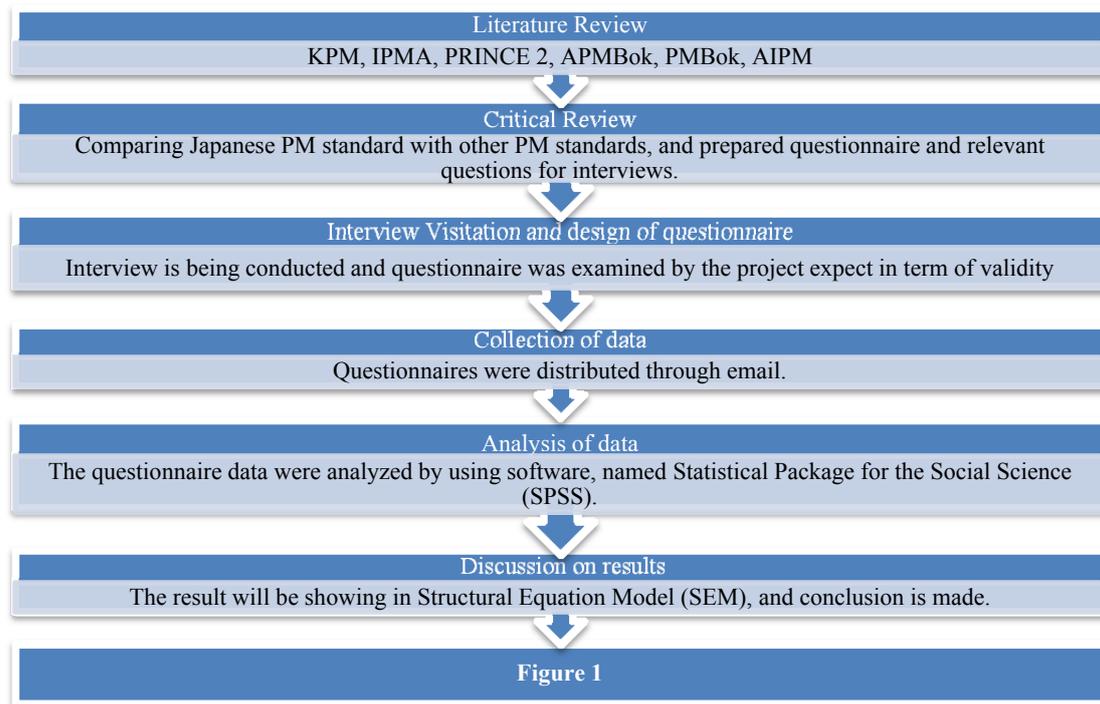

Figure 1 Framework of Methodology

Figure 1 shows the flow chart of the methodology for this research study. The research data is collected through interview visitation and also questionnaire survey. The questionnaire was pre-designed and was proofread during the interview visitation by the project manager. Necessary changes were made on the questionnaire based on the inputs by the project manager.

2.2 Critical review

Journals from P2M, KPM, IPMA, PRINCE2(R. Max Wideman, 2002), APMBok (Mike Bresnen, 2016), PMBok and AIPM (GAPPS, 2006) were studied and reviewed to gain information related to the objectives of this research. The purpose of critical review on journals is to understand those methods and find out the similarities and differences among the methods. By conducting critical review on journals and published articles, relevant information is captured thoroughly. The questionnaire and interview questions were set based on the information gained from critical review.

2.3 Interview

Interview visitation is one of the main information sources for this research. The interview is conducted with the managers from Malaysia based Japanese companies (John L). Interview visitation is a preliminary study to find out the types of project management philosophy that is being applied in the organization and how Japanese companies based in Malaysia manage their projects. Interview is an alternative way to obtain extra information. The interviewer can control the interview circumstances to get the data that is relevant to the research. Interviewer has the opportunity to explore the research data in more details. In other words, interviewees are also given the opportunity to elaborate more on the research topic. Semi-structured interview gives a lot of flexibility to the research purpose. During the interview, data is recorded by taking down notes and taking pictures of the data being presented by the interviewees. Subsequently, the data collected is summarized and restructured to help in the amendment of the questionnaire survey(Kathleen).

2.4 Questionnaire survey

The questionnaire survey method is being used to collect the data for analysis. The information and ideas obtained from the critical review were used to design the questionnaire (GAPPS, 2006). During the interviews with project managers, the experienced project managers were requested to proofread the pre-designed questionnaire, as to give comments and inputs, if any, to enhance the questionnaire. This is to examine the quality and validity of the questions. The relevant comments were utilized to restructure the questionnaire before distribution.

2.5 Data collection and analysis

A list of Japanese based companies is gained from Jetro (Japanese External Trade Organization), Malaysia. The companies are mainly from manufacturing industry, F&B industry, construction industry and government related industry. Questionnaires were distributed accordingly to the companies through email. A total of 200 questionnaires were sent by email. Email and telephone calls were launched as to remind the return of completed questionnaires and further explanation on the purpose of the questionnaire. The data is collected through email (Chinho Lin).

The data is analysed by using the statistical analysis software SPSS (Statistical Package for Social Science) (Dubem I, 2012). Six types of analysis were carried out (Tung-Tsan Chen, 2010; Dubem I, 2012). Firstly, description analysis was done to generate the demographic characteristics of respondents. Secondly, Cronbach's alpha coefficient was analysed to check the consistency and reliability of the data. Thirdly, t-test was done to find out the mean scores of the data. Subsequently, a chi-square test was carried out to measure the agreement level among the respondents. Next, the Kruskal-Wallis test was carried out. This test is to find out the differences among two or more independent variables. Lastly, regression analysis was studied to find out the parameter of project management that lead to the success of the project.

3 Results and Discussions

3.1 Results of critical review

After studying the project management philosophies, the similarities and differences among the project management philosophies are determined (Low Foon Siang, 2012). The similarities and differences are arranged in five categories. There are namely project planning developments, progress management, product acceptance, project transition and project evaluation. These five phases have to be conducted by following the sequence. The five phases are actually the flow of a project. There are total 33 of components in these five categories. Each component may belong to more than one project management philosophies.

3.2 Results of interview

The interviewees are the senior manager or head of division of the company who has project management experiences of more than five years. The results are kept anonymous to protect the confidentiality of the companies. One company from the manufacturing field has been interviewed. There are altogether six big questions being asked during the interview. Those are as follows:

- 1) The company background
- 2) Project Management practiced by the company.
- 3) Phases and stages involved in the project management
- 4) Characteristic in the phases
- 5) Localize the project management method.
- 6) Knowing of other project management methods.

Throughout the interview, the code of semi-structured interview is being applied. This is to make sure that the results of the interviews can be obtained with high consistency (John L.).

3.3 Results of questionnaire survey

The results of questionnaire survey were being analysed by using Statistical Package for Social Science (SPSS) (Dubem I, 2012). By conducting the analysis on the data gained from the questionnaire, the results can be read in a clearer and structured way. The readers can have a clear idea by refereeing to the analysis done by using SPSS. There were a total 36 completed questionnaires being collected. Table 1 shows the distributions of the company types.

Table 1 Distributions of the Company Types

Industry	Frequency	Percent	Valid Percent	Cumulative Percent
Automobile	4	11.1	11.1	11.1
Manufacturing	23	63.9	63.9	75.0
Construction	3	8.3	8.3	83.3
IT	2	5.6	5.6	88.9
Other	4	11.1	11.1	100.0
Total	36	100.0	100.0	

Table 1 shows the manufacturing companies contributed the most in the survey, which is 63.9 percent.

Cronbach's alpha coefficient was analysed using SPSS. The question of reliability rises as the function of scales is stretched to encompass the realm of prediction. The Cronbach's alpha coefficient for this whole set of data is **0.871**. This value exceeds the minimum value of reliability which is 0.7, showing that the data gained had good reliability and consistency (Joseph A, 2003). Thus, further analyses can be proceeded.

A total of 33 project management methods were being analysed to find out the mean score in different phases. The first ranking method was 'Product characteristics are agreed by related stakeholders and documented'. This method was actually applied to two project management philosophies which are P2M and Prince2. While, the second was 'Transition activities are planned and conducted', this method was applied to AIPM and Prince2. The third was 'A shared understanding of desired outcomes is agreed among the stakeholders' which was applied in P2M. Based on the results, even though the companies were mostly Japanese based, but the companies were practicing some method which was not included in P2M/KPM. This also showed that the Japanese based companies are not solely practicing Japanese based project management, but also applying other project management methods.

The purpose of chi-square test was to find out whether there is relationship between the project management method with the different industries (food & beverage, manufacturing, automobile, etc) and different company types (local, joint venture and foreign based). In this research, the hypothesis H_0 with p value ≤ 0.05 was set to imply results that exhibit significant relationship. H_A with p value > 0.05 was set to signify that the outcome has no significant relationship. The gained chi-square test result was 0.288, and the H_0 was being rejected. This shows that the project management methods have no significant relationship between industries and company types.

The purpose of Kruskal-Wallis test is to find out whether there are any differences on methods usage among the industries namely, automobile, manufacturing, construction, information technology (IT) and others (Elvar). H_0 with p value ≤ 0.05 was set to be having significant differences. H_A with p value > 0.05 was set to be having no significant differences. From the results, there were only 13 out of 33 methods having the p value ≤ 0.05 , which indicates that these 13 methods have significant differences, while the remaining 20 methods (61% of the 33 methods) do not have significant differences. Therefore, the test failed to reject H_0 , which implies there is no significant differences on method usage among industries.

Regression analysis was carried out to find out the relationship between the 33 project management methods and the satisfaction rate. Regression analysis is the analysis between the dependent value, i.e. the satisfaction rate and the predictor value, i.e. the project management methods (Astrid Schneider). The results on the satisfaction rate based on the questionnaire outcome are shown in Table 2.

Table 2 The Results on the Satisfaction Rate

Satisfaction	Frequency	Percent
Strongly not satisfied	0	0
Not Satisfied	8	22.2
Neutral	16	44.4
Satisfied	9	25
Strongly satisfied	3	8.3
Total	36	100

R-square value is the amount of variability in the satisfaction rate. The R-square value of this research was 0.91. This means that the total of 33 project management methods contributed 91% percent of changes in the project satisfaction, with the remaining of 9% contributes from other factors. The H_0 with p value ≤ 0.05 was set as project management method that contributed special effects to the satisfaction. H_A was set as project management method that did not contribute special effects to the satisfaction. Based on the regression analysis of this research, all of the 33 methods have a p value larger than 0.05 ($p > 0.05$). Therefore, meanwhile all methods did contribute to the satisfaction rate; there was no specifically one method that signifies special influence on the satisfaction rate. Meanwhile, by referring to the coefficient-B, the satisfaction rate changed based on the unit changes of the predictor value. For example, the 'Stake holder's decision' has a coefficient-B value of -1.477. This indicates that this method particularly caused the satisfaction rate to decrease by 1.48% with every increase of one unit of Likert scale. The result is shown in Table 3.

Table 3 The Result of the Satisfaction Rate

	Unstandardized Coefficients B	Sig (P value)
Stake holder's decision	-1.477	0.899

4 Conclusions

The Japanese companies in Malaysia are practicing more than one project management philosophies. Most of the companies have adapted to the dynamic environment by using more than one project management philosophy methods. Furthermore, the project management method has no significant relationship between industries and company types as per the results from the statistical analyses. The company types and industries are not determining the usage of the project management methods. Subsequently, the research has shown that the usage of project management methods are not significant different among the industries. Most of the industries practice almost the same project management methods. Lastly, there is no particular project management method that contributes special effects to the satisfaction of project managers. All the project management methods contributed to the satisfaction rate.

Autonomy and Creativity of Home-Based Professional Teleworkers: The Mediation Role of Intrinsic Motivation

N.P.G.S.I. Naotunna^{1,2}, Iris Zhou¹

¹ School of Management, Huazhong University of Science & Technology, Wuhan, P.R. China, 430074

² Faculty of Management Studies, Sabaragamuwa University of Sri Lanka, Belihuloya, Sri Lanka,
70140

(E-mail: shashinaotunna@ymail.com, iris.zhou@hust.edu.cn)

Abstract: Organizations increasingly introduce home-based telework for professional employees. While telework schedules are widely adopted in organizations, their impact on creativity has not been incorporated. Following this gap, the objective of this paper is to develop a conceptual model to explain the creativity of home-based professional teleworkers. In the light of Self Determination Theory (SDT), researchers hypothesized that high level of autonomy experienced by home-based professional teleworkers should lead to their creativity through the intrinsic motivation. This study makes novel contribution to the existing literatures by integrating the two fields of telework and creativity. Further, the model can be empirically tested in future research.

Key words: Telework; Autonomy; Intrinsic motivation; Creativity

1 Introduction

Alvin Toffler, the famous futurist once declared “work is not necessarily going to take place in offices or factories. It is going to take place everywhere, anytime” (Morgan, R. E.,2004) . This has become a reality since the traditional boundaries of working has been changed as the advances in information communication technology (Felstead, A,et al,2005; Wheatley, D.,2012). Today, work has become increasingly unbound and performed at home (Felstead, A,et al,2005; Wheatley, D.,2012). The terms telework, telecommuting are often used to describe home based work (Bailey, D . E., & Kurland, N. B,2002). However, there are some issues on the definitional clarity of the term telework or telecommuting. Thus, in this study the meaning of telework is surrounded the Fulton’s(Fulton, C.,2002) definition of “working regularly from home using telecommunication technology” (P. 209). Further, Bailey and Kurland (Bailey, D . E., & Kurland, N. B,2002) also disentangle the meaning of telework as which employees work outside the work place hence often at home, using communication and ICT(Bailey, D . E., & Kurland, N. B,2002). Part time employees, senior managers, and administrative staff have been found to be more appropriate with telework (Coenen, M., & Kok, R. A. W.,2014). Teleworkers are often represented as professional and managerial workers (Schwarz, H.,et al,1999). Home based telework is relatively common among managerial and professional workers since they seek less control and supervision. Hence, home-based professional teleworkers have been considered in this research owing to the growing popularity of their work.

Creativity has become salient in organizations to adapt, grow, and gain competitive advantage (Nonaka, I.,1991;(Shalley, C. E., & Gilson, L. L.,2004; Shalley, C. E.,2004). Thus, a crucial task of contemporary organization is to create and maintain a creative workforce (Ong, H. L. C., & Jeyaraj, S.,2014). In this point defining the term creativity is worth since the creativity is attributed to artistic work. “The art bias implies what is essentially a myth, for example, namely that only the arts have a monopoly on creative”(Runco, M. A.,2015). Creativity refers to production of novel and useful ideas by an individual or collection of individuals (Madjar, N.,2002; Shalley, C. E.,2009). Even though, organizations attempt to foster creativity through various strategies such as restructuring, selecting most appropriate individuals and training programmers those are often unsuccessful (Taggar, S.,2002). As a result research into creativity has burgeoned in recent years(Joo, B. K.,2013). However, even after deep investigations, “creativity is something we desperately need, but we do not know how to get it, and we are not really sure what it is”(Glăveanu, V. P.,2011). In particular, individual creativity has become a challenge to organizations (Perry-smith, J. E.,2006).

Creativity is important not only for organizations but also for the individual employees (Perry-Smith, J.,2003). “Particularly for the professional worker who uses unseen and unobservable inputs like intellect, the ability to incorporate unique and effective twists should help him or her stand out from the crowd” (Perry-Smith, J.,2003). Although there are many researches examined creativity within the organizational boundary, creativity has hardly been investigated beyond the boundary of

organizations (Zhou, J., & Shalley, C. E., 2003), while such work schedules growing in organizations. Addressing this gap, the objective of this paper is to develop a conceptual model to explain the creativity of home-based professional teleworkers grounding on the theoretical insights of Self Determination Theory (SDT).

The rest of the paper is organized as follows. First, it theorizes the relationship between job autonomy and creativity of home-based professional teleworkers being based on the theoretical lens of the Self Determination Theory. Second, it argues the direct relationship between autonomy and creativity of home-based professional teleworkers. Third, it shows the intrinsic motivation as a mediator of the relationship between autonomy and creativity of the home-based professional teleworkers. Finally, it ends with a brief conclusion.

2 Theoretical Background and Hypotheses

2.1 Self determination perspective and creativity of home-based professional teleworkers

The Self Determination Theory (SDT) as it exists today emerged as a result of the pioneering work of Deci & Ryan early in the 1980s. Principally, SDT is a theory of motivation which has been applied to explain the impact of the work environment on motivation to do something (Deci, E. L., 2008). SDT differentiates between intrinsic and extrinsic motivation (Ryan, R. M., 2000). “Intrinsic motivation, which refers to doing something because it is inherently interesting or enjoyable, and extrinsic motivation, which refers to doing something because it leads to a separable outcome” (Ryan, R. M., 2000). SDT recognizes the importance of intrinsic motivation. Intrinsic motivation helps to engage in exploratory and curiosity driven behaviors without having any external rewards (White, R. W., 1959). “Self-Determination Theory is specifically framed in terms of social and environmental factors that facilitate versus undermine intrinsic motivation” (Ryan, R. M., 2000). Further, autonomy is considered as a critical job related environmental factor that required for intrinsic motivation (Ryan, R. M., 2000) as it provides opportunity for self-direction (Zuckerman, M., 1978). SDT postulates that need for autonomy is essential for the inner motivation in order to perform an activity (Ryan, R. M., 2000). In particular, intrinsic motivation causes for creativity (Ryan, R. M., 2000). Hence, SDT helps to theorize a relationship between autonomy and a behavioral outcome through the intrinsic motivation.

2.2 Autonomy and creativity of home-based professional teleworkers

The general meaning of autonomy is employees’ freedom associated with their task accomplishment (Sia, S. K., 2015). Telework provides more opportunities for freedom with flexible work schedules (Coenen, M., & Kok, R. A. W., 2014). Unlike clerical workers, aligning with job enrichment perspective professionals experience more autonomy while working at home (Olson, M. H., 1984). Also, Baruch (Baruch, Y., 2001) identifies ability to satisfy the need of autonomy as an advantage of a teleworker. Telework can be seen as an extreme movement which facilitate control and freedom (Chris, G., 2001). Overall, teleworkers perceive a greater level of autonomy than that of non-teleworkers (Gajendran, R. S., 2007).

Job autonomy is a key determinant of creative work involvement (Volmer, J., 2012). When employees receive autonomy it makes a relaxed mind within them which helps to be more creative (Sia, S. K., 2015). Amabile (1983); Amabile, Conti, Coon, Lazenby, & Herron (1996) through their componential theory of creativity proposed that the autonomy in working environment burgeon employees’ creativity. Findings of Oldham, Cummings (1996) also showed the positive relationship between employees’ job related autonomy and their creativity. Study of Zhou, J. (1998) echoes these idea of autonomy work environment generates more creative ideas within employees. Also, psychological empowerment has been found to be a determinant of creativity (Sia, S. K., 2015). The above argument leads to the development of the following hypothesis.

H1: The greater autonomy experienced by home-based professional teleworkers will have a positive relationship with their creativity.

2.3 Mediation role of intrinsic motivation in the relationship between autonomy and creativity of home-based professional teleworkers

Telework has become an important mechanism of achieving high level of motivation among employees (Chris, G., 2001). Autonomy provides key ingredient for the need of intrinsic motivation (Deci, E. L., 2008; Ryan, R. M., 2000). Job design has been recognized as an important determinant of employees’ intrinsic motivation and creativity (Amabile, T. M., 1996). In particular, when employees perform challenging jobs while in the absence of external control and interferes they tend to be more excited and interested in completing those (Amabile, T. M., 1996). Psychological empowerment leads to manifestation of intrinsic task

motivation (Joo, B. K.,2013). Contemporary forms of working enriched with job autonomy, positively related to intrinsic motivation (Van Yperen, N. W.,2016). Confirming this view a meta-analysis also prove that job autonomy is positively related to intrinsic motivation (Humphrey et al., 2007).

Amabile's (Amabile, T. M.,1983; Amabile, T. M., 1996) componential theory, which is considered as a dominant model of creativity emphasizes the intrinsic motivation perspective is more related with creativity (Zhou, J., & Shalley, C. E.,2003). Though, intrinsic motivation is considered as an important predictor of creativity, little research investigated the mediation role of intrinsic motivation in between contextual factors and creativity (Zhou, J., & Shalley, C. E.,2003). As explained in the above and the theoretical insights of SDT, intrinsic motivation should be a mediator between autonomy and creativity. This leads to the development of the second hypothesis.

H2: Intrinsic motivation will be a mediator in the relationship between autonomy and creativity of the home-based professional teleworkers

The above explained network of relationship between autonomy, intrinsic motivation and creativity of professional home-based teleworkers based on Self Determination Theory is illustrated in the figure 1.

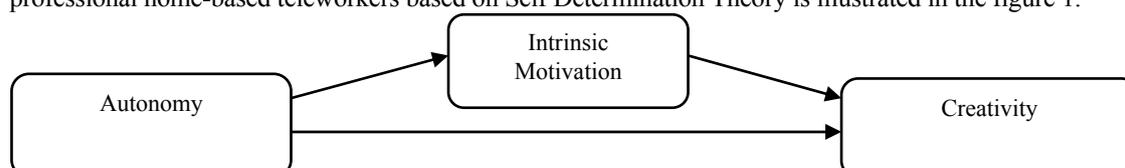

Figure 1 The Conceptual Model

3 Conclusions

The aim of this study was to explain the creativity of home-based professional teleworkers. In order to achieve this objective, article has presented a theoretical model of the creativity of home-based professional teleworkers being based on the Self Determination Theory. It first, argued the direct relationship between autonomy and creativity of the home-based professional employees. Second, it showed intrinsic motivation as the mediator in the relationship between autonomy and creativity of the home-based professional teleworkers. This research has implications for both future research and practice. First, this model can serve as a basis for subsequent empirical research. All of the constructs included in the model can be measured through available validated and reliable measurement instruments. From practitioners perspective, once the model is tested it can be used as a source of recommendation for companies that employ teleworking for professional employees. As organizations looking forward for creativity of professional employees, home based telework may provide the seeds in attaining that.

Study on Management Model Innovation of Huge Petrochemical Engineering Building Project

Su Hua

School of Management, Wuhan University of Technology, Wuhan, P.R. China, 430070

(E-mail: suhua@whut.edu.cn)

Abstract: The petrochemical industry is very important to any country in the world. Facing challenges of systematic risk, time, quality, time constraints, lots of project stakeholders, project management standards in huge petrochemical project building process, project manager should to refine advanced management ideas, build a new management model of huge petrochemical engineering building project. It has important significance on the development of China petrochemical industry.

Key words: Petrochemical engineering building project; Management model; Project management

1 Introduction

Petrochemical industry provides a lot of necessities of life for the people, provides a large number of raw materials for industrial production, is one of the basic industries of the national economy. Life provides a number of basic raw materials. China's petrochemical industry started in the early days, Soviet-built 156 key projects have 8 a petrochemical project. And other advanced enterprise culture of Daqing oil field generations petrochemical technical staff. However, with the rapid development of science and technology, new products, new materials, new techniques, new equipment development of blowout, petrochemical industry is the constant technological innovation (Qiyang W, Xiaoling Z, Hongbo L, etc,2015). As the world's factory and has 13 million population of the country, huge demand for all kinds of industrial raw materials and consumer goods, the traditional petrochemical industry of the manufacturing system has been unable to meet the rapid development of the national economy. In this context, to PetroChina, Sinopec and CNOOC as a representative of China's petrochemical enterprises have carried out a large number of construction, reconstruction projects in order to expand the scale of production, improve product quality, optimizing the production processes, processes of new products as well as to reduce environmental pollution and other purposes (Jia Jianguo, Yang Yu, Liu Aijun ,2011). By 2015 years, Petro-chemical industrial output value has exceeded 14 billion yuan, enterprises above the designated size reached 27000 families. Industry leader in petrochemical projects in recent years: The Xinjiang dushanzi petrochemical company 1000 tons / year refinery and 120 tons / ethylene expansion project God huaning coal group 167 Million tons / Methanol and 50 Million tons / Year pp coal-based olefins project; Chongqing medical group 40 Million tones / Year MDI, 80 Million tones / Methanol and 65 Million tones / Years of integration projects such as acetate.

The present situation of petrochemical engineering construction in our country. With China's accession to the WTO since, petroleum and chemical industry have greater impact, according to the domestic and foreign market demand, of petroleum and chemical products in quality and variety requirements are higher and higher, some of the old equipment, old equipment and old technology cannot meet the requirements of technology development and quality of new products, some need to be removed, and some need to change, the construction of equipment renewal and new device, the petrochemical company every year to put in a lot of funds for technological transformation, improve production technology and expand the scale of production, to enhance the overall competitiveness of enterprises.

In recent years, especially after 2005, many provinces in the country, PetroChina, Sinopec and CNOOC are in actively and vigorously expand or new refinery and chemical plant, in the coming days, some small refineries will be eliminated gradually, more and bigger tens of millions of tons of oil refining device are under construction or planned, enterprise benefit to economies of scale to reflect is more international competitiveness.

Large petrochemical projects in the course of construction, project planning, technical design, construction and operation of the system aspects, the required investment, involving many stakeholders, professional and technical, installation of strong association, construction period long, high risk, high quality requirements. This determines the type of project risks, and the General staff lacks in technical ability and practical experience, makes the introduction of professional project management advisory service projects.

2 A Comparison Between Typical Project Management Modes

Construction project of science and technology with the development of more complex, larger scale projects possible. Project management began in World War II United States Manhattan project, gradually applied to all kinds of projects. Traditional management cannot meet the scale of large construction projects, in 60 of the last century, modern project management system matures, some advanced methods of management, tools, tools have to be verified in practice. Specializing in project management and technical services consulting business also began to appear. Now, most of the large projects are engaged in the world of project management company, provides professional and technical services. China first introduced modern project management techniques in 1984 year of Lubuge hydropower station project. Efficient construction of the project, construction management system in our country, labor efficiency and Division has had a significant impact in terms of costs, setting off a boom of the study and practice of project management theory. Following modes of project management consulting company involved in specific projects, as well as the scope of its application in practice, and the advantages and disadvantages.

2.1 DBB mode

DBB Mode that is Design-Bid-Build, Referring to projects by design — Tender — A model for construction management in phases. Characterized in the previous phase is completed, before they can carry out the next stage. DBB mode, owners keep the ownership of the project, its contract signed directly with the design, construction, and its co-ordination role in the management of specific projects. But this mode of construction cannot affect the design (Kang Xiangping, Guo Hongying, 2010). DBB mode is the most classic and the most common mode of project management and its wide scope, management system, collaborative methods mature. DBB mode, the landlord must have a wealth of experience and projects in the process of building a lot of human and material resources. In addition, due to the design and construction of an independent bid, is not conducive to mutual learning and communication, tend to increase subsequent design changes, project construction period delay and so on.

2.2 CM mode

CM Mode that is Construction Management and construction management. This pattern to the construction phase of the project to control the starting point, the whole project is split into independent multiple subprojects and subparagraph tenders, designs, construction of building the whole project. Split phase of the project using the fast-path method. In the construction phase of the project, defined interfaces between projects, interior design, procurement and construction of the project the full interface. CM pattern is a "design and construction" construction method. Road-building in the use of such models.

CM Mode, the project management company based on actual experiences, involved early in project design work, strengthen the design and the construction site of the Association, can effectively reduce the project changes. Every project is relatively independent, parallel construction, greatly reducing project time. But at the same time project management companies to undertake large projects management, faces enormous challenges, requiring higher qualifications. Owners need to fully trust the project manager and project manager full authority.

2.3 The BOT mode

BOT Mode that is Build-Operate-Transfer Means building — Operation — Transfer mode, which originated from Government-led infrastructure projects. BOT mode from Government project construction costs in the commercial capital, by financing the construction and management of the market related projects. In BOT mode, the Government signed contracts with commercial companies, by commercial companies are responsible for financing, design, procurement and construction. After the project is completed, a business contract with project facilities during the franchise period property, rights, and maintenance work. Commercial company in accordance with the license fees on public officers on the use of facilities of the project. After the expiry of the licence, government ownership of project facilities. Through investment and construction, quotation, and achieved operating income of the last transfer of property rights. In General, the BOT project of low cost, but a longer concession period. BOT pattern apply some natural monopoly, a less competitive and stable project. Railways, roads, subways, bridges, tunnels, ports, airports, water supply and drainage system and other projects can use this kind of project management. Huge investment in such projects, the long construction period, but stable, able to attract commercial capital, and for the Government to save a lot of expenses.

2.4 The PMC mode

PMC Mode that is Project Management Contractor, also known as the project management contract model. PMC mode, the project owners to employ some qualified project engineering manager, manage the entire construction process on their behalf. Was employed by the company called project management contractors, also known as PMC. PMC at the owner's full authorization of the scoping, technical design, construction to completion, management throughout the project life cycle.

PMC Mode, the owners of the major decisions on major issues in the work is part of the project, and therefore does not require too much staff, leaving only a few policy makers. And projects a lot of routine work, coordinated by PMC is responsible for. Accordingly, the owners choose PMC Shi must investigate alternative companies with rich experience in project management, with appropriate management methods and technical means, is there a reasonable knowledge structure of human resources. But in this mode, the project management costs. PMC model applies to owners of their project management with less experience, lack of the necessary technical means and human resources, and the project as a whole huge investment and technology integration difficult, facilities and equipment.

2.5 EPC general contract mode

EPC Mode that is Engineering-Procurement-Construction Design - Purchase - Construction general contract mode. Generally refers to one or more contractors on the overall project design, procurement, until the completion of the whole process of construction general contract management. EPC mode, the owners of the project goals, after the technical requirements, investment constraints, entrust certain qualified EPC contractor managed the whole project. EPC contractor's work is divided into engineering, procurement and construction of three parts, and responsible for the construction of the entire project. Owners during the construction phase, only a clear boundary, planning, management and control of engineering principles, supervision project goals to achieve little. EPC contractor and owner of such functions, and determine mutual rights and responsibilities of the contract relationship. EPC contractor also known as the general contractor, which will be based on the nature of the work, some items can be tasks to two contractors, subcontractors are generally not signed a contract with the landlord, but by the general contractor responsible for the owner (Yanwenzhou ,2001). EPC mode typical organizational structure figure 1.1 below.

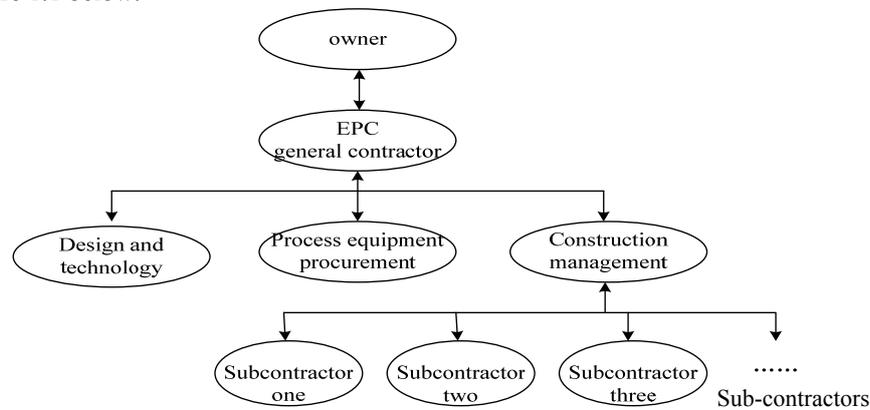

Figure 1 EPC EPC Diagram

In addition, the derived therefrom are E+PC modes, namely, procurement and construction contract, design single row; E+P+C mode, design, procurement and construction contracting model.

2.6 The PC mode

PC mode that is, Project Controlling, project controlling model. In PC mode, the owners deploy staff composition of the lead agency for the whole project, according to various engineering information, overall planning and implementation of the construction project as a whole. By means of destination management, development of human resources, risk, cost, schedule and quality plan, forming an effective project objectives control mechanism. By means of data analysis, collection, analysis, project construction of many kinds of information flow and material flow in the process of coordinating and controlling the actual construction. By forming the total made up of Senior Adviser to the prosecution, to handle projects of all kinds of information, and to control the reporting controls in the form of projects and processes. PC mode for large projects, project controlling as a decision support only the implementation status of the owners judgement and adjustment of all is not involved in the

implementation process. PC mode normally and EPC, andPMC as they mix both owner's control and oversight of the project, and ensure a high level of project implementation management (Mao R. L, Ismailb S, Hussainic M,2014).

Comparative analysis of these patterns are shown in specific engineering practices should be combined with project feature, the owner, control resources, investment preference, select the appropriate management mode.

Table 1 Comparison of Project Management Mode

Pattern name	Advantages	Disadvantages	The scope of
DBB Mode (Design - Tender - Build mode)	Rights to three parties involved in the project, assign clear responsibilities and interests; Management maturity.	The long construction period; Owners large amount of resources; Frequent design changes, coordination difficulties.	Smaller, relatively simple technology, and projects the duration is not strictly required.
CM Model (Construction management mode)	Short construction period; Reducing design changes during construction.	CM Unit requires high qualifications and credibility; High requirements on the quality of employees.	Higher risk projects design changes; For time critical construction projects; Total project scope and scale could not be accurately determined pricing of construction projects.
BOT Mode (Construction - Operation - Transfer mode)	Reduce the financial burden of the Government; The Government can avoid the risk of a large number of items; Project rate of return clearly; To improve operational efficiency.	Length of the project period; High bid costs; Financing difficulties; Mechanisms not flexible; During the term of the concession that the Government could lose control of the project.	The long construction period, a huge amount of investment in infrastructure and construction projects, such as power plants, roads, airports, and so on.
PMC Mode (project management contract model)	To improve project management level; Save project investment; To streamline the management of clients ' bodies.	Role of the project management company limited; Easy management issues; Lack of industry self-regulatory standards; Lack of senior management personnel.	Investment and large, complex technology projects; Owner's own capacity and limited resources or a lack of experience in project management; Owners of low asset-backed.
EPC Patterns (design - procurement - construction mode)	Owners bear the risk; Owners reduce administrative interface, management is relatively simple.	Able to assume EPC Small number of contractors for large projects; Project, quality depends on the contractor's experience and level of benefits; Project cost is relatively high.	Larger, longer duration, considerable technical complexity of projects, such as factories, power plants, oil development and infrastructure.

3 The Analysis of Characteristics of Huge Petrochemical Engineering Building Projects

Compared with common projects, huge petrochemical engineering building construction projects have posed higher demands and challenges to builders in many respects.

First is the high degree of system integration. Modern petrochemical industrial integration with high, high associated upstream and downstream products, high level of resource utilization, showing a device number, monomer scale of technical characteristics. Major petrochemical project is not just a single species production, but construction project throughout the product chain, such as Chongqing medical group MDI project building a total 17 sets of production equipment, covering the MDI, andPVC, nitrobenzene and aniline, Acetylene, Chloroprene rubber, synthetic ammonia, nitric acid,

methanol, formaldehyde and chlor-alkali products. In the course of project construction, once a link problem, can easily lead to knock-on effects for the whole program, must be coordinated from the angle of overall optimization of the construction of the subsystem (Wang Tingjun, 2008).

Second is the long construction period. Huge petrochemical engineering building projects can be divided into research, advanced research, detailed design, construction, commissioning, production and so on. The long construction period, but taking into account factors such as government approval process and key equipment manufacturing cycles, the actual construction period of tension.

Third, high technical content. Petrochemical products in the production process inevitably produce highly corrosive, strong volatility and other dangerous substances, modern petrochemical construction projects focus on building quality on the one hand, on the other hand are early in the design process using high standards, high degree of automation of process equipment.

Four is immense investment. For example, mentioned above, the Xinjiang dushanzi project investment of 300 billion yuan, God huaning coal group of coal-based olefins project investment of 350 million Yuan, Chongqing medical group of MDI projects investment of 400 Billion. Large petrochemical construction projects invested 50 billion yuan, on the project's cost control, risk management, presents a major challenge.

Five is the project subjects are in numerical. Project stakeholders are: owners, primarily responsible for project investment and project called design, primarily responsible for project technical program development; supervision, primarily responsible for project implementation monitoring contractor, is responsible for the implementation of specific projects. But that contains multiple installations of major petrochemical projects in the construction of a single appliance can be treated as a single project, generally have their own owners, design, supervision and construction. Generally composed of large enterprise groups (such as PetroChina, Sinopec, etc) all secondary companies undertake to construct the device project. In the course of project implementation, you need to consider management issues between multiple owners, need to coordinate the technical interfaces of different design problems and optimize the overall technical solutions, administrative rights on the need to define more than one supervisor, need to be the construction side of the construction of the optimal allocation of resources.

Six international cooperation. Large-scale construction of petrochemical engineering construction projects often take the form of joint ventures, in part because of the large investment, and partly because Europe and the petrochemical Enterprise controls the 80% more advanced technical patents, compared with the international advanced level, and technology in petrochemical industry in China is still very weak. Such as Chongqing medical group of MDI projects major joint investment with the BASF company in Europe, Germany Linde in syngas separation unit-building, United States Mr Lake, the company involved in the construction of air separation plants, France Dalkia company participation in building island unit, United Kingdom AMEC provided project management consulting services (Kang,2011).

Seven is the deep government involvement. Petrochemical industry related to people's livelihood, consume a lot of resources on eco-environment and socio-economic impacts, environmental assessment, resources, construction of basic industries, immigration, construction, project supervision plays an important role. Government is deeply involved in construction, to fast forward the program process (Xie Jiaping, Kong Lingcheng , JI Wei ,2009).

Eight is the strong management regulation. Large petrochemical construction projects with internationally accepted norms, procedures, technical standards, such as the quality management system and HSE system, to ensure the smooth completion of the project.

Large petrochemical engineering construction project of eight a features for antibody following: features a requirements must and manpower planning, and coordination the subsystem construction; features II, and three or four requirements in construction process in the reached expected of time, and quality, and cost requirements; features five, and six or seven requirements in construction process in the coordination internal the project subject, and foreign company and the Government relationship; features eight requirements construction process in the must established international passage of quality management system. In the practice of huge petrochemical engineering building projects, using sophisticated project management mode and adjusted according to the characteristics mentioned above and innovation, are key to ensuring project implementation.

4 Innovation of Large Petrochemical Engineering Construction Project Management Pattern

4.1 "IPMT control +EPC composite" model

IPMT (Integrated Project Management Team) was set up in project management "integrated project management team", also known as the integrated project headquarters or headquarters. IPMT has several PMT (Project Management Team) which means that the project management team, also known as owner's headquarters or headquarters. Great investment determines the financial risk of a single owner-led construction, joint investment in building large petrochemical projects by many enterprises. Model in the integrated management of multiple owners, difficulty of optimization of the system is huge. Therefore, multiple owners of a group, such as PetroChina, Sinopec, CNOOC, facilitate the overall coordination. Form IPMT when led by the group, each owner is represented, with project management contractor (PMC), the overall programme design, general supervision company as well as a variety of other advisory or consultative bodies. Through the integration of efforts, on the organizational and technical realization of overall control of the project and system optimization. Group II-Enterprise and enterprise project, is the owner of the project.

"EPC compound" is in the implementation phase of the project, the specific needs of each project and the owners of the actual capacity, flexibility in design, procurement, building relationships between the three. You can select Design procurement construction contract (EPC) pattern or design, procurement, construction of two contracts (E+PC) pattern or design, procurement, construction (E+P+C) in three contract mode as the mode of construction. EPC composite mode's main objective is to ensure the engineering quality and progress under the premise, maximize the owner's power to save construction costs.

4.2 "IPMT control +EPC composite" model of organization structure

"IPMT control +EPC composite" pattern construction project management organizational structure shown in the following figure. According to the system is highly integrated feature, management norms established IPMT coordinate each subproject relationship IPMT departments and PMT functions belonging to matrix management; according to the long construction period, with high technical content, characteristics of construction investment, IPMT Engineering Department, Technology Department, Ministry of finance the overall project progress control ; According to project many features for clear butt sector; according to the characteristics of a special liaison group for international cooperation is responsible for communicating with foreign investment projects; according to Government-deep features, composed of the competent government agency teams leading group, for the policy support and public services.

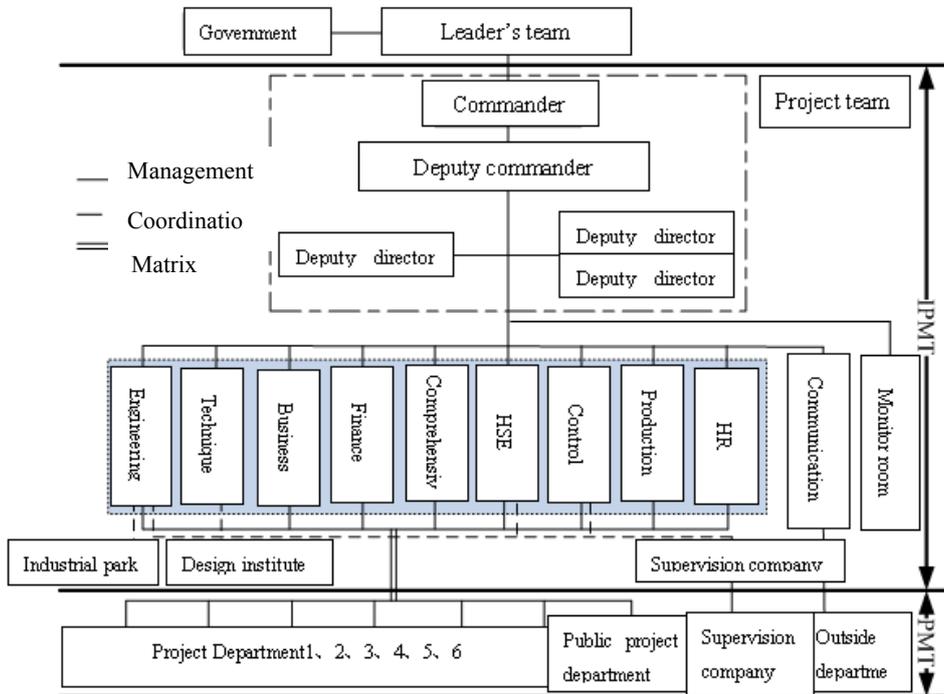

Figure 2 "IPMT Control +EPC Composite" Modes of Management Structures

Organizational structure is divided into two layers: A Government integration under the leadership of the leading group on the first project command (IPMT). It consists of Engineering Department, technical department, approved by the Ministry of Commerce, Ministry of, comprehensive Department, financial Department and the Department of field and other functional departments, performing project management functions on behalf of the Chinese owners. An owner on the second command (Project Management Team, PMT). Owners command in the project implementation stage win the headquarters and managed its one or more subproject, their headquarters is responsible for business integration project. IPMT of the owners of the parent company drawn and with professional qualification PMC formed; PMT formed by the owners, owners according to their ability and features select EPC mode (Picha J, Tomek A, Löwitt H,2015).

On the framework of the Organization adopted a "small command service" levels of operation. The so-called "small headquarters," refers to small government and owners of enterprises drawn out only a small number of soldiers forced integration project command with the landlord, the second refers to the headquarters management than common sense of the scope of project management Department has reduced, more is responsible for the coordination and decision-making on key issues of management. "Service" refers to projects take full advantage of the Government, the overall design, EPC contractors and consultancy expertise, use of social resources to complete the project.

4.3 "IPMT control +EPC composite" mode operation mechanism

"IPMT control +EPC composite" run mode according to the following principles: the first principle is the center of gravity moves down, PMT building work on their respective projects, is a subject of law and implementation of the contract responsibility, IPMT is responsible for decisions on important matters and integration work. Approval followed by permissions, PMT only authorized Professional decisions exceed mandates required by procedures, IPMT or company agrees to perform. Finally dispersed the principle, dealing with common issues, such as coordination of overall design, detail design (to be Cheng Da), bulk / key equipment, hoisting large equipment, material management, IPMT uniform decisions.

"IPMT control +EPC composite" mode functioning the biggest challenge is how to deal with the many stakeholders, clear all rights responsibilities. There are two main kinds of coordination: administrative and contractual constraints. Administrative Committee on coordination by the Government or group of coordinated relations between the owner companies. Contract is mainly in the form of signed contracts explicit relationships between different legal subjects. The petrochemical engineering construction owners generally belong to a group, the Administrative Committee on coordination is relatively easy. But PMC contractors, design institutes, EPC contractors, construction, supervision and other need to clearly determine the powers and responsibilities of the contract. Of interface management in contract of the stakeholders of the program through the relationship in a contract and the parties in the overall operation of the project, ensure the smooth progress of the management model.

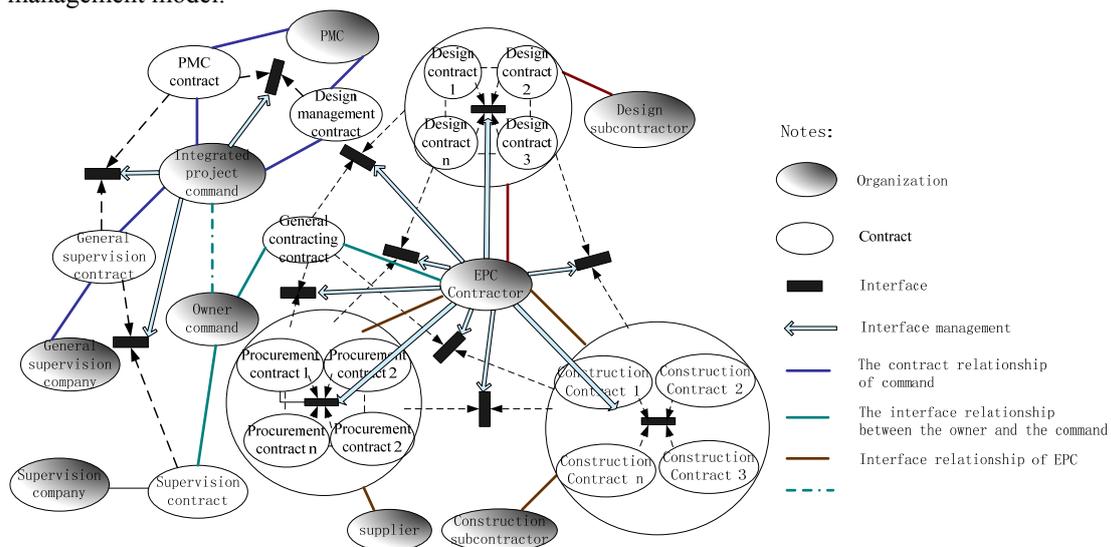

Figure 3 "IPMT Control +EPC Composite" Modes of Interface Management of Contracts

The figure shows that, IPMT and project management contractor PMC contract, who is responsible for management of the entire project coordination, especially progress and other aspects of cooperation between the various subprojects; IPMT general supervision contract with the management company by the General management company on behalf of IPMT pair project supervision company supervision and examination. However, in specific cases, supervisor general supervision may be specific projects, at which point its supervision of specific projects in accordance with contract owner with the EPC contractor for turnkey contracts, who is responsible for the plant construction project. EPC contractors through their own technological design, signed with suppliers procurement contract, will be part of the project to secondary contractors for specific building owner supervision contract with the management company, supervising company in total under the supervision of the company's management is responsible for the project management (Tseng C.H, Chu H.W,2004).

4.4 " IPMT control +EPC composite "pattern analysis of advantages and disadvantages

"IPMT control +EPC composite" model fully considers the petrochemical engineering construction project status, in the implementation phase of the project has the following advantages:

First, ensure unified leadership, sharing the risk. IPMT overall control and coordination roles meet the fundamental requirements of the major petrochemical project. Meanwhile, project implementation stage "small command service" model and IPMT exert the advantages of integrating external resources, allocation of project risks.

Second, make full use of government resources, promote the process. Project implementation stage, the Government still plays a large role, such as railways, docks, roads and other auxiliary facilities with related departments such as transport, environmental protection and security coordination. The strengthening of the role of Government to Government coordination of external advantages, speed up the process.

Third is the owner's responsibility, motivate. Due to specific project management responsibility to the owners, IPMT and a clear division of labor between the owners, full authorization to the owner in this way helps to improve the owners ' initiative and creativity, and to give full play to the owners and the owners own the project management personnel.

Four is to take full advantage of owners of resources, reduced construction costs. Taking full account of the different owners in the technical capacity, financial capacity, persons on the basis of differences in skills, managerial ability, engineering construction mode of EPC patterns, so owners can choose the conditions are familiar with the traditional construction patterns, which is conducive to fully tap the potential owners, improve all EPC and of the high cost of (Du Jun Jie ,2015).

Five different bodies of work are a clear division of labor is clear. Although the project implementation stage introduces a number of services, but the mode of operation of services at Headquarters more clear division of responsibilities with the owners, different service functions at the same level also form a complementary relationship, so clear interface between different bodies of work.

Six, helps to save administrative costs. PMC introduction of cost management will increase, but the patterns in the PMC are positioned as in command under the authority of the MDI project for overall coordination and control, does not directly manage the individual projects, related management costs were greatly reduced.

Seven is beneficial to the project management and the cultivation of talents. The working model and not too much reliance on PMC and the EPC, although this increases the workload of headquarters command with the owners, but the owners cultivate a large number of project managers with practical experience, the follow-up project construction is very important (Guo Yurong,2010).

Eight is to improve the IPMT of asymmetric information. By introducing a variety of service organizations, IPMT through multi-channel access to project information. Analysis and comparison of information through different channels, can effectively solve large-scale projects, problems of asymmetric information by various stakeholders.

Restricted by various factors, "command control +EPC composite" pattern in the implementation phase of the project has the following disadvantages:

First IPMT between owners and non-contractual relationship is the key link of administrative relationship. Specific project management responsibilities will be handed over to the owners relied on is not a contract but rather administrative authority and the administrative authority does not have the substantive claims in contract mechanism and, therefore, this may affect the implementation of responsibility.

Second PMC responsibilities is not easy to define, the effect may be limited. PMC is defined as a lightweight PMC management cost savings, but fewer management obligations it will accordingly, it cannot be clearly defined responsibilities, which is not conducive to playing PMC 's role in the project.

Third, the high requirements on the supervision work. Supervision of company is defined as a large, relative to the traditional sense of the supervision company expanded its functions – part of management. Supervision of this aspect will bring the company's management evaluation difficult question, on the other hand higher requirements on chemical supervision company project management skills.

4.5 "IPMT control +EPC composite" pattern of practice

Practice of construction of major petrochemical projects in China with less experience, through the introduction of external capital and the introduction of advanced fossil technologies and advanced management techniques. In the 90 's of the last century, petrochemical engineering management mode is still dominated by foreign parties, "PMC+EPC" mode, such as the Yangtze - BASF integrated project (referred to as YPC). Starting from Shanghai Secco project, China's petrochemical projects builders began to explore with Chinese characteristics "IPMT control +EPC composite" model, and success. YPC project planned 60 million ton / year ethylene production capacity, Secco project planned 60 million ton / year ethylene production capacity, planned a total investment of 208.28 million, actual investment 204.78 billion; construction period of 36 months project management cost 10.8 billion; engineering commissioning successful site continuous safe man hours to 1700 hours. Secco project planned 90 tons / year ethylene production capacity, actual investment of 198.59 billion; construction period is 26 months project management cost 7.5 billion; the same is engineering a successful commissioning project site continuous safe man hours 1700 hours. The successful management experience rapid promotion in the industry.

5 Conclusions

Petrochemical industry provides a lot of necessities of life for the people, provides a large number of raw materials for industrial production, is one of the basic industries of the national economy. Life provides a number of basic raw materials. It has important significance on the development of China petrochemical industry.

Abstract: This study empirically investigates the impact of personal innovativeness on Intention to Use (IU) Social Networking Sites (SNS). The theoretical perspective of Technological Acceptance Model (TAM) and Personal Innovativeness of Information Technology (PIIT) were used to explain the relationships developed in the study. This research is descriptive in nature and based on primary data collected through a self-administered questionnaire, administered to a sample of 216 undergraduates in Sri Lanka. Findings reconfirmed the relationships in original TAM, enabling to use TAM in SNS context. Further, we found PIIT is significant in predicting IU SNS. Theoretical and practical implications of these findings and directions for further research are discussed.

Key Words: Social Networking Sites (SNS); Personal Innovativeness of Information Technology (PIIT)

1 Introduction

The recent revolution of Information technology has diffused Social Media widely among the human beings. This has created ample of opportunities to marketers, to communicate with their global customers while provoking researchers to do research on social media. Kaplan and Haenlein (2010) have categorized social media into six categories by considering social presence/media richness and self-presentation/self-disclosure as follows. Blogs, collective projects (Wikipedia), social networking sites (Facebook), content communities (You Tube), virtual social worlds (Second Life) and virtual game worlds (Word of Warcraft). Current study focuses only on SNS.

TAM is one of the well-researched models and was developed to predict how individuals adopt and use new ITs. This model explains that, intention to use IT depends on two beliefs: Perceived Usefulness (PU) and Perceived Ease Of Use (PEOU) (Venkatesh & Bala, 2008). Since SNS is a new technology, scholars have used TAM to understand the acceptance of SNS by individuals (Acarli & Sağlam, 2015; Choi & Chung, 2013; Rauniar, Rawski, Yang, & Johnson, 2014). User will consider how easy it is to use SNS and to what extent it supports to achieve their SNS related needs when accessing the SNS (Rauniar et al., 2014). Therefore, we use TAM as the main theoretical framework to describe the IU of SNS. Consumer innovativeness is significant in accepting internet based new technologies (Aldás-Manzano, Lassala-Navarre, Ruiz-Mafe, & Sanz-Blas, 2009; Ratten, 2014). Therefore, current study incorporates PIIT to the TAM. We have selected only one SNS called Facebook, since it is the largest multilingual SNS (Grosbeck, Bran, & Tiru, 2011) and most interested SNS among researchers due to its high usage and technological feasibility (Ellison, Steinfield, & Lampe, 2007). Further, it is the most famous SNS among young Sri Lankans who will be the next generation of mass consumers.

A momentous body of research in technology acceptance has gathered evidence, supporting the importance of PEOU and PU in acceptance of SNS. Although there is a large body of research on these constructs, very little work has been done to understand the impact of PIIT on acceptance of SNS. Social media is one of the most powerful innovative media in the century (Lee & Ma, 2012) and PIIT is significant in accepting innovative technologies. Thus, we argue that there should be a considerable impact of PIIT on SNS acceptance and this will be worth exploring.

This study attempts to present an in-depth study with the objective of developing comprehensive model to understand the IU, SNS based on TAM. In order to achieve above objective, we incorporate a new construct to TAM called PIIT and examine the impact of PIIT on IU, SNS.

The rest of the paper is organized as follows. Section I is the development of the conceptual framework by focusing on the rationale of the constructs and hypotheses development. Section II includes the methods used in the study. Validity and the reliability of the constructs are discussed in this section. Following methodology, data analysis and findings are presented with the answers to the research questions. Finally, discussion and conclusion are presented with the managerial implications and directions for future research.

2 Theory, Hypothesis Development and Conceptual Framework

2.1 SNS

SNS are “Web-based services that allow individuals to (1) construct a public or semi-public profile within a bounded system, (2) articulate a list of other users with whom they share a connection, and (3) view and traverse their list of connections and those made by others within the system” (Boyd & Ellison, 2007, p. 211). According to Kim, Jeong, and Lee (2010, p. 216) SNS are “Web sites that make it possible for people to form online communities, and share user-created contents”. Further, it can be identified as “online communities that focus on bringing together people with similar interests or who are interested in exploring the interests and activities of others” (Marcus & Krishnamurthi, 2009, p. 59). These online networks have different objectives such as friendship-oriented SNSs (Facebook), professional-oriented SNSs (LinkedIn) (Shneor & Efrat, 2014) and they do not rely upon face to face encounter as it was in traditional social networks. In SNS some friends are second-order friends (friends of friends) or more than that, sometimes they have never met or not have any idea to meet (Clemons, 2009).

2.2 TAM

There are a number of theoretical models used by scholars to study user acceptance and usage behavior of new technologies. However, TAM is the most widely applied model in this regard (Venkatesh, 2000) and it is a valuable instrument for predicting intention to use information systems (Szajna, 1996). TAM model was developed by Davis (1986) based on the theoretical foundation of the theory of reasoned action (TRA) (Fishbein & Ajzen, 1975). TRA explains general human behavior while, TAM particularly explains the determinants of computer acceptance (Davis, Bagozzi, & Warshaw, 1989). According to TAM PEOU, PU are the basic antecedents for developing Attitudes toward technology (A), Intention to Use (IU) and finally actual usage (AU) of technology (Choi & Chung, 2013). PU is defined as “the degree to which a person believes that using a particular system would enhance his or her job performance” (Davis, 1989, p. 320) and PEOU, in contrast, refers to “the degree to which a person believes that using a particular system would be free of effort” (Davis, 1989, p. 320). Venkatesh and Davis (1996) analyzed the antecedents of PEOU, without A (Rondan-Cataluña, Arenas-Gaitán, & Ramírez-Correa, 2015).

Over time, the TAM model has been changed twice as TAM2 (Venkatesh & Davis, 2000) and TAM3 (Venkatesh & Bala, 2008). TAM2 includes social influence processes and cognitive instrumental processes (Rondan-Cataluña et al., 2015). TAM3 came up with antecedents of PEOU. Rauniar et al. (2014) have modified the TAM to explain the acceptance of social media technology and came up with a model called revised TAM. It includes more constructs relevant to social media acceptance (critical mass, capability, perceived playfulness and trustworthiness).

2.3 TAM and SNS acceptance

In order to be compatible with social media, general definitions given to the constructs in TAM changes as follows. PU can be defined as the “extent to which the social media user believes that using a particular social media site helps to meet the related goal-driven needs of the individual” (Rauniar et al., 2014, p. 10) and PEOU as the “degree to which the social media site is free of effort” (Rauniar et al., 2014, p. 11). PEOU is a leading antecedent in explaining PU in accepting personal computers (Igarria, Zinatelli, Cragg, & Cavaye, 1997). Liu (2010) added empirical evidence to prove positive relationship between PEOU and PU of wikis usage. The higher the consumer PEOU, the greater the PU of SNS (Pinho & Soares, 2011). According to Qin, Kim, Hsu, and Tan (2011) PEOU has a significant positive influence on the PU of SNS. Rauniar et al. (2014) also highlighted that PEOU of social media site is positively related to PU. As per Choi and Chung (2013) PEOU was a fundamental determinant to PU of SNS.

PU is a key determinant of user’s IU computers (Davis et al., 1989). Liu (2010) concluded that PU of wikis has significant direct impact on IU. PU of social media is positively related to the IU of the social media site (Rauniar et al., 2014). Choi and Chung (2013) mentioned that PU has robust effects on IU of SNS. PU has a significant positive influence on the IU of SNS (Qin et al., 2011). However, a contrasting finding was introduced by Pinho and Soares (2011) that, there is no such relationship between PU of SNS and IU of SNS.

As per best of our knowledge, very few studies have examined the acceptance of SNS from TAM point of view. Based on the associations proved in the TAM for social media model, we propose the following hypothesis for SNS.

Hypothesis 1: PEOU of SNS is positively related to PU of SNS

Hypothesis 2: PU of SNS is positively related to IU the SNS

2.4 Personal innovativeness and technology acceptance

PIIT is a vital concept for understanding the acceptance of information technology, and it can be defined as the, “*the willingness of an individual to try out any new information technology*” (Agarwal & Prasad, 1998, p. 206). Parasuraman (2000, p. 311) Identified it as a “*tendency to be a technology pioneer and thought leader*”. As per Schillewaert, Ahearne, Frambach, and Moenaert (2005, p. 326), it is predisposition or attitude describing a person’s learned and enduring cognitive evaluations, emotional feelings and action tendencies towards adopting new information technologies. Based on previous definitions, willingness of users to try SNS as a new media will be considered as “PIIT” in this study.

Joo, Lee, and Ham (2014) pointed out that PIIT has significant effects on PEOU of the technology. According to van Raaij and Schepers (2008), it has a positive impact on PEOU of the system. Lewis, Agarwal, and Sambamurthy (2003) reported that PIIT has a significant positive influence on individual beliefs about the ease of use of a technology. Further, Schillewaert et al. (2005) provide evidence to prove same relationship with a sample of salespersons

Hypothesis 3: **PIIT is positively related to PEOU of SNS**

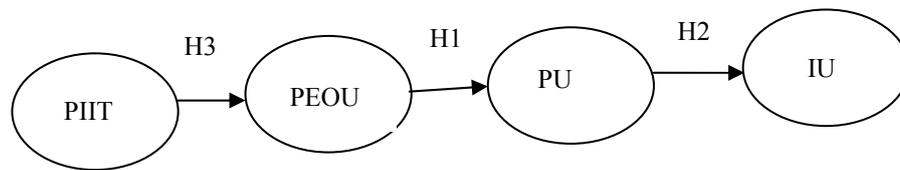

Figure 1 Conceptual Framework

3 Methodology

3.1 Data collection and participants

For the empirical study, 400 questionnaires were distributed among selected students in the lecture rooms and completed questionnaires were collected on the following day. These students were full-time students at a state university in Sri Lanka. Self – Administered questionnaire, containing closed ended questions, was used as the data collection tool. First section consisted questions to measure the main constructs with Likert type scale questions where respondents had to make their level of agreement such as, Strongly Agree, Agree, no idea, Disagree and Strongly Disagree. Scores of 5, 4, 3, 2, and 1 were assigned respectively for above mentioned categories. Questionnaires were in English. However, only 251 questionnaires were submitted and 35 questionnaires were dropped due to the incomplete answers. Finally, 216 questionnaires were used in analysis resulting in a response rate of 54% (217/400). Next section of the questionnaire consisted of questions related to demographic factors.

From total sample 42.4% were male and 57.7 % were female students. Majority of the students (46.3%) are using Internet less than one hour per day. Further, 51.4% respondents have more than 3 years’ experience with the social media sites. Moreover, 25.5% have 101- 250 social media friends and 35.2 % respondents use social media 0-2 hours per week.

3.2 Measures

All constructs in the study involved multiple items. Content validity of the study was assured thorough literature review and expert opinion (academics, industry researches). Further, a pilot survey was conducted to test the questionnaire. All items included in the questionnaire were suitable for further proceeding. Measurement scales used in the current study were adopted from past studies including PEOU (Rauniar et al., 2014), PU (Choi & Chung, 2013; Rauniar et al., 2014), IU (Choi & Chung, 2013) and IU (Agarwal & Prasad, 1998) . Since the study adopted scales from number of previous studies, factor analysis was done to verify the underlying structure of the variables before it proceeds with further analysis.

4 Results

PLS was used with SmartPLS 3 software to test hypothesis and estimate path models involving latent variables which is observed through multiple indicators. Reliability and validity were ensured by cronbach’s alpha, composite reliability (CR), factor analysis, and average variance extracted (AVE). Coefficient alpha is the widely used reliability coefficient in social-science research (Green, 2003³⁵). As shown in Table 1 all alpha values are above 0.7 for all constructs indicating good internal consistency of the items in the scale (Gliem & Gliem, 2003). Further; composite reliabilities of the five scales are higher

than 0.7 which is satisfactory level.

Table 1 Properties of Measurement Constructs

Construct	Items	Measurement Variables	Loadings	Mean	SD	AVE	CR	α
PEOU	PEOU1	Facebook is flexible to interact with	0.793	3.45	0.67	0.562	0.793	0.716
	PEOU 2	I find it easy to get Face Book to do what I want to do	0.745					
	PEOU 4	I find Face Book easy to use	0.708					
PU	PU2	I find Facebook useful in my personal life	0.772	3.50	0.66	0.551	0.786	0.794
	PU3	Using Facebook enhances my effectiveness to stay in touch with others	0.695					
	PU4	Using Facebook makes it easier to stay informed with my friends and family	0.757					
IU	IU1	I will continue to use Facebook in the future	0.875	3.32	0.76	0.570	0.797	0.729
	IU2	I will continue to increase my use of Facebook	0.730					
	IU2	I will continue to use Facebook whenever possible	0.642					
PIIT	PIIT1	If I heard about a new information technology, I would look for ways to experiment with it	0.856	3.38	0.70	0.605	0.820	0.795
	PIIT2	Among my peers, I am usually the first to try out new information technologies	0.69					
	PIIT4	I like to experiment with new information technologies	0.779					

Note: All items shared a common prompt: “Indicate how much you agree with each option by marking the appropriate response” and were measured with a 5-point Likert-type scale ranging from “Strongly Disagree” to “Strongly Agree.”

Convergent and discriminate validity were ensured by factor analysis since it is widely used method for this purpose. Factor analysis provides the tools for analyzing the structure of the correlations with many variables and highly correlated variables are called as factors (Hair, 2006) Kaiser-Meyer-Olkin (KMO) value measures the sampling adequacy for factor analysis. If it is in the .90s— marvelous, in the .80s — meritorious, in the .70s — middling, in the .60s — mediocre, in the .50s — miserable, below .50 — unacceptable (Dziuban, Charles & Shirkey, Edwin, 1974). Bartlett test of sphericity is “statistical test for the overall significance of all correlations within a correlation matrix factors” (Hair, 2006). KMO value was .815 and Bartlett’s Test of Sphericity was significant in giving evidence that the data were generally appropriate for factor analysis. Table 1 shows all factor loadings are at a higher level and lowest value was 0.642 which is higher than satisfactory level. Further, AVE for all scales were higher than 0.5 (Table 1) which is the minimum level recommended by Fornell & Larcker (1981).

Standardized parameters for the research which were obtained by bootstrap simulation were used to test the hypothesis. The results from the PLS indicate that three hypotheses were supported by empirical evidence, at $p < 0.05$ significant level (Table 2). The first hypothesis suggested that there is a positive relationship between PEOU and PU. The Path coefficient of 0.501 was found to be statistically significant at $p < 0.05$. Second hypothesis was PU of SNS is positively related to IU the SNS, which was supported at 0.05 significant level ($\beta = 0.401$) at $p < 0.05$. Third hypotheses were supported with standardized coefficient values of 0.254.

Table 2 Summary of Hypotheses Testing Result

* Significant at 5% for the two-tailed test (> 1.96).

Relationship	Hypotheses	t-Value	Path coefficients	Conclusion
PEOU → PU	H1	8.944*	0.501	Supported
PU → IU	H2	6.691*	0.401	Supported
PIIT → PEOU	H3	3.060*	0.254	Supported

5 Discussion

This research examines the impact of PIIT in IU of SNS among undergraduates. As explained, the TAM by itself may not be good in explaining the SNS acceptance that became a revolution in past decade. Revised TAM for social media developed by Rauniar (2014) has not considered PIIT despite the fact that it is an essential human feature in accepting new technology. As such, this study incorporates PIIT to the main constructs in TAM based on revised TAM for social media.

Our first hypothesis which assumes that there is a positive relationship between PEOU of SNS and PU of SNS has been proved by empirical evidence. This finding is concurring with Rauniar (2014) which assume same relationship in revised social media model and number of other scholars such as Liu (2010), Qin et al., (2011) proved with different technologies. Then we assume positive relationship between PU of SNS and IU SNS. There was sufficient evidence to accept this hypothesis supporting Rauniar (2014) in a developing context. Further, this finding is in agreement with some previous studies (Davis et., al 1989, Liu ,2010, Choi & Chung 2013). Our third hypothesis assume positive relationship between PIIT and PEOU that originally incorporate to the social media acceptance model was proved supporting Joo et., al (2014), Van Raaij & Schepers (2008) and Lewis et., al (2003).

6 Conclusions

Based on empirical evidence, current study contributes for the development of social media literature in the area of SNS acceptance. As explained earlier data were collected in new context which is a lower middle income country with a 20,639,000 population¹. Currently there are 4.79 million internet users and 2.80 million active social media accounts and its penetration is 14%².

This is the first study which incorporates PIIT to the social media acceptance model through adopting scales from existing literature. Indicators were validated through proper validity and reliability techniques providing an opportunity to replicate them in future studies. This is a significant contribution for social media theory and future researches. Result reconfirmed relationship in original TAM (H1, H2, and H3) and revised TAM for social media (Rauniar, et.al (2014) enabling to use TAM in social media context. However, we found that PIIT is significant in predicting PEOU of SNS. If users are less in PIIT then they will not perceive SNS as an easy medium for their communication activities. This means they still rely on traditional communication mediums.

In this study, we developed a comprehensive model to understand the acceptance of social media among young adults (undergraduates) in a developing context. Along with the development of technology, most Sri Lankan companies tend to use social media marketing strategies to communicate with their customers. In order to get maximum benefits from social media, marketing managers should have a clearer idea about the advantages and disadvantages of it. For these reasons, we hope that findings of this study will be a useful guideline for both academics and practitioners.

Though, the findings include valuable insights about SNS acceptance, there are some limitations. The participants of this study were students from a single faculty which represents a sub-culture;

¹ Ease of Doing Business in Sri Lanka [I]. Retrieved on 24th May 2016 from <http://www.doingbusiness.org/data/explore/economies/sri-lanka,2016>

² Wearesocial, [I]. Retrieved on 12th March 2016 from <http://wearesocial.com, 2016>

therefore, they may hold similar norms and beliefs. It is important to study norms and beliefs of that group to conduct a deep study. This will help to get an understanding of how it affects their SNS acceptance. Even though SNS is a global phenomenon, it is constrained by local conditions such as culture (wijesundara, 2014). As such future, researchers' can use this model for cross cultural comparison. There are many SNS such as LinkedIn, Twitter, we chat and Face Book. However, in this study, we selected only the Facebook. In order to get deeper knowledge about SNS, it better to study this model with other SNS. Only young adults were recruited as our respondents although other demographic groups are also growing fast. Future studies should take in to account of more age groups since age can be important factor in accepting SNS.

Simulation Research of Regional Logistics and Economic Development of Wuhan Based on System Dynamics

Liu Xiaoping

School of Management, Wuhan Technology and Business University, Wuhan, P.R. China, 430065
(E-mail: liuxiaoping_0301@163.com)

Abstract: Development of logistics industry is a major indicator used for measuring the economic development level and modernized level of a region, and also is one of basic power to promote the development of regional economy. On the basis of system dynamics and combining with the related data about Wuhan in terms of economic and logistics from 2006 to 2013, the paper makes analogue simulation on the problems of logistics and economic development of Wuhan through SD model, and conducted the test analysis with Vensim PLE software. Finally, the paper concludes that the economic development of Wuhan stimulates the growth of the logistics demand, but insufficient supply capacity will cause economic barriers. The supply and demand balance of logistics, therefore, not only promote the coordinated development of economy, but also propose effective ways and thinking for the development of the logistics system.

Key words: System dynamics; Regional logistics; Regional economy

1 Introduction

Regional logistics is an important component of regional economy and its industrial added value is part of added value of regional gross domestic product (GDP). In regional economy, the development of logistics industry profoundly influences the technical renovation and upgrade of other industries (Poreddy,2016; Hsu,2016). Besides, the development of the regional logistics also affects regional economic in turn. They are closely linked and interact with each other (Chow,2007; Trappey,2011; Oumer,2006). Therefore, to clarify the mutual relation between regional logistics and regional economy and summarize the function mechanism of the regional logistics to regional economic is of great significance for the harmonious development of regional economy and regional logistics.

A lot of scholars at home and abroad have researched and analyzed the relationship between the regional logistics and regional economy. From the aspect of costs and benefits, smooth logistics management can promote the development of economy, while urban traffic congestion can inhibit the local economic development (Rienstra, 2010; Weisbrod, 2013; Kopits, 2015). Large logistics enterprises can promote the vitality of market logistics system, because they can reduce the logistics cost, improve logistics efficiency and enhance the development of the whole logistics industry through their own internal adjustment and change (Cooper, 1997). From the perspective of the government, scholars have emphatically analyzed the important factors such as government subsidies, facilities financing, transportation and regional trading rules, global production and distribution network in the enterprises tax law (Bloemhof, 1997). For the point of view of research methods, many scholars use DEA model to study the efficiency of regional logistics (Zhang Cheng, 2000; Fan Yuejiao, 2007; Liu Ping, 2015). Liu Weilin (2011) conducts model design and simulation demonstration on the dynamic relationship between regional logistics system and regional economic growth and coupling structure with the method of complex system, by taking Tianjin Binhai New District as a case. Mr. Liu thinks moderate advance of logistics can slow regional economic growth in the short term, but can significantly increase regional economic growth in the long run. From the perspective of the exploratory spatial data analysis, Fan Yuejiao (2012) establishes spatial econometric model and executes specific quantitative inspection and analysis on the relationship between the two. Since the regional logistics system is non-linear, the theory and method of linear system used to describe the regional logistics system it is difficult. Besides, due to the multiple feedback and the long time lag in the regional logistics system, it could hardly master and track the development and changes in the social system by means of intuitive experience. Accordingly, using system dynamics to study large complex systems is reasonable and can be helpful to construct non-linear, multiple feedback and long time-delay dynamic model based on the causality of the social system. Based on the characteristics of system dynamics tools, the paper built the model that is as close to the reality so as to simulate the relationship between logistics and

economy of Wuhan, and found the suitable path for the coordinated development of regional logistics and regional economic through studying the impact brought by the different industrial policy changes to the system as a whole.

2 Analysis of System Dynamics of Logistics Industry of Wuhan and the Industrial Structure

2.1 System dynamics model of logistics of Wuhan and industrial structure

The relationship between logistics industry and industrial structure of Wuhan is an integrated complex and open system: logistics industry is a part of the industrial structure and its development is under the restriction of the other industries; at the same time, logistics industry plays important roles in promoting economic development and adjusting industrial structure. There are internal factors including people, government and environment in the system, and they are dynamic and mutually influence. The system dynamics structure model of relation between logistics industry and industrial structure of Wuhan is shown in Fig 1:

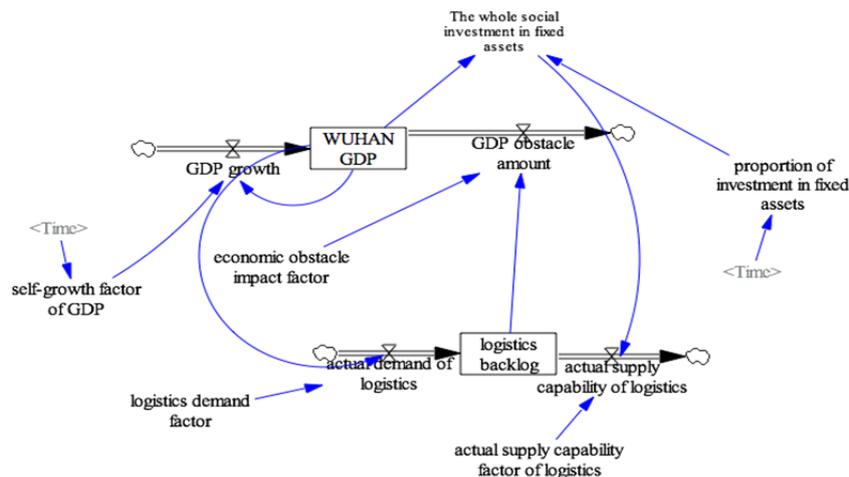

Figure 1 System Dynamics Structure Model of Logistics Industry and Industrial Structure of Wuhan

In Figure 1, the level of economic development is measured with GDP of Wuhan. GDP is the best indicator of economic conditions. The main influencing factors of GDP growth include investment degree, labor and technology progress. Economic obstacle is used to denote the obstacle degree of logistics industry development to economy and it is mainly affected by economic obstacle factors and logistics backlog. When the growth of the actual demand of logistics is faster than supply capacity, logistics backlogs will emerge. Poor logistics supply capacity will severely hinder the development of economy.

2.2 SD equation and parameters description

According to the Figure 1, the correlation between the variables in the model was determined; the equation and parameters were expressed with the following index data.

- 1) Wuhan GDP = INTEG (GDP growth - GDP logistics obstacle amount, initial value).
- 2) Self-growth of GDP = GDP * self-growth factor of GDP.
- 3) Self-growth factor of GDP = the table function of self-growth factor of GDP.
- 4) Logistics obstacle amount= logistics backlog*economic obstacle impact factor.
- 5) The whole social investment in fixed assets = WU HAN GDP * proportion of investment in fixed assets.
- 6) Logistics backlog= INTEG (actual demand of logistics – actual supply capability of logistics, initial value)
- 7) Actual demand of logistics= GDP of Wuhan * logistics demand factor.
- 8) Actual supply capability of logistics= the whole social investment in fixed assets* actual supply capability factor of logistics
- 9) Determination of other parameter values. According to the data statistics of the impact logistics of Wuhan in recent years on its national economy, it was assumed that economic obstacle impact factor was 0.015; according to the domestic economic environment, it was assumed that 80% of logistics

demand generated by economic level was converted to the actual demand; the conversion factor of logistics demand was 0.8; logistics supply capacity factor was 0.7; the logistics demand coefficient was 0.13.

10) Self-growth factor of GDP and table functions. Self-growth factor of GDP denotes the growth rate of GDP of the current year relatively to the previous year under natural conditions. According to the GDP of Wuhan, the growth rate of GDP from calendar year of 2006 to 2013 was calculated, as shown in Fig 2.

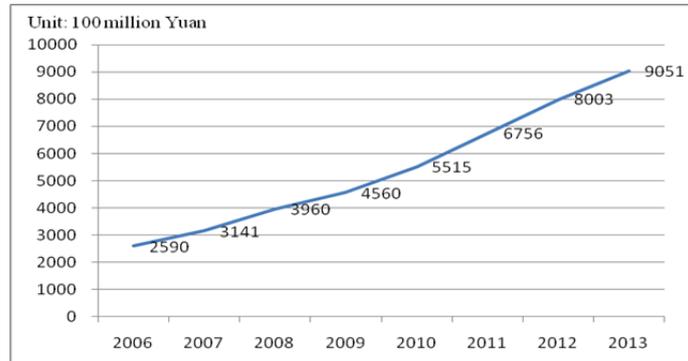

Figure 2 GDP Growth of Wuhan from 2006 to 2013

In recent years, the growth rate of GDP of Wuhan has been 10%~25% and showed an overall rising trend. Because the economic obstacles to the logistics restricted the GDP growth, the actual growth rate was slightly lower. GDP growth factor of Wuhan was set: GDP growth factor = WITH LOOKUP (TIME, [(2006, 0)-(2020, 1)], (2006, 0.21), (2007, 0.2), (2008, 0.15), (2009, 0.2), (2010, 0.22), (2011, 0.18), (2012, 0.12) and (2013, 0.12)).

11) Factor of proportionality of investment in fixed assets. By referring the data of Wuhan from 2006 to 2013, a table function was established and the GDP of Wuhan was set as the independent variable, and the coefficient of investment in fixed assets was set as the dependent variable. Factor of proportionality of investment in fixed assets = WITH LOOKUP (TIME, [(2006, 0)-(2020, 1)], (2006, 0.5), (2007, 0.5), (2008, 0.56), (2009, 0.65), (2010, 0.68), (2011, 0.62), (2012, 0.62) and (2013, 0.66)).

2.3 SD model simulation and analysis

The change tendency of the GDP of Wuhan was analyzed by changing the economic obstacle factor value. The economic obstacle impact factor in Scheme 1 was 0.015; the economic obstacle impact factors in Scheme 2 and Scheme 3 were set as 0.02 and 0.03 respectively. GDP simulation results were shown in Fig 3.

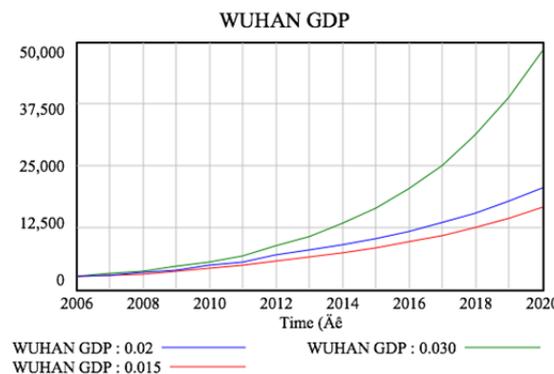

Figure 3 Simulation Results of Different Economic Levels on GDP of Wuhan

According to Figure 3, the simulation results of Scheme 2 had the minimum actual deviation, while the GDP that economic relevance correspond to in Scheme 1 and Scheme 3 had relatively large deviation. Therefore, the correlation coefficient of scheme 2 was more in line with the actual situation and then the economic obstacle amount was adjusted to be 0.02. Similarly, by assuming other variables constant, the conversion factor of actual demand of logistics was changed on the basis of the scheme 2. The results showed that the logistics industry could create more economic value and the biggest GDP, or

have the best effects on the economy of Wuhan and promote the economy to the greatest degree when the entire ability of logistics demand, was satisfied.

3 Conclusions

1) Increasing the proportion of investment in logistics fixed assets can promote logistics supply capacity which means the development of logistics playing a positive role in promoting economic growth. At the same time, it should be noted that such initiatives will likely lead to an oversupply situation in the future for a long period of time, or even result in idle and waste of resources. Therefore, it is significant to grasp the investment proportion of logistics fixed assets. At present, Wuhan logistics demand has developed rapidly. The development of economy can greatly promote the actual demand of the urban logistics, and also enhance the urban logistics supply capacity. Thus, to increase the investment in fixed assets can better improve the logistics supply capacity and reduce logistics backlogs.

2) When all ability of logistics demand is satisfied, logistics industry will create more economic value, and the largest GDP. In order words, it will have the best effect on economy of Wuhan and the most greatly promote the economy of Wuhan.

3) Currently, Wuhan has had a certain scale and system of logistics infrastructure, but there is a certain space for improvement and it urgently needs to strengthen the efficiency of logistics infrastructure. In addition, Wuhan needs to improve logistics technology, especially logistics informationization level. Besides, the system involves many parameters and the change of some key parameters will greatly change the running of the system, so people should further study relevant quantitative indicators and improve the effect of the simulation in the future researches.

Abstract: There are two IT system software development methods named Waterfall and Agile. By the Waterfall, software making starts after all requirements definition of the system is completed. By the Agile software making starts when one of the functions is completed in the system requirements definition. Use of the Waterfall is, but the Agile is sometimes used recently. There is very few research about the man-hour comparison between the Waterfall and the Agile. In this paper, man-hour of the Waterfall and the Agile is compared taking into account the man-hour reduction in the system requirement definition and the man-hour increase in the software making for the Agile. As a result, followings are made clear that 1) The Agile development is advantageous in the case of man-hour reduction in the requirements definition > rework man-hour. 2) In other cases, Waterfall is advantageous. This result surely gives the guideline for the selection of the Waterfall and the Agile.

Key words: IT system; Software development; Agile; Waterfall; Man-hour

1 Introduction

Reduce man-hours in IT system development is an extremely important issue. System development processes consist of those for a system requirements definition and for software development.

1) In a system requirements definition phase, engineers are assigned so as to complete a definition process adequately.

2) In a software development phase, software engineers are assigned so as to complete software development adequately.

There are two major development methods named Waterfall and Agile. In the Waterfall method, the number of engineers assigned for the system requirements definition does not change until the definition completion. As the system requirements are completely defined, software development proceeds very smoothly. In the Waterfall, long time requirements definition causes an increase in man-hours as the initially assigned engineers engage the whole definition process.

In the Agile method, when some requirements definition is completed, software development starts to realize the function whose requirements definition is completed.

Hence, the number of the engineers for requirements definition can be reduced resulting in a man-hour reduction. However, the software developed in advance are sometimes subject to be required to modify by the software developed later. This results in a man-hour increase.

Which is better to reduce man-hours, the Waterfall or the Agile?

To answer the above question, it is necessary to compare man-hours quantitatively between the two.

Up to now, no report can be searched among the preceding research works.

This paper aims to formulate and calculate the man-hours in two methods and to compare the man-hours between the two.

2 Preceding Research Work

The research with which Waterfall and Agile were compared are as follows.

Balaji et al. describe about Waterfall and Agile and analyzes the pros and cons of comparing two software development modelling (S. Balajiet al,2012). The major pros and cons of Waterfall are follows. Pros: requirement is clear before development starts and Cons: the problems with one phase are never solved completely during that phase. On the other hand, Agile are follows. Pros: The most important of the advantages is the ability to respond to the changing requirements of the project and Cons: If it is large, it becomes difficult to judge the efforts and the time required for the project.

Austin highlights, describes and compares both methods of CMM and Agile software development in the fictional company in the Harvard Business Scholl case (R. D. Austin,2007). He explains that

CMM proponents point to the fact that some of the best software organizations in the world use it on their most important projects. On the other hand, Agile advocates suggest that there is a management movement as much as it a development strategy. The keys to Agile are collaboration and commitment in the development team.

White reviews several system dynamics models of the requirements process from the literature (A. S. White, 2013), especially the model of Andersson and Karlsson (C. Andersson, et al, 2001). He proposes a new control-theoretic model of requirements gathering that is devised using the Software Test Model of Cangussu (Ä. W. Cangussu, et al, 2002) as a framework. His result shows that the model can be used to predict an estimate of the possible number of requirements that could be devised for the project. His model can be used to operate in Waterfall, iterative or incremental (Agile) modes by suitable choice of parameters, such as the total number of requirements set at each stage and the number of staff involved.

Indicated above, there are no report which quantified and compared the man-hour of Waterfall and Agile.

3 Formulation and Calculation of Man-Hours

3.1 Setting of prerequisite

Prerequisites are clarified for the formulation and calculation of man-hours as in the following.

1) The IT system development man-hours are defined as the sum of those for the system requirements definition and for the software development.

2) The IT system consists of plural functions.

3) The number of engineers assigned for the requirements definition is as follows.

a. In the Waterfall, the number of engineers does not change from the beginning to the end of the requirements definition,

b. In the Agile, the number of engineers is reduced every time when one of the requirements definition is completed.

4) The software development starts after the full completion of all of the requirements definition in the Waterfall. In the Agile, it starts partially from the software whose requirements definition is completed.

3.2 Man-hour formulation

Here are symbols used in this section.

N: Number of the system functions to develop

R: Total man-hour spent for the completion of requirements definition in the Waterfall

K: Number of engineers assigned for requirement definition

L: Hours spent for requirement definition completion

I: sequential number of system function, $1 \sim n$

R_i: man-hour spent for the requirements definition of the system function i

D_i: man-hour spent for the software making of the function i

P: total man-hour spent for the completion of requirements definition in the Agile

rt: development rework rate

3.2.1 About the waterfall

1) Man-hour for the requirements definition

The number of the functions to be developed was labeled as N. The man-hours (R_i) necessary for requirements definition were expressed as: R₁, R₂, R₃, ..., R_n.

About R: the total requirements definition man-hour

$$R = \sum R_i \quad (1)$$

Also About R: the total requirements definition man-hour

$$R = K * L \quad (2)$$

2) Man-hour for the software development

Development man-hours (D_i) were calculated after the requirements were defined, and were expressed as: D₁, D₂, D₃, ..., D_n.

About D: the total development man-hour

$$D = \sum D_i \quad (3)$$

3) Total development man-hour

Normalization of R values was conducted assuming a requirement-definition man-hour (R₁) equal to 1. D values were rather normalized against a development man-hour (D₁) of 3.5. Consequently,

man-hours of requirements definition and development were found to be in the range of 0.6 - 1.4 and 1.5 - 5.5, respectively. Man-hours of requirements definition were defined as the man-hours needed during the "requirements definition phase". Man-hours of development referred to the man-hours needed for basic system design, program design, programming and the program unit test phase.

The sum of the man-hours of Waterfall are calculated based on the following equation:

4) Total development man-hour

Normalization of R values was conducted assuming a requirement-definition man-hour (R1) equal to 1. D values were rather normalized against a development man-hour (D1) of 3.5. Consequently, man-hours of requirements definition and development were found to be in the range of 0.6 - 1.4 and 1.5 - 5.5, respectively. Man-hours of requirements definition were defined as the man-hours needed during the "requirements definition phase". Man-hours of development referred to the man-hours needed for basic system design, program design, programming and the program unit test phase.

The sum of the man-hours of Waterfall are calculated based on the following equation:

$$\sum_{i=1}^n Ri + Di \tag{4}$$

3.2.2 About the agile

1) Man-hour for the requirements definition

Let us take the 1st requirements definition man-hour to be $K \times L/N$,
the 2nd requirements definition man-hour as $(K - K/N) \times L/N$,
and the 3rd requirements definition man-hour as $(K - 2K/N) \times L/N$.

Every time one requirement definition ends, personnel are reduced. In this study, it is assumed that the requirements definitions for the man-hour of one function or a collection of functions are equivalent. In addition, it is developed from the function of solidified requirements, and there is no change in the requirements for the development that has been started, since it has already been verified.

From the above concept, the total requirements definition for man-hour of Agile development is the following equation:

$$(K - (i-1) K/N) * L/N \quad (i=1, 2, 3, \dots, N) \tag{5}$$

About P: man-hour spent for the completion of requirements definition in the Agile

$$P = \frac{\sum_{i=1}^n (K - \frac{(i-1)K}{N}) \times L}{N} \tag{6}$$

2) Man-hour for the software development

Next, the necessary cases for rework in Agile development are listed as follows, while their countermeasures are considered:

① Rework is considered as the mutual use between the developed modules

Based on the above concept, the calculation method of rework of man-hour has to be examined, in which the design changes to the pre-developed modules by the definition of the other user requirements occurs after the development has been started as a user requirement has been defined. A module is a collection of programs to be developed. The Agile development man-hour in this case is calculated as the rework man-hour in consideration of the mutual use of the inter-developed module rather than a change of requirements. As shown in Table 1, the mutual design change percentage is given as a development rework rate $a = 0 \sim 100\%$ in the development man-hour $Di = (D1, D2, D3, \dots, Dn)$.

a. Definition of rework rate r_{ji}

This rework rate is considered in i -th development rework rate that influenced by subsequent j -th software development.

b. Man-hour of development rework

For rework man-hour, the development man-hour is considered as A_{ij} , in which j -th Agile development influences the i -th single Agile development man-hour D_{ii} , so the rework man-hour for the i -th development man-hour is considered to be the following equation:

$$A_{ij} \quad (j = 1 \sim i-1, i + 1 \sim n) \tag{7}$$

For convenience, A_{ij} occurs equally in all development stages of the requirements and is also calculated as following equation:

$$A_{ij} = Di * r_{tj} \tag{8}$$

c. Total development man-hour

The sum of the man-hours of Agile are calculated based on the following equation:

$$P + \sum A_{ij} \tag{9}$$

Table 1 Calculation Method of Rework Man-Hour in Agile Development

Items							Total man-hour
Number of functions (N)	N=1	N=2	N=3	•	•	N=n	
Number of requirements (Ri)	R1	R2	R3	•	•	Rn	
Man-hour of requirements definition	1	0.6-1.4	0.6-1.4	•	•	0.6-1.4	$\sum_{i=1}^n Ri$
Number of development (Di)	D1	D2	D3	•	•	Dn	
Man-hour of development	3.5	1.5-5.5	1.5-5.5	•	•	1.5-5.5	$\sum_{i=1}^n Di$
Total man-hour of Waterfall (Ri+Di)	4.5	2.1-6.9	2.1-6.9	•	•	2.1-6.9	$\sum_{i=1}^n Ri + Di$
Development rework rate (rt)	← Rework →						10%-100%
Rework man-hour (Aij)	D1*rt	D2*rt	D3*rt	•	•	Dn*rt	$\sum Di * rt$

As explained above, normalization of R value was conducted assuming a requirement-definition man-hour (R1) equal to 1, and ranged from 0.6 to 1.4. Normalization of D value was also conducted assuming a development man-hour (D1) equal to 3.5, and ranged 1.5 to 5.5. To date, almost no research has been conducted regarding to those value normalizations. These normalized values can be set freely in a simulation tool to be described later. In this study, we assumed these values from the empirical observation of the past (S. Komai,et al,2011)-(S. Komai,et al,2014).

②Rework for program error corrections discovered by system test

The systems test in Waterfall is generally conducted after the development, but the system test in Agile is conducted several times for every collection of requirements, and provides feedback with efficient improvements to the development work with the obtained knowledge or experience (H. Kniberg,2013). Regarding efficiency, the system test man-hour is added to Table 1, and it is possible to expand and consider in order simulating. However, the digitization of knowledge and experience are very difficult. When analyzing data while grasping the actual testing man-hour from many cases, it seems possible, and is considered as future work.

③Rework about compatibility of the middleware

This is the rework of the wasteful man-hour for the partially advanced development. It has been revealed that the usage of the middleware is improper as progress of requirements definition, and change to new middleware forms as the development progresses using the middleware. Since the development does not start until the requirements definition is completely settled in Waterfall, the wasteful development man-hour about the change of the middleware does not occur. However, a redo of the requirements definition about change in the middleware occurs equally. In addition, it is a difficult issue about the judgment and the timing, where the usage of middleware is improper. This point is also made an issue for future study.

The possibility of the following rework is said that all Waterfall is similar.

④Rework in the case of the rework above-mentioned 2) affects the other applications in development.

This occurs in the case of the association between subsystems is high and dividing the development team for each of the subsystems. Moreover, this is the rework which occurs under the conditions to develop it by more than one development team at the same time to one requirements definition.

⑤Rework to the requirements definition that has been discovered in the basic system design

⑥Rework for program error discovered on a program unit test

⑦Rework for program error corrections discovered on the user acceptance test

⑧Rework for program quality requirements improvement pointed out on the user acceptance test

⑨Rework for quality requirements improvement related program design, basic system design, and requirements definition

⑩Rework for program error corrections discovered in system test after a vendor offered middleware substitution for a middleware malfunction correction

⑪Rework between the middleware and application

As for the behavior when application (program) gives the middleware a parameter, the following two points are considered a parameter error.

It is included in a programming man-hour where middleware checks it and returns it to a programmer as an error b Mistake of the parameter Program error is often not found in the program unit test because middleware returns the wrong data when a programmer gives the middleware a wrong parameter. Therefore, it is discovered as a program error in the system test, user acceptance test, or the operational phase.

3.3 Calculation results

Therefore, rework man-hour of Agile development was considered the contents examined by the above item 4.5.1, then the following parameter were set in Agile Waterfall Simulation Table-I (AWST-I), which was built based on the manner of thinking explained by the above and a calculation result is gained.

- N: number of functions = 60
- R2 or later: the second and subsequent requirements definition man-hour = 1
- D2 or later: the second and subsequent development man-hour = 3.5
- rt: development rework rate = 12%

Table 2 Agile Waterfall Simulation Table-I

25		60	60	60	60	60	60	60	60	60	60	60	60	60	60	60
26	Agile manpower	1	0.2167	0.2000	0.1833	0.1667	0.1500	0.1333	0.1167	0.1000	0.0833	0.0667	0.0500	0.0333	0.0167	
27	Σ agile manpower	1	29.2	29.4	29.58333	29.75	29.9	30.03333	30.15	30.25	30.33333	30.4	30.45	30.48333	30.5	
28	(K - (1-K)/N) x L/N	1	0.2167	0.2000	0.1833	0.1667	0.1500	0.1333	0.1167	0.1000	0.0833	0.0667	0.0500	0.0333	0.0167	
29	Σ Agile manpower	1	29.2000	29.4000	29.5833	29.7500	29.9000	30.0333	30.1500	30.2500	30.3333	30.4000	30.4500	30.4833	30.5000	

Based on the above results, in the case of the requirements definition, man-hour Waterfall is 60 man-months, requirements definition man-months of Agile becomes 30.5 man-months, and man-months reduction in the requirements definition of Agile: the 60-30.5 = 29.5 man-months. On the other hand, the Agile rework man-hour in this setting value is 25.2 man-months. Thus, from this result the Agile development is advantageous to the extent that it holds the "man-hour reduction in the requirements definition > rework man-hour."

The above Table 2 Agile Waterfall shown in Simulation Table-I (AWST-I) was created to determine the suitability of Waterfall or Agile. Next, new table is created in which the number of functions is set in a constant, and R2 or later 0.6-1.4 (0.1 increments), D2 or later 1.5-5.5 (0.5 increments), and rt 10% -100% (10% increments) are set for changing by 8100 lines shown Table 3.

- In this table, the calculation results are obtained as below in the range of the following settings.
- R2 or later: the second and subsequent requirements definition man-hour = 1
- D2 or later: the second and subsequent development man-hour = 3.5

Table 3 Agile Waterfall Simulation Table-II

The man-hour calculation results of Waterfall are:
 Total Requirements Definition man-hour of Waterfall = 60 Man-months
 Total Development man-hour of Waterfall = 210 Man-months
 Total software development man-hour of waterfall = 270 Man-months
 The man-hour calculation results of Agile are:
 Total Requirements Definition man-hour of Agile = 30.5 Man-months
 Rework is increased depending on Development work change rate (a) x Development work influence rate (b) from 2.1 man-months to 210 man-months.
 The graph is created from the above calculation result as follows.

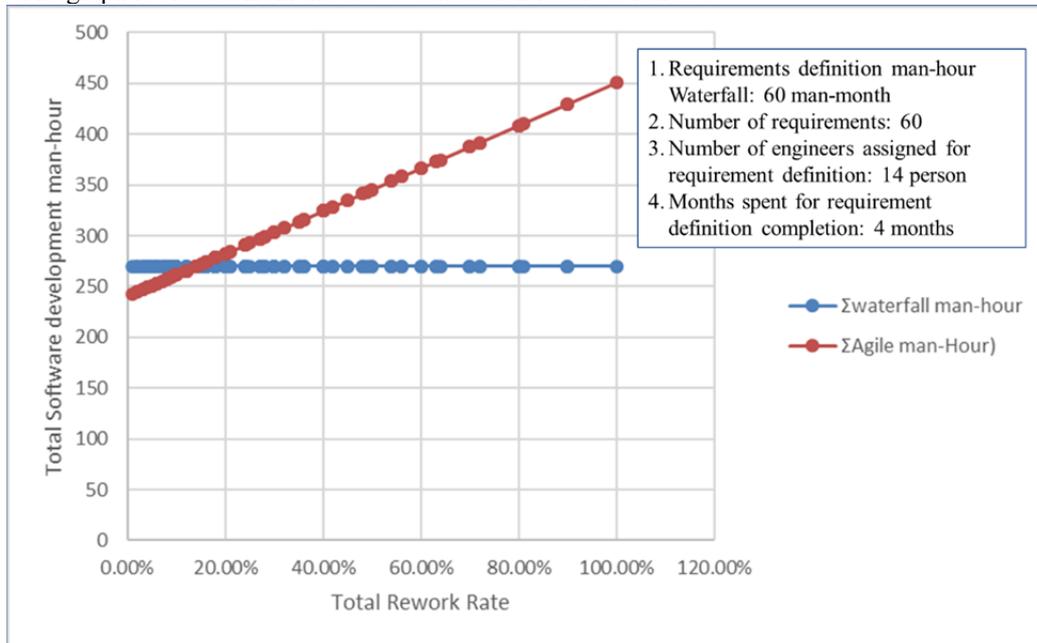

Figure 1 Man-hour Comparison of Waterfall and Agile

4 Discussion

4.1 Conditions that Waterfall is advantageous

A parameter in Table 2 was changed, and the condition that Waterfall becomes profitable was examined. If the Waterfall is advantageous, it is in the range that holds true man-hour reduction (29.5 man-months in Table 2) = < total rework man-hour in the requirements definition of Agile. The following list presents the conditions.

5.1.1 Condition 1: In the case of fixing requirements definition man-hour and development man-hour, then setting rt: development rework rate highly.

For example, Waterfall becomes advantageous in the case of Agile rework man-hour becomes 33.6 man-months for rt: development rework rate = 16%.

5.1.2 Condition 2: In the case of fixing rt: development rework rate, then setting development man-hour of D2 or later highly

For example, Waterfall becomes advantageous in the case of Agile rework man-hour becomes 32.4 man-months for development man-hour of D2 or later = 4.5.

5.1.3 Condition 3: Hybrid type of above condition 1 and 2

For example, Waterfall becomes advantageous in the case of Agile rework man-hour becomes 36 man-months for the development man-hour of D2 or later = 4, rt: development rework rate = 12%.

4.2 Validation of IT system development methods

The results shown above were validated by using three advanced IT system development methodologies. Waterfall and Agile man-hour calculations were examined. Parameters related to the estimation of man-hour based on a development scale are listed in table 3.

Table 3 Parameters Influencing Man-Hour in IT System Development

Parameters	System 1	System 2	System 3
K: personnel number of requirements definition	2	2	17
L: period of requirement definition (month)	1.1	3.5	6
N: number of functions	3	11	102
Requirements definition man-hour (R2, R3, ---, Rn)	0.6	0.6	1
Development man-hour (D2, D3, ---, Dn)	2	2	5
Development rework rate (rt)	6%	12%	12%

4.2.1 Validation of System 1

When parameter N=3, R2 or after = 0.6 or D2 or after = 2, rt =6% are given to AWST, requirements definition man-hour = 2.2 man-months (K = 2 men * L = 1.1 months) and the development man-hour is 6 man-months of Waterfall. On the other hand, the rework man-hour of Agile is 0.36 man-months, and requirements definition man-months of Agile are 1.47 man-months. From the result, man-hour reduction in the requirements definition of Agile is 2.2 man-month - 1.47 man-months = 0.73 man-month > rework man-hour of Agile is 0.36. Thus Agile development becomes advantageous.

4.2.2 Validation of System 2

When parameter N=11, R2 or after = 0.6 or D2 or after = 2, rt =12% are given to AWST, requirements definition man-hour = 7 man months (K = 2 men * L = 3.5 months) and the development man-hour is 22 man-months of Waterfall. On the other hand, the rework man-hour of Agile is 2.64 man-months, and requirements definition man-months of Agile are 3.82 man-months. From the result, man-hour reduction in the requirements definition of Agile is 7 man-month - 3.82 man-months = 3.18 man-month > rework man-hour of Agile is 2.64. Thus Agile development becomes advantageous.

4.2.3 Validation of System 3

When parameter N=101, R2 or after = 1 or D2 or after = 5, rt =12% are given to AWST, requirements definition man-hour = 102 man months (K = 17 men * L = 6 months) and the development man-hour is 510 man-months of Waterfall. On the other hand, the rework man-hour of Agile is 61.2 man-months, and requirements definition man-months of Agile are 51.5 man-months. From the result, man-hour reduction in the requirements definition of Agile is 102 man-month - 51.5 man-months = 50.5 man-month > rework man-hour of Agile is 61.2. Thus Waterfall development becomes advantageous.

5 Conclusions

This work elaborated on the characteristics of two development methods: Waterfall and Agile. The methods were compared by estimating the total man-hours associated with both. In a nutshell, the

following conclusions were made:

1) Agile development was found to be best described as a method that allowed design and software development to proceed in the order that the system requirements are established.

2) Waterfall development was found to describe a process whereby system design and software creation commenced after all requirements were defined.

3) The rework associated with Agile was enumerated comprehensively. Countermeasures were considered; and rework was found to result primarily from concomitant processes as modules were contrived.

4) An Agile-Waterfall simulation table was built, in which rework man-hours were integrated. This enabled the alteration of this parameter, along with the sum of development man-hours to compare the two methodologies with confidence.

5) The results showed that Agile development was advantageous provided that the reduction of man-hours in the requirement-definition phase exceeded rework man-hours. In cases whereby rework man-hours were too many, Waterfall was found to result in fewer man-hours overall.

The findings of the present work could serve as an invaluable guide for engineers to select the proper development methodologies for various systems.

Ranking Critical Success Factors for Sustaining Total Quality Management Implementation in Sudan

Sharaf Eldin Hamed Ahmed, Sha'ri Mohd. Yusof
RAZAK School for Engineering and Advanced Technology, University Technology Malaysia (UTM),
K.L, Malaysia
(E-mail: sharafageed@gmail.com, shari@utm.my)

Abstract: Sudan is in the process of transforming its industry to be globally competitive. One of the efforts needed is in enhancing its quality programs through continuous improvement and total quality approach. This study aims to rank the several critical success factors (CSF's) for sustaining TQM implementation in Sudan. The main objective is to identify major criteria to be considered in sustaining of total quality management implementation among Sudanese companies. In this study a comprehensive literature review was done to determine the critical success factors and to develop initial CSFs hierarchy model for sustaining total quality management implementation in Sudan. Analytic Hierarchy Process (AHP) is used for evaluating and ranking the determined CSF's. The findings of study highlight some key barriers affecting the sustainability of TQM implementation and proposes conceptual model using AHP approach for sustaining TQM implementation in Sudan.

Key words: Total quality management; Critical success factors; AHP; Sudan

1 Introduction

Total quality management (TQM) is a management philosophy that empowers every member of the organization. TQM encourage each individual to participate, contribute and offers to present suggestions for improvement. It is intended to promote continuous and sustained improvement in quality and performance, and develops an attitude of quality culture (Talib et al., 2012). TQM address overall organizational performance and recognizes the importance of processes (Seetharaman et al., 2006). For TQM to be successfully adopted by an organization there needs to be a perceived need for change in that organization. From past few decades, TQM has been extensively discussed in the literature and can be seen as a management philosophy characterized by its principles, practices, and strategies that emphasizes upon continuous improvement in quality, increased involvement of employees, commitment of top management, employee empowerment, teamwork, benchmarking, leadership, rewards and recognitions, feedback and relationship with suppliers (Dean and Bowen, 1994; Rönnbäck and Witell, 2008).

TQM has been studied by a few researchers in Sudan. Most of the research in Sudan has focused on describing the implementation, importance, and effect of TQM in various sectors. Faysal Bashir (2010), attempt to investigate the impact of implementing quality management system (ISO 9001) on the improvement of institutional performance in Sudan Customs Authority through the examining the nature of relation between the application of quality management system and the improvement of institutional performance, the study proves the positive relationship between QMS implementation and institutional performance. Omer Abd Allan (2013), conduct study on QMS in Holy Quran and Sunnah and its Implementation using a case study views and opinions of staff members in Sudanese Universities. There is a lack of study relating to the critical success factors effecting the effectiveness and continuous improvement of TQM implementation in Sudan. Critical success factors (CSFs) are those few things that must go well to ensure success, those areas in an organization which help to provide satisfactory results and ensure the organizational competitive performance, (Zmud and Pun et al 1984, Joyce and Green, 2006). According to Horng and Huarng, (2002) CSFs are those key factors that must be analyzed by the organization or those areas that will help to yield greatest competitive influence. Specification and measurement of the critical factors of quality management permit managers to obtain a better understanding of quality management practices and allow researchers to proceed with the task of developing and testing theories of quality management, and to examine certain hypotheses concerning quality management. (Badri and Masood A, 1995).

Although some surveys, group discussion events and official reports conducted by some Sudanese companies and quality and excellence experts have identified barriers and critical success factors facing implementation and continual improvement of TQM in Sudanese companies there is no existing research taking a holistic view to determine, prioritize and ranking the critical success factors for sustaining TQM implementation in Sudan. This study aims to rank the several critical success factors (CSF's) for sustaining TQM implementation in Sudan. The main objective is to identify major criteria to be

considered in sustaining of total quality management implementation among Sudanese companies. Figure.1 illustrates all the factors and sub factors identified by the comprehensive literature review for sustaining TQM implementation in Sudan.

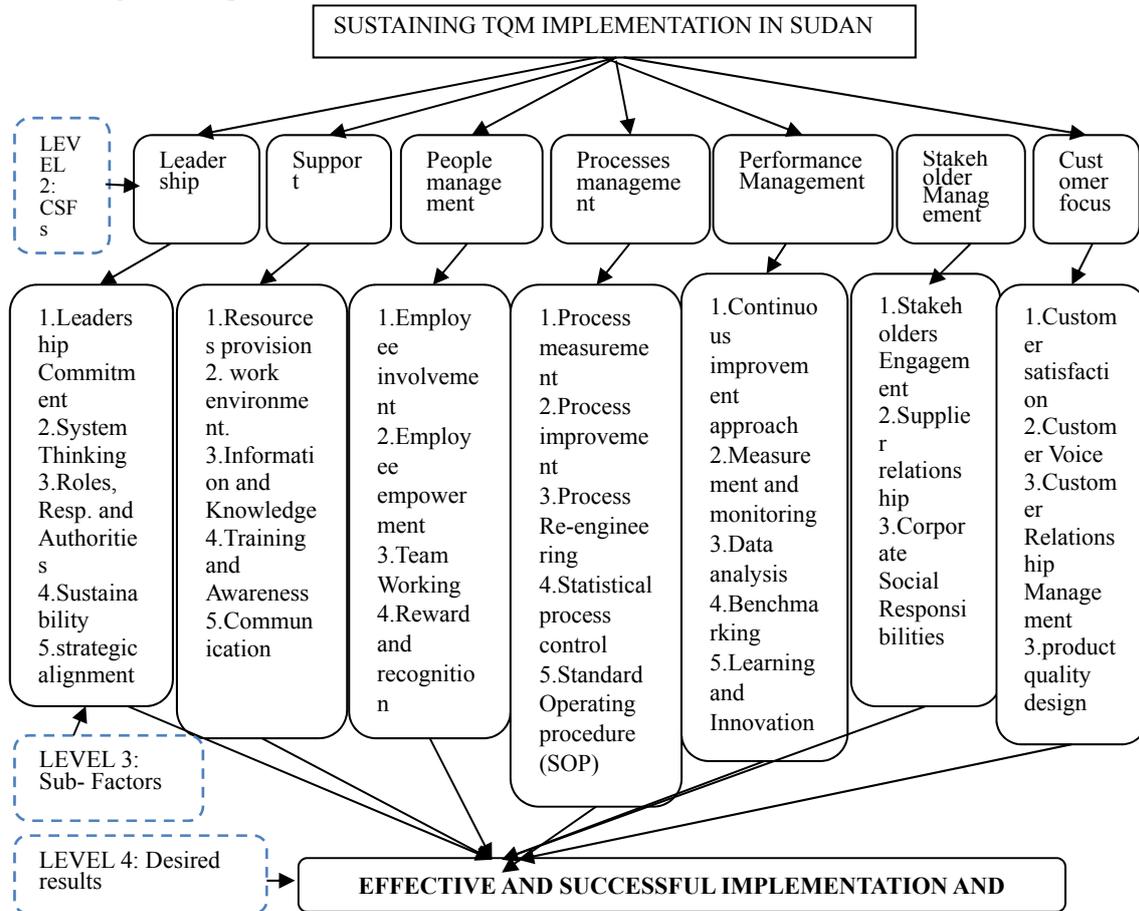

Figure 1 The Factors and Sub Factors For TQM in Sudan

2 Methodology

There are currently three major research paradigms in education (and in the social and behavioral sciences). They are quantitative research, qualitative research, and mixed research (Tashakkori and Teddlie, 2003). The difference between qualitative and quantitative methods is generally described in terms of the type of data collection: the quantitative method involves numerical data and statistical analysis while the qualitative method collects descriptive data for interpretation analysis. The qualitative method focuses on patterns of inter-relationships between a previously unspecified set of concepts, while the quantitative way narrowly looks through a specified set of variables (Brannen, 1992). Mixed method studies combine qualitative and quantitative approaches within different phases of the research process. It would neutralize the biases of any single method, provide insight into different levels or units of analysis enhance the research validity since it provides the opportunity to corroborate findings from different perspectives (Tashakkori and Teddlie, 1998, Denscombe, 2003). The qualitative method will direct the quantitative method and the quantitative method gives the feedback into the qualitative discussions for further validity improvement. The research process in this study therefore included mixed method studies for qualitative and quantitative approaches within different phases to ensure the accurate and precise research process. Table 1. Outlines the research process.

This study involved reviewing and understanding the concept of continuous improvement, and identifying critical success factors, through a study of theories and research in this area. The author employed various methods in an attempt to determine CSFs and continuous improvement methodologies. Literature review was employed and questionnaires was developed and Delphi method was used to collect empirical information and data and to obtain experts judgment by consulted experts therefore the experts

from different fields from Sudan were selected.

Table 1 The Research Process

Research Activities	Research process	Research method(s)
1. To determine critical success factors and barriers for sustaining total quality management implementation in Sudan.	Phase 1	<ul style="list-style-type: none"> • Literature studies • Content analysis • Related Print media • Academic and trade journal, • Delphi Technique (Round one and two)
2. To identify major criteria to be considered in sustaining of total quality management implementation in Sudan	Phase 2	<ul style="list-style-type: none"> • Delphi Technique (Round three) AHP

The Delphi process is a ‘structured process for collecting and distilling knowledge from a group of experts by means of a series of questionnaires interspersed with controlled opinion feedback’ (Ziglio, 1996, p.3). A key characteristic of the method is its use of experts, whose responses remain anonymous throughout a series of iterative questionnaire rounds. The controlled feedback during these rounds includes details of the collective group opinion, and it allows experts to either retain or amend their earlier opinions in light of information about other experts’ views. McKenna (1994) describes Delphi as a multi-stage process, built around iterations. Van Zolingen and Klaasen (2003) discuss that through iteration, data collection and feedback continue until a stability of responses has been reached. Brockoff (1975) reports that whilst the number of rounds is variable, Delphi studies seldom go beyond two iterations (3 rounds).

Chan and Chen, (2009)	TQM	Analytical Hierarchy Process (AHP)	This study aimed to develop TQM measurement model for the biotechnology industry in Taiwan to enact quality improvement.
Manish Kumar Sagar and Amit Singh Tomar, (2014)	TQM	Delphi/AHP	The purpose of the paper is to rank and review the various critical success factors (CSF’s) of total quality management (TQM) in favor of Indian manufacturing industries for improving product and process quality.
Alireza Yazdani, Mohammad Ali Soukhakian, Mohammad Reza Mozaffari (2013)	Total Quality Management	Delphi/AHP	The research aims to answer two main questions: 1. What critical success factors in the implementation of Total Quality Management are proposed in Pars Oil and Gas Company? 2. What is the priority of critical success factors in the implementation of Total Quality Management based on different levels of management’s perspective?
Nilda Tri Putri, Sha’ri Mohd. Yusof and Dradjad Irianto, (2011)	Quality Engineering	Delphi/AHP	The paper aims to present the critical success factors (CSFs) and to develop a self-assessment tool of quality engineering (QE) implementation for Malaysia and Indonesia automotive industries based on the CSFs identified.

AHP is a multi-criteria decision-making method that uses a hierarchical structure to solve

complicated, unstructured decision problems, especially in situations where there are important qualitative aspects that must be considered in conjunction with various measurable quantitative factors, AHP has been applied in different fields such as management, engineering, industry, education, etc. (Kamal and Al-Harbi, 2001). (AHP) proposed for the first time by Thomas L. Saaty in 1970. This method is based on the pair-wise comparisons and is capable to examine different conditions. Since AHP is simple and comprehensive, it is the subject of current research and development efforts (Saaty, 1991). Analytic Hierarchy Process (AHP), since its development, has been a tool at the hands of decision makers and researchers; and it is one of the most widely used multiple criteria decision-making tools. Many outstanding works have been published based on AHP: they include applications of AHP in different fields such as planning, selecting a best alternative, resource allocation, resolving conflict, optimization, and numerical extensions of AHP (Vargas, 1990).

In this study, DHP, which have commonly been used to mean the same class of models, is the chosen approach, because CSFs is a discrete decision, where there is a discrete set of alternatives and in which each can be described by some criteria. Thus, a DHP for selecting CSFs and CI methodologies would attempt to develop an integrated framework for continual improvement by providing a step-by-step process. Table 2 show the previous researches using DHP

3 Ranking the Critical Success Factors

The DHP processes used in this study consists of three rounds of survey conducted with nine industrial and academic experts consisting of practitioners and academics with more than six years of working experience and research in TQM field. In the first round the panel of experts was asked to validate the factors of the preliminary theoretical framework of CSFs which attained from literature review in order to obtain further study by expert's panel. Semi- structured interview was conducted with selected experts. This interview aims to collect data for round 1 DHP method. The main objective of the second round of Delphi technique is to obtain the consensus amongst the experts in terms of the final AHP model of CSFs for effective implementation of TQM and continuous improvement. The experts' panel were asked to review the revised AHP model, after adjustments and changes were made to the model (figure 1), using e-mail and visit with interview. All the experts participated in this round and agreed with the revised hierarchy model of critical success factors for effective implementation of TQM and continuous improvement.

In the last round of Delphi technique, the expert panel were asked to determine the relative scales of a given list of critical factors and sub factors affecting the implementation and continuous improvement of TQM in Sudan in a pair-wise fashion. The pair-wise was constructed by using Saaty (1988), point scale and score. All expert panel members were participated in this round. The participants assessed the pairwise comparison among seven CSF and related thirty-one factors as output of Delphi round one and two, and lastly a series of judgment matrices for the critical factors and sub factors were attained. To conduct Delphi round three, the importance weight or relative weights to critical factors and sub factors were calculated. A pair wise comparison matrix was developed to calculate "weights" which involved the relative significance among the criteria in the second level of the hierarchy. Expert choice software used to determine the ranking of critical factors and sub factors. By using this software, the researcher can obtain the local and global priority weight. The local priority weight is relative to the parent elements, whereas global priority weight is relative the goal.

The local weight is the priority of an element related to the preceding element and it is first calculated. Meanwhile, the global weight of each element related to the goal of sustaining TQM implementation in Sudan was calculated by multiplying the local weight of an element by the weight of its preceding element. Tables 2 shows the normalized local weights of judgment and ranking for criteria and sub criteria form expert panel. After that the consistency ratio (CR) was calculated to measure how consistent was the judgment given by experts' panel. CR indicates how consistently respondents compared criteria. According to Saaty (1987) who developed the AHP, a CR of .10 or less is considered acceptable. As illustrated in Table 4.4, overall pairwise comparisons were consistent (CR= .044). This means that the overall consistency of evaluator judgments falls within the Saaty (1988) suggested ratio of 0.10

Table 3 Normalized Local Weights of Judgment and Ranking for Criteria

TQM implementation and continuous improvement (CR= 0.044)	Weights	Ranking
Leadership	0.386	1
Support	0.036	7
People Management	0.083	5
Process Management	0.158	3
Performance Management	0.208	2
Stakeholder Management	0.047	6
Customer Focus	0.083	4

Table 3 summarizes the priorities of criteria for categories and sub-categories. The geometric mean was then used to synthesize the assessment of each evaluator. The results form geometric mean of evaluators was combined into judgment matrixes of pair wise comparison. Appendix C shows the judgment matrixes and evaluation results. As per findings, the consistency ratio for these matrixes falls under 0.10, which means that the results are within the acceptable level of 0.10 according to the consistency ratio.

Table 4 Normalized Local Weights of Judgment and Ranking for Criteria and Sub Criteria Form Expert Panel

Level 1	Weights	Level 2	Weights	Ranking
Leadership	0.386	- Leadership Commitment	0.479	1
		- System Thinking	0.165	2
		- Roles, Resp. and Authorities	0.130	4
		- Sustainability	0.084	5
		- strategic alignment	0.142	3
Support	0.036	- Resources provision	0.068	5
		- work environment	0.107	4
		- Information and Knowledge	0.291	2
		- Training and Awareness	0.387	1
		- Communication	0.146	3
People Management	0.083	- Employee involvement	0.487	1
		- Employee empowerment	0.065	4
		- Team Working	0.283	2
		- Reward and recognition	0.165	3
Process Management	0.158	- Process measurement	0.252	2
		- Process improvement	0.292	1
		- Process Re-engineering	0.058	5
		- Statistical process control	0.252	3
		- Standard Operating procedure (SOP)	0.145	4
Performance management	0.208	- Continuous improvement approach	0.439	1
		- Measurement and monitoring	0.111	4
		- Data analysis	0.074	5
		- Benchmarking	0.133	3
		- Learning and Innovation	0.242	2
Stakeholder Management	0.047	- Stakeholders Engagement	0.684	1
		- Supplier relationship	0.205	2
		- Corporate Social Responsibilities	0.111	3
Customer Focus	0.083	- Customer satisfaction	0.399	2
		- Customer Voice	0.405	1
		- Customer Relationship Management	0.119	3
		- Product quality design	0.077	4

The following section discusses relative weights of each criterion for categories and sub-categories based on priorities calculated. Table 4.6 shows the ranking of the critical factors based on local weights.

Level Two: For main categories of CSFs, Leadership (0.386), is the most important factor, followed by Performance Management (0.208), Process Management (0.158), Customer Focus (0.083), People

Management (0.083), and Stakeholder Management (0.036) based on global weights calculation the results show that the most important sub factors effecting the implementation and continuous improvement of TQM in Sudanese companies were Leadership, Performance Management and Process Management. It is observed that Customer Focus (0.083), People Management (0.083), get same weights and placed at the fourth and fifth rank, This may indicate that evaluators do not agree with which one is more important than the other, followed by Stakeholder Management (0.047). Meanwhile the least influential factor is Support (0.036).

Table 5 The Ranking of the Critical Factors Based On Local Weights

Criteria	Weights	Ranking
1. Leadership	(0.386)	1
2. Performance Management	(0.208)	2
3. Process Management	(0.158)	3
4. Customer Focus	(0.083)	4
5. People Management	(0.083)	5
6. Stakeholder Management	(0.047)	6
7. Support	(0.036)	7

Table 6 Summary of Ranking from 31 Sub Factors Based on Local Weights

Criteria	Priority
Leadership (CR= 0.027)	
1. Leadership Commitment	0.479
2. System Thinking	0.165
3. strategic alignment	0.142
4. Roles, Responsibilities. and Authorities	0.130
5. Sustainability	0.084
Performance Management (CR= 0.011)	
1. Continuous improvement approach	0.439
2. Learning and Innovation	0.242
3. Benchmarking	0.133
4. Measurement and monitoring	0.111
5. Data analysis	0.074
Process Management (CR= 0.015)	
1. Process improvement	0.292
2. Process measurement	0.252
3. Statistical process control	0.252
4. Standard Operating procedure (SOP)	0.145
5. Process Re-engineering	0.058
Customer Focus (CR= 0.017)	
1. Customer Voice	0.405
2. Customer satisfaction	0.399
3. Customer Relationship Management	0.119
4. Product quality design	0.077
People Management (CR= 0.034)	
1. Employee involvement	0.487
2. Team Working	0.283
3. Reward and recognition	0.165
4. Employee empowerment	0.065
Stakeholder Management (CR= 0.017)	
1. Stakeholders Engagement	0.684
2. Supplier relationship	0.205
3. Corporate Social Responsibilities	0.111
Support (CR= 0.017)	
1. Training and Awareness	0.387
2. Information and Knowledge	0.291
3. Communication	0.146
4. work environment	0.107
5. Resources provision	0.068

Leadership: Leadership commitment was the most important criterion, the next most important

criterion for leadership is, system thinking, followed closely by strategic alignment and roles, responsibilities and authorities, sustainability was least important.

Measurement, Analysis and Improvement: For measurement, analysis and improvement, continuous improvement approach was the most important criterion followed by learning and innovation. Benchmarking, measurement and monitoring received the next highest importance ratings. Data analysis was least important for.

Process Management: With regard to process management, Process improvement is the most important sub factor. Process measurement, Statistical process control were the next most important criteria with their priorities similar to each other. This indicates that relative importance of these two criteria for process management are similar. Followed by Standard Operating procedure (SOP). Process Re-engineering was least important.

Customer Focus: For the customer focus category, customer voice and customer satisfaction were two major criteria for customer satisfaction, subsequently customer relationship management and followed by product quality design.

People Management: With respect to people management, employee involvement is the most important sub factor. Followed by team working and reward and recognition, employee empowerment was least important.

Stakeholders Management: For stakeholder management, stakeholders' engagement, is the most important sub factor, followed by supplier relationship and corporate social responsibilities.

Support: Regarding to support, Training and Awareness and Information and Knowledge are the most important two sub factor, the priorities of Communication and work environment indicate that these criteria were less important for support, compared to other criteria. Resources provision was relatively unimportant compared to other criteria in the support category. Table 5 shows the summary of ranking from 31 sub factors based on local weights.

The results of global weights calculation for 31 sub factors in Table 6 show that the ten most important sub factors are leadership commitment, continuous improvement approach, system thinking, strategic alignment, learning and innovation, roles, responsibilities and authorities, process improvement, employee involvement, process measurement and statistical process control.

Table 7 The Ranking of the Sub Factors on Global Weights

Sub Factors	Global Weights	Ranking
Leadership Commitment	0.185	1
Continuous Improvement Approach	0.091	2
System Thinking	0.064	3
Strategic Alignment	0.055	4
Learning and Innovation	0.050	5
Roles, Resp. And Authorities	0.050	6
Process Improvement	0.046	7
Employee Involvement	0.040	8
Process Measurement	0.040	9
Statistical Process Control	0.040	10

4 Conclusions

After the validation through Delphi hierarchy process methodology, the seven factors and thirty-one sub factors have been proposed to be critical to the effectiveness, continuous improvement and sustaining in Sudan. Based on all experts the three most critical factors to achieve effective and continuous improve TQM implementations in Sudan are:

1) Leadership (with its sub factors i.e. Leadership Commitment, system Thinking, strategic alignment, roles, responsibilities and authorities and sustainability),

2) Performance Management (with its sub factors i.e. continuous improvement approach, learning and Innovation, benchmarking, measurement and monitoring and data analysis),

3) Process Management (with its sub factors i.e. Process improvement, process measurement, statistical process control, standard operating procedure (SOP) and process re-engineering).

In this study, comprehensive CSFs criteria for sustaining TQM implementation in Sudan were collected and structured into an AHP criteria model in the form of a hierarchy, based on judgment of panel of industrial and academic Sudanese experts. The top level of the proposed hierarchical structure was Sustaining TQM implementation in Sudan, which is to provide effective and successful implementation

and improvement of TQM in Sudan.

At the next level there were seven main factors which are: 1) leadership, 2) Support 3) people management, 4) process management, 5) performance management, 6) stakeholder's management, and 7) customer focus. Based on AHP, relative priorities of factors, sub-factors, and criteria were determined using a pairwise comparison. Leadership was the most important factor in achieving sustained TQM implementation goal, followed by performance management and process management. Hence these three factors must be considered as a main element of proposed framework for sustaining TQM implementation in Sudan. People management and customer focus get the same ranking at fourth rank there for people and customer involvement can be considered vital factors for supporting TQM suitability in Sudan. Unexpectedly the support gets the least ranking and under the supporting the work environment and resources provision get the lowest ranking based on global weight calculation, this indicates that the provision of required resources has little or no effect in sustaining TQM implementation.

In the third level there are sub-factors for every main factor. Under Leadership there are leadership commitment, system thinking, roles, resp. and authorities, sustainability and strategic alignment. By using the AHP methodology it was found that the leadership commitment most important sub-factor in sustaining TQM implementation in Sudan under leadership category, system thinking and strategic alignment.

The results also show that the four most critical sub factors to sustain TQM implementation in Sudan are leadership commitment, continuous improvement approach, system thinking and strategic alignment. Based on the result we can conclude that the leadership commitment, measurement and monitoring, continuous improvement, system thinking and learning and innovation can play an important role in sustaining TQM in Sudan. This supports the opinions of experts that the lack of measurement, monitoring and simple and practical approach is one of the key barriers affecting the sustaining of TQM implementation in Sudan. Meanwhile corporate social responsibilities, work environment and resources provision were the three least important factors for sustaining TQM implementation in Sudan. It also indicates the importance of focusing on continuous improvement projects and events that support the strategic alignment and achieving sustainable excellence. This is supported by Process improvement, Process measurement and Statistical process control which were most important for process management.

Customer Voice and Customer satisfaction was the most important criterion under the customer focus. Employee involvement and Team Working was the most important criterion under the people management. Stakeholders' engagement is an important sub-factor under stakeholder's management. All these results reflect the importance of listening to customer voice, involving people and engaging of stakeholders in sustaining TQM implementation in Sudan.

Abstract: The main focus of this paper is to study the uncertainty in the investment decision making and to clarify how knowledge and technology affect it. The research was conducted in a local Finnish energy provider related to the renovation of its energy distribution networks. The Analytic Hierarchy Process was used to determine and weight the investment decision criteria. Then these criteria were inserted to the sand cone model in order to see their relative importance. Furthermore, the knowledge and technology rankings were used to calculate the variability coefficients i.e. the uncertainty which questions the decision making and could be seen also as so called collapses in the sand cone. The source of the collapses in the case company was determined to be the uncertainty over future technologies. From this a conclusion can be drawn that the company relies a lot on basic technology in securing its operations and that the knowledge and technology is essential in the investment decision making. Also some further steps can be defined based on the results.

Key words: Investment decision making; The sand cone model; Knowledge and technology (K/T) rankings; The Analytical Hierarchy Process; Uncertainty management

1 Introduction

The growing role of technology brings many opportunities as well as threats to companies. Technology can be seen as a source of business development, growth, profit and competitiveness. On the other hand, it also demands a lot from the companies. They must be able to continually adapt to the technical requirements of the market. Since technology has been linked to the possibility to achieve a competitive advantage the recommendation for the decision maker has been to integrate this opportunity to the strategy. The idea of competitive advantage or more precisely the sustainable competitive advantage (SCA) has been connected to Porter's work in the 1980's and in 1991 Barney determined it as an implementation of a value creating strategy that is not implemented nor successfully duplicated by the competitors (Takala, et al, 2013).

The sustainable competitive advantage also requires knowledge and intellectual capital as the primary bases of core competencies. In order to achieve sustainable competitive advantage knowledge must be spread within the firm since without it remains a property of few and will therefore have a limited impact on value creation. Obviously there is always a risk that the knowledge spread within a firm spreads also to other firms. Therefore in order to achieve sustainable competitive advantage knowledge, skills and resources should be relative easy to share inside the firm but difficult for other firms to copy. This kind of tacit knowledge is information that is "difficult to express, formalize or share". It is clear that tacit knowledge has a lot to do with experience and is related to the work of experts. Also organizational routines are an important part of tacit knowledge and one major part of these standardized operating procedures and roles in the companies is the decision making (R. Lubit, 2001).

This study was conducted as a part of the MittaMerkki research project comprising the University of Vaasa and VTT as research partners and a local Finnish energy provider as a case company. The aim of this research was to study how the technology and knowledge affect in investment decisions and how much they can cause uncertainty in the decision making. Furthermore the differences between the three departments/product areas of the case company were analyzed thoroughly. According to Takala and Uusitalo the emphasis has shifted significantly from the traditional risk management towards uncertainty management (Takala, 2012). This is a trend in which also this paper aims to deliver.

2 Research Methodology

2.1 Theory and models

In order to implement SCA the critical attributes in resource allocation must be detected. This can be done through the sense and respond methodology (S&R). The knowledge and technology factors (K/T) are inserted to the S&R in the form of a requirement section in which the respondent has to evaluate each S&R questionnaire attribute in terms of basic, core and spearhead technologies. In other words, each attribute is divided based on these three technologies so that the sum of the technologies equals 100%. Basic technology refers to commonly used technologies that can be purchased or outsourced. Core technology is the current competitive technology in a company and the term spearhead is related to future technologies. The importance of these three different technology levels is the knowledge that they require. This affects a lot in the strategy implementation and furthermore to the success of the technology-based businesses (Takala, et al, 2013).

The sand cone model illustrates the studied object by showing its hierarchies as well as the relative importance and relationships of the sub-objects (Takala, Leskinen, et al, 2005). Since the original sand cone has been developed and used successful for example with the Finnish Air Force (Takala, Leskinen, et al, 2005). One major strength of the sand cone is that it can be used for many purposes as well as with many different attributes and for example in the research of Saufi, Rusuli, Tasmin and Takala the sand cone model has been used to study Knowledge management in the Malaysian university libraries (2012). In the developed model of Takala from 2002 the Analytic Hierarchy Process is used to derive the relative importance percentages determining the levels of the sand cone model (Takala, Leskinen, et al, 2005). The idea of the Analytical Hierarchy Process is to give a method of scaling that evaluates tradeoffs between different criteria such as cost, create measures for the entities for which there are normally no measures and then to use these entities in the decision making (Saaty,1980).

Also in this study the AHP was used to weight the four selected criteria of investment decision making before being inserted to the sand cone model. After this the uncertainty is determined with the help of the aforementioned knowledge and technology rankings (K/T) from which variability coefficients are calculated using the following equation (1).

$$VarC_{C1,C2,C3,C4} = \sqrt{\sum_{i=B,C,SH} C_{1,(C2,C3,C4)} \left(\frac{std_i}{mean_i}\right)^2} \tag{1}$$

After the calculations the variability coefficients are inserted to the sand cone in the form of risk that can cause collapses in the sand cone layers. These collapses might happen due to the different technology and knowledge requirements of the different departments which are competing from the same investment budget. In addition a figure can be calculated from the variability coefficients determining the amount of T&K affected risk in each department. This figure is called T&K – uncertainty and it describes how much in generally the department “falls” under its competitive range when the T&K risk estimate materializes. The equation for the T&K–uncertainty is illustrated below (2).

$$T\&K - uncertainty = \sqrt{\sum VarC_i^2} \tag{2}$$

Dept. A, B and C *i = C1,C2,C3,C4*

All in all the end result would look as in the figure 1 below. The variability coefficients are pictured with the darker shade of grey in the sand cone layers and the accurate percentage values are illustrated always next to the criterion in question. Right to the cones are then presented the T&K –uncertainty figures as well as the graphical illustration of the possible collapse of the department’s sand cone.

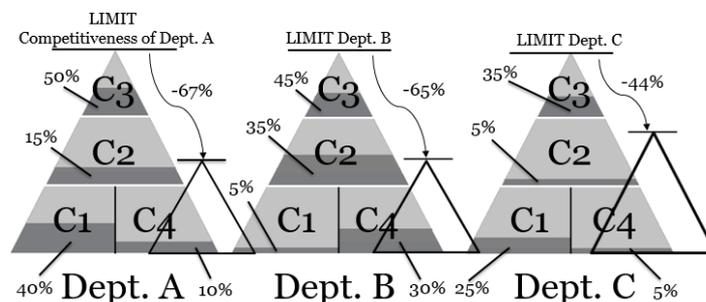

Figure 1 The T&K -uncertainty and the Sand Cone Model (example)

2.2 Case company and data collection

This study was conducted in cooperation with a Finnish energy group which operates as a local

electricity, water and district heat provider. With its subsidiary companies it produces, sells and distributes the electricity, water and district heat. However this study concentrated solely to the subsidiary distribution company and to its evaluation of energy infrastructure investments.

The data collection was started with the selection of the investment criteria and by weighting the criteria with the AHP method. After this the knowledge and technology rankings were gathered with a questionnaire specially designed for this study. In this questionnaire each criterion is divided according to the three technology categories so that the sum equals 100% in both the department and the criterion in question. The interviewees consisted of the company’s executive board and some experts from each department. The board members answered for every department and the experts on behalf of their own department. Before answering at least one example to each of the three technology categories (basic, core and spearhead) was named as well as the time perspective utilized.

3 Analysis Results

Based on the results the following variability coefficients (figure 2) were determined for the case company. As can be seen from the figure department C has the highest variability in every criterion. Furthermore, only one criterion (C4) had lower variability than 1 in all the departments. Altogether it can be said that there is uncertainty in the investment decision making of the case company.

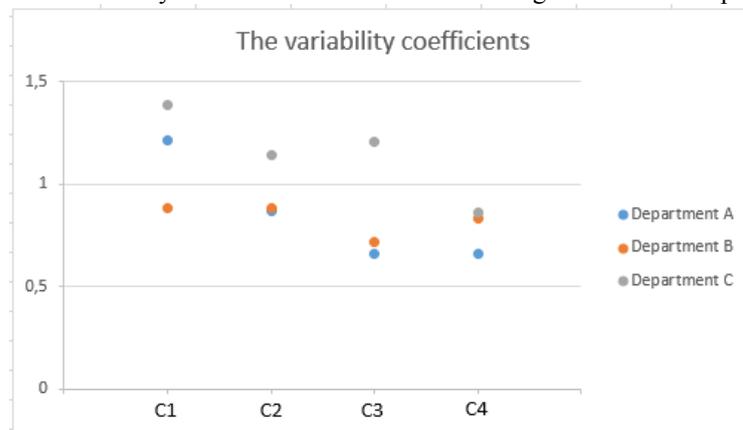

Figure 2 The Variability Coefficients of the Case Company

When inserted to the sand cone model the variability coefficients are illustrated in the form of collapses (figure 3 below). Those criteria with over 100 percent variability question the investment evaluation based on that criterion. Although there are small differences among the uncertainties of different criteria in different departments the big picture can be seen from the T&K-uncertainty figures next to the sand cones. As can be seen the T&K-uncertainty is over 100 percent in each department. This puts the investment evaluation under question as well as the comparison of different departments.

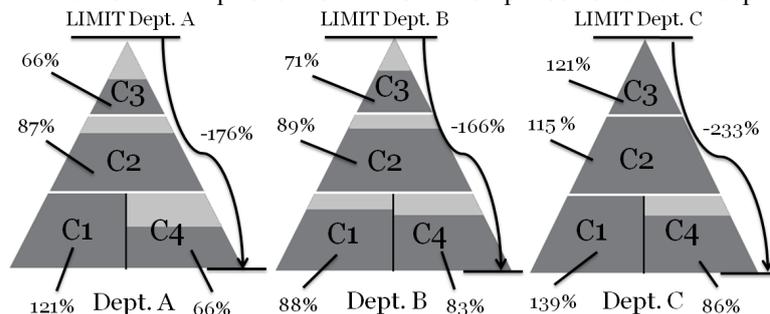

Figure 3 The Sand Cones of the Case Company

Furthermore was studied which part of the basic, core and spearhead classification causes the variability in the departments. The reason is clear as can be noticed from the next figure. The spearhead technology and –knowledge is the main source of the uncertainty. It can also be pointed out that even the core technology gets high variability in every department but still much smaller than the spearhead. Therefore a conclusion can be drawn that the company bases its technology and knowledge management

mainly on basic technology. This is not necessarily a bad thing since it can be seen also as a way to secure the distribution of energy to the customers. Moreover, the amount of spearhead technology can be quite small compared to the basic technology which illustrates the low uncertainty over basic technology as a reasonable and positive outcome.

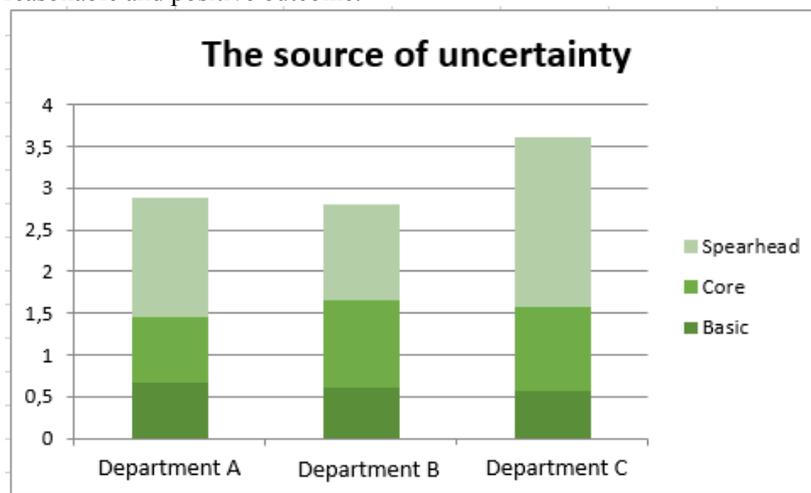

Figure 4 The Source of Uncertainty in the Case Company

4 Discussions

Although the results seem rather clear feedback from the case company is required especially for determining the reasons behind the uncertainties. This feedback will be organized in the form of interviews that would include 1-2 experts from each department. Furthermore, the market-based validation of Kasanen, Lukka and Siitonen would be followed (1993). There are two possible ways to proceed. With the first one, conclusions would be made about the results based on interviews where the interviewees would analyze the results, reasons behind the results and how the results might appear in practice. This option is called the weak market test in which also the experts' willingness to apply the results in decision making would be figured out (Kasanen, Lukka and Siitonen, 1993). The other option is to use the semi-strong market test in which the results should be adopted in the company (Kasanen, Lukka and Siitonen, 1993). In this case it would mean to clarify whether there is any data from some project or in one of the departments that would support the results of the study.

5 Conclusions

The main finding of this study is that there is uncertainty in the case company's investment decision making. From the department sand cones can be concluded that there are many layers in which the risk of collapses is over 100 percent and so the investment decision making based on the criteria in question is challenged. Furthermore, the T&K –uncertainty figures underline this conclusion and question also the comparison of the departments. It is also illustrated that the main source of the possible collapses is the uncertainty over spearhead technology. From this a conclusion can be drawn that the case company leans on basic technology in securing its distribution operations. All in all from the big picture can be argued that knowledge and technology is essential in the investment decision making and as revealed in the discussions more information is needed to detect the reason behind the uncertainty and for example to figure out what the future (spearhead) technologies demand from the case company.

Management Study Program, Faculty of Business, President University, Indonesia
(E-mail: shintahavidz@yahoo.com, jianmuye@126.com, chandra@president.ac.id)

Abstract: The present study was conducted to estimate cost efficiency of Islamic Public banks in Indonesia by using data envelopment analysis (DEA); rank the banks according to their highest and lowest cost efficiency, and to determine the cost efficiency determinants by defining bank specifics and macroeconomics factors. It covers quarterly data of 2011.1 – 2014.4 periods from Indonesian central bank website of the eight Islamic public banks that were selected as the sample of observation. The results revealed that Bank Victoria Syariah performs the best with the average score of 59.7%, while Bank BRI Syariah performance was lowest with an average score of 11.1%, in term of cost efficiency among all the Islamic public banks in this study. Net operating income, size, and GDP growth rate were found negatively impact and are statistically significant to cost efficiency, while capital adequacy ratio has a positive impact and are statistically significant to cost efficiency.

Key words: Cost efficiency; Bank specifics; Macroeconomics; Data envelopment analysis; Islamic public banks

1 Introduction

The functioning of Islamic banks is similar to conventional banks that mediates and beadle the money of customer. The two banking types differ in sharing profit and loss between the Islamic banks and the depositors, while conventional banks practice the interest rate system. The mutuality of ownership is introduced by the Islamic banking system that the customers of Islamic banking as the depositors have the right of ownership (Dar & Presley 2000). The transactions in Islamic banks that are administrated without involving elements of *riba* that makes the main dissimilarity from conventional banks, it is mentioned in Quran, the Muslim's holy book, regarding the prohibition of *riba*. *Ribaisury* or excessive interest that insisted the debtors during the maturity date on imposing failure of payments and wants to roll it over (Kamarudin et al. 2014). Typically, fixed price that added the margin of its profit in advance is commonly known as Islamic banks basis, namely buying and selling principles (Khir et al. 2008)

During the past twenty years, the performance of Islamic banks in Indonesia has shown good performance rather than conventional banking as one of national financial system (Zuhroh et al. 2015). The total assets growth of Islamic banking in Indonesia from 2010 to 2014 is 100 trillion IDR to 279 trillion IDR or with its compound annual growth rate (CAGR) as 29.2%. Comparing to other Islamic banking systems in other countries, it indicates higher significant growth recorded since Islamic banking in Indonesia started with low capital in the beginning of the period. However, the total asset growth of conventional banks is even lower with CAGR for 16.9% on the same period (2010-2014). Explicitly, the Islamic financial industry in Indonesia is left behind of its counterpart, conventional banks, as the market share is only 4.7% from the overall total assets of banking industry in Indonesia. Indonesia financial services authority developed and launches the roadmap of the coming five years, in 2023, to boost up Indonesian Islamic banking market share to 15%. Indonesian government support the target to be the center of Islamic banking globally and prevent from the negative impacts of unstable economic situations (Schaar 2015).

Hence, the operational efficiency for Islamic banking is needed since the improvement of bank efficiency will improve the ability of bank to provide higher return to depositor. Moreover, customers would rely on an efficient bank because the more efficient bank tend to have lower service expense with better service to the customer (Fries & Taci 2005). During the last decade, it has been becoming focus of the study to ensure the future sustainability, especially in competition era by assessing the efficiency of banking sector as the most important thing (Zuhroh et al. 2015). As the banks improve their competitive advantage, the banks will be more efficient. Besides the role as financial intermediary, cost efficiency has its crucial role in understanding the environment of its market in which the foreign banks and the other financial intermediaries may become more competitive by fulfilling its cost efficiency (Allen & Rai 1996). Although there have been many researches done before, the study of Islamic bank efficiency is

still in infancy, particularly in Indonesia. Additionally, it is rare to find the rank of Islamic public banks in Indonesia based on the level of efficiency. To fill the gap of the literatures, this study therefore examine the case of Islamic public banks in Indonesia to provide new contribution as an evidence by using a non-parametric approach based on data envelopment analysis (DEA) in measuring cost efficiency and its determinants by using panel data regression.

2 Literature Review

The study of bank efficiency by utilizing frontier analysis approaches of Islamic banks have been researched many years ago in different countries (Havidz & Setiawan 2015; Sufian 2007; Yudistira 2004; Hassan 2006; Sufian et al. 2008; Rahman & Rosman 2013; Zuhroh et al. 2015). The techniques of frontier efficiency represent the best practice to measure performance evaluation as well as its inefficient strategy. Non-parametric approach is employed in this study, known as data envelopment analysis (hereafter is shorten as DEA). An effective tool to identify the frontiers had been proved for efficiency evaluation is firstly introduced by Charnes et al. (1978) which commonly used among the researchers (Zhu 2009).

Yudistira (2004) performed a research on technical, pure technical, and scale efficiencies by utilizing DEA. The results suggest that the inefficiency is just lower at 10% across 18 Islamic banks indicating when it is compared to conventional counterparts. The scores of efficiency are taken to be regressed on its environmental variables by focusing on overall technical efficiency on the second stage. It reveals that an encouragement of M&A should be taken since the Islamic banks of small up to medium class were dealing with inappropriate scale economies. Rahman & Rosman (2013) measured the efficiency scores using DEA based on intermediation approach of 63 Islamic banks. The technical inefficiency is driven by inappropriate scale operations among the Islamic banks. On the other words, pure technical efficiency scores are higher than scale efficiency which indicates a controllable of banks' management in controlling the costs as well as maximize outputs in a given inputs. Furthermore, the researchers used bank specifics ratio (profitability, capitalization, and size) and macroeconomic factor (GDP per capita) to find its determinants by applying ordinary least square of panel regression. The economic condition of a country determined as the main factor of Islamic banks efficiency. A positive impact of capitalization on efficiency is proved. Meanwhile, Islamic banks size indicated negative and significant impact on scale efficiency as well as negative impact of profitability on efficiency. Havidz & Setiawan (2015) estimated the three efficiency measures of overall technical, pure technical, and scale efficiencies in the fourth Indonesian Islamic banks. Bank Muamalat Indonesia, Bank Mega Syariah, and Bank Syariah Mandiri deal with scale inefficiency as overall technical inefficiency main source, while Bank BNI Syariah may deal with inappropriate management as the dominant source of overall technical inefficiency. The second stage of regression indicates significant impacts proved by operational efficiency ratio (OER), return on assets (ROA), and inflation rates on efficiency.

Isik & Hassan (2002) further analyzes the measurement addressing cost efficiency investigates input and output efficiency in the Turkish banking industry during 1988-1996. Technical inefficiency dominated the main source of inefficiency as compare to allocate inefficiency. The impact of bank size to efficiency is negative as the relationship is analyzed on the second stage. Bader et al. (2008) measures and compares the cost, profit, and revenue efficiencies in the 43 Islamic and 37 conventional banks started from 1990 to 2005. It is suggested that the overall efficiency results have no significant difference when it is compared between conventional and Islamic banks. Kumar (2010) analyzed the cost efficiency trends from 1992/93 until 2007/08 as it is known as the period of post deregulation in the public sector of Indian banks by defining the components as well. The findings indicate that technical inefficiency mainly drives the cost inefficiency. The regression model is estimated and found that there is no statistical significant impact of banks size in all models of regression and only two regression models of profitability indicating statistical significant and positive. Zuhroh et al. (2015) aims in several objectives of study that applying stochastic frontier approach to estimate cost efficiency of Islamic banks, determine the source of cost inefficiency, and analyze the influence of the competency of managers and several variables on cost efficiency. It is conducted in full-fledged Islamic banks of Indonesia, totally 3 and listed conventional banks on the Indonesia Stock Exchange (IDX), totally 19 from 2004.03 – 2010.4. It is revealed that allocate inefficiency dominantly caused the cost inefficiency and the average cost of conventional banks is higher than Islamic banks. Asset has negative impact and significant on efficiency as well as negative impact and statistically significant of NPL on efficiency. It proves that LDR has positive impact and significant on particular frontier.

Based on the literature above, it shows there are several studies about efficiency measurement in the banking industry and variously applying technical, pure technical, scale, cost, profit, and revenue efficiency. This study focuses on cost efficiency as it measures how close the bank's cost to its best practice of bank's cost to produce the same output by the same conditions. The range score of cost efficiency over 0 to 1, in which firm's best practice equals to one within the observed data (Berger & Mester 1997). In order to determine the cost efficiency, regression is conducted on the second stage by measuring bank specifics and macroeconomics environment. The efficiency studies have been researched world widely. However, there are still few studies in the banking industry of Indonesia especially Islamic banking as it is needed in-depth and ongoing study on Islamic banking literature that related to the efficiency frontier. This study may contribute in giving the ranks of Islamic public banks in Indonesia that provided as a reference.

3 Research Methodology

3.1 Data collection method

The evaluation of efficiency of Islamic Public Banks in Indonesia is based on secondary data that is published quarterly on the website of the central bank in Indonesia, named *Bank Indonesia* which consists of foreign exchange and non-foreign exchange banks. The data compiled from balance sheet, income statement, off balance sheet and financial ratio calculation in the period of observation 2011.1 – 2014.4. There are four foreign exchange banks and all the data are complied with the objective of the study. However, there are only four out of six non-foreign exchange banks that fit the required data in this study. Hence, the overall samples are eight Islamic public banks in Indonesia.

3.2 Model of the study

This study employs intermediation approach by using input-oriented. Zhu (2009) has developed the DEA Excel Solver to solve the cost efficiency model with the range score within 0 and 1, that summarized by Zhu as:

$$\begin{aligned} & \min \sum_{i=1}^m p_i^o \tilde{x}_{io} \\ & \text{Subject to} \\ & \text{CRS} = \begin{aligned} & \sum_{j=1}^n \lambda_j x_{ij} \leq \tilde{x}_{io} & i = 1, 2, \dots, m; \\ & \sum_{j=1}^n \lambda_j y_{rj} \geq y_{ro} & r = 1, 2, \dots, s; \\ & \lambda_j, \tilde{x}_{io} \geq 0 \end{aligned} \end{aligned} \tag{1}$$

Where p_i^o is the unit price of the input i of DMU_o . The DMU may vary one another based of the price data. The cost efficiency of DMU_o is defined as:

$$\frac{\sum_{i=1}^m p_i^o \tilde{x}_{io}^*}{\sum_{i=1}^m p_i^o x_{io}} \tag{2}$$

After obtaining the cost efficiency scores, the second stage of analysis is held by regressed the determinants of efficiency with the equation as follows:

$$CE = \alpha_{it} + \beta_1 NOI_{it} + \beta_2 CAR_{it} + \beta_3 SIZE_{it} + \beta_4 OER_{it} + \beta_5 GDP_{growth_{it}} + \beta_6 INF_{rate_{it}} + \epsilon_{it} \tag{3}$$

- CE : Cost Efficiency
- β : coefficient of independent variable
- NOI : Net Operational Income
- CAR : Capital Adequacy Ratio
- SIZE : Total assets of a bank (Log TA)
- OER : Operational Efficiency Ratio
- GDP growth : Gross Domestic Product growth rate
- INF rate : Inflation rate
- ϵ : error terms
- i : number banks in total
- t : number observations for each bank in total

4 Empirical Results and Discussions

4.1 Cost efficiency of Islamic Public Banks in Indonesia

There are three variables of input employed; labor, total funds, and fixed assets, with three variables of output; total financing, off-balance sheet items, and other earning assets. Further, input prices are required to conduct the cost efficiency, such as; labor price, funds price, and fixed assets price. As the cost efficiency scores are obtained, we further give the bank's rank by defining the average scores of its efficiency from the whole periods, as below:

Table 1 Average Rank of Cost Efficiency

Ranking	Islamic Public Banks	Mean
1	Bank Victoria Syariah	0.597
2	Bank BNI Syariah	0.548
3	Bank Jabar Banten Syariah	0.436
4	Bank Muamalat Indonesia	0.421
5	Bank Syariah Bukopin	0.256
6	Bank Syariah Mandiri	0.228
7	Bank Mega Syariah	0.226
8	Bank BRI Syariah	0.111

Based on table 1, it reveals the rank of Islamic public banks in Indonesia based on the average cost efficiency score. Bank Victoria Syariah performs the best among other banks in this study, in which the results show that it achieves as highest rank in the eight quarter with the average score 59.7%. By utilizing the 59.7% of resources employment, it is expected to produce outputs in the same level of inputs when it is not producing on the current location other than its frontiers. More resources are needed for 40.3% since more cost is spent to produce efficiently the same outputs averagely. On the other hand, Bank BRI Syariah indicates as the least efficient among all banks in this study with the average score of cost efficiency only 11.1%.

4.2 The determinants of cost efficiency

Dependent variable is obtained from the scores of cost efficiency to find its determinants by employing panel regression. The result of Hausman test reveals that the p-value is bigger than 5 percent hence the study used random effect. Prior to the regression, it is found that there is no multicollinearity issue among the independent variables thus the regression could be further studied.

Table 2 Determinants of Cost Efficiency

Variable	Coefficient	Std. Error	t-Statistic	Prob.	R-squared	0.3785
C	6.9966	2.0067	3.4867	0.0007	Adjusted R-squared	0.3477
NOI	-0.0066	0.0024	-2.7135	0.0076	S.E. of regression	0.1769
CAR	0.0045	0.0011	3.8838	0.0002	F-statistic	12.2819
SIZE	-0.0754	0.0362	-2.0836	0.0393	Prob(F-statistic)	0.0000
OER	-0.0034	0.0027	-1.2285	0.2216		
GDP	-1.0012	0.3546	-2.8232	0.0056		
INF	-0.0064	0.0058	-1.1068	0.2706		

Based on table 2, it indicates that out of six, there are four independent variables have significant impact on cost efficiency. Net operating income (NOI) is significant on one percent level with negative impact on cost efficiency; capital adequacy ratio (CAR) is significant on one percent level with positive impact on cost efficiency, banks size is significant on five percent level with negative impact on cost efficiency, and GDP growth rate is significant on one percent level with negative impact on cost efficiency. It indicates that this study supports the results of Rahman & Rosman (2013) that capitalization has positive impact, while size and profitability have negative impact on cost efficiency. Additionally, GDP growth rate is the main determinants of bank efficiency. Adjusted R-squared is 0.3477 that indicates 34.77% the variation of independent variables could explain the dependent variable; meanwhile the remaining 65.23% may be determined through other factors which excluded in this study. F-statistic and p-value indicate as good model for analysis, hence the results are reliable.

5 Conclusions

There are eight Islamic public banks in Indonesia, which were taken as the sample of this study with quarterly data from 2011.1 to 2014.4. It employs non-parametric and its efficiency scores are regressed to find its determinants. Data envelopment analysis is used as non-parametric approach by assuming cost efficiency in measuring the best practice of the cost of banks by maintaining the same condition in producing the same outputs. The Islamic public banks are expected to minimize the cost in order to achieve higher profit. The average score of Bank Victoria Syariah as the most efficient banks among other Islamic banks in term of cost efficiency is 59.7%, while Bank BRI Syariah which is the most inefficient bank with the average score 11.1%.

There are three determinants that indicate negative impacts on cost efficiency, such as net operating income (NOI), size and GDP growth rate, while capital adequacy ratio has positive impact on cost

efficiency. Due to time limitation and specific scope of case in Indonesia, the authors may recommend for further research to broaden the study as comparative study among countries as well as among Islamic and conventional banks. Bank efficiency study may also measure the profit and revenue efficiency to capture better understanding from various measurements of efficiency. The determinants of bank efficiency may find the impacts from other bank specifics and corporate governance aspects as well.

Decision Support Capabilities of Enterprise's Management Information Systems: An Empirical Study

Ahmed Abdulatef Mashli Aina, Wang Hu, Al-Nakib Noofal Ahmed Mohsen Mohammed
School of Management, Wuhan University of Technology, Wuhan, P.R. China, 430070
(E-mail: ahmedainaaina@gmail.com, wanghu61@126.com, tpil2011yi@gmail.com)

Abstract: In this paper a quantitative analysis of MIS use contributing to development of decision support capabilities is performed. The findings of the study explain why certain decision supports capabilities are generated determining the relationship between uses of MIS decision support capabilities. Additionally, the moderating effects of information content quality and information access quality are tested. Finally, by identifying the levels of decision support capabilities and MIS use in Saudi Arabia companies, valuable insight is provided for local businesses on how to achieve IT capability and competitiveness. This paper provides clear insights in the role of MIS and its consecutive importance in maintaining the activities of decision support systems. Our model demonstrated that all of the variables had significant and relevant impact and correlation with the use of information systems. All of the hypothesized relationships: that use of MIS positively impacts on problem definition in the decision support processes, the speed of problem identification in the decision support process, decision making analysis in the decision support process, decision quality in the decision support process, decision speed in the decision support process, decision maker's satisfaction in the decision support process exhibited relevant significance. The outcomes of the paper can be beneficial for business executives in terms of simplifying their day to day decision making process based on the timely and relevant information. Management Information systems also ensures the information quality and speed of the decision making process which can be valuable asset for the business managers.

Key words: MIS information access; Information quality; Decision making; Decision quality

1 Introduction

An unprecedented and clandestine predicament has emerged from the congruence of new technology and increasing volume of data (Oh, 1998). The natural consequence of cheap storage and high-speed connectivity has created the strategic tendency for organizations to a mass data for the sake of extracting collective knowledge (Leidner and Elam 1994, Alalwan, 2014). Yet, as the information content becomes increasingly complex and dispersed the ability to utilize this information for quick and effective decision making declines. One strategic approach to realize business value from the cumulative content assets is to employ appropriate decision support (DS) technology (Mead and Kennett, 2007). DS technology offers a means to structure, to filter and analyze information in order to reduce uncertainty and increase efficiency in the decision making process. Traditionally, DS technology encompassed tools such as decision support systems (DSS) expert systems (ES), executive information systems (EIS) and group decision support systems (GDSS). More recently, newer technologies have emerged that are designed more specifically around the problem context of organizational data and include systems that support knowledge management and generation. Management Information Systems (MIS) are widely used in big corporations to collect organize, filter and present data, resulting in more effective decision-making. Through use of MIS, individuals shape the way how they make decisions. In our study, we posit that utilization of MIS in the decision-making process impacts the decision support capabilities of systems. The use of MIS develops speed, quality, and other features of decision-making (Jarupathirun and Zahedi 2007). Moreover, improvement in decision-making is aimed to ensure customer satisfaction and good business results. All MIS strategies should therefore be tailored in a way that the all business goals are achieved. The main problems that the study aims to solve are: how the use of information system contributes to the development of decision support capabilities. Research gaps as the existing studies have failed to quantitatively evaluate the factors that lead to development of these key capabilities. With knowing that use of information systems leads to developing of certain capabilities, management can argue for implementation of such system.

2 Literature Review and Research Model Development

While some previous studies have discussed the strategic capabilities of MIS, to the best of our knowledge no published research has assessed the impact of MIS on decision support in an

organizational context of Saudi Arabia. Specifically, we know of no research that has been conducted to determine the extent to which MIS use enables decision makers to recognize problems, explore possible solutions, and improve decision making speed. To address this research gap we develop a conceptual model that combines the sequential decision making framework of Mintzberg et al. with the content stewardship activities of MIS identified by Smith and McKeen. We use this conceptual model as the basis to formulate our hypotheses, and our research model to analyze the effect of MIS use on problem definition, speed of problem identification and decision making, decision quality, and decision satisfaction. The importance of decision maker is found to be crucial in maintaining the activities of decision support systems. The solutions provided by decision support systems is considered as being vital in ensuring efficiency of work by reaching high level of employee satisfaction. Besides providing flexibility and automated work conditions, decision support systems are becoming popular for improving organizational efficiency. In this regard, Power (2002) and Ghazi (2016) highlighted that making decisions is an essential part of working especially in the organization. Improving financial performance is considered as a main priority for most companies therefore decision support systems contributes to the operations of the firm through better exploitation of business opportunities. One of the most efficient ways of making decision is ensured through Management information system (MIS), which was conducted to collect manual data previously. The underlying idea behind MIS is to maximize the constant flow of information to the management which will be later used for decision making purposes. Uma (2009) provided some examples of decisions which are reached with the help of decision support systems including those such as merger acquisition, expansion of the plant and new product development. Thus, it is necessary to shed more light into how management information systems ensure the quality of decisions made by DSS. Review of the previous literature (Alalwan,2014; Ghazi, 2015; Oh ,1998;Jarupathirun and Zahedi 2007; Mead and Kennett, 2007;Leidner and Elam, 1994;Sanders and Courtney, 1985 resulted in identification of the following important variables including impact on problem definition, speed of problem identification, decision making analysis, decision quality, speed of decision making and decision maker satisfaction Through a detailed review of all factors belonging to the scope of capabilities the factors that are most conducive to creating a most favorable decisions have been determined. The research model represents the possible generation of decision support capabilities as an outcome which, is significant for organizational performance. Therefore, a relationship between use of MIS and problem definition, speed of problem identification and decision making, decision quality, and decision satisfaction has been hypothesized. Decision support capabilities have implications for success of decision-making. In our model, however we are assessing for which capability is MIS use more beneficial. Therefore, a link of MIS use with decision-support capabilities is tested.

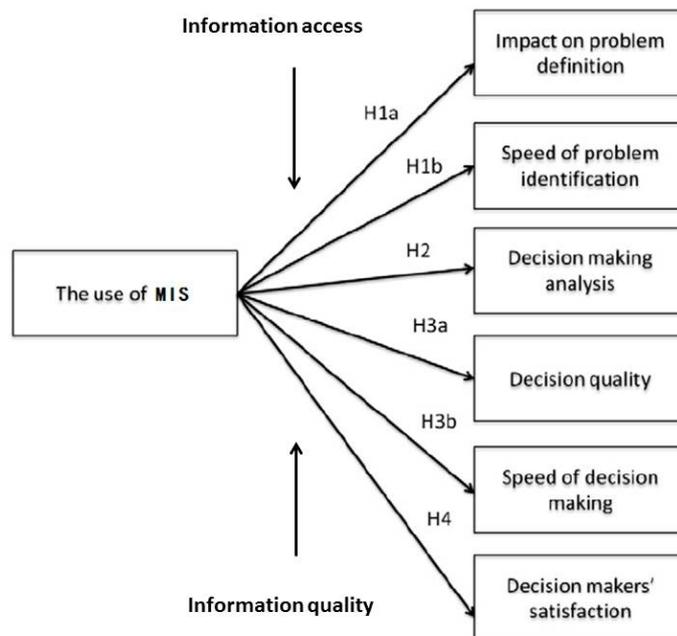

Figure 1 Research Model

The hypothesized relationships are:

H1a The use of MIS positively influences impact on problem definition in the decision support process.

H1b The use of MIS positively influences speed of problem identification in the decision support process.

H2 The use of MIS positively influences decision making analysis in the decision support process.

H3a The use of MIS positively influences decision quality in the decision support process.

H3b The use of MIS positively influences decision speed in the decision support process

H4 The use of MIS positively influences decision maker's satisfaction in the decision support process

H5 Information content quality has a moderating effect on the relationship between MIS use and decision support capabilities

H6 Information access quality has a moderating effect on the relationship between MIS use and decision support capabilities

3 Research Methodology and Results

This particular survey used closed-ended questions and a Likert-scale, meaning that the questionnaire displayed first, for multiple choice questions, and allowed us to estimate the percentage of people who responded to the questionnaire in a specific way, after which matrix questions were used for rating or ranking answer choices which included a weighted average so we could see which answer is picked most often. The questionnaire which was constructed to determine the employees' usage of the management information system of employees of manufacturing companies in Saudi Arabia was divided into two different sections. The goal of the questionnaire survey was to test the use of management information systems by employees in manufacturing companies in Saudi Arabia. It also attempted to capture an overview of the current level of management information systems in the overall industry in Saudi Arabia. The questionnaire was composed in the English language for scales pertaining to previous studies and research, which was then translated into Arabic, validated by experts and with the vocabulary adapted to this specific context of the study, administered to employees of manufacturing companies in Saudi Arabia, but to those factories using the management information system.

Table 1 Questionnaire Variables and Their Source

Questionnaire variables	Adopted from:	Original Source
Management Information system	Alalwan (2014)	Zain et. al (2005)
Impact on problem definition	Alawan (2014)	Oh (1998)
Variable Decision	Alalwan (2014)	Leidner and Elam (1994)
Speed of problem identification	Alalwan (2014)	Leidner and Elam (1994)
Decision making analysis	Alalwan (2014)	Leidner and Elam (1994)
Information Quality	Alalwan (2014)	Mead and Kennett (2007)
Decision Quality	Alalwan (2014)	Jarupathirun and Zahedi (2007)
Decision maker satisfaction	Alalwan (2014)	Sanders and Courtney (1985).
Information access	Alalwan (2014)	Mead and Kennett (2007),

All the variables of the research model were measured with scales that were adopted from prior studies. Altogether nine variables of the research model were measured. All the utilized scales exhibited sufficient level of reliability exceeding the level of 0.7 in all the studies that the scales were taken from. Language and vocabulary changes were made in order to fit the context of our study. Furthermore, the translation was made to the Arabic language. Information access was analyzed in prior studies performed by Mead and Kennett (2007), which was a combination of multiple scales adopted from previous research. The survey was conducted in large manufacturing companies, since it was important that these companies have a large and adequately developed IT and IS sector, to ensure reliability and authenticity of the obtained statistical results. The questionnaire was sent to 560 people, 320 individuals completed the questionnaire and because of the missing values, 208 questionnaires were taken into consideration and could be further analyzed. The return rate was 57.1%, and the response rate was 37.1%. 48.2% of the employees were between the age of 24 and 35 and 29.9% were between the age of 35 and 44. Less than 2% of the entire interviewed population was over the age of 55. The present study

attempted to determine whether the use of management information systems leads to certain decision-support capabilities. Moreover, we wanted to find out how the information content quality and information access quality moderate the impact on these capabilities. The variables which were analyzed were: use of IS system, impact on problem definition, problem identification speed, decision-making analysis, decision quality, decision-making speed, decision makers' satisfaction, information content quality, and information access quality.

The R Square indicates how much of the variance in the statistical analysis is explained by the predictor variables: satisfaction, problem identification speed, information access quality, decision-making analysis, impact on problem definition, decision quality, information access quality, decision-making speed in correlation with the influence on the dependent variable, use of information systems. The moderating effect of information access quality and information content quality was also measured. In the multiple regression analysis section, we also checked if the significance value was less than .05 in order to obtain if the findings were statistically significant. In the multiple regression interpretation, F value is also exhibited as the relevant degrees of freedom. In our present study, we tested the hypothesized relationships between the proposed variables and the corresponding variables. Our model demonstrated that all of the variables had significant and relevant impact and correlation with the use of information systems. All of the hypothesized relationships: that use of MIS positively impacts on problem definition in the decision support processes, the speed of problem identification in the decision support process, decision making analysis in the decision support process, decision quality in the decision support process, decision speed in the decision support process, decision maker's satisfaction in the decision support process exhibited relevant significance.

Table 2 Regression Analysis Results

Dependent variables	R square	F value	Significance
Decision maker's satisfaction	,466	15,335	,000*
Speed of decision making	,419	12,717	,002*
Decision quality	,429	13,225	,000*
Decision making analysis	,312	7,965	,017*
Speed of problem identification	,409	12,191	,000*
Impact on problem identification	,329	8,625	,002*

*p value is significant at <.05

*Independent Variable: Use of IS system

4 Conclusions

The research attempts to determine whether the use of management information systems leads to certain decision-support capabilities. Additionally, we want to find out how the information content quality and information access quality moderate the impact on these capabilities. The research contributes to empirically based knowledge concerning management information systems in large companies. The contributions of the current study lie in the fact of accomplishing subsequent objectives: Identification of the exact value of MIS use for each factor of decision support; Determining the value of information quality for MIS use – capabilities relationship; Getting more insight into decision support capabilities, level of MIS use for a specific sample of companies in the service sector and Building foundation for creating an MIS that would bring effective management results

(E-mail: tahirakhtar01@gmail.com, tareq.mjiiit@gmail.com, sakti.finance@hotmail.com)

Abstract: This paper examines the relationship between earnings and capital expenditures for the firms listed on five ASEAN markets during 2000-2014. The sample period is categorized into investment period (2000-2007) and the performance period (2008-2014). Portfolios are sorted based on capital investment ratios estimated from the investment period to test the relationship between capital expenditure and earnings. The results contradict traditional view that suggested positive association between capital expenditures and future earnings. Among other factors, over-investment by the managers was found to be the main reason that negatively affect earnings.

Key words: Capital expenditure; Corporate earnings; Developing financial markets

1 Introduction

Firms made decisions about the capital on the basis of investment needs. The decisions related to capital budgeting such as, plant expansion, equipment replacement, instalment of machinery etc. are known as capital expenditure (C. H. Jiang, H.-L. Chen, and Y.-S. Huang, 2016). The purpose of expanding investment is to increase earnings. The management invest capital in optimal NPV projects that help the firms to increase their earnings. Thus, the traditional view about the capital expenditure suggests positive relationship with the firm earnings. But sometime entrenched managers invest capital in the wasteful projects which effect the firm earnings negatively (R. La Porta, 1998; A. a. K, 2005; L. Fresard and C,2008).

Studies have shown mixed evidences on the relationship between capital expenditure and the firm earnings. Firms with higher ratios of capital expenditure have higher abnormal returns in that current-period as argued by Callen, Livnat(J. Callen, J. Livnat, and S. Ryan,1996). By controlling for industry differences, Lev and Thiagarajan (1993) found that the values are high for the firms that have high capital expenditures. Some other studies are not found to be conclusive as the evidence by Echevarria (1997) on the data of 500 industrial firms over the period 1971-1990 showed that the financial performance of the sample firms varies widely. They further found that only a single quarter of the sample firms have shown increased profitability in the performance period 1981-1990, although huge investment was done to upgrade manufacturing and operating facilities from 1971-1980. The study by Kim(2001) on a sample of manufacturing firms in the USA making 515 observations per year over the sample period 1976-1989, showed no linear relationship between capital expenditures and future earnings for the overall sample. On splitting the sample firms into winners and losers he found a positive relationship between capital expenditures and future earnings for winner firms while negative relationship between capital expenditures and future earnings for the loser firms.

The aim of this study is to test the traditional view that there is positive impact of capital expenditure on firm earnings. Studies in the past have addressed this issue mainly in the developed financial markets. The only study by Jiang(2016) have discussed this issue in developing context. The results of our study are contradictory to Jiang (2016) as they have supported the traditional view but in this study we have found the negative impact of capital expenditure on corporate earnings. Our results support the agency view of capital investment on the wasteful projects by the management which is inconsistent with Jiang (2016) results. The next section provides a brief literature review followed by methodology. Section 4 provides the empirical results and last section provides the conclusion.

2 Literature Review

Two major schools of thoughts describe the relationship between capital expenditures and firm earnings. The phenomenon is related to the use of free cash-flow on the capital expenditure by the managers. First school of thought is related to convergence of the interests between shareholders and managers. The managers use the free cash in the positive NPV projects, predicting the positive relationship between the capital expenditure and corporate earnings (J. Davis, F. Schoorman, and L.

Donaldson, 1997). On the other hand, Jensen and Meckling(1976); Jensen(1986) and Harford (1999) gave opposing view by arguing that in cash-rich firms, managers are more likely to invest cash in acquisitions and these acquisitions results in poor performance, supporting the agency cost hypothesis. Some authors for example, Mikkelson and Partch(2003) argued about the conflicts of interests among managers and shareholders on the investment and did not found any evidence for decrease performance. Other than agency perspective authors have found some other factors that effected the firm earnings. Customers' nature related to the taste, preferences of the brands and unexpected changes in competitors about supply conditions may also effect demand conditions which leads to increase or decrease of firm earnings (D. P. Echevarria, 1997). Chung, Firth(2005), Dechow, Richardson (2003) and Nelson, Elliott (2002) have discussed the role of earning management in the firm to increase the performance. Lobo and Zhou(2001); Richardson(2000) and Tendeloo and Vanstraelen(2005) have argued about the agency perspective of earning management and their impact on earnings and DeFond and Park(2001) and Xie (2001) provide the evidence of earnings management impacts on information asymmetry and financial markets.

The decisions and the strategies made by the management about the investment of capital expenditure effects firms' earnings. The operating performance will increase if the management of the firm invest capital in the optimal NPV projects. The investors in the US prefer reduction in the capital expenditure for the reason that lower capital expenditure will produce higher distributed dividends in the future, as argued by Titman, Wei(2004). Gompers, Metrick (2003) compares well-governed US firms with the badly governed firms. They have found that the firms with well monitoring over the management were engaged in less capital expenditure and less acquisitions. They have showed that the firms operating under strong monitoring spend less on the capital expenditure that increases the firm's earnings.

More recently, Jiang(2016) have studied the data of 357 manufacturing firms listed on the Taiwan Stock Exchange from 1992-2002 to investigate the relationship between capital expenditures and corporate earnings. They have divided the sample period into capital investment period and performance period because it took long for manufacturing firms to do planning and implementation of capital expenditure. On ranking the firms based on capital investment ratio estimated from the investment period, they make portfolios to test the relationship. The results of Jiang (2016) study showed positive relationship between capital expenditures and future corporate earnings even after controlling for current corporate earnings.

3 Methodology

Data of 696 listed firms from the manufacturing sector on ASEAN stock markets were obtained for the period 2000-2014 from Thomson Reuters Database. The study focused on the manufacturing sector because of the difference related to the capital expenditures and firm's earnings from retail, agricultural, financial and utility firms. The other reason is that the ratios of capital expenditures are higher in manufacturing sector than any other sector. The initial sample consisted of all manufacturing listed firms on five-ASEAN stock markets (Malaysia, Indonesia, Singapore, Thailand and Philippines). But due to the non-availability of data for all the firms, the final sample is reduced to 696 firms making a firm year observations of 10440 for fifteen years. The summary of the sample firms are presented in the Table 1.

Table 1 Number of Firms per Country

Country	No of Firms
Malaysia	227
Indonesia	118
Singapore	151
Thailand	160
Philippines	40
Total	696

The focus of the study is to test the performance of the firm against the capital expenditure. Following Jiang(2016), we have divided the duration of the study into two sub-periods: capital investment period (2000-2007) and the performance period (2008-2014). The reason to divide the duration of the study is because it takes several years to plan and implement any investment project. The potential benefits of those projects may last for several years after implementation. Thus by doing so, we can easily examine the association of the firms' performance with the capital expenditures from the prior

periods.

The capital investment ratio is used to measure the capital expenditures for the first eight years from 2000-2007. The capital investment ratio is obtained by dividing capital expenditures to total assets (C. H. Jiang, H.-L. Chen, and Y.-S, Huang,2016). The annual investment ratios are then obtained by calculating the average investment ratio for each sample firm. Similarly, the annual return on total assets is used to measure corporate earnings for the next seven years from 2008-2014. The return on total assets is obtained by dividing annual operating cash flow to total assets for each firm (C. H. Jiang, H.-L. Chen, and Y.-S, Huang, 2016). The average value of return on total assets is then calculated to obtain the annual return on total assets.

The sample firm are first sorted according to capital investment ratio estimated from the investment period 2000-2007. A total of ten portfolio are made in the way that each portfolio containing equal number of stocks. The association between capital expenditures and corporate earnings is analyzed by applying regression analysis on the portfolios made. In the regression analysis, the average capital investment ratio estimated from the investment period is used as the predictor variable while the average corporate earnings in the seven year performance period are used as the response variable.

The purpose of applying regression analysis is to test the hypothesis that the capital investment in the investment period is positively associated with the corporate earnings in the subsequent performance period. The contemporaneous corporate earnings in the capital investment period are used as a control variable because corporate earnings over the past years also determine the future earnings. Thus, two regressions are run i-e., regression 1 with average capital investment ratio while regression 2 with contemporaneous corporate earnings as a control variable.

$$ROA_{2008-2014} = \beta_0 + \beta_1 investment\ ratio_{2000-2007} + e \tag{1}$$

$$ROA_{2008-2014} = \beta_0 + \beta_1 investment\ ratio_{2000-2007} + \beta_2 ROA_{2000-2007} + e \tag{2}$$

4 Empirical Results

Table 2 shows the average annual figures for each variable for all 696 firms. In 2000 the capital expenditure for the sample firms have an average of US\$ million 36.65 while for total assets and the operating cash have the annual average values of 514.86 and 43.11 respectively. Similarly, the annual average values of all these variables are shown in the table from 2000-2007. All the variables shows upward trend from 2000 onward to 2007.

Table 2 Capital Investment Period 2000-2007

Variables	2000	2001	2002	2003	2004	2005	2006	2007
<i>Panel A: Capital Expenditure</i>								
Capital Expenditure (in US\$ million)	36.65	30.76	35.82	41.13	46.67	60.39	73.42	87.86
Total Assets (in US\$ million)	514.86	473.93	535.97	558.11	648.59	729.77	857.31	994.08
Capital Investment Ratio (Capital Expenditure/Total Assets, in %)	7.11	6.49	6.68	7.37	7.19	8.27	8.56	8.83
<i>Panel B: Corporate Earnings</i>								
Operating Cash Flow (in US\$ million)	43.11	39.50	44.03	64.30	70.20	85.30	91.51	107.69
Return on Assets (Operating Cash Flow /Total Assets, in %)	8.37	8.33	8.21	11.52	10.82	11.68	10.67	10.83

In the table 2 the capital investment ratio shows increasing trend from 2000 to 2007 except for the year 2001 which is 6.49. Similarly, return on assets is also showing the increasing trend from 2000 to 2007 which is used as a control variable for the next seven years (2008-2014). The capital investment ratio fluctuates during the first seven years, as it decrease from 7.11% in 2000 to 6.49 in 2001 and then again move upward in the following years.

Table 3 depicted the statistics for the performance period that is, from 2008-2014. The operating cash-flows show the fluctuations throughout the seven years, as it moves from 110.72 in 2008 to 109.81 in 2009. In 2010 again shows the upward trend while in 2011 it moves downwards. The total assets

continuously showing the upward trend in the performance period as it increase 40% from 1155.76 in 2008 to 1901.3 in 2014.

The return on assets ratio fluctuates a bit from 2008 to 2010. But from 2010 onward it is showing downward trend until 2012. In 2014 return on assets again increases to 8.91 from 6.13 in 2012.

Table 3 Corporate Performance Period 2008-2014

Variables	2008	2009	2010	2011	2012	2013	2014
Operating Cash Flow (in US\$ million)	110.72	109.81	140.80	136.10	111.32	145.29	169.42
Total Assets (in US\$ million)	1155.76	1200.99	1405.83	1602.99	1761.87	1848.85	1901.35
Return on Assets (Operating Cash Flow /Total Assets, in %)	9.58	9.143	10.01	8.49	6.31	7.85	8.91

The results of the capital expenditure and the corporate earnings for the ten portfolio that are made by sorting the firm on the basis of capital investment ratio from highest to lowest ratio are displayed in table 4.

Investment ratio shows downward trend for the first three portfolios that is, from 6.23 for portfolio 1 to 1.24 for portfolio 3, but after that it shows the upward trend from 1.24 to 15.47 which is almost 92% increase. The return on assets fluctuates in the investment period for all the ten portfolios. But in the performance period, the return on assets shows the downward trend from portfolio 3 to 10 which shows the negative impact of capital expenditure on corporate earnings.

Table 4 Portfolios Sorted by Capital Investment Ratio (2000-2007)

Variables	1	2	3	4	5	6	7	8	9	10	All
<i>Panel A: Capital Expenditure in investment period 2000-2007</i>											
Capital Expenditure (in US\$ million)	27.25	20.82	2.76	4.84	8.37	14.50	14.30	108.93	147.52	165.50	
Total Assets (in US\$ million)	436.76	451.30	221.68	266.86	315.83	455.94	288.26	1489.2	1607.2	1069.4	
Investment Ratio (Capital Expenditure /Total Assets, in %)	6.23	4.61	1.24	1.81	2.65	3.18	4.98	7.31	9.17	15.47	
<i>Panel B: corporate earnings in the investment period 2000-2007</i>											
Operating Cash Flow (in US\$ million)	39.07	41.95	10.69	10.29	17.13	18.60	29.04	135.67	155.63	224.10	
Return on Assets (Operating Cash flow/Total Assets, in %)	8.94	9.29	4.82	3.85	5.42	4.07	10.07	9.10	9.68	20.95	
<i>Panel C: Corporate Earnings in the Performance Period 2008-2014</i>											
Operating Cash Flow (in US\$ million)	649.78	144.80	244.97	143.24	44.57	42.09	18.08	15.55	9.30	1.62	
Total Assets (in NTS million)	7997.79	1168.81	1455.66	1107.84	1329.7	1977.8	1380.3	1557.08	2320.21	2387.37	
Return on Assets (Operating Cash-Flow/Total Assets, in %)	8.12	12.38	16.82	12.93	3.35	2.12	1.31	0.99	0.40	0.06	

The regression analysis is applied on the portfolios made to check the impact of contemporaneous capital expenditures on corporate earnings. The regression results based on 696 firms are shown in the panel A of table 5. Investment ratios for each sample firms are estimated first from 2000-2007 and then annual average values are calculated for each year which is used as explanatory variable. Similarly, return on total assets is estimated from 2008-2010 for each sample firms and then the average annual values are calculated for each year, to use it as dependent variable.

Two separate regressions are applied to check the relationship between the investment ratios and the return on assets. In the first regression only investment ratio₂₀₀₀₋₂₀₀₇ is used as a predictor variable

while in regression 2, the investment ratio₂₀₀₀₋₂₀₀₇ is used as a predictor variable and ROA₂₀₀₀₋₂₀₀₇ as a control variable. The results have showed no significant relationship for investment ratio in regression 1 and regression 2 even after controlling the earning of the previous period which shows significant positive relationship in regression 2. However, the explanatory power shows much higher improvement in the regression 2 that is, R² value shows a jump from 0.078 to 0.59 after controlling ROA₂₀₀₀₋₂₀₀₇.

Table 5 Regression of Future Corporate Earnings against Current Capital Expenditures and Current Earnings

Regressions	Intercept β_0	Investment ₂₀₀₀₋₀₇ β_1	ROA ₂₀₀₀₋₀₇ β_2	R ²
Panel A: Regression Based on the 357 Sample Firms				
1	11.91	-0.44 (-0.65)ns		0.078
2	11.12	0.75 (1.02)	0.81 (2.23)s*	0.59
Panel B: Regression Based on the Eight Portfolios Sorted By Investment Ratio (1992-1996)				
1	10.91	-0.89 (-2.19)s**		0.37
2	8.13795	-2.19 (-1.83)s*	1.17 (1.15)s*	0.47

*significance at the 0.1

**significance at the 0.05

***significance at the 0.01

Panel B in table 5 shows the regression results of the based on ten portfolios sorted by capital investment ratio. The explanatory power improves in the regression 1 which is 0.37. The regression 1 of the panel B shows significant negative relationship between investment ratio and ROA. The slope coefficient value in regression 1 is -0.89 which is significantly negatively related with a t-value of -2.91. In the regression 2 both investment ratio₂₀₀₀₋₀₇ and ROA₂₀₀₀₋₀₇ shows significant relationship with ROA₂₀₀₈₋₁₄. Investment ratio₂₀₀₀₋₀₇ shows significant negative relationship with ROA while for ROA₂₀₀₀₋₀₇ the slope coefficient value is 1.17 which is significantly positively related with a t-value of 1.15.

The empirical results of the study oppose the traditional view that there is a positive relationship between capital expenditures and future earnings. Significant negative relationship is found between current expenditures and future earnings even after controlling the earning from the investment period which contradicts the results of (C. H. Jiang, H.-L. Chen, and Y.-S, Huang,2016).

5 Conclusions

This study has investigated the relationship between capital expenditures and future firm earnings on 696 manufacturing listed firms on five ASEAN stock markets. Investment ratio is used for measuring capital expenditure while ROA is used for firm earnings. To test the relationship between capital expenditures and future firm earnings the sample firms are used to make portfolios by sorting the firms on investment ratio. A total of ten portfolios are made in a way that each portfolio containing equal no of stocks. Regression analysis is then applied to test the relationship. Contradictory to Jiang (2016) this study has found significant negative relationship between capital expenditures and future firm earnings. The reason might be the investment by the managers in the wasteful projects like unnecessary acquisitions which results in the overinvestment as argued by Jensen(1986). Thus, capital expenditure in the emerging markets might be the bad news for investors in the investment practice. The future researchers can find out the reason behind the negative impact of capital expenditures on future firm earnings.

Impact of Exchange Rate, Relative Per Capita Income and Relative GDP on China-Pakistan Bilateral Trade

Najaf Iqbal, Xu Fengju

School of Management, Wuhan University of Technology, Wuhan, P.R. China, 430070

(E-mail: Najaf_iqbal@live.com, 619616583@qq.com)

Abstract: The aim of this study is to investigate the impact of different economic factors on bilateral trade balance between China and Pakistan. A number of qualitative and quantitative factors affecting bilateral trade have been discussed but not all are included in the proposed model. Annual data from 1991-2013 on exchange rate between China and Pakistan, relative Per Capita income, relative GDP and Balance of trade is collected, analyzed and modeled using multiple linear Regression. Relative GDP and per capita income have a significant positive and negative impact respectively on bilateral trade balance between China and Pakistan. Exchange rate does not have a significant impact on China-Pakistan bilateral trade balance in the sample considered here while one year lagged values of trade balance are found significant in predicting trade balance between these two countries. This study is the first attempt to model China-Pakistan bilateral trade balance till now up to the best of author's knowledge. Future studies can include a panel data set to model Pakistan's overall trade balance with all major countries which should definitely consider a larger and more heterogeneous data set. This study will be helpful for Pakistani authorities to forecast trade balance and formulate appropriate policies to lessen any expected trade deficits with its 2nd largest trading partner (China).

Key words: Bilateral trade balance; Exchange rate; GDP; Per capita income

1 Introduction

There is no doubt that international trade is one of the primary drivers of peaceful co-existence between countries of the world. Even the countries with severe conflicts tend to avoid confrontation when they have a huge bilateral trade volume. Due to ever increasing economic cooperation between China and Pakistan, it is the need of the hour to investigate how trade pattern between these two countries is affected by different economic factors. Understanding of trade balance modeling between Pakistan and China can help policy makers to form policies to reduce any negative impacts of trade deficits and formulate an effective trade policy for the betterment of the people of both countries. Although Pakistan records a net deficit in trade volume with the world while China shows a surplus, still consistent rise in trade deficit with China is the focal point of trade policy discussion these days in Pakistan.

The aim of this study is to determine the impact of some macroeconomic variables on bilateral trade between China and Pakistan. Per Capita Income, Economic size (Pakistan and China GDPs) and Exchange rate are selected as macroeconomic variables to be included in this study. Selection of only these variables was a result of data availability and time related issues. This research will be helpful for policy makers to formulate favorable policies for creating healthy environment for bilateral trade between the two countries. By enhancing trade volumes, the two countries can get great benefits in terms of economic development. Specific study of this nature on these two countries is rarely available in the literature up to the best of author's knowledge.

2 Literature Review

2.1 Exchange rate

Exchange rate is the value of one currency in terms of another foreign currency. "Direct exchange rate" refers to the value of Home Country's currency in terms of foreign currency while "Indirect exchange rate shows the value of foreign country's currency in terms of home currency (Chong Lee-Lee, 2007). Increase in the value of the home currency as compared to foreign currency due to market forces is called appreciation of home currency and decrease in value called depreciation (Koi Nyen Wong, 2008). From home country's perspective, increase in direct exchange rate quotation means appreciation while increase in indirect exchange rate quotation means depreciation of home currency as compared to foreign currency (Mohsen, et al, 2007). Direct exchange rate quotations from Pakistani perspective will be used for the purpose of analysis in this study. A number of factors including inflation, interest rates, income level, government controls and people's expectations affect the exchange rate between any two

countries whereas changes in exchange rates affect the volume and direction of bilateral trade between these countries as a result (ABEL, et al, 1982).

2.1.1 Exchange rate regime in China

Asia is experiencing a gradual shift of exchange rate regimes from managed to freely floating. China is not an exception to this phenomenon (Eichengreen, 2006). Chinese currency remained pegged with U.S dollar for a long period of time. China faced great pressures from international community to shift its exchange rate regime to a more flexible one after recording consistent trade surplus for most of the countries, especially United States (Ramkishan, 2012). In response to these pressures, China allowed its currency to depreciate slowly against U.S dollar after 2005. It was a kind of "managed float" regime. Numerous studies have shown the positive effects of undervalued Chinese RMB on its exports. However some researchers have found insignificant impact of undervalued RMB on Chinese exports to the rest of the world recently by taking multiple related considerations into account (Frankel, 2009).

2.1.2 Exchange rate regime in Pakistan

Pakistan adopted a flexible exchange rate policy in 2001 as compared to previous more rigid policy of almost fixed exchange rate. Today's exchange rate regime of Pakistan is nearly free float with intervention from Central Bank only if necessary (Komain, 2012). They don't stick to some rules when it comes to exchange rate rather try to manage it according to situation and need of the hour. Some studies have shown the negative impact of Pakistani Rupee depreciation on the economic growth of the country.

2.2 Bilateral trade

International Trade between two countries is called bilateral trade. Bilateral trade is very important for the development of the countries' masses (Holger., 2011). It is considered as a gauge of relations between countries. It is also considered as a driver for international peace. Trade surpluses and deficits are very important as wealth transfers from countries in trade deficit to surplus countries. Relevant authorities pay great attention to balance of trade in the best interest of their countries. Deliberate exchange rate depreciation is one of the most famous tools to increase trade balance with other countries. Sometimes exchange rate depreciation becomes the major issue of debate to tackle international trade balances among world's greatest powers. A number of other factors than exchange rate also affect the volume and direction of bilateral trade between two countries.

2.2.1 Factors affecting bilateral trade

Different international trade theories and models have identified different factors affecting international trade.

1) Economy size

"Gravity theory" is the famous study to discuss this issue (Wang, et al, 2010). First form of "Gravity theory" stated that bilateral trade between two countries is a function of sizes of two economies and physical distance between them. This remained quite simple and impressive explanation for bilateral trade volumes for a long period of time (Deardorff, 1984).

2) Current and historical trading costs

Second form of gravity theory included "current and historical trading costs" as additional explanatory variables in the gravity equation and excluded physical distance. This form is called "Dynamic Gravity model". This model has widespread support from empirical studies as trading cost is the most significant factor which determines the direction and volume of international trade.

3) Exchange rate

Apart from simple variables included in static and dynamic forms of Gravity equation, a list of other explanatory variables has also been used in numerous studies to explain bilateral trade. Most important of these factors is exchange rate volatility. Impact of Exchange rate changes on bilateral trade between China and Pakistan is the main focus of this study. Its detailed effects on bilateral trade will be discussed later in this study.

4) Per capita income

Little difference in per capita income is associated with large volume of bilateral trade (Helpman, 1985). It implies that countries with similar per capita incomes trade more with each other than countries with large differences in per capita income.

5) Bilateral foreign direct investment

It is not obvious till now that increased trade flows cause FDI or increased FDI causes increased bilateral trade flows but latter has got some empirical support (Gopinath, 1999). A recent study has shown the positive impact of "Japanese FDI in China" on bilateral trade volumes (Jinping, 2008). Both China and Japan are large economies and have positive size effects on bilateral trade.

6) Distance between countries

First form of gravity theory states that bilateral trade between two countries is directly proportional to the gross domestic products of the countries while inversely proportional to the physical distance between them .

7) Institutional arrangements and trade agreements

Literature on effects of "free trade agreements" on bilateral trade shows mixed results sometimes (Magee, 2003). Free trade agreements can increase the volume of bilateral trade up to 100 percent within 10 years' time (Bergsten, 2007). Theoretically this argument sounds good but some studies casted a doubt on its credibility. Another study questions the "greater market access" for developing countries through bilateral trade agreements with industrialized economies.

8) Trade complementarity

Trade complementarity refers to the degree to which one country sells what the other tends to buy. If one country sells the same products which the other needs, they are said to have a high trade complementarity. Trade volume between countries with high trade complementarity is expected to be much higher than countries with low complementarity. This factor is not much favorable for Sino-Pak trade.

9) Cultural similarities

It is much convenient to conduct trade and transactions between people sharing similar values, norms and languages. As they can understand each other well and communicate more easily and effectively. This factor is not favorable in Sino-Pak trade perspective as they have very different culture, norms, traditions and languages. This hurdle is being removed now by cultural exchanges, Chinese language teaching to Pakistani students in China and in Pakistan also now.

2.2.2 Exchange rate and bilateral trade

Effect of exchange rate depreciation is favorable in literature due to increased competitiveness of prices in depreciating country. While in the absence of sound "risk management practices", trade volumes become small in an area of high exchange rate volatility (Gagnon, 1993). According to a recent study, devaluation is contractionary in case of Pakistan (Shahbaz et al, 2011). Depreciation of Chinese RMB is associated with positive trade balances for China due to huge trade surplus and export orientation of the economy (Claus, 2011). China is also accused often to deliberately keep its currency undervalued to take undue advantage in foreign trade (Goldstein, 2003; Taylor, 2003). In such a perspective, it is interesting to know how undervalued RMB affects trade volume and direction with one of its best friends.

2.3 International trade theories

Classical Ricardian model of international trade suggests that countries trade due to differences in their relative production efficiencies. This model is superior to "Absolute advantage theory" of Adam Smith, as it explains the trade patterns far better than that. Heckscher-Ohlin model suggests that international trade patterns are determined on the basis of differences in factor endowments between the countries. Standard trade model is a general international trade model which include other models, such as; Ricardian, H-O and specific country characteristics as special cases. It states that differences in physical capital, labor skills, labor services, land type, technological differences cause differences in production possibilities across different countries. The gravity model specifies the value of trade between two countries as a positive function of incomes of the countries and a negative function of the distance between them (Deardorff, 1984). It has been justified theoretically by Leamer and Stern, and Anderson (Learner, 1970; Anderson, 1979). Many researchers have extended Gravity model to include various other variables like current and historical trading costs etc. Linder hypothesis states that countries with little per capita income differential are expected to have more bilateral trade. If transportation costs are controlled to check the effect of similar per capita incomes on bilateral trade, results tend to be somewhat different (Deardorff, 1984). The empirical research on Linder hypothesis is further extended to test it from a product quality perspective. Research has got support for the hypothesis that product quality determines the level of bilateral trade between two countries (Hallak, 2010). Abrams have found support for the hypothesis that exchange rate variability affects the pattern of bilateral trade (Abrams, 1980). Deliberate depreciation of the local currency can increase the exports volume of an export oriented country. This phenomenon sometimes triggers competitive devaluations between different countries. Exchange rate is the most widely discussed factor affecting international trade patterns, in literature today (Wang, et al, 2010; Magee, 2003).

2.4 Economic size (GDP), per capita income differential and bilateral trade

First form of gravity theory stated that bilateral trade between two countries is a function of sizes

of two economies and physical distance between them. This remained quite simple and impressive explanation for bilateral trade for a long period of time (Wang, et al, 2010). Little difference in per capita income is associated with large volume of bilateral trade (Helpman, 1985). Literature on physical distance has found consistent support according to "Gravity equation" (Egger, 2000; Egger, et al, 2004).

3 Data, Methodology and Results

Data set consists of 23 annual observations for each variable from 1991 to 2013. Exchange rate data is collected from United Nations Conference on Trade and Development. Bilateral trade volume data is collected from statistical website of Government of China while Data on GDP and Per Capita Income is collected from World Economic Outlook by IMF. To avoid problems of non-stationarity, first ratios and then logarithms of the series are taken. Such a data transformation is consistent with the relevant studies in literature (Khan, 2010). Use of exports/imports ratios instead of trade balance values is easy to interpret and unit free. Same is true for ratios of GDPs and per capita incomes. Zakir and Ismail have included import weighted distance while modeling trade balance of Bangladesh with all other major trading partners (Khan, 2010). This study considers only two countries, so distance will have no variability and hence no explanatory power here.

Two different date dummies were tried in the model to capture the effects of shift in exchange rate regime in Pakistan after 2001 and negotiation of "free trade agreement" between China and Pakistan in 2006. Both of these dummies were found insignificant and did not improve any results so they were dropped. One period lagged value of ratio of Pakistani exports to Pakistani imports is also included in the model as its inclusion helped to improve explanatory power of the model (suggested by improved adjusted R²) and removal of serial correlation (suggested by DW statistic).

Final model of trade balance between China and Pakistan formed here is as following:

$$\ln(exim) = a_0(\text{constant}) + b_1\ln(er) + b_2\ln(cgdpgd) + b_3\ln(cpcppc) + b_4(exim(-1)) + u_t$$

$\ln(exim)$ is the log of ratio of Pakistani exports to Pakistani imports from China, a_0 is intercept, $\ln(er)$ is the log of direct exchange rate between China and Pakistan (pkr/cny), $\ln(cgdpgd)$ is the log of ratio of Chinese GDP to Pakistani GDP, $\ln(cpcppc)$ is the ratio of Chinese per capita income to Pakistani per capita income, $exim(-1)$ is the one period lagged value of ratio of Pakistani exports to Pakistani imports from China and u_t is the disturbance term. Coefficients are represented by b_1 , b_2 , b_3 and b_4 .

All data included in this study is secondary and time series data. "EViews 7.2" (Statistical software) is used for data analysis. Multiple linear Regression is run after satisfying all conditions of OLS to check the impact of exchange rate, GDP, lagged values of dependant variable and per capita income on bilateral trade balance between China and Pakistan. Annual data is collected for 23 years ranging from 1991 to 2013. Results of the regression are shown in the following table:

Table 1 Regression Results

Variable	Coefficient	Std. Error	t-Statistic	Prob.
C	-8.44941	2.577929	-3.277595	0.0044
LOG(ER)	-0.08289	0.647323	-0.128052	0.8996
LOG(CPCPPC)	-2.04431	0.928881	-2.200826	0.0419
LOG(CGDPGD)	2.694382	0.830478	3.244374	0.0048
EXIM(-1)	1.66841	0.30222	5.520513	0

Value of Adjusted R-squared is **0.80**.

F statistic is **22.70** and Probability of F statistic is **0.00**.

AIC value is **0.15** while DW statistic is **2.29**.

Adjusted R² is 80% and F statistic is very high (22.70) suggesting an overall good fit of the data to proposed model. Coefficients of per relative capita income, relative GDP and lagged values of trade balance (exports/imports) are significant while of exchange rate is insignificant. One unit increase in the logarithm of ratio of Chinese per capita to Pakistani per capita is followed by almost 2 units decrease in the logarithm of ratio of Pakistani exports to China to Pakistani imports from China suggesting a negative impact. One unit increase in the logarithm of ratio of Chinese GDP to Pakistani GDP is followed by almost 2.6 units increase in the logarithm of the ratio of Pakistani exports to China to Pakistani imports from China suggesting a positive impact on trade balance. Improvement in the trade balance in the previous period is associated with improvement in the coming period suggested by a positive coefficient of lagged value of ratio of Pakistani exports to China to Pakistani imports from

China. This Regression overall explains 80% of the variation in trade balance which is quite good. Descriptive statistics show that variables included here are almost normally distributed on the basis of Jarque-Bera test. Correlations between independent variables suggest some multicollinearity but it does not affect the coefficients or overall explanatory power of the model (which is the purpose here). No strategy including dropping a variable or including a proxy variable worked here. More data or a panel data set could not be considered here because of limited time and data availability issues. So multicollinearity here was not dealt with and other tests of the model fitness gave good results. Residuals are almost normally distributed suggested by Jarque-Bera test. 2.29 value of DW statistic shows almost no serial correlation. Breusch-Godfrey serial correlation LM test also suggested presence of no serial correlation in the equation. At 5% significance level, null hypothesis of homoscedasticity could not be rejected using White's test for heteroscedasticity.

4 Conclusions and Recommendations

Relative increase in Chinese GDP with respect to Pakistani GDP improves Pakistan's trade balance while relative increase in per capita Chinese income deteriorates Pakistani trade balance with China. Depreciation in Pakistani currency has no role in improving its trade balance due to increased dependence on imports from China for its Industrial sector. Despite little significance found here, exchange rate needs to be kept at a stable and predictable level to give traders and investors confidence, in both countries. Serious efforts are needed at higher official level to address the issue of increasing trade imbalances between the two countries. Recent "Currency Swap Agreement" is a positive step in this regard which can indirectly decrease trade imbalances. Increased trade deficit of Pakistan with China is moving side by side with increase in Per Capita Income Differential. Increased Differential means increased gap between living standards of the people of China and Pakistan. This issue should also be addressed through decreasing the trade imbalances between the two countries by enhancing Pakistani exports to China and providing greater market access by China to Pakistan or by increasing FDI by China in Pakistan.

Effects of Leone Exchange Rate Fluctuation on Sierra Leone's Foreign Trade

Sesay Brima, Zhao Yulin

School of Economics, Wuhan University of Technology, Wuhan, P.R. China, 430070

(E-mail: brimasesay30@gmail.com, ylzhao@whut.edu.cn)

Abstract: A stable and sustaining improvement of foreign trade is a significant assurance for a country to attain economic development. As an important tool, exchange rate plays a significant role in attaining a country's economy balance and stable development. It also affects the international trade of a country. Owing to this fact, the relationship between exchange rate and trade is widely studied by researchers. This paper is an attempt to study this relationship for Sierra Leone via time-series framework and provide important policy implications. The study employs an econometric approach and found statistically significant relationships among the variables. The result shows that real exchange rate depreciation has adverse effect on total trade volume over the period under review.

Key words: Leone exchange rate; Trade balance; Foreign trade; Sierra Leone

1 Introduction

The relationship between exchange rate and foreign trade is undoubtedly an important subject from both the descriptive and policy prescription perspectives. Since the late 1980s, the economy of Sierra Leonean has undergone significant changes in terms of reforms. The shift to export-led growth from import substitution resulted in removing major restrictions on the economy placed on it by the government, including the implementation of a floating exchange rate regime. In recent years, policy discussions have increasingly included references to real exchange rate stability and proper exchange rate positioning as vital elements in the improvement of Sierra Leone's economic performance. Real effective exchange rate movement affects economic activity in Sierra Leone, mainly owing to its dependence on imported capital goods and specialization in commodity exports. The economy has undergone a series of exchange rate devaluations in an effort to improve its trade balance. The government has considered the exchange rate to be an important macroeconomic instrument for ensuring a low inflation rate and a stable financial system, controlling imports, promoting exports, and enhancing favorable balance of trade. In the literature, the real effective exchange rate serves as a better international price for influencing a given country's competitiveness than the nominal exchange rate. Management of the nominal exchange rate depends on the real exchange rate, which is influenced by, inter alia, the nominal exchange rate (Montiel, 1997). An overvalued real exchange rate affects the intensity and pattern of production, the allocation and level of expenditure, the supply and level of factor payments, the composition and size of trade flows, the level of international reserves and external debts, the parallel foreign exchange markets, currency substitution and capital flight. Real effective exchange rate is the best way to objectively reflect the actual exchange rate of a country situation.

At this junction it is important to give an illustration of both real effective exchange rate depreciations in Figure 1 and Sierra Leone's trade with the world in table 1, to see how both the trade balance and total trade volume responded to devaluations of the Leone. Figure 1 revealed a series of depreciation. However, the highest rate of real exchange rate depreciations occurred during 1986 and 2014.

Table 1 Sierra Leone's Trade with World % GDP

Year	Export	Import	Balance	Total Trade
2005	17.8	29.7	-11.9	47.5
2006	16.8	25.0	-8.2	41.9
2007	15.6	24.7	-9.1	40.2
2008	13.5	25.7	-12.2	39.2
2009	13.4	27.9	-14.5	41.4
2010	16.7	34.5	-17.8	51.2
2011	13.8*	31.2*	-17.4*	45.0*
2012	26.3	32.2	-5.9	58.5
2013	12.8*	33.2*	-20.4*	46*
2014	12.3*	34.1*	-21.8*	46.4*

Source: World Development Indicators (WDI), * Indicates estimated figures.

The table above shows that the value of exports declined between 2005 and 2014, though it was reported to be very high in 2012. This is mainly due to the increase in exportation in iron ore products during this period. The table also shows a continuous increase in imports, which is a result of increased demand for finished goods and foreign inputs for the manufacturing sector throughout the periods. In general, imports have always exceeded exports and hence a continuous decrease in the trade balances.

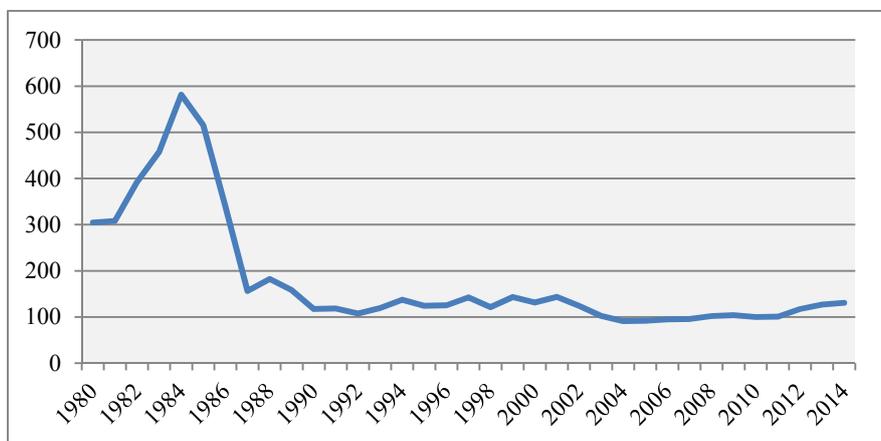

Figure 1 Real Effective Exchange Rate Fluctuation

However outcomes on empirical results on the relationship between exchange rate and international trade are still mixed, for instance, Rose and Yellen (2009) in their study found real exchange rate has no effect on export and import in the long and short run when they estimated bilateral trade elasticity between US and other countries in the case of U.S data for the period 1960 to 2009. In fact, depreciation of currency does not affect the value of import and export commodity itself. However, through changing their relative prices in international trade it can enhance or weaken their competitiveness in international market. Even if for some reasons, the demand for imports have not reduced following the devaluation, industries which produce the same goods in domestic market will be developed and import of this kind of goods will be reduced due to the rise of local currency prices of imported goods (Cerra V. & Dayal A. 2013).

In view of these conflicting results, it is clear that the impact of exchange rate devaluation on international trade remains an unsolved problem in the empirical literature. In the present study therefore, an attempt has been made to examine the extent of relationship between fluctuations of Leone’s exchange rate and foreign trade in Sierra Leone via time-series analysis.

2 Methodology

The ordinary least squares (OLS) estimation was used. The choice of this model is based on the fact that OLS is best suited for testing specific hypothesis about the nature of economic relationship. The study uses multiplicative of X-12-ARIMA method to adjust original data and take their logarithm. Unit roots test was also done to test the stationary properties of the variables. The next step was conducted in confirming the level of time lag and constructing co integration test. The final step was the construction of the equation. By evaluating Sierra Leone’s export and import demand flexibility, we can validate if Marshall-Lerner condition is appropriate in Sierra Leone, and use general distributed-lag model to analyze the J-Curve Effect.

2.1 Empirical model specification

The main objective of the study is to evaluate the effects the Leones exchange rate fluctuation has on Sierra Leone’s total trade volume. Thus in deriving our empirical model for estimating this relationship we assume that:

Domestic Price (P): $P_D = P_X$

Foreign price (P*): $P_M = P_F$

Real effective exchange rate(R): $E \times (P / P^*)$

We have,

$$M_D = M_D (Y_1, R) \tag{1}$$

$$X_D = X_D (Y_2, R) \tag{2}$$

Where, M_D and X_D are the import and export demand function depends upon their respective incomes and real effective exchange rate. Therefore, the total trade volume (T) can be expressed as follows

$$T = X_D + M_D = T(Y_1, Y_2, R) \tag{3}$$

In a simple regression form, equation (3) can be written thus:

$$T = \delta + \alpha Y_1 + \beta Y_2 + \lambda R + \mu \tag{4}$$

For ease of interpretation, all the variables have been assumed in logarithmic terms. The advantage of taking natural log in a time-series framework is that one can achieve the level of stationary at the earliest level of integration. In the log-linear regression, the coefficients are easy to interpret as the problems of different units have been solved and the interpretation becomes easy in elasticity terms.

$$\text{Ln}T = \delta + \alpha \text{Ln}Y_1 + \beta \text{Ln}Y_2 + \lambda \text{Ln}R + \mu \tag{5}$$

2.2 Data and estimation procedure

Annual time series data for the present study have been taken from World Development Indicators (WDI) and Sierra Leone's total trade volume with its major trading partners from 2005 to 2014. In order to increase the sample size and to avoid biasness in the estimation output, the quarterly data were obtained through interpolation of annual time series data using E-views 7.2. This was done using the low frequency to high frequency method and the quadratic match average and quadratic match sum for each observation of the low frequency series (2005Q1-2014Q4). The study has used time series co integration technique to evaluate the relationship between exchange rate and the volume of trade in Sierra Leone with the world. The following variables are incorporated in the regression to achieve the objective of the study.

- Sierra Leone's total trade volume T is the sum of quarterly total imports and exports with the world in constant prices and t is logarithms of T
- The rest of the variables R, Y_1 , and Y_2 are the logarithms of real effective exchange rate, Sierra Leone's GDP (Y_1), and USA's GDP (Y_2) respectively.

Since quarterly data may have seasonal fluctuation, it is adjusted using multiplicative of X-12-ARIMA method.

3 Presentation and Interpretation of Results

3.1 Unit root test

The unit root test result (table 2) reveals that all the variables in the trade equation were non-stationary at their level but became stationary at first differencing. Thus the variables are integrated of order one, denoted as I (1). This suggests the use of co-integration analysis since the concept of co-integration requires variables must be integrated of same order.

Table 2 Unit Root Test

Augmented Dickey-Fuller Unit Root Test				
Variable	Level/ Δ Level	ADF test statistics	ADF critical value	Inference
T	Level	-0.765997	-3.020686	I(1)
	Δ Level	-4.739353	-3.020686**	
R	Level	-0.877805	-2.998064	I(1)
	Δ Level	-5.538360	-3.004861**	
Y_1	Level	0.473877	-2.998064	I(1)
	Δ Level	-4.019898	-3.004861***	
Y_2	Level	-0.518238	-2.998064	I(1)
	Δ Level	-5.886847	-3.004861**	

Note: ***, ** and * indicates that the variable is stationary at the 1 %, 5% and 10% level of significance respectively.

3.2 Lag length selection process

Before proceeding with the Johansen's test of co-integration, the optimal lag selection criteria was employed to determine the lag length to be used in carrying out the estimation so as to ensure reliability of long run relationship. In table (3) the lag order selection criteria for sequential modified likelihood ratio (LR), final prediction error (FPE), akaike information criterion (AIC), schwarz information criterion (SC), and hannan-quinn information criterion (HQ) suggested the selection of an optimal lag of 1. Thus a maximum of lag one has been chosen.

Table 3 Lag Length Selection

Lag	LogL	LR	FPE	AIC	SC	HQ
0	-198.80	NA	18635.6	18.3462	18.4950	18.3813
	90		3	7	5	2
1	-151.56	77.3023	583.191	14.8698	15.4649	15.0100
	87	4*	1*	8*	9*	7*
2	-145.93	7.67713	838.209	15.1762	16.2177	15.4215
	88	7	7	5	0	9

* indicates lag order selected by the criterion

LR: sequential modified LR test statistic (each test at 5% level)

FPE: Final prediction error

AIC: Akaike information criterion

SC: Schwarz information criterion

HQ: Hannan-Quinn information criterion

Source: E-views output

3.3 Co-Integration Test

The co-integration test results of each series in the trade equation are reported in table 4. The result of the trace test indicates that at least one co-integrating equation exists at the 5% significance level. Therefore the null hypothesis of no co-integrating equation is rejected since the trace test statistics of 21.23304 is greater than the critical value of 21.13162 at the 5% level of significance. Therefore, it can be concluded that there is one significant long run equilibrium relationship among T, Y₁, Y₂ and R.

Table 4 Unrestricted Co-Integration Rank Test Result (Trace)

Hypothesized No. of CE(s)	Eigen value	Trace Statistic	0.05 Critical Value	Prob.**
None *	0.619069	21.23304	21.13162	0.0484
At most 1	0.212244	5.248462	14.26460	0.7102
At most 2	0.013195	0.292227	3.841466	0.5888
At most 3	0.001653	0.044681	1.642741	0.8326

Trace test indicates 1 cointegrating eqn(s) at the 0.05 level

* denotes rejection of the hypothesis at the 0.05 level

**MacKinnon-Haug-Michelis (1999) p-values

Table 5 Cointegrating Relationship

Variable	Coefficient	Std. Error	t-Statistic	Prob.
C	-125.2926	30.36971	-4.125579	0.0062
R	-2.224994	0.561731	3.960958	0.0074
Y ₁	0.420007	0.125403	3.349270	0.0030
Y ₂	0.379324	0.118384	3.204173	0.0043
R-squared	0.895012	Mean dependent var	57.93281	
Adjusted R-squared	0.842518	S.D. dependent var	24.23666	
S.E. of regression	0.618069	Akaike info criterion	7.654338	
Sum squared resid	0.540435	Schwarz criterion	7.775373	
Log likelihood	34.27169	Hannan-Quinn criter.	7.521564	
F-statistic	17.04982	Durbin-Watson stat	2.083371	
Prob(F-statistic)	0.002430			

Source: E-views output

In a regression form, the long run relationship can be written as:

$$T = -125.2926 - 2.2249R + 0.4200Y_1 + 0.3793Y_2 \quad (6)$$

The residual stability test of the total trade volume equation shows a stable relationship. Therefore there is long run stable relationship among T, Y₁, Y₂ and R. The real effective exchange rate has a negative sign and exerts statistically significant effect on total trade volume. The coefficient of the real effective exchange rate implies that 1% depreciation in the Leones exchange rate will decrease Sierra Leone's total trade volume by 2.2 percent. This finding is in conformity with theories that exchange rate fluctuation can affect international trade, where the depreciation of a country's currency will adversely affect its trade balance. The elasticity of total trade volume to Sierra Leone's GDP and world GDP is

0.42 and 0.38 respectively. Since Sierra Leone's import is more than export, Sierra Leone's foreign trade volume is impacted greatly by the world economy than its economy.

4 Conclusions

The paper has examined the relationship between exchange rate fluctuation and foreign trade in Sierra Leone over the period 2005Q1-2014Q4. The study followed an econometric approach where various tests were conducted in order to avoid spurious regression results. Total trade volume was taken as dependent variable and real effective exchange rate, Sierra Leone's GDP and world's GDP as independent variables. All the variables were found to be stationary after first differencing. The Johansen's cointegration test approach was adopted to estimate the long run relationship of the model. The test suggests that there exists a unique cointegrating relationship among total trade volume, real effective exchange rate, Sierra Leone's GDP and world's GDP.

The study has underscored the importance of exchange rate alignment in influencing foreign trade in Sierra Leone. The findings indicate that foreign trade can be stimulated by the adoption of long run policy to ensure proper exchange rate management. Therefore, the policy suggestions for enhanced favorable balance of trade will be for policy makers to facilitate the maintenance of a stable exchange rate by allowing the exchange rate to appreciate/depreciate within a certain band; to discourage the importation of certain goods that are also produced locally by imposing high import tariffs on them so as to encourage their local production and consumption. Government should help local producers to expand on their production and increase the quality of their products by adding value which will in turn increase their demand.

Comparative Research on the Impact of Transformational Leadership on Banking Project Success in China and Ghana

Saviour Ayertey Nubuor, Xu Hongyi

School of Management, Wuhan University of Technology, Wuhan, P.R. China, 430070

(E-mail: steven_64@163.com, saviolah2000@yahoo.com)

Abstract: The purpose of this study is to comparatively investigate the impact of Transformational leadership (TL) on banking project success in China and Ghana. Primary data was obtained through questionnaires administered to 200 employees within banks in China and Ghana. The results revealed that there is a strong positive correlation between transformational leadership and banking project success in China and Ghana. The highest predictor to project success in China is Intellectual Stimulation While in Ghana is Inspirational Motivation. The study concluded that project leaders (managers) in the banking industry in both China and Ghana can increase the probability of project success by implementing and ensuring an environment that permits the use of TL behaviors notably Idealized Influence, Inspirational Motivation, Intellectual Stimulation and Individual Consideration.

Key words: Transformational leadership; Project; Project success; Leadership; Banking

1 Introduction

Project management is seen as the process of making decisions and defining specific strategies and tactics to bring a project to success. According to the Project Management Institute (2008). Projects are the organization's activities that cannot be carried out within the normal or routine activities in the organization or a transient effort to achieve an unparalleled output. Projects create a better business value.

The service industry of which banking is a part is one of the growing and important sectors in every economy, but, amidst this growth lies various challenges as far as leadership and project success are concerned. These challenges limit their benefits and impede them from achieving their strategic goals and this call for a critical look at leadership and project success

Leadership can affect many work related behaviors like employees' attitude, motivation and performance which can affect the outcome of any project (Bass, B.M, 1985). Bass, B.M (1985) among others proposed that there are two major styles of leadership namely: transformational and transactional. Transformational leadership is person oriented and brings desired changes in their followers. They are most of the time physically strong, enthusiastic and passionate and make sure that every member of the team succeeds. Past researches reveal that project success or failure is linked to the attitude of the employees, their work manners, motivation and performance and transformational leadership is positively correlated with all these attributes of the employees (Dumdum, U.R., et al 2002).

Even though there are a lot of researches exploring the relationship between leadership style and job satisfaction, relatively little attention has been paid to leadership styles and project success in the banking sector of China and Ghana. This provides a significant research gap, so, there is the need for this study to unearth the impacts of transformational leadership style on project success in the banking sector.

In view of the above, the following research questions are posed: What is the impact of transformational leadership style on project success in the banking sector of China and Ghana? And which dimension of the transformational leadership style strongly influence project success in the banking sector of China and Ghana.

2 Literature Review and Theoretical Background

According to Prabhakar (2005), leadership is defined in many ways, but, all the definitions have the following in common; the fact that leadership is a process that influences individuals and groups, concern with facilitating the performance of tasks of teams or groups and focuses on setting and achieving goals and objectives.

Turner and Muller (2004) have studied the impact of project leaders and their leadership style on project success. In their works, it can be deduced that, the studies conducted over the years on the factors of project success have not paid attention to the project leader or manager and his or her style of leadership and competence for project success. The cause of this situation has been attributed to the fact that most of the studies request the project leaders' opinion rather than their own impact on the success of projects. Or it can be because the project manager has no direct impact on project success which in any case is contrary

to the general literature of management which asserts that the leadership style and competence of the manager has a direct and measurable influence on the performance of an organization. To Prabhakar (2005), the transformational leadership style of being an example to a team and person oriented is directly linked to the success of projects. He also put out that transformational leaders who enlivens and motivates their team members by challenging them have a high probability of project success.

According to Bass (1998), there are four facets of transformational leadership: charismatic (charisma and idealized influence), inspirational motivation, intellectual stimulation and individualized considerations which are related to each other. The idealized influence dimension ensures that the vision and mission of an organization is made known and internalized by the followers. They hold on to the assertion that leaders influence their followers when they live an exemplary life. The trust of such leaders is won by their way of life. They value the needs of their followers more than their own, they are sacrificial leaders. As the name suggests, inspirational motivation leaders inspire and highly motivates the firm or business unit as a whole by using words that appeals to their emotions and bringing the best out of its followers; this type of leader builds the organizational morale by making the followers share in the organization’s culture (Rafferty, A., E. & Griffin, M., A 2004). Intellectual stimulation refers to the dimension which inspires the followers to be creators and innovators, hence the employees can critique why something is done in a certain way and not the other way. For individualized consideration, the leaders perform the role of trusted counselors or teachers to their team members or followers. Each follower is uniquely treated based on his or her skills and knowledge base. To Bass, B.M (1985) transformational leadership entails three steps: 1) Elevating followers’ awareness of the task and its importance and value 2) Making them transcend their self-interest for the sake of achieving organizational goals 3) At the same time, activating their higher-level needs of self-esteem and self-actualization needs.

For the purpose of this research, leadership styles will be conceptualized as possibly being related to project success. The conceptual framework for this research is shown in figure 1.

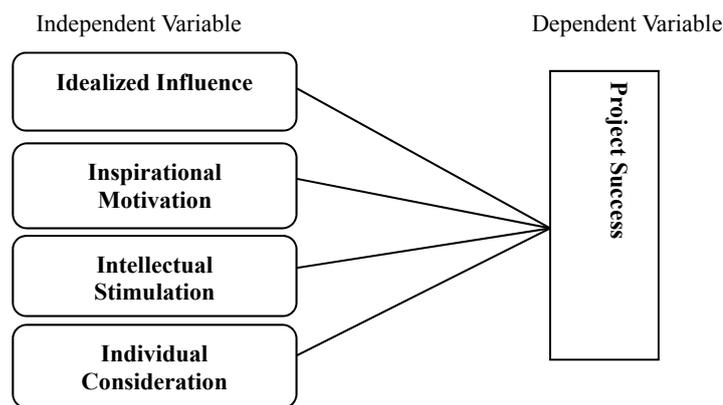

Figure 1 Conceptual Model

Transformational leadership can be seen at various sections of a company, be it within employees’ groups or divisions of an organization. Transformational leaders are vision-driven, courageous, think tanks and like taking risks.

According to Lim & Mohammed (1999), two distinctions must be taking into consideration before answering what project success is made up of. The first distinction is the difference that exists between project success and project management success. Project success is measured against the general objective of the project, whereas project management success is measured by using the well-known measures like time, cost and performance. The second distinction is the difference between project success criteria and project success factors.

For a long time in the literature of project success, the iron triangle (cost, time and quality) has been the measuring tool for assessing project success. However, the iron triangle as success criteria focuses only on the delivery stage of a project ignoring the other stages. The success of a project in line with cost, time and quality does not mean that the other stakeholders like customers, sponsors among others view has been taking into consideration (Pinto and Slevin 1989). It is worth noting that there is no generally accepted or defined set of project success criteria.

Pinto and Slevin (1989) carried out a research on 159 R&D projects to understand the factors that are

critical to the success of those projects. In their research, they realized that critical success factors change throughout the life cycle of a project. At each particular stage of the project be it the defining, planning, executing and closing stages, there are new sets of factors that are most critical for the success of the project. From the research of Pinto and Slevin there are two groups of critical success factors. One group is under the control of the project manager and the other group is out of the control of the project manager. The groups that are under the control of the project manager interact with each other differently in each stage of the project life cycle. These factors are: 1) Project mission- clear goals and directions, 2) Top management support- summaries in providing the necessary resources and the delegation of power/authority to the project manager, 3) A detailed specification of the tasks and the sequence of activities needed for project success, 4) Client consultation – particularly at the initial stages of the project life cycle, 5) Selection of the project team members, 6) Availability of technology and expertise to complete the required tasks and technical actions, 7) Client acceptance and the act of selling the final product to its end users, 8) Monitoring, control, feedback throughout the project implementation phase, 9) Communication among all the project stakeholders and 10) Readiness to handle the unexpected crisis and project deviation from the pre-determined plans (Pinto and Slevin 1989).

For the second factors which are not under the control of the project manager, Pinto and Slevin opined that there are four critical factors. These are: 1) Characteristics and competencies of the project team leader – administrative, interpersonal and technical skills in addition to the authority given to the team leader to perform the assigned duties, 2) Politics and power within the organization, conflict of self-interest with project success and the goals of the organization from the project, 3) Influence of the external environmental factors, 4) Sense of urgency regarding the importance of a project and the need to implement the project as soon as possible.

In the same research by Pinto and Slevin (1989), four stage life cycle was considered and to support their assertion that different factors are critical for the success of a project at each stage of the project, their findings revealed that the first stage of the project (defining or conceptual stage), the most critical success factors are project mission, client consultation, selection of the project team members and the sense of the projects significance, At the second stage (planning stage), project mission planning and scheduling, external environmental factors and monitoring, control and feedback are very critical success factors. In the third stage (executing stage), project mission, top management support and technical competence and availability are critical success factors. In the final stage (closing or termination stage), the critical success factors are project mission, planning and schedule, project team member selection, technical tasks and client acceptance.

3 Research Methodology

3.1 Population, sample and sampling technique

The banking industry was considered for this study because of the frequent interaction among leaders and employees clearly depicting the influence of that bank leader's leadership style on the employees. The population is made up of all the employees in the bank. Through a simple random sampling technique, 3 banks namely, Standard Chartered Bank, Ecobank and UT bank were chosen from Ghana and 3, namely, Industrial and Commercial Bank of China, Agricultural Development Bank of China and Bank of China were selected. 230 questionnaires were distributed in the selected banks but 200 were correctly filled and used for the analysis.

3.2 Research instrument

Two research instruments were used in this research to collect the data. These are the short version of the Multifactor Leadership Questionnaire (MLQ 5x Short) by Bernard Bass and Bruce Avolio (2004) The variables in the MLQ are the independent variables and the Project Implementation Profile (PIP) for measuring project success by Pinto and Slevin (1989) is the dependent variable. The MLQ was used because it is the most widely used and reliable instrument for measuring transformational leadership (Schriesheim, C, A, Wu, J.B, and Scandura, T, A (2009). 20 statements of MLQ 5x Short were used to assess the transformational leadership dimensions. 8 items for idealized influence, 4 items for inspirational motivation, 4 items for intellectual stimulation and 4 items for individualized consideration were employed in this study.

A 5 point Likert scale is used to rate the observed leadership behavior of the leaders (managers) and it bears a magnitude estimation based on 0:1:2: 3:4 (Julie Pallant, 2005). The rating scale for the leadership items are: 1=Not at all, 2=Once in a while, 3=Sometimes, 4=Fairly Often, 5=frequently if not always.

The PIP which is the second questionnaire that was used has 12 critical success factors (CSFs) that

were found to be necessary for project success. The PIP can be used in any stage of the project. The CSFs used in the questionnaire are: 1) Project Mission, 2) Top Management Support, 3) Project Schedule/Plan, 4) Client Consultation, 5) Personnel-Necessary, 6) Technical Tasks, 7) Client Acceptance, 8) Monitoring & Feedback, 9) Communication, 10) Troubleshooting (Finch and Peter, 2003). The Critical Success Factors of the PIP has been measured using a set of statements. The rating scale for each statement is a 7 Point Likert scale beginning from 1=Strongly Disagree, 2=Disagree, 3=Quite Agree, 4= Neutral, 5= Quite Agree, 6=Agree and 7=Strongly Agree (Finch, Peter 2003).

The questionnaire which has been used and described above for this research consists of general and specific questions and an attached letter. The letter describes the purpose of the survey. Both the letter and the questionnaire were subject to much effort to make the questionnaire appealing to the respondents.

3.3 Data analysis

The Statistical Package for Social Sciences (SPSS) and Excel were used to carry out the analysis to achieve the objective of this research. The questionnaires were edited, coded and entered into the software where reliability test, factor analysis and multiple regression were carried out to establish relationships between variables.

4 Results and Analysis

4.1 Demographic characteristics of respondents

Majority of the respondents in both China and Ghana were project team members 41 (41%) in China and 49 (49%) in Ghana. 25 (25%) are Functional/Group managers in China and 12 (12%) in Ghana. 10 (10%) are senior or top managers in both China and Ghana. 9 (9%) project managers in China and 12 (12%) in Ghana. 9% educators in China and 10% in Ghana and the last one 6% were project management consultants in China and 7% in Ghana.

4.2 Cronbach alpha test

The internal consistency reliability is used to measure the reliability of the research instruments. Most of the items that range between reliability coefficients of 0.6-0.8 will be retained and used in the scale. Removal of Individual Consideration for China will not significantly affect the reliability of the scale, so, it is preferable to retain it. Table 1 below gives the summary of the reliability test results for the entire scale.

Table 1 Summary of Cronbach Alpha (a) Reliability Test For Each Variable

Sr #	Leadership Styles	China	Ghana
A	Idealized influence behavior	0.838	0.890
B	Inspirational motivation	0.809	0.896
C	Intellectual stimulation	0.630	0.895
D	Individualized consideration	0.522	0.878
P	Project success	0.937	0.926

4.3 Factor analysis

Factor analysis ensures that the researcher is able to condense a large set of variables or scale items to a smaller, manageable number of dimensions or factors. This is done by SPSS summarizing the underlying patterns of correlation and search for “clumps” or factors of closely related items that best measures the construct (Julie Pallant, 2005).

The factor analysis output is mainly a number of factors that represents the measures and the factor loadings of any of the variables on the resultant factor. For the factor loadings of this study, any value less than 0.3 is suppressed and the variable associated with that factor loading is excluded from the rest of the variables. Table 4.2 below shows the summary of the factors for the independent variables and their accompanied factor loadings. No items were excluded from the rest of the group in the rotated matrix since no factor loading was less than 0.3 as could be seen in table 4.2. All the variables are loaded in one component or the other; this shows that the variables are usable for this research and clearly showing a positive effect of factor analysis with the possibility of having effective result.

Table 2 Summary of the Factors and the Factor Loadings for Each Independent Variable, Ghana and China

Idealized influence	A1	A2	A3	A4	A5	A6	A7	A8
Factor loadings	.758	.827	.707	.541	.594	.767	.810	.741
Inspirational motivation	B1	B2	B3	B4				
Factor loadings	.595	.584	.649	.564				
Intellectual simulation	C1	C2	C3	C4				
Factor loadings	.600	.675	.734	.803				
Individualized Consideration	D1	D2	D3	D4				
Factor loadings	.677	.790	.771	.733				
China factors and factor loadings								
Idealized influence	A1	A2	A3	A4	A5	A6	A7	A8
Factor loadings	.772	.862	.737	.629	.528	.772	.736	.815
Inspirational motivation	B1	B2	B3	B4				
Factor loadings	.787	.806	.514	.555				
Intellectual simulation	C1	C2	C3	C4				
Factor loadings	.562	.563	.712	.558				
Individualized Consideration	D1	D2	D3	D4				
Factor loadings	.501	.596	.867	.751				

4.4 Regression analysis

Regression analysis explores the relationship among variables, particularly where there is the need to examine how well a set of variables (independent variable) is able to predict an outcome (dependent variable). In this research, stepwise regression is applied between the dependent variable which is project success and the four independent factors obtained by the factor analysis in tables 4.2. The dependent variable (project success) is obtained through the transformation and computation of all the 12 items or elements for measuring project success into a single variable using SPSS.

Table 3 China Model Summary for Dependent Variable (Project Success)

Model	R	R Square	Adjusted R Square	Std. Error of the Estimate
1	.742a	.551	.532	11.24309

a. Predictors: (Constant), Individualized Consideration, Idealized Influence, Intellectual Stimulation, Inspirational Motivation

Table 4 China ANOVA for Dependent Variable (Project Success)

Model	Sum of Squares	df	Mean Square	F	Sig.	
1	Regression	14718.485	4	3679.621	29.109	.000a
	Residual	12008.675	95	126.407		
	Total	26727.160	99			

a. Predictors: (Constant), Individualized Consideration, Idealized Influence, Intellectual Stimulation, Inspirational Motivation

b. Dependent Variable: Project Success

Table 3 and 4 displays the results of the regression model summary and ANOVA of the independent variables and the dependent variable. It can be seen that R=.742 showing that there is a strong positive correlation between transformational leadership and banking project success in China. This is because the regression model selected can predict about 74% of the variance dependent variable (project success). R2 =.551 shows the change in dependent variable due to independent variable. The R2 value shows that 55.1% of the change in dependent variable (project success) is due to independent variable (transformational leadership) and the rest can be attributed to other factors. The F-test for the regression model is 29.109, which is far greater than 1. This means that the chosen regression model is better than using the mean model. Since the value of the F-test is greater 1 with a significant value of .000, it can be said here also that there is a significant relationship between the dependent variable (project success) and all the independent variables and the probability of this result occurring by change is .000 (p=.000<.05). The general assumption here is that the model significantly helps to predict the outcome variable.

Table 5 Model Summary for Dependent Variable in Ghana

Model	R	R Square	Adjusted R Square	Std. Error of the Estimate
1	.591a	.349	.322	7.46138

a. Predictors: (Constant), Individualized Consideration, Individualized Influence, Intellectual Motivation, Intellectual Stimulation

Table 6 ANOVA Model Summary for Dependent Variable

Model		Sum of Squares	df	Mean Square	F	Sig.
1	Regression	2839.135	4	709.784	12.749	.000a
	Residual	5288.865	95	55.672		
	Total	8128.000	99			

a. Predictors: (Constant), Individualized Consideration, Individualized Influence, Intellectual Motivation, Intellectual Stimulation

b. Dependent Variable: Project Success

Table 5 and 6 displays the results of the regression model summary and ANOVA of the four independent variables together with the dependent variable. It can be seen that R=.591 showing that there is a strong positive correlation between transformational leadership and banking project success in Ghana. This is because the regression model selected can predict about 59% of the variance dependent variable (project success). $R^2 = .349$ shows the change in dependent variable due to independent variable. The R^2 value shows that 34.9% of the change in project success is due to the dimensions of transformational leadership and the rest can be attributed to other factors. The F-test for the regression model is 12.749, which is greater than 1. This means that the chosen regression model is better than using the mean model. Since the value of the F-test is greater 1 with a significant value of .000 ($p=.000$), it can be said here also that there is a significant relationship between project success and all the four dimensions of transformational leadership style and the probability of this result occurring by change is .000 ($p=.000<.05$). The general assumption here is that the model significantly helps to predict the outcome variable.

Table 7 Comparative Regression Analysis and Coefficients for Dependent Variable (Project Success)

TL DIMENSIONS	PROJECT SUCCESS				PROJECT SUCCESS			
	CHINA				GHANA			
IM	3.268				2.026			
II		2.571				1.436		
IS			4.300				1.482	
IC				2.153				1.607
Constant	26.044	23.852	33.366	36.057	37.239	38.880	38.749	37.425
Observation	100	100	100	100	100	100	100	100
R-Squared	0.430	0.375	0.197	0.105	0.226	0.176	0.226	0.314
St. Error	0.376	0.335	0.876	0.636	0.360	0.316	0.277	0.240
Sig. Value	0.000	0.000	0.000	0.001	0.000	0.000	0.000	0.000

From table 7, all the four dimensions of the transformational leadership were used in the regression model one by one to determine the contribution of each on project success (dependent variable) since almost all of them have significant impact ($p=.000<.05$) on the regression model as well as the outcome (project success). These dimensions are: Inspirational Motivation (IM); Idealized Influence (II); Intellectual stimulation (IS); and Individual consideration (IC). From the table 4.7, the highest predictor to project success in China is Intellectual Stimulation with B value of 4.300 ($B=4.300$), with $R^2=.197$ and a significant value of .000 ($p=.000$). This is followed by Inspirational Motivation with B value of 3.268 ($B=3.268$), with $R^2=.430$ and a significant value of .000 ($p=.000$) and Idealized Influence has a B value of 2.571 with Individual Consideration having a B value of 2.153 and a significant value of .001 ($p<.05$). Similarly, for Ghana, all the dimensions of TL have significant impact ($p=.000<.05$) on the regression model as well as the outcome (project success). From the table 4.7, the highest predictor to project success in Ghana is Inspirational Motivation with \hat{a} value of 2.026 ($\hat{a}=2.026$), with $R^2=.226$ and a significant value of .000 ($p=.000$). This is followed by Individual Consideration with \hat{a} value of 1.607 ($\hat{a}=1.607$), with $R^2=.314$ and a significant value of .000 ($p=.000$) and Intellectual Stimulation has a \hat{a} value of 1.482 ($\hat{a}=1.482$) and $R^2=.226$ with Idealized Influence having a \hat{a} value of 1.436 and an R^2 value of 0.176

($R^2=.176$) with a significant value of 0.000 ($p=.000<.05$)

It can be inferred that transformational leadership style of leaders in the banking industry of China is strongly correlated to banking project success than in Ghana. For example, Inspirational motivation leadership dimension accounts for 43% of project success in China while the same leadership dimension accounts for 22.6% of banking project success in Ghana. Again, Idealized Influence contributed 37.5% to project success in China but 17.6% in Ghana. Intellectual Stimulation and Idealized influence contributed 22.6% and 31.4% respectively.

4.5 Discussion

The findings of this research revealed that Inspirational Motivation and Intellectual Stimulation leadership dimensions have great impacts on project success. Idealized Influence is about making a vision of an organization clear to team members and Inspirational Motivation has to do with motivation of an organization as a unit and inspiring them through the use of emotion laden statements and inspirational talks to make the employees transcend their self-interest for the sake of the organization and also by providing meaning and challenge through the display of optimism of the future and enthusiasm. These findings agree with the results of Pinto and Slevin (1989) on the factors that contribute to project success.

5 Conclusions

This research attempts an investigation on the impact of transformational leadership styles on the success of large strategic banking projects in China and Ghana. The Industrial and Commercial Bank of China (ICBC), Bank of China (BOC), Agriculture Bank of China (ABC) and the Standard Chartered Bank, Ghana, UT Bank Ghana and Ecobank Ghana were purposively selected as case study for this research. The principal aim of this research is to examine the impact of leadership styles particularly the four dimensions of transformational leadership styles namely; Idealized Influence, Inspirational Motivation, Intellectual Stimulation and Individual Consideration on project success. To achieve this objective, the following research questions were posed:

Research Question 1: What is the impact of transformational leadership style on project success in the banking sector of China and Ghana?

Research Question 2: Which dimension of the transformational leadership style strongly influence project success in the banking sector of China and Ghana.

To answer the research question 1, the findings obtained from the empirical analysis show that banking project success depends largely on transformational leadership style as a whole both in China and Ghana. In China 74.2% of project success is dependent on Transformational leadership style ($R=.742$ and $p=.000<.05$), and in Ghana 59% of banking project success is dependent on Transformational leadership style ($R=.59$ and $p=.000<.05$).

With regards to research question 2, the findings revealed that banking project success depends largely on the project leader's (manager's) application of intellectual stimulation leadership dimension of Transformational leadership (TL) style in China and inspirational motivation of TL in Ghana. These dimensions are strongly linked to project success even though the other dimensions also have a significant contribution to banking project success both in China and Ghana.

The research has come out with the idea that project leaders in the banking industry of China should make use of the intellectual stimulation dimension of transformational leadership style to ensure success of projects while in Ghana, project leaders and for that matter managers of banking projects should make use of the inspirational motivation dimension of the transformational leadership style.

An Empirical Study of Financial Sustainable Growth Models in O-Film

Yan Wensheng, Fang Ruyang

School of Management, Wuhan University of Technology, Wuhan, P.R.China, 430070

(E-mail: 190496999@qq.com, 465706946@qq.com)

Abstract: Based on the Robert Higgins's sustainable growth models, this article selects financial statistics of Shenzhen O-film Technology Co, Ltd from 2010-2015 to make an empirical study. In the empirical part, it analyzes the relevant financial data and uses the paired t-test and Wilcoxon's sign rank test to verify whether O-film achieves sustainable growth. The results show that O-film belongs to the speeding growth. Then it explores the factors why this company cannot achieve sustainable growth and the suggestions of O-film to achieve sustainable growth. Finally, this article puts forward some suggestions about financial management and development.

Key words: Sustainable growth model; Speeding growth; O-film; Empirical study

1 Introduction

Sustainable growth of companies has been a popular researching topic of academia. At present, the research on the financial sustainable growth model is mainly focused on the theoretical research in China. Li Jinlong, who introduces the financial cost control and restraint mechanisms for combination a sustainable growth model and the enterprise's financial crisis, then the financial value of the merged object can be better reflected (Li Jinlong, 2013). Fan Xingjian and Guo Xiaoyan thought that the growth of enterprise needs to consider the change of market and the innovation ability of enterprise (Fan Xingjian, Guo Xiaoyan, 2007). Yang Yongsheng put forward application of enterprise capital structure and dividend theory for sustainable growth (Yang Yongsheng, 2011).

A large number of studies on sustainable growth models have been carried out in foreign countries. Robert Higgins, who is an American financial expert and had conducted the thorough research for corporate growth and financial problems, then put forward the sustainable growth model in 1977. The sustainable growth rate is the maximum ratio of the company's sales growth without run out of financial resources. According to the sustainable growth rate to set up sales target could make a reasonable balance between increase revenue and control the size of the debt. It is the company's largest growth rate in the condition of not increasing and maintaining the operating efficiency and financial policies, in fact, is a balanced growth (Higgins, Robert C, 1977). After Higgins put forward the model of financial sustainable growth, James C Van Home, whose opinion is that enterprise development needs of management staff to maintain the balance between the company sales targets and business efficiency and financial resources, also according to the different economic environment respectively to establish the sustainable growth rate of the equilibrium model and non-equilibrium mode (James C Van Home, 2010).

In summary, no matter in China or abroad, the research of the sustainable growth model is mainly discussed from the theoretical and lack of empirical analysis. This article selected financial statistics of O-film to make an empirical study and puts forward some suggestions about financial management and development.

2 Research Design

The financial sustainable growth model is based on the following hypothesis:

Hypothesis 1: Company intends to grow in some growth that market conditions permit;

Hypothesis 2: Managers are willing to issue new shares;

Hypothesis 3: Company intends to maintain the target capital structure.

On the basis of the above hypothesis, the model is summarized as follows:

$SGR = \text{Net profit margin} \times \text{Asset turnover} \times \text{Retention ratio} \times \text{Equity multiplier}$

$G = (S_1 - S_0) \div S_0$, of which: SGR is the sustainable growth rate, G is the actual growth rate of enterprise, S_1 is the final sales revenue, S_0 is the initial sales.

In an enterprise, the actual rate of growth (G) = sustainable growth rate (SGR), which indicate the enterprise had realized the sustainable growth; if (G) > (SGR), that indicate the enterprise is speeding growth, this stage generally appears in the growth period of the enterprise, adequate funding has played

a decisive role for the further growth of the enterprise; if $G < SGR$, that indicate the enterprise is insufficient growth, at this stage, enterprise often face the problem of surplus funds, idle financial resources and lower turnover rate of assets.

2.1 Sample selection and data sources

This article takes Shenzhen O-film Technology Co, Ltd as the research object and select 2010-2015 as the analysis period, adopt the financial statistics from that period such as net profit, prime operating revenue and total assets and so on, which are related to the financial sustainable growth model. Selected data are derived from the annual financial report of O-film.

2.2 Descriptive statistics of samples and hypothesis testing

According to the composition of the sustainable growth model, select six financial indicators to study, after summarizing the basic data, the sample data are obtained as shown in Table 1.

Table 1 The Growth Rate Summary Sheet of O-Film from 2010 to 2015

index	time					
	2010	2011	2012	2013	2014	2015
actual rate of growth	0.675	1.015	2.158	1.315	1.140	-0.051
sustainable growth rate	0.038	0.021	0.217	0.149	0.099	0.079

The table 1 shows that the sustainable growth rate of O-film is 0.038 in 2010 and 0.149 in 2013, however, followed by a decline in the two years. At the same time, the actual growth rate of each year is greater than the sustainable growth rate beside the 2015 and not achieve sustainable growth.

Hypothesis: There were no significant differences between the actual growth rate and the sustainable growth rate, adopt the paired t-test to verify and the results are shown in table 2.

Table 2 The Results of the Paired T-Test

	Paired Differences					t	df	Sig. (2-tailed)
	Mean	Std. Deviation	Std. Error Mean	95% Confidence Interval of the Difference				
				Lower	Upper			
G - SGR	0.944500	0.669069	0.273146	0.242355	1.646656	3.458	5	0.018

Table 2 shows the significance probability of two tailed t-test was 0.018, less than 0.05 and reject the null hypothesis, which indicate the mean difference between the sustainable growth rate and the actual growth rate is highly significance in confidence level that more than 95%, so there were significant differences between the actual growth rate and the sustainable growth rate from 2010 to 2015. In order to test the growth of O-film is excessive or inadequate, use the Wilcoxon's sign rank test for non-parametric test. The results as shown in table 3. In conclusion, during the six years, the negative rank sample of the sustainable growth rate is less than the actual growth rate is 83%, so O-film belong to speeding growth, which reflect the firm is in the fast growth and not achieve sustainable growth.

Table 3 The Results of the Wilcoxon's Sign Rank Test

		N	Z	Asymp. Sig. (2-tailed)
SGR - G	Negative Ranks	5 ^a	4.00	20.00
	Positive Ranks	1 ^b	1.00	1
	Ties	0 ^c		
	Total	6		

a. $SGR < G$ b. $SGR > G$ c. $SGR = G$

3 Factors Why O-Film Cannot Achieve Sustainable Growth

O-film did not achieve sustainable growth from 2010 to 2015 because the actual growth rate is greater than the rate of sustainable growth. Therefore, based on the composition index of sustainable growth model, this article has made a concrete analysis for the driving factors of financial sustainable growth and have a further exploration about the reason of O-film did not achieve sustainable growth. Driving factors for sustainable growth of O-film are shown in table 4.

Table 4 The Driving Factors for Sustainable Growth of O-Film from 2010 to 2015

	2010	2011	2012	2013	2014	2015
Sales of net profit margin	0.084	0.017	0.082	0.063	0.035	0.026
Total asset turnover	0.458	0.523	0.823	0.956	1.376	1.151
Equity multiplier	1.395	2.447	3.693	2.914	2.432	2.660
Retention ratio	0.705	1.000	0.874	0.849	0.849	1.000

3.1 Sales of net profit margin is declined

Sales of net profit margin is a measure for the ability of an enterprise to obtain sales revenue in a certain period time. During the six years, the net profit of O-film had expanded from 52 million in 2010 to 478 million in 2015, but the growth rate of main business income is far higher than the growth rate of profit and the main business income in 2015 is 32 times in 2010. The rise of profits could not keep up with the pace of the rising incomes, which led to the sales of net profit margin had a decline in the overall trend. At the same time, the development of O-film has a large amount R&D expenditure without reasonable cost control, so that the firm could not achieve large scale when pursuing expansionist.

3.2 Total asset turnover rate is not stable

The total asset turnover reflects the management quality and utilization efficiency of enterprise's total assets. In this 6 years, the total asset turnover of O-film fluctuates almost and trend is up: during the 2010 to 2011, O-film had successful listings and brought huge issues to market, however, the main business income in this period just realize steady growth so that lead to the speed of asset turnover became slow. After 2011, this situation significantly improved and achieve faster of the six years in 2014 that is 1.376.

3.3 Equity multiplier is fluctuation

Equity multiplier is a multiple that total assets equivalent to the shareholder's equity. O-film is a company of new electronic components industry, development requires a large number of internal financing so that the firm has a higher equity multiplier. Meanwhile, the equity multiplier of O-film is fluctuation that indicate the firm not only had been able to raise considerable debt and equity but also realized the perniciousness of high equity multiplier. Then the firm appropriate to slow the pace of external financing and adjust the capital structure to provide power for the rapid development.

3.4 Retention ratio is fluctuation

The Retention ratio reflect how much of the revenue to stay in the company for the development. The retention ratio of O-film is 0.705 in 2010 and rose to 1.000 in 2011, but had a decline three years later, final rose to 1.000 in 2015. Prior to listing in 2010, O-film is at the early stages of development, the firm need to retain more retention earning to enterprise expansion. After had issued shares, cash dividend need to hold most of the net profit and the retention of company will be reduced. Then the firm expanding the scale of debt to balance the cash flow.

4 Suggestions of O-film to Achieve Sustainable Growth

4.1 Opportunities in the external market

As the dark horse in the new electronic components industry, O-film had been established the differentiation of market position for its product and insist on producing good product could enter the world market with independent intellectual when the firm was founded. After joined the WTO, China became a veritable world factory and the international business is getting bigger. On one hand, the new techniques developed abroad in recent years were taken, on the other hand, pay more attention to foreign markets. Thus, O-film would have a broad space for development in the future.

4.2 Strong competition power

The development of O-film has a strong pertinence. O-film is a high-tech platform type of leading enterprise in the field of mobile internet industry and the profession technology have brought stable and high-end customer, which establishes good base for the stability and future development of the company. Moreover, the firm adopt production patterns of produce by order, which could coordinate with real time order requirement from high-end customer to organize production and realize goods supplying, eventually build up a great foundation for the company to maintain high-end customer.

4.3 Financing channels are insured

Although the asset-liability rate of O-film is higher and there is a great economic risk, it was not changed for carry out the strategy that expansion in a high speed growth. From 2010 to 2015, the sales revenue had grown by 59.48% in O-film. The businesses operate is more dynamic with flows from borrowers, besides, the growing sales also had a considerable impact on the huge debt burden. During the six years, the stable equity multiplier had provided a quality financing channel for the firm, and the lower retention ratio had provide space for O-film made full use of internal funds and taken positive dividend policy.

4.4 Profitability is guaranteed

During the 2010 years to 2015 years, O-film's main business income and operating profits had

achieved a quantum leap, as the table 5 shown. At the same time, the business efficiency and growth capability of O-film had always stand at the front of industry and the development prospects are more optimistic. From the perspective of production and sales, O-film depend on the strong R&D strength to expand and consolidate a number of major customers in the industry. Thus, the profitability of O-film should be worthy of recognition.

Table 5 Main Business Income and Operating Profits of O-film from 2010 to 2015 Unit: Billion

index	time					
	2010	2011	2012	2013	2014	2015
main business income	6.18	12.45	39.32	91.02	194.82	184.98
operating profits	0.56	0.91	3.15	6.20	6.37	5.46

5 Conclusions

Based on the above analysis, O-film is in the fast growth and not achieve sustainable growth. Thus, this chapter puts forward some suggestions about financial management and development, hoping to provide certain value of reference.

5.1 Issue new shares and increase equity capital

It could provide adequate funding for sales growth through the new equity from issue new shares so that avoid a lot of debt and relieve borrowing pressure. The biggest advantage of this financing way is low cost of financing, in addition, the management decide whether or not to dividend distribution and the quantity, which led to the management have a great autonomy to use this part of funds.

5.2 Reducing dividend payout ratio and raising retention ratio

The earnings retained provide the endogenous equity capital to enterprise. Shareholder's interest in dividend payments is inversely proportional to the opportunity to invest, thus, the payment of cash dividends on the amount should be properly contracted and adopt reasonable dividend payout rate to get the optimistic expectations of the company's prospect from shareholders and potential investors, which is conducive to the further financing for O-film.

5.3 Reinforce the management of the assets and increase total asset turnover

In recent years, market competition is becoming more and more vigorous, the profits of each link will inevitably be squeezed to the lowest. O-film should be speeding up the inventory turnover ratio, average accounts receivable turnover ratio and fixed asset turnover ratio, could not let abundant funds become a stumbling block that stop the improve of asset turnover ratio.

Abstract: Scientific-technical progress and finance developments promote each other, and improvement and optimization of the combination efficiency of finance and technology can achieve the results of promoting enterprises' development. As an experimental zone of the combination of finance and technology, Wuhan should affirm its advantages characteristics and should pay attention to the existence of shortages at the same time. Accordingly, this paper uses quantitative and qualitative methods, and analyzes situation of technology and finance's combination efficiency in Wuhan, including the advantages and disadvantages of their combination efficiency, and proposes the optimization suggestions for Wuhan's combination efficiency of technology and finance.

Key words: Finance and technology; Combination efficiency; Financial service

1 Introduction

China's economic development has entered into a new period, economic structure need to be adjusted, transforming the existing economic growth model of factor-driven and investment-driven, into new economic growth model of technology-driven and innovation-driven ahead. Therefore, there is an urgent need to support the development of science and technology industry in order to achieve economic transforming and upgrading. Science and technology have characteristics of high investment, high risk and high-yield, which requires substantial capital investment in each stage from R&D to production(Zhang Yuxi, 2015;Fang Hanting,2013). The economic development relies on science and technology, and the science and technology development requires a strong boost of finance support. Finance can provide technology companies with liquidity support, risk diversification, value discovery, incentive-restriction function and other functions. While technology can provide financial capital with high-quality technical support and value-added approaches (Chowdhury,2012;Ann Yun,2012). Promoting the effective combination of technology and finance, and guiding more financial capital enter the field of science and technology, it is beneficial to achieve effective docking and optimize configuration between scientific and technological resources and financial capital, thus promoting the mutual development of science and technology and finance (Xi Bin, 2013).

As the first experimental zone of the combination of finance and technology, Wuhan continue to explore in many areas, such as policies system and service system of finance and technology, and technological innovation of financial products. During 12th Five-Year-Plan period, it has formed technology and finance service system of various financial formats mutually supportive and complementary. Finance and technology continue to show the efficiency of combination. At the same time, for various reasons, there still have problems which cannot be ignored, and will affect the development of finance and technology. Therefore it is necessary to pay more attention to the optimization research on efficiency of the combination of finance and technology in Wuhan, in order to better serve the development of the financial and technology situation of Wuhan

2 Situation of Technology and Finance's Combination Efficiency in Wuhan

In July 22, 2015, the State Council approved the government document called "Reform and Innovation Programs of Technology and Finance in Wuhan City Circle ". Then, Wuhan city circle became the first financial reform and innovation of Technology and Finance Experimental Zone, as the first pilot city, Wuhan take institutional innovation as fundamental, sound science and finance service system as the way, finance investment as guidance, financial investment as the main body, and gradually formed a diversified investment and financing system of high-tech industrial technology development and technological service achievements' transformation. Particularly, in 2015 with "innovation and entrepreneurship" campaign booming, and the emergence of a large number of science and technology market financial elements, an orderly, efficient and self-evolution of science and technology combined with benign financial ecological environment is gradually taking shape (see Figure 1).

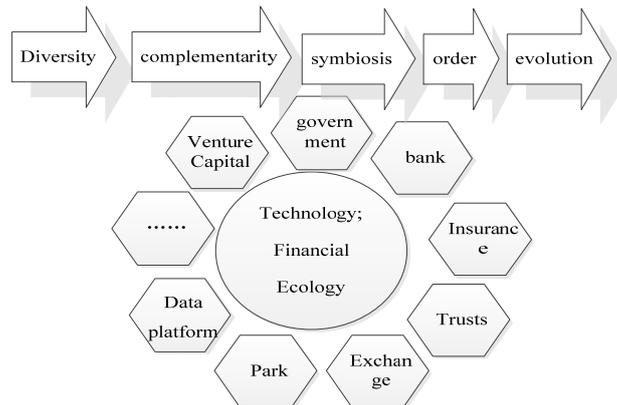

Figure 1 Wuhan Technology and Finance Combination Benign Ecological Sketch Map

2.1 Advantages and Characteristics

2.1.1 Improvement of policy system of technological finance

By the end of 2015, Wuhan issued a total of more than 50 financial policies about science and technology, covering science and technology loans, venture capital, science and technology insurance, capital markets, credit system, financial statistics and science and technology capital of the SAR building, urban linkage mechanism and other technology fields finance. For example, 16 policies focus on technology loans have been issued. In aspect of risk sharing, the credit risk reserve management policy has been issued; in aspect of loan cost, the approaches about loan discount and guarantee fee subsidies have been issued; in aspect of loan variety, the policies of insurance microfinance, copyright pledge, leasing and credit financing have been issued (Gustav, 2010). Bridge loan has issued a financing contingency fund management approach, with the policies of the credit system construction and of the loans statistics of technology enterprise.

2.1.2 Improvement of the technology monetary subjects' interaction

In 2011, Wuhan, one of the pilot areas to promote the integration of technology and finance, has set up technology and finance integration leading group. The government administration department and financial management department have established a good working relationship of technology and finance. What's more, the government department and financial institutions have established a strategic partnership. Science and Technology Department in Wuhan has established a strategic partnership with 10 banks including China Development Bank, The Export-Import Bank of China, Bank of China, Bank of Communications, China Merchants Bank, Huaxia Bank, Minsheng Bank, etc. The department have established 21 technology branches and promoted 19 technology loans products.

2.1.3 Improvement of service system of technological finance

At the initial stage of the pilot, the technology financial services are mainly led by the government. The Technology Department and Wuhan East Lake High-tech Development Zone respectively initiated and established technology financial service centers of city and district level, such as Wuhan Technology Financial Innovation Center and Productivity Promotion Center of Wuhan East Lake high tech Zone. The centers provide all kinds of technology financial service and technology transferring service, relying on incubators, industrial research institutes, and pioneer parks and so on, which are the physical carriers of the technology and finance integration. It can make technological resources and financial resources to be combined efficiently, and can fully improve technology industry strength and financial service strength. Technology financial information platforms such as Wuhan Technology and Finance Public Service Platform and Optics Valley Credit Network play a good role in technological finance information issuance, policies and regulations propaganda and enterprise financing demand collection.

2.1.4 Expansion of development space of technological finance

In Wuhan, there are more than one million college students, a strong force of innovation and entrepreneurship. As shown in Figure 2 and Figure 3, in latest few years, Wuhan has constantly increased the technology investment and research and development expenses, which stimulates technological financial innovation. Chinese government is now encouraging "Mass entrepreneurship, multitude innovation", and the government maximize reduced the access threshold of market subjects, which gives entrepreneurs considerate service and ignite entrepreneurial passion of college students,

university teachers and researchers. According to the authoritative department statistics, in 2015, Wuhan newly registered 56448 enterprises (excluding the financial enterprises), 155 new companies formed every day averagely, 9688 companies (excluding the financial enterprises) having access to social investment of 141.350 billion Yuan. Wuhan innovative entrepreneurial wave attracts social capital, providing great space for the development of technological finance.

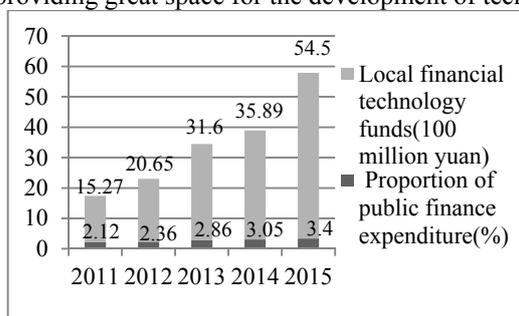

Figure 2 2011--2015 Wuhan Science and Technology Investment Growth

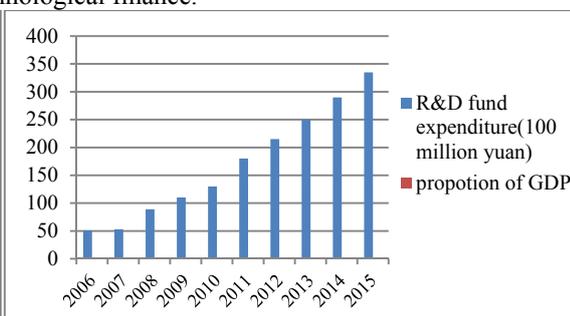

Figure 3 2006--2015 Wuhan R & D Expenditure Trends

2.2 The disadvantage of combination efficiency of technology and finance in Wuhan

2.2.1 Problems of government functions

In pilot of combination of technology and finance, the system of government departments is somehow a hindrance. Some of the functional departments rely on top-down management system, which means some functional departments are administrated locally and have no independent power, resulting in vacuum in management. Management departments have their own systems which are mutually separated, resulting in hard work, mutual information closing, many information platform resources not being shared. Working efficiency and service quality of some government departments are low. The service is time-consuming, through too many departments which don't cooperate and linked with each other. What's more, there are a variety of procedures; thus it takes a long time for government's preparatory work to set up projects for the technology companies. Moreover, there is no unified information platform, and the information between departments cannot be effectively inquired. On the other hand, the service level of some departments' officers is not high; they involved in the production and operation of enterprises too much directly, to a certain extent, will affect the efficiency of the management of companies.

2.2.2 Weakness of economic strength

Table 1 Main Economic Indicators of Wuhan at the End of 2015

Projects	Actual value (100 million Yuan)	Growth over the previous year (%)
Gross product	10905.60	8.8
Primary industry	359.81	4.8
The secondary industry	4981.54	8.2
Tertiary industry	5564.25	9.6
GDP per capital	104132	6.8
Financial revenue	2231.67	12.7
Industrial added value	4081.91	8.4
Fixed assets investment	7725.26	10.3
Investment in real estate development	2581.79	9.7
Gross output value of Agriculture	620.28	4.8
Total retail sales of social consumer goods	5102.24	11.6
Total import and export volume of foreign trade	280.72	6.3
Per capital disposable income of residents	32478.00	9.6
Per capital disposable income of urban residents	36436.00	9.5
Per capital disposable income of rural residents	17722.00	9.7

(Data source: Wuhan Municipal Bureau of statistics, 2015 Wuhan national economic and social development statistics bulletin)

In the process of rapid economic development in China, the total economy in Wuhan has grown rapidly. The indicators in 2015 obtain a certain degree of growth (the data see Table 1) than the previous years. However, compared with the same scale domestic city in some areas, there is a

certain gap. Wuhan is the old industrial base which has few famous brand, famous product and famous enterprises. In recent years, the scientific and technological content of products, brands and enterprises in Wuhan has improved, but the ratio of traditional industrial enterprises is still too high; the overall efficiency of enterprises, management level and degree of modernization are not high enough. Moreover, the development level of service industry is not balanced, and the capital accumulation, local fiscal revenue and income maintain a relatively low level. Wuhan city circle construction force is not enough, and the synergistic effect between the cities is not strong. Wuhan city's strength is still relatively weak compared to other rapid developed cities, which restricts the growth of the economy in Wuhan city. These aspects, to a certain extent, affect the efficiency of the combination of technology and finance.

2.2.3 Weakness of technological finance service innovation consciousness

In recent years, although China and Wuhan City have introduced many loan support policies to support small and medium-sized technology companies, which ease the financing problem of some small and medium-sized technology enterprises. But it did not fundamentally solve the problem of their financing difficult. The awareness of financial institutions to imitatively serve the technology is weak. The reason, on the one hand, is that the overall understanding of financial industry to support technology enterprises have not improved, without financial service innovation power, despite the fact that some financial institutions set up a technology specializing agency, business is relatively small, business product is single, loan size is too small, which cannot meet the demand of technology enterprises. On the other hand, the financial industry has higher risk awareness, taking into account the effect of the small scale of small and medium-sized technology enterprises, as well as uncertain factors of the production and operation of product. That is to say, the financial industry of the small and medium-sized technology enterprises gets "credit crunch". Authoritative statistics show that: 79.8% of small and medium enterprises are collateral or security deficient. In the small and medium enterprises to obtain loans, 59.6% real estate mortgage, inventory mortgage loans, credit loans, secured loans accounted for 11.5%, 10.5% and 14.9%. On the other hand, it takes a long time for small and medium enterprises to apply for loans to the financial industry. The loan is mainly of short-term, since it is difficult to obtain long-term loans. Many small and medium-sized enterprises and high-tech enterprises to apply for loans is not timely, resulting in restricting the development speed and efficiency.

3 Ideas and Countermeasures of the Optimization of Combination Efficiency of Technology and Finance in Wuhan

3.1 Optimization ideas

Through the foregoing analysis, the disadvantages in combination efficiency of technology and finance cannot be ignored, including the functions of the government, financial services, as well as the overall level of economic development. In these aspects, the government's function belongs to the superstructure while financial service belongs to the operational level, which is more likely to change and optimize in the short term. The efficiency of these two aspects increased, the overall level of economic development will naturally improve. Under the logic of this research, the key point to optimize the combination of technology and finance is the change and efficiency improvement of financial services.

3.2 Optimization strategies and recommendations

3.2.1 Innovation of technological finance services model

In Wuhan, combination of technology and finance is a mode reform. The development of technology needs financial support; and financial industry needs to increase innovation and support the rapid development of technology enterprises in Wuhan City, and to provide high quality financial services. Considering of the layout of the scientific and technological enterprises in Wuhan City, it needs to set up professional technology branches in the technology enterprises' intensive area when necessary, and designate officers responsible for technology enterprise business services, providing convenient services for the technology enterprise. It is suggested to speed up the construction of Wuhan financial information, to achieve financial electronic, and to imply financial services network. Moreover, it is suggested to establish Wuhan circle information payment system, perfect customers' credit information database, and provide background

information service for the surrounding city. What's more, central region financial integration development platform should be built to make Wuhan financial information background service center.

3.2.2 A financial credit ecological demonstration zone

It is suggested that the government departments establish the comprehensive financial service platform combining guarantees and credit rating in technological ecological demonstration area to collect technology enterprises credit information in the demonstration district; through information sharing, it can provide advisory services for technology enterprises assessment, credit, loans and guarantees.

3.2.3 Acceleration of legislation process of the technological finance

Wuhan as a pilot city of technological finance reform, in order to reform smoothly, should focus on the problem founded in the reform process, should timely develop related laws and regulations system for the pilot of the reform of the technological finance ecological environment, and should effectively promote the reform of the financial ecological environment in the technology pilot. Effective laws and regulations can promote reform and development, and further improve the efficiency of the combination of technology and finance.

3.2.4 Transformation of government functions

In the reform process of combination of technology and finance, on the one hand, the government departments should accelerate the change of working styles, provide positive service for financial enterprises of technology, and change the problems such as "door hard", "ugly face", mutual shirk, low working efficiency, long service cycle, complicated procedures, self-system, block segmentation, etc. On the other hand, government departments should strengthen the functions of service role, increase financial input for science and finance, improve the management system and regulations, help enterprises solve problems in production and management, and correctly guide the financial industry to support the development of technology enterprises, to provide good technical financial ecological environment for the enterprises.

4 Conclusions

As a pilot of combination of technology and finance, Wuhan has made exciting achievements, but the problem of low efficiency of the combination of technology and finance cannot be ignored. The paper analyzes the present situation of combination efficiency of technology and finance of Wuhan. With the efficiency, aiming at the disadvantages of the present situation, the paper puts forward the ideas of optimizing the combination of technology and finance in Wuhan, which includes innovation of technological finance services model, to build financial credit ecological demonstration zone, to accelerate of legislation process of the technological finance and so on. And, what we must point that comparison research about combination efficiency between Wuhan and other cities is very important, it needed to be studied in the further research.

Key Success Factors of Commercialization of Ocean Thermal Energy Conversion Product in Malaysia

Zakaria Bin Yasin

Master of Philosophy, Management of Technology

Malaysia-Japan International Institute of Technology-University Teknologi Malaysia

(E-mail: yasinzek@yahoo.com)

Abstract: This qualitative method study paper studies on the key success factors of commercialization of Ocean Thermal Energy Conversion (OTEC) product by focusing on deep sea water (DSW) from Ocean Thermal Energy Conversion (OTEC) plant in Malaysia. It is possible to commercialize DSW in Malaysia even though OTEC plant is not yet exist in this country. The study will benefit the stakeholders in the chain of commercialization of DSW from OTEC plant in setting strategic commercialization strategy in producing and commercializing DSW in Malaysia. The study, in addition, will also contribute to an eye-open to new business opportunity in the area of fresh and healthy drinking water in Malaysia.

Key words: Ocean thermal energy conversion; Deep sea water; Commercialization; Stakeholders

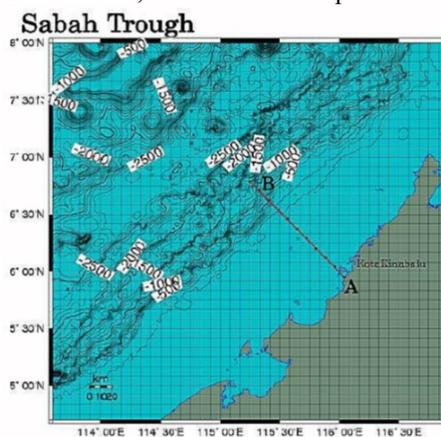

1 Introduction

“Commercialization is a rational process which begins from idea creation and continues toward market and commerce”. (Nazanin Jalili, Morteza Mousakhani & Mehdi Behboudi). In knowledge economy era, the government’s attitude towards the country economy governance is no more, a mere, to distribute wealth, but also to produce wealth. It requires integrated roles between government and financial venture or risk taker investor, in making the commercialization of products, like OTEC, to success.

Research on Ocean Thermal Energy Conversion (OTEC) being initiated by Jacques-Arsene d’Arsonval in 1880’s, and since then, a lot of effort being put in producing electricity and improving the its technology. Georges Claude developed open-cycle-OTEC (OC-OTEC) system 40 years after D’Arsonval discovery, and able to produce electricity as well as desalinated water. In 1979. A generation of electrical power of 100kW gross power from OTEC land-based plant, subsequently operated in Nauru Island, Japan was successful.

Commercializing OTEC product in Malaysia is a challenge. There is no OTEC plant in existence in Malaysia. The potential OTEC area in Malaysia in Sabah trough, located about 100 kilometers off the Sabah coast in the South China Sea. Please refer Figure 1 below.

The differences temperature of over 22°C, with the reading of 4°C of the bottom and 29°C of the surface sea level between the year 2006 and 2008, is highly potential to generate renewable energy (RE) and fresh water (otec.utm.my) produce during the process of generating electricity at OTEC plant. The fresh water is also names desalinated water, cold water or deep sea water (DSW).

Potential OTEC area in Sabah, Malaysia

Figure 1 Sabah Trough

2 Potential of Commercializing Deep Sea Water from OTEC Plant in Malaysia

Ocean Thermal Energy Conversion in the process of utilization of differences of cold deep sea water at 1,000 meter depth with 4 degrees Celsius to 5 degrees Celsius and hot sea water at 22 degrees Celsius to 29 degree Celsius in producing electricity. (Luis A. Vega, Ph.D., 1992). Accordance to Finney, “OTEC as a process that employs the natural temperature difference between the surface and the depths of the ocean”. (Finney K.A. 2008).

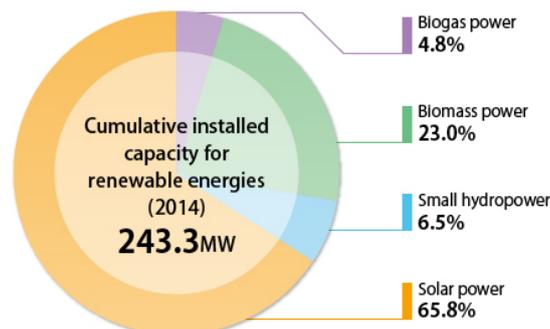

Deep sea water (DSW) is the by-product of OTEC producing during the process of generating electricity, pumping up from approximately 100 kilometers depth from the sea level. (otec.utm.my). Commercialization is converting or moving “technology” into a profitmaking position. (Richard A. Siegel Sten-Olof Hansén Lars H. Pellas,1995). Stakeholders is parties which having interest in OTEC consists of the government of Malaysia, researchers, investor or manufacturer and corporate consumers.

The relatively far location of potential OTEC area in Sabah increase the cost of building the OTEC plant and transporting OTEC products, including DSW. Therefore, the commercial cost of DSW will increase. Sharing the experience of De Vega, the team leader of OTEC plant operators in Hawaii, it is found that one of the challenges in OTEC is the cost of transportation of OTEC products to the shore is very high. De Vega had identified 26 problems in OTEC plant in Hawaii, one of them is high cost of transportation will effect cost of product in the market. Transporting hydrogen (H₂) may cost approximately USD250/barrel-of-cruded-oil (BOC). The cost increase up to 4 to 16 times of BOC at present cost, to cover costs of corrosion, military expenditures, crops losses, health impacts, radioactive waste and research findings for present technologies. (L. A. Vega, 1999). The transportation of DSW from potential OTEC plant in Sabah trough in the near future is expected to face the same challenge with OTEC plant in Hawaii.

Increasing cost, price and problems of utilization of fossil-fuel non-renewable (NRE) source of energy offers wide opportunity to source of renewable energy (RE) to be positioned in energy industry landscape. Besides many islands benefits more from cheaper, low carbon emission and reliable sources of RE, it's provide fresh water by product. Advancement in OTEC technology and keep increasing of fossil fuels price and problems caused, elevate the interests to focus in ocean thermal RE solutions for future energy needs. (Nancy E. Kinner, 2009).

There was initiative done by the Malaysian government in the Malaysia Third Outline Perspective Plan (OPP3) (2001-2010) and the Eighth Malaysia Plan (2001-2005) by Government of Malaysia through Ministry of Energy , Green Technology and Water (KeTTHA) to generate source of power from source of renewable energy. The initiative focused in six focused renewable sources of energy, that are biomass, biogas, mini-hydro, wind, solar and municipal waste. (www.kettha.gov.my, 15 May 2015).

In the plan, Malaysia is potentially able to generate cumulative total of 243.3 MW as of 2014 from RE. The total value represented by 11.7 MW from biogas power, 55.9 MW from biomass power, 15.7 MW from small hydropower, and 160 MW from solar power. (<https://www.asiabiomass.jp>). Please refer figure 2 below.

OTEC was not yet included in the Malaysian government initiative in OPP3

Figure 2 Malaysia's Cumulative Installed Generating Capacity for Renewable Energy

Although OTEC being recognized by the government as a source of RE, but, it is not included in the Malaysian government initiative in OPP3 does not include OTEC in the agenda. Solar power, biomass, small hydropower and biogas power are the focus sources of RE in Malaysia until 2014.

The potential of OTEC plant producing DSW through desalination process is up to two million liters per day from the generated of each megawatt of electricity without fuel. The production of electricity and desalinated water does not affects sources of fossil fuel. (<http://empowertheocean.com/otec-a-smart-investment/>, pp. 16). The research finding shown that the cost of production of electricity

by OTEC plant is relatively high. High volume of electrical user is required, if OTEC plant only rely on its single main product to cover the cost of production.

Interestingly, the savior of this dilemma is desalinated water that include DSW, by-product of OTEC plant. (G. C. Nihous and M. A. Sed, 1996). Desalinated water and chill water for air conditioning from cold deep seawater, are economically potential by products of OTEC, and able to return back the value of investment in 3 to 4 years of duration. (L. A. Vega, Dec., 1999).

Therefore, DSW become a highly valuable by-product of OTEC which can off-set the high cost of electrical power generation. Therefore, it is highly significant to study DSW to support the investor and the government to establish OTEC industry in the country.

At this point, there is only one write up research found in commercialization of DSW being done in great details by (Chiawu Lin et. al., 2009) in Taiwan. A case study was prepared by Professors Chiawu Lin of National Dong Hwa University, Taiwan, Tsai-Hsin Chu of National Chiayi University, Taiwan, and Kuo-I Chang of National Dong Hwa University, Taiwan, .studying the case of Kung Long is a Taiwanese company established by Mr. Hsin-Hsiung Tseng in 1967 and becoming the first enterprise in Taiwan investing in DSW in 2005. Kung Long having extensive experiences in marble manufacturing, venture into DSW industry by using its own technology, not using such as those offered by the Japan OTEC technology provider, in pumping the water at 618 meters below sea level.

Usually, DSW pumping up from 1,000 metres below sea level, but, in the case of Kung Long, the black tidal runs through the Atlantic Ocean and Indian Ocean to the Pacific Ocean brings DSW up to approximate 600 meters depth. In this case study, DSW also called “Blue Gold”, pumping up from 200 meters ocean depth and having cold temperature with rich of nutrients. The study found that the DSW having a stable quality due to few pathogens contained in the water and less affected by pollutants dropping from surface of earth.

DSW contains more than 60 kinds of nutrients, with some of them are magnesium nitrogen, selenium. Phosphorus, silicon, calcium, and other inorganic nutrient salts. Interestingly, the magnesium in DSW found to be 20 times greater than general mineral water.

The health value of mineral drinking water is the main issue to the consumers. DSW is found to be beneficial in relieving the symptoms of diabetes, reducing high blood pressure and preventing osteoporosis. Selenium contain in DSW beneficial in reducing heart attacks, diabetes, and cancer incidental illness.

Besides richness of nutrients, DSW water also found to be easily absorbed by the cells and become an instant moisturizing agent and nurturing the skin. According to the case study made by Professor Chiawu Lin et. al, clinical reports done in Japan and Korea shown that, the active mineral content as well as the alkaline characteristics of DSW helpful in increasing blood circulation and removing excess ozone in the human body, which is beneficial in preventing aging effectively and improving body immunity.

Other triggering factor in studying further DSW commercialization is the revenues generated from the industry. In 2009, Kung Long generate total sales of \$150 million NTD from the sales of bottled drinking water. The company extracted 28,000 tons of DSW water daily and at the weight of 120 tons of 500 ml per bottle drinking DSW in three shifts of production. The capacity of Kung Long production is 500 bottles per minute and producing 140,000 cartons daily.

Commercializing DSW from OTEC plant in Malaysia is possible. Lack of research in the commercialization of OTEC product, not to mention on commercialization of DSW from OTEC plant in Malaysia give a positive challenge to the stakeholders.

The potential of open-cycle OTEC plant generating 1 MW electricity in producing DSW is 55 kg. Per second, which this amount can reach at approximately 4,000 Meter square feet per day. This rate of fresh water capable of supply a small coastal community. (Finney K. A., 2008).

Since there is lack of study in DSW commercialization, the research question number one is expected to get more opinions on this study area. Barriers in commercialization of DSW in Malaysia from various perspectives are expected to be able to be collected. From the synthesis of the first round feedback in round two responses of participants, more specific issues will be addressed in the question. Eventually, the research is expected to produce practical solutions in overcoming the barriers in the third or final round of the survey in this research.

3 Description of Participants and Context

Participants were selected among whom having some background knowledge in OTEC. In this

study, the first participant is officer of state agency that had signing up agreement with OTEC Universiti Teknologi Malaysia (UTM) to collaborate with UTM Holdings Sdn. Bhd. to collaboratively participate in OTEC business, and the second participant is the researcher of OTEC from MJIT schools of UTM.

Both participants were selected due to their deep involvement in OTEC business and research. Since OTEC is a new area of business, and had not yet having any business activity and plant in Malaysia, the selection of participants is crucial in getting the right and valid qualitative data in this area.

4 Explanation of Data Collection Process

The qualitative data were collected from the participants through telephone interview. The interviews were conducted after getting an agreement from the participants. The time for interview were mutually agreed between the participants and the interviewer. The telephone conversions during the interviews were recorded. Participants were informed by the interviewer on the recording process and the purpose of the transcribing for analysis. The telephone interviews were driven by set of questions referred by the interviewer. Each interviews took about half-an-hour duration.

5 Explanation of Data Analysis

Data were collected through telephone interview guided by interview sets of eleven (11) questions with five (5) sub-division question for main question number nine (9) in getting wider perspectives in various factors of commercialization of OTEC products. The recorded voice of the interviews were transcribed by the interviewer. The transcribed data were synthesized in order to combine ideas to get a theme or cluster of ideas that relevant in giving answers to the research questions.

6 Preliminary Findings and Discussion

OTEC is coming to be industry in Malaysia, but limited information available about OTEC in Malaysia. However, the study requires data and information in studying the commercialization of OTEC products in Malaysia. Synthesizing the transcription from participants' interview, the findings can be categorized into three major areas in answering three research questions. Firstly, knowledge in OTEC, secondly, the key success factors in commercializing OTEC products in Malaysia, that covering six major areas; government, potential buyers, market potential and demand; technology, investor and investment return; and thirdly, marketing mix for commercialization.

Answering the first research question, the study had identified two sources of information. Participants knowing OTEC from the briefing session conducted by Dato Prof Dato' Ir Dr A. Bakar Jaafar, Co-Chairman, Universiti Teknologi Malaysia (UTM), Ocean Thermal Energy Centre, and the participant also knows about OTEC and its product from online source of information. The online information offers areas of study in OTEC to research candidates for their master at either master or doctor of philosophy of study. Besides OTEC producing two main products, that are electricity and hydrogen, it's also producing deep sea water, cold water and mineral water, as the spin-off products. Both participants having a clear information with regards to these products and giving high level of confidence to the study in getting further information about OTEC from them.

It is a great challenge to study commercialization of products which there is not available in the market. But, it is meaningful to the future OTEC industry when the study able to answer the second question of the research related to the key success factors in commercializing OTEC products in Malaysia. The findings shown that the government of Malaysia has to play a big role in driving the OTEC industry and has to support the industry politically. Ministry of Energy, Green Technology and Water, Malaysia focusing on six sources of renewable energy; that are biomass, biogas, mini-hydro, wind, solar, municipal waste in their programme [Malaysia Third Outline Perspective Plan (OPP3) (2001-2010) and the Eighth Malaysia Plan (2001-2005)] and do not including ocean thermal source of renewable energy in this agenda.

The financial back-up from government, in the sense of getting support from the banking and financial institutions to provide fund to OTEC project become an important success factor for OTEC products commercialization. OTEC industry, especially in building OTEC plant, require high volume of investment fund. The fourth success factor related to government roles is, the government intention reducing dependency on diesel, gas and charcoal. This direction gives wide opportunity to commercialization of OTEC products with less competition in the market. The fifth factors create good speed momentum to the industry. The findings suggest to educate the stakeholder (government),

investors and buyers with knowledge of OTEC. The green or non-pollution effect of OTEC products, such as hydrogen fuel cell, create a good impact on the environment.

Second major area of the key success factors of commercializing OTEC products is the potential buyers. The findings found that Tenaga Nasional Berhad (TNB), PETRONAS and Government of Malaysia are the potential buyers of OTEC products. TNB need electricity, PETRONAS require electricity and water, and government of Malaysia in demand of getting more source of energy in replacing depleting domestic source of energy such as petrol, diesel, gas and charcoal. Hydrogen and electricity producing by OTEC plant in near future in Malaysia becoming potential option to the government.

The third major area is the market potential and demand on the products. The findings found that OTEC potentially become a largest contributors of energy in Malaysia in near future. Safe drinking water, electricity and hydrogen as a source of energy capable of fulfilling increasing domestic demand.

Technology becoming the fourth major area in the commercialization of OTEC products. Findings shown that the advancement in OTEC technology able to transport OTEC products throughout Sabah, Peninsular Malaysia and even all over the world. Adopting ready OTEC technology developed by Korean and French, as being mentioned by the participants, will be able to stimulate faster the development of knowledge and expertise of OTEC in Malaysia.

Investors plays the important roles in commercializing OTEC products in Malaysia. This fifth major area giving an evidence that the high profit margin from selling of OTEC products, especially water, become the attractive elements to investors. The highly commercialize water product and good demand from the world market able to offset the high investment in building the OTEC plant.

Marketing becoming the important factor in commercializing products (Leslie H. Vincent, 9 Mar 2015). This sixth major area of commercialization of OTEC products, benefit of products were highlighted. The findings shown that, OTEC cold water able to cooling the land for the purpose of agriculture, air conditioning building with optimum cost compared to conventional system and the deep sea water able to produce a good product of aquaculture. Moreover, a relatively cheap price of OTEC products, if locally produced, will support the commercialization of the products. When the product were locally produced, it is available at all time for the market.

The third research question focusing on the barriers, problems or challenges in commercializing OTEC product in Malaysia. The findings were divided the theme into five major areas that are government, potential buyers, financial capability, logistic cost and piracy.

The government need to be convinced on the technology capability of OTEC. OTEC technology provided by the technology from overseas must be proven and at the best level of performance. The Malaysia government need to be convinced on the viability of the OTEC project and to be viable industry in Malaysia in the near future. Evaluating OTEC project and industry becoming a great challenge because there is no OTEC plant in Malaysia, and even there is no OTEC commercial plant in the world operating at this moment. Findings on OTEC rely on few OTEC pilot plant, one of them is research OTEC plant in Hawaii, United States of America.

Second challenge of OTEC commercialization is potential buyers. There are prospect buyers, but not confirmed buyers to OTEC products. The third challenge is financial capability of OTEC industrial players or investors. Building OTEC plant require high cost and not to include the storage and logistic factor of the OTEC products.

High logistic cost become the fourth challenge. Even though the high cost of logistics can be offset by the expected revenue from the spin-off product, especially water, but, it become a great challenge as well because the OTEC plant build far from the shore. Transporting electricity and hydrogen require a special kind of transport.

The last challenge of OTEC commercialization is the pirating activity around the nearby area of Sabah through. The cost of securing the plant and logistic require engagement of highly trained and skilful personnel. Involvement from the military is needed on securing the OTEC plant area.

OTEC is potential industry to the government of Malaysia in the near future. Commercializing OTEC products in Malaysia require a lot of effort and highly creative and innovative ideas and strategic plan of action. OTEC is new and there is no OTEC plant in existence in Malaysia, but, the result of the study will contribute to the industry to look consider few major areas in commercializing OTEC products in Malaysia.

7 Response to Research Process

The study made a selection of participants for interviews. Participants with some background of OTEC able to give ideas and opinions regarding OTEC. But, the weaknesses of the study is the participants do not having practical business experience. Lacking of this experience create a vacuum in determining the commercialization aspects required by the potential buyers and investors in valuing the OTEC products and business viability. The limitation of the study clearly seen in the numbers of participants. Opinion of two participants does not portray the right picture of OTEC. Moreover, their lacking of experiences in business may lead them to give an ideal scenario and situation of the OTEC industry. Their opinions may bias to the potential buyers of OTEC products and OTEC investors.

8 Conclusions

The key success factors of commercialization of OTEC products in Malaysia rely on five major areas; government policy and support, potential buyers, market potential and demand, technology, investor and investment return and marketing. There are five barriers, problems or challenges in commercializing OTEC in Malaysia; government policy and readiness, potential buyers to buy the products, financial capability of investors, high cost of logistics and pirating activities. OTEC capable to become a new source of renewable energy and complimentary to depleting fossil fuel source of energy for Malaysia in the near future.

The Impact of Audit Quality and Earnings Management Conceptual Review

Mohammad Reza Hosseini, Mohammad Ali Tareq
PhD Candidate, MJIT, UTM, Lecturer, MJIT, UTM
(E-mail: Mh_hoseini94@yahoo.com, tareq@utm.my)

Abstract: In this paper investigates to impact of audit quality on the earnings management. The ability to control the company's earnings for private gain is considered as disadvantageous for the reliability of the reported earnings. One of the effect on earnings management measured as the degree of discretionary accruals prevalent in a firm is audit quality, where Big Four auditors deliver higher quality audits than non-Big four auditors. A stream of literature explains that audit quality of external auditor mechanisms such as auditor size, audit fees, non-audit services, and auditor industry specialization are able to contribute towards improving the firms' performance and reducing information asymmetry. The other dimension of value creation is the reduction in the earning management raised by companies. Theoretically to some extent, high audit quality of external auditors will lead to lower firm risk, information asymmetry and subsequently, high earnings. This paper aims to prepare a critical conceptual of the empirical literature on the effect of audit quality on the earning management.

Key words: Earnings management; Audit quality and accrual; Emerging markets

1 Introduction

A large body of research has over the last two decades documented the importance of legal foundations, including the quality of the audit, for earnings management. This paper examines the association between audit quality and real earning management. Past literature suggests that higher quality auditors reduce the level of accrual earnings management (Johnson et al, 2002; Balsam et al. 2003; Becker et al. 1998). Despite the importance of audit quality, corporate governance such as boards of directors and its committees are recognized as monitoring mechanisms that may impact the quality of financial reports (Lin and Hwang, 2009; Carcello et al., 2002; Larcker and Richardson, 2004;). Therefore, how audit quality and the monitoring role of the board of directors and shareholders its committees influence the market's perception of reported earnings and audit quality remains important to the policy-makers and regulators. Levitt (1998; 2000) claims that the assessment of audit quality and earnings management is crucial because it is reflected the investors' confidence in the financial reporting and it affects the allocation of resources. Since, most of the prior studies relating to audit quality, corporate governance and earnings management have been conducted in developed countries. Monitoring the financial reporting process and ensuring high-quality financial statements is one of the prime tasks bestowed on corporate boards in general, and independent outside directors in particular. In line with this, the annual report and prior evidence suggest that the presence of inside directors on the audit is likely to be related to poorer financial reporting choices (Klein 2002; Bédard et al. 2004), because insiders often have incentives to tolerate a lower quality of reported earnings.

The majority of the research which seeks to explain the incentives for managing earnings draws on costly contracting theory. This study utilizes costly contracting theory which characterizes the corporation as a "legal nexus of contractual relationship" and assumes that corporate reporting enables principals (shareholders) to monitor agents' (managers) compliance with contractual obligations (Godfrey et al., 2003). Jensen and Meckling (1976) identify the existence of two agency relationships:

- The shareholder-debtholder (e.g. debt contracts) where the manager is assumed to act on behalf of the shareholders; thus the manager is an agent whereas the debtholder becomes the principal.

- The manager-shareholders (e.g. bonus plans) where the manager acts as an agent for the shareholders who are considered to be the owners, and Such situations impose agency costs, due to the existence of conflicts of interest between the agents and the principals. Bartov et al. (2000) note that agency costs include a manager's incentive to manage earnings. Experiential evidence from agency theory also reports that management has a preference for managing earnings numbers in order to benefit from the contracting process (Holthausen et al., 1995). Prior studies document that higher transaction costs result from greater information asymmetry amongst market participants. When the markets or investors have less information and cannot observe a company's performance and prospects, they then require higher rates of return and lower current firm's stock prices (Bodnar and Bartov, 1996). Most of

studies also document evidence that the existence of information asymmetry between shareholders and managers is a necessary condition for earnings management (Dye, 1988). Because shareholders have less information, thus management can use its' insider position to manage reported earnings (Lobo and Zhou, 2001). It is argued that earnings management decreases the reliability of earnings because reported earnings is biased, and misrepresents the true reporting earnings figure. Levitt Jr (1998), the former chairman of Securities and Exchange Commission, states that the practice of earnings management has negative impacts on reliability of financial statement. This paper assumes opportunistic earnings management is high characterized via accounting method choices and DAC (Wilson and McNichols, 1988).

Also, existing agency cost proposes a series of mechanisms that seek to reconcile the interests of shareholders and managers. These include external governance instruments such as takeovers (Manne, 1965), competition in product markets (Hart, 1983), and the managerial labor market (Fama, 1980). Viewing the statutory audit as one of a number of monitoring mechanisms available to shareholders is a useful framework in which to understand the relationship between ownership, board composition, audit quality, and ultimately, audit fees. In their respective reports on corporate governance, emphasize the value of increased non-executive representation on boards' suggesting that non-executives are able of bringing greater independence and impartiality to board decisions. In regard of the audit process, it is anticipated that developed non-executive representation is able of improving the quality of the audit process in a number of respects. First of all, external auditors are to discuss matters arising from the audit process with non-executive board members, free from managerial influence. This is very important if auditors seek to question certain aspects of the way in which the financial statements have been prepared by management, or require further (more exclusive) testing in order to reach an opinion on the quality of the financial statements. The second, in negotiations with the non-executives, external auditors are expected to place a greater emphasis on the quality and extent of the audit rather than on the cost, compared to executive directors. Also, non-executives are expected to favor more comprehensive auditing in order to complement their own monitoring responsibilities, but they share with auditors the objective of identifying and rectifying reporting errors deliberately or otherwise made by managers.

2 Audit Quality

External auditor services to verify accounting numbers are demanded as a market-induced mechanism to reduce agency costs that can arise as a result of the potential conflicts of interest between a firm's owners and managers (Gore et al. 2001). Research shows differences in the degree of audit services quality delivered by auditors. One of the first studies that examined this phenomenon has been carried out by DeAngelo (1981). She argues that the quality of audit services must be defined as the joint probability that a given auditor will discover a breach in a firm's accounting system and at the same time report this breach. In order to evaluate this audit quality, potential clients must incur costs to assess the joint probability, which are likely to be significant. Because of the fact that audit quality is costly to evaluate, potential clients develop surrogates for audit quality. According to DeAngelo (1981) this is done to rely on a less costly to observe variable which is correlated with the quality of the audits. Palmrose (1987) shows that it is possible to assess litigation activities of auditors as a means for making quality distinctions among them. With litigation against auditors, Palmrose means the process of the discovery of false statements, the filing of lawsuits and the resolution of them (Palmrose 1987). She demonstrates that auditors with relatively low litigation activity represent higher quality suppliers and vice versa. Palmrose defines audit quality in much the same way as DeAngelo, namely the probability that statements contain no material misstatements. The lower the probability, the higher level of assurances and the higher the quality of services provided (Palmrose 1987).

2.1 Auditor independence (FEE)

LNNAF and LNTOTALFEES are associates to the fee dependence of auditor on a client. Besides the audit fees received by the auditor, the level of NAS fees further increase the client-auditor economic bond as the auditor reliance on the client increases (Simunic, 1984; Beck et al., 1988). The present study argues that the level of NAS fees and the sum of audit and NAS fees are better measures to capture the economic important of the client to the auditor than the NAS ratio. Although FEERATIO1 and FEERATIO2 do not necessarily capture the client's importance, they do explain the financial link between the auditor and the client, and have an impact on the regulators' perception of independence (Ashbaugh et al., 2003).

2.2 Industry specialist auditor (SPEC_AUD)

The existing literature suggests that the industry specialization of auditors can be measured using several approaches, such as the market share approach (Krishnan, 2003a; Dunn et al., 2000; Balsam et al., 2003; Velury et al., 2003; Chen et al., 2005) and the portfolio approach (Krishnan, 2003a), as well as a complementary approach set out by Neal and Riley (2004). Despite the limitations of each approach, they are recognized as the most appropriate measures for auditor industry specialization. Also, Neal and Riley (2004) introduce the weighted market share, a complementary approach which captures the complementary effects between the market share approach and the portfolio approach. This measure offers a solution for the inconsistency between the two main approaches. However, Neal and Riley note that, like the other two approaches, this approach does not consider the lead/lag period effect. Thus, to ensure the consistency and robustness of the findings, the present study considers all three of these approaches in determining the industry specialist auditors based on audit fees.

2.3 Audit fees (LNAFEE)

The audit fees variable (AFEE) is transformed to natural log and prefixed by LN to achieve normality of information, in order to prevent the largest firms from unduly influencing the findings. Data for this variable (LNAFEE) is gathered from the FAME database.

3 Relationship Between Audit Quality and Earning Management and IPO

The external audit exercise is a governance procedure that analyses and reviews a firm's internal audit and controls the fiscal reports to avoid material misstatements. According to Wallace (1980), claims that shareholders demand audited fiscal reports as these reports offer details that are advantageous for their decisions on investments; hence, the external audit would act as a tracking device that reduces managers' interests in misstating the earnings. Thus, the audit is used as a method of enhancing the top quality of the fiscal information; hence, it is expected that a good audit quality will be linked with reduced cost of capital by organization. Shareholders depend on the external auditor to offer some guarantee that the fiscal reports of a firm are not deceiving. It is critical that the tracking mechanism offered by the external auditors is not affected and becomes the most necessary aspect for the study delivery of an independent auditing function. One of the most important elements that influence the reliability of fiscal reports are said to be the audit quality (Arruñada, 2004). The stakeholders would show more trust on the information revealed in the fiscal reports if the audit of the fiscal reports is recognized to be of top high quality. The auditing quality is based on the likelihood of the auditor being able to find and report any misappropriation in the financial reports (R. Watts & Zimmerman, 1986). DeAngelo (1981) focus on the audit quality pointed out two important aspects that it is dependent on.

The accounting role has to face a growing pressure from external elements to observe and enhance the high audit process of company (Sutton, 1993). To contend efficiently in this setting, audit companies must continuously endeavor to enhance the audit quality and increase customer satisfaction. Firstly, the auditor's capability is to analyses the records and recognizes mistakes or flaws, i.e. their technical proficiency, and secondly, their objectivity or detachment, i.e. their independence. The auditing quality is the unique blend of the auditor's ability to recognize and report issues found in the records (R. Watts & Zimmerman, 1986). According to DeAngelo (1981), defining audit quality is beneficial for research as proficiency and independence to carry out their jobs are quite unique constructs. Nevertheless, these two measurements are not very different nor separate: for instance, the audit company could determine not trying to locate the problematic areas (competence) which they do not wish to report (independence).

Also, Public offerings: "Window dressing", or enhancing financial reports prior to an IPO or secondary equity offering to attract better valuations; Executive compensation: Increasing reported earnings to increase executive bonuses; Financial liabilities: Fulfilling financial requirements in loan covenants; Regulation: Reducing regulation costs or enhancing regulatory benefits. Beneish (2001) suggests that an insider trading can be added to this list of motives. Managers aware of mis-statement of profits can benefit by trading the securities. Stolowy and Breton (2000) suggest three broad objectives for earnings management: minimization of political costs; minimization of the cost of capital and maximization of managers' wealth. Also, most earnings management studies examine whether companies manage earnings in response to some economic incentive. One setting where management has an incentive to manipulate earnings is at the time of an IPO, since greater earnings may be reflected in a higher offering price and greater proceeds to the company and offering shareholders.

Francis et al. (1999) argue that high-accrual firms have greater opportunity for opportunistic

earnings management and have an incentive to hire a big five auditor to provide assurance that earnings are credible. They find that high accrual firms are more likely to hire a big five auditor, but report lower unexpected accruals, consistent with big five auditors constraining opportunistic reporting of accruals.

The objective of this paper is to investigate the limited but expanding body of literature on the effect of audit quality on the earnings management. The remaining of this study is organized as follows. The next section looks at the measurement of audit quality and empirical evidence of audit quality on the earnings management. The final section concludes this study and provides suggestions for future research.

4 Earnings Management

Accounting earnings are used for contracting and can provide investors the information about the firm they need. For these purposes, accrual-based earnings are more appropriate than cash flows (Subramanyam 1996). Since the real earnings are not observable by outsiders, only the reported earnings, uncertainty remains because of potential bias and noise due to possible self-interested behavior by managers. Managers have incentives to alter the earnings to maximize their own wealth. Auditors can provide credibility to management's reported earnings by issuing audit reports. These reports reduce the existing information asymmetry between the firm's shareholders and its managers by allowing the outsiders to validate the reliability of the financial statements. Thus, asymmetric information – and the associated agency costs – affects the demand for auditors by means of an external monitoring-mechanism (Becker et al. 1998; Francis et al. 2004).

Most of the effort in testing earnings management behavior has focused on explaining accounting choices by examining the relationship between an accounting choice variable and a number of explanatory variables. In defining the accounting choice variable, three different approaches have been most widely used: (1) single procedure (e.g., Hagerman and Zmijewski, 1979), (2) sets of procedures (e.g., Zmijewski and Hagerman, 1981; Press and Weintrop, 1990; Inoue and Thomas, 1996), (3) and net accruals (e.g., Healy, 1985; DeAngelo, 1988). All three definitions of accounting choice have been criticized as being poorly specified, and consequently, they may have contributed to the low power of the tests (Watts and Zimmerman, 1990). Jones (1991) developed a model to capture the discretionary component of total accruals. Jones defines the total accruals as “the change in noncash working capital before income taxes payable less total depreciation expense.

In literature accruals have been intensively used as the proxy for earnings management. These accruals can be measured by two different approaches.

- Balance sheet approach
- Cash flow statement approach

5 Audit Quality Measuring

It is challenging and complicated to measure audit quality (K. L. Jensen & Payne, 2005; Niemi, 2004; Wooten, 2003). Nevertheless, according to Bailey and Grambling (2005), Francis (2004) and PCAOB (2008); there are several possible measurements of audit quality available in practice and in the literature. Three proxies of audit quality are examined in this study. In the first empirical analysis, the audit quality proxies are dependent variables, whilst in the second, they are represented as independent variables. The definition and measurement of each audit quality proxy are described below.

6 Relationship Between Audit Quality and Earning Management

Based on the above mentioned arguments and other studies, it is evident that auditors do influence a firm's ability to engage in earnings management. This is stated very comprehensible by Jackson and Pitman (2001, p. 39):

“Independent auditors should lead the crusade to prevent deceptive accounting practices, because they not only possess in-depth knowledge of accounting and reporting matters, but they also have access to the audit quality and the board of directors responsible for scrutinizing a company's decision makers. Auditors are in a prime position to curtail abusive earnings management and help maintain and enhance public confidence in financial reporting.”

A distinction exists in the level of impact auditors have, based on the quality of the audits carried out. So, whether the auditor restrains or perhaps even promotes earnings management and to what extent, is partly depending on the quality of the auditor. Once again, I use the dichotomy of Big Four versus non-Big Four auditors as a surrogate for audit quality, in which Big Four auditors provide higher quality

audits than non-Big Four auditors. I will show what exactly the impact of audit quality on earnings management is and to what extent. After that, I will take a closer look at some other factors influencing audit quality and thereby earnings management.

7 Conclusions

Empirically and theoretically to some extent, high audit quality of external auditors will lead to lower firm risk and subsequently to a lower cost. Firms that are well-managed in terms of the existence of external and internal robust monitoring devices as well as the provision of quality financial reporting and protection of stakeholders' well-being will be able to limit the exercise of power of corporate managers and carefully allocate resources, which in turn enjoy lower risk than other companies. It follows that these companies should have access to cheaper source of capital, either in the form of earnings and accrual, than other firms. A few areas can be the focus of future research. First, the influence of audit quality on the earnings management in emerging markets such as the East Asia, Eastern Europe and Russia should be undertaken so as to enable generalization of research findings. Lastly, future research could also draw on cross-countries comparisons by examining the impact of different level of accounting principles and their level of implementation on the earnings management.

Study on the Development Approaches of Supply Chain Finance of Commercial Bank Based on Internet Plus

Yu Haijing, Kang Canhua

School of Economics, Wuhan University of Technology, Wuhan, P.R.China, 430070

(E-mail: yuhaijing@cmbc.com.cn, kchhua@whut.edu.cn)

Abstract: This paper, using industrial competitiveness and ecological theory, holds the view that with the implementation of the Internet plus strategy and innovation of the supply side, the commercial bank supply chain financial business, as a kind of service to the real economy, should be transformed from traditional industry to ecological industry under the Internet financial impact. Moreover, it is necessary to build the supply chain financial ecological industry attractiveness evaluation index system on the basis of industry scale, industry development potential, industry innovation capability, and industry advantage and industry social benefit. The paper comes up with the supply chain financial industry development path in terms of its prior development, important issues and general cooperation using factor analysis, cluster analysis and quantitative analysis method. To an extent, it is significant to provide decision-making and the practice basis for commercial banks in its selection of supply chain finance business development direction.

Key words: Internet plus; Supply chain finance; Industrial development approach; Industry attractiveness

1 Introduction

After entering to the 21st Century and facing the rapid development of Internet industry, the trend of internationalization becomes more and more remarkable for all industries. During the periods of two sessions in 2015, Chinese government put forward the concept “Internet Plus” to promote the transformation of Chinese economy and reshape industrial structures by combining with the advantages of Internet. “China Made 2025” works close with the development planning, such as information integration and national informatization, especially the reform of the supply side and new technological revolution featured by big data, cloud computing, Internet and Internet of Things largely change the channels and instruments of finance. It will certainly have constant and deep reform on commercial mode, development model and financial demands.

The rapid development of Internet finance is likely to reshuffle the ability for commercial bank to contend for customers and quicken the market reform of financial industry. The financial innovation changes rapidly, the multi-agent, multilevel and multi-field comprehensive financial market patterns are emerging. Private finance, industrial capital and the cross-industry competition new format of internet finance remarkably form new finance eco-system. As a result, it brings dangerous subsistence crisis for banking industry. In 2015, Chinese banking industry faced several difficulties and situated in a severe development situation, such as low increase of profits, prominent pressure of asset quality and constant “increase” of non-performing loans. Therefore, commercial bank must return to the essence of serving substantial economy under the background of new age. It requires for deep involvement in the optimization of industrial chain and the innovation of commercial mode, exploring new finance and non-finance service models and finding the increasing point fitting with industrial development. As a great achievement for bank to serve substantial economy, supply chain finance is becoming a strong and powerful gripper for commercial bank. Basing on the policy of “Internet Plus”, how can commercial bank go on internalization reform and carry out supply chain finance in itself? How to precisely seek out excellent industry? It is the practical difficult problem and require to be handled for commercial bank to suit the demands of the changes of macro-economy environment and cope with the challenges brought by Internet.

2 Present Situation of the Research at Home and Abroad

Supply chain finance is a great achievement to solve financing difficulties for small and medium-sized enterprises. Alen N Berger and Gregory G Udell (2004) think supply chain finance is an innovation of financing and they are the earliest person to build the framework of supply chain finance. Hofmann (2005) points out that supply chain finance is the cross product of finance, enterprise cooperation, logistics and supply chain management and is a way for several commercial subjects to cooperatively create values from the aspect of the subjects in the supply chain finance. Michael

Lamoureux (2007) thinks supply chain finance centers on the ability of financing and the systematical optimization of finance cost and goes on optimization management on fund by credit balance, financing preferences and inventory control. This kind of systematical optimization can be achieved by the information flow of supply chain. Towergroup (2006) thinks that supply chain finance is an innovative service for the financing of current assets and it is constantly developed by the promotion of technology, globalization and the management of supply chain. Walters (2004) also believes supply chain finance is an innovation for financial products and services and it is a kind of value chain management process to achieve the value of supply chain. Based on those achievements, Aberdeen (2006) sums up that the essence of supply chain finance is a scheme to optimize the flow of the financing of supply chain and decreases the overall financing of supply chain and settlement cost. Domestic scholar Yan Junhong (2007) believes supply chain finance is a new financial service. By providing services to related enterprises on the whole supply chain, it can finally form a supply chain financing “production-supply-marketing” and achieve industry financial ecological chain by the cooperation between financial capital and substantial economy. Sun Li (2014) points out that commercial bank must combine with Internet to achieve the transformation of supply chain finance and points out detailed direction of transformation. Huang Rui (2014) points out that commercial bank has to be innovative and takes advantages of the Internet to lay out financial industry chain, meets the financial demands of small and micro enterprises and individuals and achieves the transformation and upgrade of commercial bank under the wave of Internet. Chen Zehan (2015) focuses on the analysis of the financial business of a certain commercial bank and points out that he major direction centers on tradition industries, such as steel, automobile and coal.

It is obvious that the researches of supply chain finance theory at home and abroad mainly focus on operation model and types of product type of supply chain financial transaction, financing effects on small to medium sized enterprises and the risk control to carry out supply chain finance for commercial bank. Domestic scholars highlight the transformation of supply chain finance, but they mainly center on business types and changing off-line business to on-line business. They lack the study on the transformation from traditional industries to new industries. The supply chain finance for traditional industries has one core enterprise and provides information basis and risk control to supply chain finance. However, with the promotion and application of new technology, featured by big data, cloud computing, Internet and Internet of Things, especially the promotion of Internet Plus Strategy, enterprise can integrate with the proceeding of Internet. It opens the space for the development of Internet financial for commercial bank. The prerequisite for commercial bank to grasp the opportunity of Internet Plus is to break the constraint of industry and the top priority is to find the proper industry to develop supply chain finance.

3 Industry Choose Based on Industry Attractiveness of Commercial Bank Supply Chain

As for commercial bank, the implement of supply chain financial business firstly requires for opportunity identification, but the opportunity origins from the industry itself and environment. To effectively find out the opportunity of the development of supply chain finance, the paper use the ability of industry attractiveness to measure opportunity. Industry attractiveness includes its own conditions and the guide and support of government.

3.1 Design the evaluation index system of industry attractiveness of supply chain finance

3.1.1 Index design principle

To study the cooperation of industry-finance in the change of industrial structure, the building of the index needs to judge, choose, control, guide and warn. Reasonable evaluation index system plays a key role in enhancing the scientific of results. The key of carrying out supply chain finance for commercial bank is to be on guard of systemic risks within the industry, but the core of preventing the systemic risk is the development space and growth of the industry. This text will center on this core to design the index design principle and carry out index design.

1) Scientific principle

The building of evaluation system obeys scientific principle and the design of any data and index must obey the actual conditions. Try to avoid the overlapping and crossing calculation among indexes and then get the index, which can precisely reveal industry attractiveness. The aims are to precisely reveal the actual conditions of the industry and provide scientific evidence to design approaches of the development of supply chain finance for commercial bank.

2) Ecological principle

The choice of industry must obey the guide of government's industrial policy. With the transformation from extensive management to the content-based developmental transformation to the connotation development, our economy should strengthen industrial innovation-driven model and take the road of sustainable development.

3) Growth principle

The basis of the development of supply chain finance is to have the outlook for growth. If the industry has strong momentum, the risk of the development of supply chain finance is less and it can be more effectively bring the scale effect into play.

3.1.2 Construction of index system

According to the above principles, this text will build index from the aspect of industry attractiveness. Index includes industry scale, development potentials, innovation, advantages and social benefits of the industry. Basing on the principles of index design and the optimization of index, this text will examine and distinguish from 3 levels: ① Invite experts, specializing in the industry competitiveness, to distinguish and arrive at expert validity. ② Using exploratory analysis to exclude redundant titles and increase the construct validity of the scales. Using reliability test to ensure the reliability and stability of the scales. By examining, distinguishing and optimizing part of questions to form the scale on industry attractiveness, composing by 13 indexes (refers to table 1).

Table 1 Index on Industry Attractiveness

Aim	Benchmark	Index	Computing Formula
Industry Attractiveness	Industry Scale	Proportion of Employment	The Number of Employment/ Gross Number of Employment
		Proportion of the Number of Enterprise	The Number of Enterprise/ Gross Number of Enterprise
		Proportion of Total Asset	Industrial Assets/ Total Assets
		Proportion of Total Industry Output Value	Industry Gross Output/ Total Industry Output Value
	Industry Development Potentials	Growth Rate of Industry	Industry Output Value Variable/ Industry Output in the Base Period
		Ratio of Pre-tax	Total Profit and Tax/ Industry Industrial Output Value
	Industry Innovation	Growth Rate of R&D Personnel	The Number of R&D Personnel Variable/ The Number of R&D in the Base Period
		The Proportion of Sales Values of New Technologies Products in Total Sales Values	Sales Values of New Technologies Products/ Industry Sales Values
		The Proportion of R & D Campaign Expenses in Product Sales Values	Input of R & D Campaign Expenses/ Product Sales Values
	Industrial Advantages	Turnover Rate of Current Assets	Output Value of the Industry throughout the Country/ Industry Gross Value throughout the Country/ Industry
		Value Added Ratio of Industry	Industry Added Value Variable/ Added Value Variable in the Base Period
	Industry Social Benefits	Absorption Rate of Employment	The Number of People in the Industry/ Industry Added Value
		Energy Consumption Rate/ Input-Output Ratio	Industry Gross Output Value/ Industry Total Energy Consumption

3.2 Data analysis

The text regards the division of industry in *China Statistical Yearbook* as objects. According to the selected 13 index of appraising industry attractiveness, collect and sort out the original data in *China Statistical Yearbook*, *China Torch Statistical Yearbook* and *China Statistical Yearbook on Science and Technology* in 2015 to get 62 origin data of the related industries in 2014. To avoid errors resulted by different dimensions, this text adopts common statistical standardization methods to make dimensionless treatment of the origin data.

This text adopts SPSS17.0 as statistics analysis tool to analyze industry attractiveness. If the KMO value is 0.681 and more than 0.6, it means the sample index system has pretty good internal reliability and suits for factorial analysis. The p value of Bartlett sphericity tests are 0.000, which can deny the false of the independence of indexes. That is to say, it means there are prominent correlations between variables. As a result, it means Bartlett sphericity tests and KMO test are proper to go on factorial analysis.

According to the standardized correlation matrix, the factor characteristic root and total variance of industry attractiveness can be explained. It can be known from table 3, those two both have 4 latent roots (over 1) and explain 74.442% of the standard deviation variables. It illustrates that the former 4 factors can reveal most of the information of origin information and describe the actual standard.

Table 2 Factor Characteristic Root and Total Cumulative

Element	Initial Eigenvalues			Square Extraction and Loading		
	Total	Variance %	Accumulate %	Total	Variance %	Accumulate %
1	4.393	33.796	33.796	4.393	33.796	33.796
2	2.223	17.098	50.893	2.223	17.098	50.893
3	1.782	13.710	64.603	1.782	13.710	64.603
4	1.279	9.839	74.442	1.279	9.839	74.442

To deepen the analytical ability and explanatory ability for general factor on practical questions, the text adopts varimax rotation to rotate factors and get the loading matrix (refers to table 3) by 4 principal factors. The rotated loading matrix highlights the internal relation between industry attractiveness and its evaluation index.

Table 3 Rotated Component Matrix

	Element			
	1	2	3	4
Proportion of Employment	.919	.001	.098	-.066
Proportion of the Number of Enterprise	.893	.092	.132	-.029
Proportion of Total Industry Output Value	.888	.106	-.206	.186
Output Ratio of Energy Consumption	.808	.122	-.253	-.137
Proportion of Industry Output Value	.777	.049	-.297	.166
The Proportion of R & D Campaign Expenses in Product Sales Values	.178	.900	-.088	.127
he Proportion of the Sales Values of New Technologies Products in Total Sales Values	.203	.875	-.139	.253
Turnover Rate of Current Asset	.106	-.759	.034	.296
Value Added Ratio of Industry	-.006	-.077	.895	.091
Growth Rate of industry	-.154	-.060	.835	.153
Growth Rate of R&D Personnel	-.070	-.093	.604	-.271
Absorption Rate of Employment	-.197	-.112	-.132	-.857
Ratio of Pre-tax	-.368	-.063	-.135	.489

As can be seen from rotated component matrix, the first principal factor F1 has great loading on proportion of employment, proportion of the number of enterprise, proportion of total industry output value, output ratio of energy consumption and the proportion of industry assets. Those five indexes reflect industry economies of scale. Namely, it is called industrial scale attractiveness factor. The second principal factor F2 reflects the development potentials of industry in the following 3 aspects: the proportion of R & D campaign expenses in product sales values, the proportion of sales values of new technologies products in total sales values and turnover rate of current asset. Namely, it is called industrial potential factor. The third principal factor F3 has great loading on value added ratio of industry, growth rate of industry, growth rate of R&D personnel, growth rate of sales revenues and growth rate of industry. Those five indexes reflect the growth of industry. Namely, it is called industrial growth attraction factor. The fourth principal factor F4 has great loading on absorption rate of employment and ratio of pre-tax. Those two indexes reflect industry social benefits. Namely, it is called industrial social attraction factor.

To examine the importance of index on factors and the overall evaluation, calculate the scores of factors and adopt regression method to get the matrix of coefficients of the scores of factors. According to the linear combination of the standard value of the variable of the matrix of coefficients, the scores of

the factors can be calculated. Then, the rotated variance devoting rates of latent root plus the scores of main factors to get the comprehensive scores of factors. The results and ranking refer to table 4.

Table 4 Overall Ranking

Industry	Comprehensive scores	Industry	Comprehensive scores
Computer, Communication and other Electronic Equipment Manufacturing Industry	0.7164	Wood Processing and Manufacturing Industry of Wood, Bamboo, Vine, Palm and Grass	-0.00121
Electrical Machinery and Equipment Manufacturing Industry	0.703304	Manufacturing Industry of Culture and Education, Art, Gym and Recreation Goods	-0.01892
Chemical Materials and Chemical Products Manufacturing	0.680099	Manufacture of Metal Product, Machinery and Equipment-repairing	-0.01942
Non-mental Mineral Products	0.644058	Coal Mining and Coal Washing Industry	-0.04658
Processing of Food from Agriculture Products	0.592592	Manufacture of Textiles, Clothes and Accessories	-0.05236
General Equipment Manufacturing	0.579135	Manufacture of Paper-making and Paper Products	-0.14761
Motor Industry	0.456413	Manufacture of Furniture	-0.14902
Manufacture of Special Purpose Equipment	0.371869	Leather, Fur, Feather and Its Products and Shoemaking Industry	-0.19677
Manufacture of Metal Products	0.340626	Auxiliary Mining Operations	-0.23322
Manufacture of Medicines	0.335939	Petroleum Processing, Coke Making and Processing of Nuclear Fuel	-0.28174
Manufacture of Instruments and Meters	0.239771	Printing and Record Medium Reproduction	-0.28236
Manufacture of Rubber and Plastics	0.22854	Manufacture of Chemical Fibers	-0.29936
Textile Industry	0.203332	Nonmetal Minerals Mining and Dressing	-0.30439
Smelting and Pressing of Ferrous Metals	0.200978	Nonferrous Metals Mining and Dressing	-0.31511
Manufactures of Railway, Shipping, Aerospace and Other Transportation Facilities	0.144026	Manufacture of Tobacco	-0.37848
Production and Supply of Electric Power and Heating Power	0.080014	Ferrous Metals Mining and Dressing	-0.38344
Production and Supply of Gas	0.07471	Other Manufacture Industries	-0.62436
Food Manufacturing	0.057398	Extraction of Petroleum and Natural Gas	-0.64542
Smelting and Pressing of nonferrous Metals	0.028111	Comprehensive Utilization of Waste	-0.67424
Manufacture of Wine, Drink and Refined Tea	0.013015	Other Mining Industry	-0.69988
Manufacture of Electronic Components	0.90791	Manufacture of Discrete Semiconductor Devices	-0.03311
Manufacture of Electronic Devices	0.54123	Manufacture of Integrated Circuit	-0.05386
Manufacture of Other Electronic Devices	0.46776	Manufacture of Medical Instrument and Apparatus	-0.08353
Manufacture of Chemical Medicine	0.36535	Manufacture of Office Equipment	-0.13811
Manufacture of Instruments and Meters	0.26937	Manufacture of Spacecraft	-0.17354
Manufacture of Communication Transmission Equipment	0.22204	Manufacture of Electronic Vacuum Appliances	-0.23643
Manufacture of Computer Peripheral Equipment	0.22131	Manufacture of Radio & TV Equipment	-0.26139
Production of Chinese Patent Medicine	0.0816	Manufacture of Aircraft	-0.28357
Manufacture of Complete Computers	0.01183	Manufacture of Audio-visual Equipment	-0.41791
Manufacture of Communication Terminal Equipment	-0.0113	Manufacture of Computer Components	-0.45875
Manufacture of Biological Medicine	-0.0149	Manufacture of Rada	-0.92196

4 The Division of the Development Approach of Supply Chain Finance for Commercial Bank

According to the results of calculation, only those industries with positive comprehensive scores have the space of choosing the supply chain finance for commercial bank. To further illustrate industrial difference, this paper adopts Q-mode hierarchical cluster analysis to cluster industries with positive comprehensive scores and get the development approach of the supply chain finance of commercial

bank. To highlight the differentiation, and adopt five clustering methods to three catalogues, such as top-priority, highlight and general development, the other two catalogues will not illustrate here.

1) Top-priority industry

As it can be seen from cluster analysis, the top-priority industries to be developed include 13 industries, such as Manufacture of Medicines, Manufacture of Instruments and Meters, Production and Supply of Gas, Food Manufacturing, Manufacture of Wine, Drink and Refined Tea, Manufacture of Electronic Components, Manufacture of Electronic Devices, Manufacture of Other Electronic Devices, Manufacture of Chemical Medicine, Manufacture of Communication Transmission Equipment, Manufacture of Complete Computers, Manufacture of Computer Peripheral Equipment and Production of Chinese Patent Medicine. Seen from the practical status of those industries, those industries are mainly stand at the upward momentum. They are innovated by national policies and fit with the connotation of the combination of finance with substantial industry.

2) Industries require for great attention

As it can be seen from cluster analysis, Motor Industry, Manufacture of Special Purpose Equipment, Manufacture of Metal Products and Manufacture of Rubber and Plastics have to be handled with great care to carry out the financial services of finance chain supply. Those industries are pretty matured traditional manufacturing industries. At present, majority of the finance supply chain of commercial bank focus on those industries. As it can be seen from the analysis, those industries have great space of development. Besides, they have little risk and deserve for great concern.

3) General cooperation industry

Industries like Electrical Machinery and Equipment Manufacturing Industry, Chemical Materials and Chemical Products Manufacturing, Non-mental Mineral Products, General Equipment Manufacturing and Textile Industry are too weak to grow and have relatively weak industry benefits. They selectively to cooperate with some enterprises, such as the leading enterprises of the supply chain.

5 Conclusions

Supply Chain Finance, an important financial instrument to support substantial economy, is an effective method to solve financing problem for Medium-sized and Small Enterprise. This text focuses on the slow development of supply chain finance of Commercial Bank at present, stopping the development dilemma of minor tradition industry, adopting industry attractiveness as the means of choice and employing factorial analysis and clustering analysis to choice the perspective industries for commercial bank. It has an important practical significance on promoting and developing supply chain finance for Commercial Bank.

Drivers of Bank Profitability: A Case of Commercial Banks in Morocco

Amroui Mouna, Ye Jianmu

School of Management, Wuhan University of Technology, Wuhan, P.R.China, 430070

(E-mail: high-classe@hotmail.com, jianmuye@126.com)

Abstract: This research examines the drivers of return on asset (ROA) as the proxy of profitability in the commercial banks in Morocco. Panel regression model is employed referring to time series in each cross section of data. Based on the result of Hausmann test, random effect method fit the model better. Thus it was utilized to determine the drivers of bank profitability from its bank specifics in this research. The annual data was collected from bank scope database to cover the period from 2007 until 2015 in the six commercial banks in Morocco as the samples of this research. Out of six variables, we find that there are four independent variables which have significant effect on return on assets (ROA), while the remaining two independent variables have no significant effect on to return on assets (ROA). Size and loan loss reserves to gross loan (LLR/GL) are positively affecting the return on assets with high statistical significance. On the other hand, cost to income ratio (CIR) and loan loss provision to net interest revenue (LLP/NIR) have negative effect and highly significant effect on return on assets (ROA).

Key words: Bank profitability; Panel regression; Random effect method; Bank specifics

1 Introduction

Nowadays, the national and international economic context of Morocco is marked certainly by a recovery in its activity after the "Big Recession" of 2007-2009, initially caused by the United State subprime mortgage crisis and the bankruptcy of Lehman Brothers in September 2008. Despite this recovery, the context is still being fragile. The pivotal actor of the economy are banks, they maintain the financial relations and assure the stability of economies (Suzuki 2012).

We are currently witnessing economic developments in lightning globally, profound regulatory changes in the financial markets and margin erosion in the banking sector. This dynamic has a huge impact on the international competitiveness of the site and the profitability of various activity area. Banks must find appropriate responses to the new provides. For Morocco, the structure of the banking system has undergone many changes since the eighty years. These changes are the result of adaptation of banks to the new order in financial markets marked by an opening of markets has led to an increase in competition. As part of such restructuring of banking systems, include "bank performance" and "determinants" becomes an important issue.

In the banking system, the traditional activity is to collect funds (deposits) from surplus agents to make available to those in need (lend). This conventional way of doing was further complicated by the creation of the award by financial globalization and not to mention the multiple crises. Therefore, Banks with better performance are better able to withstand negative shocks and contribute to the stability of the financial system (Athanasoglou et al., 2008).

The soundness of banks maintains the stability of the economies. Hence the performance of Morocco banks is crucial for the country economy. Since 1997 until 2016, they are 33 banks in total but many of them declared bankruptcy (BBVA Maroc SA, Fondation pour le Développement Local et le Partenariat-FONDEP, Citibank Morocco, Fondation Zakoura Micro-Credit, Société de Financement d'achats à Crédit - SOFAC Crédit, Banque Nationale pour le Développement Economique – BNDE) or they use merger and acquisition to develop their performance as the case of attijariwafabank. After the elimination of inactive bank and also the bank which haven't data during the period 2007 to 2015, only six bank have been taken as sample of the framework, those banks are: Attijariwafa Bank, Groupe Banque Centrale Populaire, Banque Marocaine du Commerce Extérieur-BMCE Bank, Société Générale Marocaine de Banques, Banque Marocaine pour le Commerce et l'Industrie BMCI and Fonds d'Equipement Communal.

The performance can be expressed in various terms, such as efficiency, productivity and profitability (Bikker and Bos, 2008). In this research, the performance will be analysis in term of profitability. Many academic researchers was attracted by the determinant of banks performance, International academic researcher have shown that "the bank performance" is represented mainly by quantitative or measurable indicators such as financial indicators (ROA, ROE, etc.), also academic researchers in Morocco wanted to examine the performance of Morocco banks like Ferrouhi & Lehadiri

(2014) and Mansouri (2009). However, the research conducted use cointegration modeling approach and others approach, hence there is a gap of studies conducted to investigate the status of Moroccan bank performance and its determinant. In view of these facts, this paper attempts to investigate the drivers of Moroccan bank profitability during and after the financial world crisis by using return on asset (ROA) as the proxy of profitability.

2 Literature Review

Numerous studies attempted to find the determinants of bank performance. Most of studies have been performed in the developed countries, but it is still very few in the developing countries, including Morocco. One of the early studies attempted to find out the major determinants of bank performance and profitability was carried by Short (1979) and Brouke (1989). Since then, many studies have been conducted by other researchers, such as; Molyneux and Thornton (1992), Demirguc-Kunt and Huizinga (1999), Abreu and Mendes (2002), Staikouras and Wood (2004), Athanasoglou et al. (2006), Micco et al. (2007) and Pasiouras and Kosmidou (2007) to investigate the variables related to bank profitability (Zeitun 2012).

Return on asset (ROA) is usually used as dependent variable in the regression equation. This ratio defines the profit gained from bank activities. It is a profitability indicator obtained by net income to total assets (Faizulayev 2011). ROA assesses efficiency management in terms of assets as percentages. In other words, it measures the ability in terms of efficiency of the banks to generate profit by using its assets. Simply to say, how efficiently assets are making earnings. The remaining bank specifics except return on assets will be used as independent variables in the regression equation. There are many bank specific variables and the researchers chose the most common one, such as; liquidity, bank size expressed by log of total asset, credit risk, asset quality, and operational efficiency ratio.

Liquidity is an important ratio measuring the ability of banks to cover its obligation; this important variable can be obtained by net loans to deposit and short term funding (NL/DS). It arises from the possible of inability of a bank to accommodate decreases in liabilities or to fund increases on the assets' side of the balance sheet (Said & Tumin 2011). Liquidity problem may lead to insolvency (Faizulayev 2011). According to (Mirzaei 2011), it is expected a positive relationship between this variable and profitability (Bourke, 1989). (Rachdi 2013) confirmed this finding in Tunisia bank.

It is considered that size is expected to have an impact on financial performance. Previous work witnessed that size banks may have positive or negative impact on the profitability. According to Mirzaei (2011) a positive relationship between size and return on asset can be issued. It can be explained that the bigger the bank is, may having higher total assets that could benefit from scale and scope economies and even larger benefit from market power. According to Sufian (2011) and Rachdi (2013), in a specific case may suggest that cost differences and product may lead to a positive relation between size and profit, large bank high degree of loan thus more revenue. Additionally, (Smaoui & Salah n.d.) find that size affect positive and significantly to return on assets (ROA) in gulf cooperation council countries (GCC) region. So, we can deduce that the size can have positive or negative effect on ROA.

Loan loss provision to net interest revenue (LLP/NIR) as a proxy of credit risk refers to a probable loss of capital accorded as credit while repaying a loan by clients. Credit ratio has significant impact on performance of banks in Malaysia, the higher the credit ratio results may lead to lower profit (Said & Tumin 2011). Furthermore, in the previous research of Miller & Noulas (1997), they found a negative impact between loan loss provision and net interest revenue. That means, the higher banks are exposed to credit risk, the higher banks are exposed to less profitability.

Asset quality refer to the main source of asset's banks, named loans (Faizulayev 2011). The management of loan loss is very important because it measures the creditworthiness of banks, in this paper loan loss reserves to gross loans (LLR/GL) is used to measure the asset quality. Loan loss reserve (LLR) is the percentage of the total loan portfolio that has been set aside for bad loans. The higher loan loss reserve ratio indicates poor quality of loans; hence it will have higher risk on the loan's portfolio. According to Kosmidou et al. (2006), a poor loan quality could reduce interest revenue and increase bank's provisioning costs.

Operational efficiency ratio of banks can be expressed by cost to income ratio. This ratio indicates how quick the expenses increase or decrease when changes to income occurred. (Rachdi 2013) found the negative effect between costs to income ratio to return on assets in the Tunisia banks. The same result found by (Zeitun 2012) in his research on gulf cooperation council (GCC) countries . Minimizing cost-income is a crucial role for banks profitability since it measures the overheads or costs of running

the bank which includes staff salaries and benefits, occupancy expenses and other expenses such as office supplies, as percentage of income. It is typically used as an indicator of management's ability to control costs. The higher expenses normally mean lower profits and vice versa, thus cost to income ratio (CIR) is expected to have a negative effect on bank profits and margins (Kosmidou et al., 2006).

Total equity by net loan ratio, forms part of the Capital and Funding ratios of a bank, and measures a company's financial leverage by calculating the proportion of equity and debt the company is using to finance its assets. Abdallah (2013) in his research on the impact of financial and non-financial measures on banks financial strength rating in the middle east found a positive and statistically significant relation between equity to net loan and profitability. His theory was build based on the finding of Poon et al. (2009). Based on previous research, the following hypotheses are concluded:

H₁: Net loans to deposit and short term funding (NL/DS) has positive effect on return on assets (ROA)

H₂: Size of bank has a positive effect on return on assets (ROA)

H₃: Loan loss provision to net interest revenue (LLP/NIR) has negative effect on return on assets (ROA)

H₄: Loan loss reserves to gross loans (LLR/GL) has positive effect on return on asset (ROA)

H₅: Cost to income ratio (CIR) has negative effect on return on assets (ROA)

H₆: Equity to net loans has positive relation effect on return on asset (ROA)

3 Methodology

3.1 Data collection method

Panel data analysis is conducted which relating its time series to the cross sectional data. In each cross section, it is produced an intercept and the score of coefficient from different slopes in each observation period (Wooldridge, 2013). Yearly based data from 2007 to 2015 is collected from world banking information source, Bankscope and the Commercial banks of Moroccan were selected as sample. All active and currently operating banks which listed on Bankscope constitute the sampling frame. Commercial banks both private and public banks that paid dividend throughout study period are taken for further analysis. There are 33 banks in total, but there are only 6 banks that actively operating and have the data from 2007 to 2015. Hence 6 banks with 54 observations make up the final sample of study.

3.2 Method of the study

This research utilizes return on asset (ROA) to measure bank profitability as dependent variable, while independent variables in this research are the bank specifics, such as; NL_DS, SIZE, CIR, LL_GL, LLP_NIR, EQ_NL. Thus, the model is as follows:

$$ROA_{it} = \alpha_i + \beta_1 NL_DS_{it} + \beta_2 SIZE_{it} + \beta_3 LLP_NIR_{it} + \beta_4 LLR_GL_{it} + \beta_5 CIR_{it} + \beta_6 EQ_NL_{it} + \varepsilon_{it}$$

Whereas:

ROA: Return on Asset

β : coefficient of independent variable

NL_DS: Net Loans to Deposit and Short Term Funding (liquidity)

SIZE: Log of total asset of a bank

LLP_NIR: Loan Loss Provision over Net Interest Revenue (credit risk)

LLR_GL: Loan Loss Reserves by Gross Loans (asset quality)

CIR: Cost to Income Ratio (operational efficiency ratio)

EQ_NL: Equity to net Loans

ε : Error terms

i: total number of banks

t: total number observation for each bank

4 The Determinants of Return on Asset

To find the determinant of return on asset, Panel least square is utilized to analyze it. Return on asset (ROA) is used as dependent variable. Based on result of Hausman test, P-value is bigger than 5 percent hence random effect model is used for further analysis.

Based on the table 1, it indicates that out of 6 variables: Net Loans to Deposit and Short term Funding, Log of total asset of a bank, Loan Loss Provision over Net Interest Revenue, Loan Loss Reserves by Gross Loans, Cost to Income Ratio and Equity to net Loans, there are four independent variables have significant on 1 percent level impact on return on asset. NL_DS ratio measuring the

degree of bank liquidity have no significant coefficient on the return on asset of Moroccan banks, hence the first hypothesis is rejected. Size ratio have significant and positive effect on banks profitability, hence we accept the second hypothesis, this result is the same with those of Mirzaei (2011) Sufian (2011) and Rachdi (2013). LLP_NIR ratio have significant and negative relation with banks profitability, this results is consistent with the model result Said & Tumin (2011), hence the third hypothesis is valid. LL_GL is significant with positive impact on return on asset, Cost to Income Ratio (CIR) significant with negative impact. Therefore the fourth and fifth hypothesis s accepted. Equity to net loan ratio have no significant effect on return on asset (ROA), hence the sixth hypothesis is rejected.

Table 1 Determinants of Profitability

Variable	Coefficient	Std. Error	t-Statistic	Prob.
C	1,425	0,573	2,488	0,016
NL_DS	-0,004	0,003	-1,102	0,276
SIZE	1,917	0,278	6,889	0,000
LLP_NIR	-0,024	0,003	-8,692	0,000
LL_GL	0,041	0,007	5,625	0,000
CIR	-0,019	0,004	-4,282	0,000
EQ_NL	0,001	0,010	0,103	0,918

Table 2 Weighted Statistics

R-squared	0,866503	Mean dependent var	1,276111
Adjusted R-squared	0,849461	S.D. dependent var	0,501528
S.E. of regression	0,19459	Sum squared resid	1,779661
F-statistic	50,8446	Durbin-Watson stat	0,895152
Prob(F-statistic)	0		

Based on table 2, F-statistic, P-value indicate that the model is good for analysis, then the conclusion reached basis on this result are reliable. Adjusted R-squared is 0.849 which represent that almost 85 percent variation in dependent variable is explained by explanatory variables of model. Durbin-Watson static is close to 1 that indicates that model is free of serial auto correlation.

Table 3 Multicollinearity test

	NL_DS	SIZE	CIR	LL_GL	LLP_NIR	EQ_NL
NL_DS	1	0,250604	-0,70511	-0,21263	-0,2479	0,426193
SIZE	0,250604	1	0,183643	0,415214	0,086243	-0,1013
LLP_NIR	-0,2479	0,086243	0,589448	0,796291	1	-0,58002
LL_GL	-0,21263	0,415214	0,603603	1	0,796291	-0,53942
CIR	-0,70511	0,183643	1	0,603603	0,589448	-0,72475
EQ_NL	0,426193	-0,1013	-0,72475	-0,53942	-0,58002	1

Tables 3 explain matrix correlation of commercial banks in Morocco. Explanatory variables may explain the effect of dependent variable when they have no correlations among independent variables. Strong association exist when the score of matrix $\geq 80\%$ (0.80). Briefly, the results show no multicollinearity problem among independent variables. Thus, all the independent variables utilize in this research.

5 Conclusions

This study empirically investigated the determinants of bank's performance for banks in Morocco during the period 2007-2015, using a cross-sectional time-series (panel data). Bank-specific factors (internal variables) have been used in this study. Total banks are 33 banks; many of them declared bankruptcy or they use merger and acquisition to develop their performance or newly created. Only 6 bank that actively operating and have the data from 2007 to 2015. Hence 6 banks with 54 observations make up the final sample of study.

Liquidity measuring the ability of banks to cover its obligation was expected to have positive impacts on profitability, results show no significant coefficient, and hence the hypothesis was rejected.

The size of banks obtained by log of total asset as expected have positive relation on banks profitability, bank in Morocco benefit from scale and scope economies and also market power. LLP_NIR ratio used as a proxy of credit risk has negative effect on return on asset (ROA). Asset quality ratio, referring to the result, has positive effect on the return on asset, hence higher asset quality lead to higher profitability of banks in Morocco. The cost-income was found to have a negative and significant impact on banks performance for banks in Morocco, developing management ability in controlling cost. Finally, equity ratio effect on return on asset was rejected, it hasn't significant coefficient.

Data collection is the main limitation for this study. Data on banking is not easily accessible or available in general. The data for this study was obtained from BankScope and the required information was not available for all banks. Therefore, many banks were not included in this study as they had missing data for many years over the period of the study. Also, some indicators of bank specifics and macroeconomics factor that are not included in this study may be added.

Innovative Design of “Win-Win” Model of Supply Chain Finance Based on Bank-Enterprise Dynamic Game

Li Shihua

Wuhan Textile University, Wuhan, P.R. China, 430077

(E-mail: lionlee007@163.com)

Abstract: The bank-enterprise credit relationship in supply chain finance is a process of dynamic game. Platform of supply chain financing is the optimal contract design and path selection to achieve “win-win” of bank-enterprise. In this paper, we’re trying to establish a dynamic game model to analyze the decisions of bank-enterprise, analyze the Bayesian Nash equilibrium and its existing conditions to find out their respective optimal choice, and design the supply chain financing platforms actively. The purpose is to meet the different financing needs of small and medium-sized enterprises in supply chain, achieve the “win-win” target of supply chain finance.

Key words: Supply chain finance; Bayesian Nash equilibrium; Dynamic game; Win-Win

1 Introduction

In recent years, with the complicated and changeable international and domestic economic situation, the SMEs (small and medium-sized enterprises) are faced with the contradiction, such as rising costs, funding constraints, financing difficulties and other conflicts, which are more prominent. The problem of capital constraint problem is prevalent in the supply chain management. Supply chain finance is to further strengthen and improve financial support and services and promote the sustained, rapid and sound development of SEMs, promotes economic restructuring and upgrading, provides a new choice path. Supply chain finance is a combination of financial services and technology solutions (William Atkinson, 2008). How to avoid the risk of a credit agreement reasonably under the risk-sharing mechanism and make the best design and financing platform is the real issue and the urgent task of supply chain finance parties must face.

2 Establishment of the Dynamic Game Model

Supply chain financing model make use of inventory of enterprise and accounts receivable, to provide financing, asset finance through under sufficient control over the banks to control risks, and reduce the probability of default of enterprises. Principal-agent relationship between banks and finance companies is a credit relationship; the game is a dynamic process that requires a dynamic analysis of the financing of corporate defaults, banking litigation process to examine the formation of the supply chain financial risks and their solutions. The participations in the core business with third-party logistics enterprises, the marginal credibility of SMEs are improved, reduce the asymmetry of information between banks and enterprises (Zhang Yan, 2011), but also cut down the cost of the bank to obtain information and the cost of corporate defaults increased, which reduce the probability of default of enterprises, improve the rate of the bank issuing the credit funds, solve the problem of the enterprise finance effectively.

In the context of supply chain finance, when banks and enterprises participating subjects are rational, both in pursuit of maximizing their own interests for the purpose according to the behavior of SMEs, the banks decide whether to lend at the same time, it can build an analysis of model about bank-enterprises credit game to analyze the decisions of them.

SMEs choose α_1 from the feasible set A_1 , after α_1 is observed, the banks select an action α_2 from viable A_2 , $\max_{\alpha_2 \in A_2} u_2(\alpha_1, \alpha_2)$ said the decision problem the banks facing, at this time their profits are $u_1(\alpha_1, \alpha_2)$ and $u_2(\alpha_1, \alpha_2)$. Assumes that there is only one solution $R_2(\alpha_1)$ to each α_1 from A_1 for the banks of optimization problem, decision-making problems faced by SMEs in the loan application is represented by $\max_{\alpha_1 \in A_1} u_2(\alpha_1, R_2(\alpha_1))$, and the same optimization problem has a unique solution α_1' for SMEs, $(\alpha_1' R_2(\alpha_1'))$ is the solution of this game. When the banks and enterprises is difficult to reconcile the conflict game, the two sides should change the performance indicators in the system, and the system solution is the optimal solution (Li Jiajun, He Sihui, 2004). When SMEs apply the banks for loans, there

are two options in the bank's strategic space: namely, two sets of lending and non-lending operations of two sets, which is based on the supply chain situation in which small and medium enterprise capacity, credit rating, collateral levels, known information etc. If the banks choose not to lend, the entire dynamic game will be suspended; if the bank approved a loan, then the next set of actions of the bank will be decided by the enterprise repayment behavior, such as the performance of SMEs, the game suspended and banks and enterprises to achieve win-win situation. The revenue collection is (1, 1), which is a perfect information dynamic game of bank-enterprise (Xia Taifeng, 2006). As shown in figure 1.

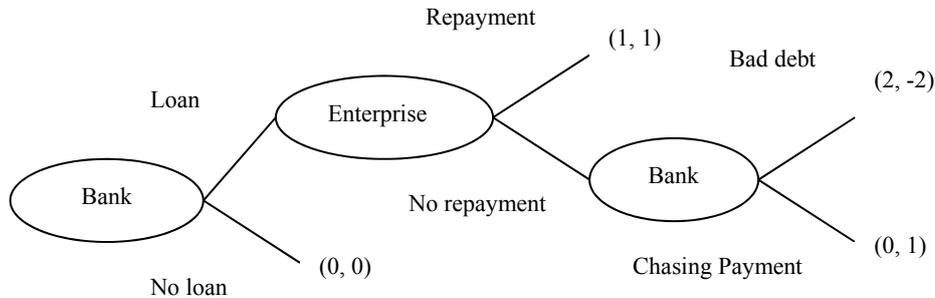

Figure 1 A Dynamic Game Model Between Banks and Enterprises under Perfect Information

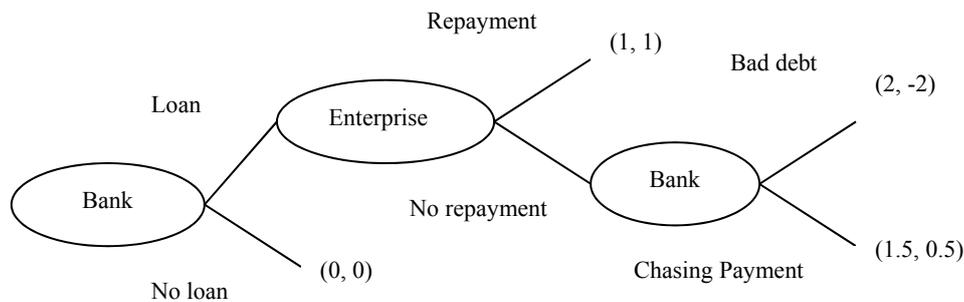

Figure 2 A Dynamic Game Model Between Banks and Enterprises under Imperfect Information

After enterprises decide whether to breach, the banks determine to the verification of enterprise (Liu Weiqi, Gao Chao, 2006). If SMEs defaults, the banks face two behavior sets: the banks take action to recover money, or tolerate and bear the bad debt losses. The bank efforts to verify is the assumption that the transaction costs for the recovery section is 0.5, the total income of the bank to recover compensation is 0.5. Due to the low impact of judicial efficiency, we assuming that businesses can use a gain of 1.5 during the loan recovery section, equilibrium occurs at this time of the game change, the companies are more inclined to default. So in order to reduce losses, the banks will take less credit or no credit policy. Which is an imperfect information dynamic game between the bank and corporate. As shown in figure 2.

3 Design of Interests of Game “Win-Win” Model

The results of the banks and enterprise in the game are facing the conflict of interest and asymmetric information environment. How does the client design for the principal and the agent is favorable “optimal contract”? Supply chain finance is the best platform designed to achieve this optimal contract, and it is also a “win-win” choice of bank-enterprise. Among them, the risk-sharing contract makes the profit of the supply chain achieve the profits level of centralized decision-making of supply chain, to achieve a Pareto improvement of supply chain systems (Peng Hongjun, Zhou Meihua, Liu Manzhi, 2013). When SMEs apply for loans from the banks and other financial institutions, there has formed a process of dynamic game between them. Throughout the game, the strategic space of SMEs, including compliance and breach of contract, depend on the probability of the bank loans, loan conditions and profit of SMEs default; the strategic space of bank, including bank loans and no credit,

depend on the risk probability of SME performance. By use the game theory to analyze the banks and SMEs to find their optimal choice, the key is to find the existence of Bayesian Nash Equilibrium and its condition. As shown in Table 1.

Table 1 Payment Matrix of Banks and SMEs

Strategic space		Bank	
		Loan (β)	Non loan ($1-\beta$)
Enterprise	Compliance (α)	$(R-r, r-C_2)$	$(-R, -r)$
	Breach of contract ($1-\alpha$)	$(R+C_1-M(\theta), B-A-C_2-C_3-r)$	$(-R-C_1, -r)$

Expected benefits are calculated according to the banks and SMEs payoff matrix, the gain model as follows (Ma Jia, 2008):

$$E_1^{pay} = \beta[\alpha(r-C_2) + (1-\alpha)(B-A-C_2-C_3-r)] + (1-\beta)[\alpha(-r) + (1-\alpha)(-r)] \quad (1)$$

Here: α expresses the probability of compliance for SMEs;

β represents the probability of bank loans;

$M(\theta)$ represents the continuous increasing function of punishment when SMEs in default;

R is the operating profit of SMEs, A is the principle of loans. And r is the interest of loans.

C_1 is the operating loss for the performance, C_2 is the cost of information for the bank to acquaintance SMEs operating status and C_3 is the transaction costs to recover the loan, B represents the recovery income.

The formula of β (1) derivative to:

$$\begin{aligned} \frac{\partial E_1^{pay}}{\partial \beta} &= \alpha(r-C_2) + (1-\alpha)(B-A-C_2-C_3-r) + [\alpha r + (1-\alpha)r] \\ &= \alpha(2r + A + C_3 - B) + (B - A - C_2 - C_3) \end{aligned} \quad (2)$$

Set $\frac{\partial E_1^{pay}}{\partial \beta} = 0$, so :

$$\alpha = \frac{B - A - C_2 - C_3}{B - A - C_3 - 2r} \quad (3)$$

$$1 - \alpha = \frac{C_2 - 2r}{B - A - C_3 - 2r} \quad (4)$$

In the same way, so:

$$\beta = \frac{C_1}{r + 2C_1 - M(\theta)} \quad (5)$$

Equation (4) is a Bayesian Nash equilibrium conditions for SMEs, it is a reflection function that represents the default probability of SMEs when the banks gain the maximum expected return. In supply chain finance model, with the cost C_2 of obtain information be reduced, the banks also reduce the cost C_3 . But the bank improved the property to recover money income by controlling in order to make the probability of default of SMEs reduced; Equation (5) is Bayesian Nash equilibrium conditions of the banks, it is a reflection on SMEs gain function or a probability of bank loans. With the increase of penalty function $M(\theta)$, that is, once the SME defaults, counter-guarantees for SMEs bear the risk of loss associated supply chain core enterprise or third-party logistics companies will penalize them, SMEs are forced to reduce the default behavior for the cost of default risk increases, then the banks will increase the probability of lending, and will give greater credit support to those SMEs.

For problems about cash flow at different stages and differences in various aspects of financing risks, the supply chain finance offers different business models for SMEs to meet the reality needs about personalized funds in order to achieve supply chain finance parties “win-win” goals (Yan Guangle, 2011). Specifically includes the following aspects: Firstly, the material procurement is using the prepayment financing model to delay payments of suppliers, and reduce the cash flow gap for SMEs; Secondly, the business operations are

using the stock pledge financing models to compensate for the cash gap that led by unsmooth circulation of cash flow; Thirdly, the products sale is using accounts receivable financing model to ease the cash flow shortfall arising from loan recovery cycle. As shown in figure 3.

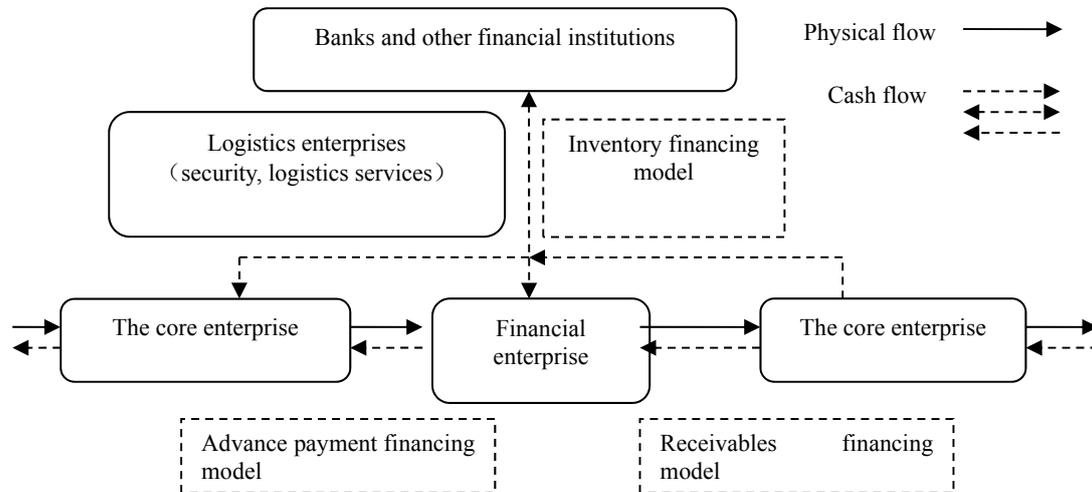

Figure 3 “Win-Win” Model of Supply Chain Finance

4 Conclusions

Supply chain financing model combine the different product innovation, and build diversified financing platform for SMEs in the supply chain to accommodate different financing needs based on the different development and corporate business sectors. Supply chain finance has broken the traditional single bank and corporate credit relationship, based on the whole industry chain credit. It concerns the entire supply chain and core business reputation and ability dynamic working conditions. And it takes the joint guarantees, inventory mortgage, credit enhancement and other ways to provide diversified and personalized financial services. It makes an inventory of the supply chain precipitation assets, strengthen the supply chain partnership, especially logistics enterprises involved in the expanded size of SME financing, reduce the bank's credit risk, enhance the logistics value-added service level, so as to achieve the win-win situation finally.

Abstract: Knowledge collaboration can accelerate the understanding of market situation of a specific time frame. Enterprise knowledge sharing and mining are often used to discover the hidden information in huge unorganized data of different enterprise company. In this paper, we mainly propose a framework to share the unorganized data and to get a better understanding of importance of different factors. Our model also provides a method to handle huge scattered raw data of different enterprise to generate a structured knowledge for better decision making using hadoop map reduce framework.

Key words: Knowledge management; Knowledge collaboration cloud big data; Decision making

1 Introduction

To handle a large number of critical real-world problems, big data analysis has become increasingly popular. There are many issues arising in big data. They are Management issues, Processing Issues (Changqing, 2012) security issues, and storage issues each issue has its own task of surviving in big data and mainly focusing on security issues. Effective and efficient solutions for many enterprises driven problems require joint collaboration for knowledge management and faster computational methods. Knowledge collaboration's main focus reflected in two aspects: knowledge innovation and interactive knowledge sharing (Cao Yanling, 2013). The theory and method of knowledge management and the synergetic theory are a basic theory of knowledge collaboration. Cloud storage is becoming a popular business tool; e.g. Amazon S3, Elephant-Drive, Giga-spaces, etc. Small companies that offer large internet program can avoid large infrastructure expenditures. Business and individual's applications are moving to the cloud because it is accessible from different devices and stored in clouds are reliable in modern technology (H. Ahmed, M. A. Ismail, and M. F. Hyder, 2014).

In this paper we use hadoop distributed file system and rough set theory to demonstrate the mutual correlation over the factors of different enterprise business on huge big data. Over the years Rough Set Theory has become a valuable tool in the resolution of various problems, such as: representation of uncertain or imprecise knowledge; knowledge analysis; evaluation of quality, identification and evaluation of date dependency.

2 Data and Methodology

2.1 Information collaboration

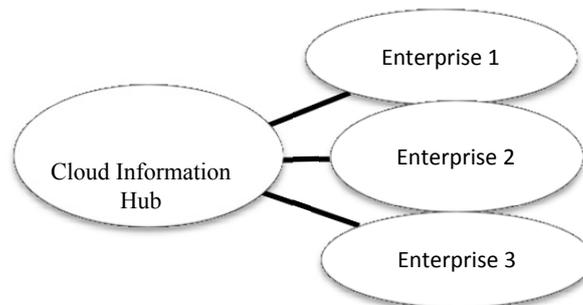

Figure 1 Enterprise Cloud Collaboration Hub

By sharing the current market situation and different factors information companies and different parts of one single enterprise can easily understand the current situation of a market. This framework can also share the correlation between the important factors which surely influence the market situation. Each enterprise that are agreed to share data they can collaborate by mutual agreement the exchange information in a common hub, shown in Figure 1.

2.2 Methodology

In our proposed system, shown in Figure 2 different enterprises jointly share the current organizational and market information in cloud using mutual collaboration. Here Hadoop distributed file system. There are mainly map & reduce module handle all the data in parallel way.

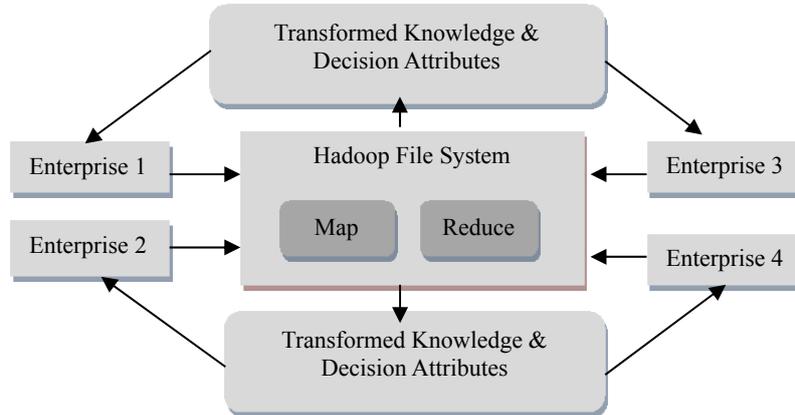

Figure 2 Knowledge Cloud Collaboration Hub

Map function organize the raw data in such a fashion that it can fit in the context, it's also generate the sorted raw data using specific rules. Reduce function is worked for generate the knowledge from the data. All conversion technique and knowledge generation rules are implemented in reduce function. Apache Hadoop is an open source software framework created by Doug cutting and Michael J. Cafarella .The Hadoop Distributed File System has been widely adopted to build cloud storage systems (Aye Chan Ko ,Wint Thida Zaw,2014), shown in Figure 3. It provides reliable storage and high throughput access to large-scale data by Map/Reduce parallel applications, shown in Figure 4.

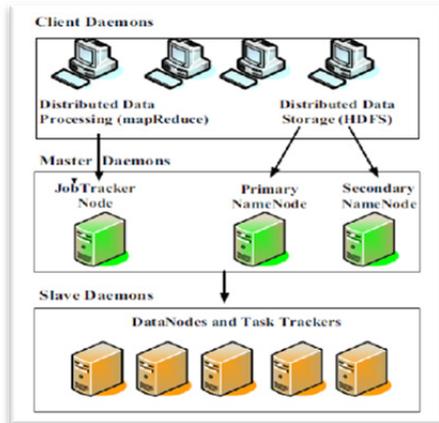

Figure 3 Apache Hadoop Master Slave Operation Structure.

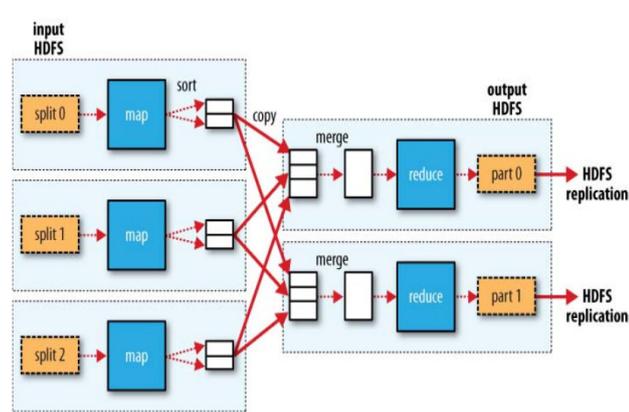

Figure 4 Hadoop Distributed File System Knowledge Collaboration & Generation Framework

2.3 Knowledge generation rule

The collaborated information is shared as a matrix or other format to hub, hub is generally the hadoop file system where map reduce organize the raw data and create knowledge. Raw data is submitted as a decision table format.

A decision table is defined as $S = (U, C, D, f)$ Where U is the domain. $A = C \cup D$ is the attribute set, among which C is the condition attribute set and D is the decision attribute set, at the same time, $C \cap D = \emptyset$.

$V = \alpha \in UV$ α is the set of attribute values. $f: U \times (C \cup D) \rightarrow V$ is a function, which gives attribute a value (Z. Pawlak, 1982).

From the decision table by the help of discernibility relation and function of calculating the significance we can calculate the correlation among the different factors and significance of attributes. The significance function, relations describe below in equation 1, 2, 3 (Z. Pawlak, 1991, 1998).

For decision table $S = U, C, D, f$, attribute subset $P \subseteq (C \cup D)$ determines a relation in the following way:

$$IND(P) = \{(x, y) \in U \times U \mid \forall a \in P, f(x, a) = f(y, a)\} \tag{1}$$

The significance of attribute $a, a \in C$, is defined by

$$Sig(a) = \frac{|POS\{a\}(Q)|}{|U|} \tag{2}$$

Where $Q \subseteq D, U$ is the domain.

The dependency of attributes $P, P \subseteq C$, is defined by

$$\gamma(P, Q) = \frac{|POS\{P\}(Q)|}{|U|} \tag{3}$$

Where $Q \subseteq D, U$ is the domain.

3 Hypothetical Example

In this part we will describe the hypothetical explanation of our framework.

The reduction can serve in each enterprise processor framework then they will send the reduction result to information hub to share and combined with other enterprise's reduction result. Eventually this process can be done both ways in local processor HDFS or cloud HDFS. It depends on the agreement among the enterprise what they want to share data or the reduction result/Knowledge with knowledge rule set.

Each enterprise share raw data, shown in table 1 in HDFS hub, where 'u' is the entity and 'a' is the attributes. Attributes represents different factors of an enterprise.

From table 1 the raw data converted into indiscernibility matrix using equation 1 shown in Table 2.

Table 1 Information System

U	a1	a2	a3	a4
x1	2	2	0	1
x2	1	2	0	0
x3	1	0	1	1
x4	1	2	1	1
x5	1	0	1	1

Table 2 Indiscernibility Matrix

	x1	x2	x3	x4	x5
x1		a1a4	a1a2a3	a1a3	a1a2a3
x2	a1a4		a2a3a4	a3a4	a2a3a4
x3	a1a2a3	a2a3a4		a2	
x4	a1a3	a3a4	a2		a2
x5	a1a2a3	a2a3a4		a2	

From the discernibility matrix at first we combine all the attributes as a pair of multiple attributes, and then using the function of significance (F_s) we can calculate the significance of the attributes. Basically this part worked in the HDFS file system.

Inside the reduce function all knowledge generation process are done using rough set theory. The example is shown below.

Equation Solving

$$F_s(a1, a2, a3, a4) = a2(a1 a3)(a1 a4)(a3 a4)(a1 a2 a3)(a1 a2 a5)(a2 a3 a4) = (a1 a2 a3)(a1 a2 a4)(a2 a3 a4)$$

Significance Measuring

$$A1 = 1/2 + 1/3 + 1/2 + 1/3 + 1/2 + 1/3$$

$$A2 = 1/3 + 1/3 + 1/3 + 1/3 + 1/3 + 1/3 + 1 + 1 + 1/3 + 1/3 + 1$$

$$A3=1/3+1/2+1/3+1/2+1/3+1/3+1/3+1/2+1/2+1/3+1/3+1/3$$

$$A4=1/2+1/2+1/3+1/2+1/3+1/3+1/2+1/4$$

After that we solve the equation and get the pairs of multiple attributes and the correlation among the attributes. If we go through by different reduction phase, we can find

1) Reduction 1

$$F_s(a_1, a_2, a_3, a_4)$$

$$= (a_1 a_2 a_3) (a_1 a_2 a_4) (a_2 a_3 a_4)$$

2) Reduction 2

$$F_s(a_1, a_2, a_3, a_4)$$

$$= (a_1 a_2 a_4) (a_2 a_3 a_4)$$

3) Reduction 3

$$F_s(a_1, a_2, a_3, a_4)$$

$$= (a_1 a_2 a_3) (a_1 a_2 a_4)$$

After going through different reduction phase for knowledge generation by rough set theory, we can see a_2 has most significant occurrence so a_2 is the core attribute and (a_1, a_2, a_4) has strong correlation between them.

4 Conclusions

With the arriving of the knowledge economy era, the growth of modern economic increasingly depends on the increase of knowledge content, in modern society, the creation value of knowledge has been much higher than human, physical, financial and he wants to survive and the core competence firstly depends on knowledge rather than the products (Jiang Cuiqing, et al,2007). So if different enterprise or companies can jointly collaborate and share information it's much easier to get better solution and understanding of the specific situation.

The performance of enterprise knowledge collaboration management is directly related to the efficiency of collaboration process. Knowledge collaboration by sharing the information also required fast transformation of the big data into structure knowledge. The cloud big data can easily handle by Hadoop distributed file system; also can process the raw data into important knowledge for understanding and decision making.

Abstracts: The quality of air traffic management is of essential in aviation safety and operational efficiency. The paper proposes the evaluation index system of civil air traffic management service satisfaction, which includes five factors of command and control service, Communication, navigation, and surveillance service, aeronautical meteorology service, and aeronautical information service. The paper takes an ATM bureau from North China as an example. The analysis results suggest that the service quality of civil air traffic management still needs to be improved. ATM managers can utilize the evaluation model to estimate the current situation of the air traffic management. The evaluation model can also to be guidance for managers to develop the operational mechanism.

Key words: Air traffic control systems; Service satisfaction; Evaluation index system

1 Introduction

The quality of air traffic management is of essential in civil aviation safety and operational efficiency (Zhou, 2014; Gawade, 2015). Air traffic control services require communication between pilots and air traffic controllers at every stage of flight (Cavcar & Cinar, 2011, Wu et. al., 2002). Some researchers utilize the quantitative method to examine and compare the quality of air traffic control services. Essner (Essner, 2007) uses the SERVQUAL model to analysis the service quality of air traffic control. Campello et. al. (Campello et. al., 2010) proposes that the development of ATM service quality leads to the satisfaction lift. However, the literatures about the air traffic management service are seldom, and the evaluation methods are simple.

Therefore, the paper aims to develop the evaluation index system of air traffic management service satisfaction. It develops the evaluation model to estimate the service quality of air traffic management. A case of an ATM bureau from North China is carried out to test the efficiency of the proposed model.

2 ATC Service Satisfaction Evaluation Index System

1) Evaluation model and evaluation method

The main services of ATC contain command and control service, command and control service, Communication, navigation, and surveillance service, aeronautical meteorology service, and aeronautical information service (Pasquini & Pozzi, 2005; Chakrabarti, et.al, 2009; Zellweger & Donohue, 2015). There are 31 indices in the evaluation index system. The evaluation indices are as follow in Table 1.

Table 1 ATC Service Satisfaction Evaluation Indices Framework

Level I	Level II	Level III
ATC service satisfaction	Command and control service (CC)	Service awareness; service attitude; command rationality; command initiative; radio standard language; command capacity; ability to assist with special circumstances; ATIS service; DCL; ATC clearance; ground control; tower control; approach control; area control; route flight routes; approach and departure flight; familiar with aircraft performance; telegram received; service agent.
	Communication, navigation, and surveillance service (CNS)	VHF communication quality; ILS signal quality; ATIS signal quality; DCL transmission quality; VOR navigation quality.
	Aeronautical meteorology service (AM)	Timely and accurate of Meteorological data; accuracy of airport alert.
	Aeronautical information service (AI)	Data validity; NOTAM distribution; explanation of intelligence information.

The evaluation criteria are divided into three levels, “satisfaction”, “ordinary” and “dissatisfied”. The evaluation formula is as follow.

Let:

$$\begin{aligned} x_1 &= \text{the score of choosing "dissatisfied"} = 1 \\ x_2 &= \text{the score of choosing "ordinary"} = 2 \\ x_3 &= \text{the score of choosing "satisfaction"} = 3 \end{aligned}$$

Then set the formula (1):

$$f(y) = \text{satisfaction degree} = \frac{x_3 \times n_3}{\sum_{i=1}^3 x_i \times n_i}, i = \{1,2,3\} \tag{1}$$

2) Questionnaires subjects and objects

The object of the survey is an ATM bureau from North China (N ATM bureau). The survey questionnaires were distributed to the pilots from the two airlines in China. One airline is a state-owned enterprise; the other airline is a private enterprise. They are both located in Beijing. Each airline gets 100 questionnaires to be asked. The questionnaires were withdrawn, with 164 as valid data.

3 Overall Service Satisfaction Analysis Results

The overall service satisfaction refers to the five factors of the evaluation model. The indices results are from the three airlines shown in the Figure 1. as shows.

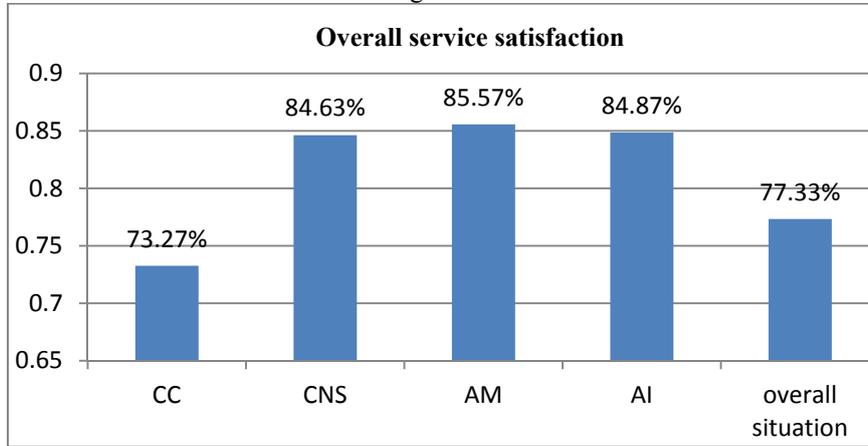

Figure 1 Overall Service Satisfaction

It shows from the Figure 1. that the score of CC factor “73.27%” is the lowest among the four factors. Aeronautical meteorology service gets the highest score “85.57%”. The gap between those two factors is 12.3%, which means the dissatisfaction of command and control service is very obvious comparing with other factors.

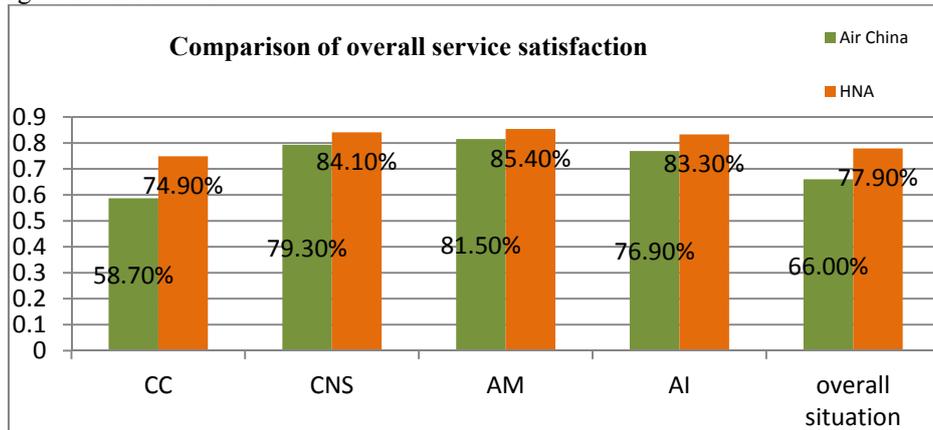

Figure 2 Comparison of Overall Service Satisfaction Between Two Enterprises

The data shows that the service satisfaction level of HNA is better than Air China from Figure 2. The lowest score in the Figure 2. is 58.7% of CC factors, which just more than one half.

4 Evaluation Indices Analysis Results

1) Index ranking result of the ATC service satisfaction

The two airlines give the index ranking of the 31 evaluation indices. The result is shown in Table 2. as follows.

Table 2 The Index Ranking of ATC Service Satisfaction in N ATM Bureau

Airline	The top ten indices	Last ten indices
Air China	<ol style="list-style-type: none"> 1. VOR navigation quality 2. ATIS signal quality 3. Timely and accurate of meteorological data 4. ATIS service 5. Accuracy of airport alert 6. Data validity of aeronautical information 7. NOTAM distribution 8. VHF communication quality 9. DCL transmission quality 10. ILS signal quality 	<ol style="list-style-type: none"> 1. Familiar with aircraft performance 2. Command rationality 3. Service awareness 4. Command capacity 5. Command initiative 6. Ground control 7. approach and departure flight 8. ATC clearance 9. Service awareness 10. Approach control
HNA	<ol style="list-style-type: none"> 1. ATIS signal quality 2. Timely and accurate of meteorological data 3. ATIS service 4. DCL 5. DCL transmission quality 6. NOTAM distribution 7. VOR navigation quality 8. Telegram received 9. Accuracy of airport alert 10. VHF communication quality 	<ol style="list-style-type: none"> 1. Command rationality 2. Familiar with aircraft performance 3. Command capacity 4. Service agent 5. command initiative 6. Service awareness 7. Approach control 8. ILS signal quality 9. route flight routes 10. service attitude

The bold indices in the Table 2 show the common between the two airlines. During the top ten indices, “Timely and accurate of meteorological data” and “ATIS signal quality” have the highest scores, which from CNS and AM. During the last ten indices, “Familiar with aircraft performance” and “Command rationality” have the lowest scores, which from CC.

2) Service satisfaction of command and control

Service satisfaction of command and control reflects the relationship between air traffic controller and pilots. Figure 3. shows the top three indices and the last three indices. It is shown that ATIS service is the best service item among those 19 indices. The air traffic controllers do not familiar with the aircraft performance, which is the biggest obstacle factor impact the ATC service.

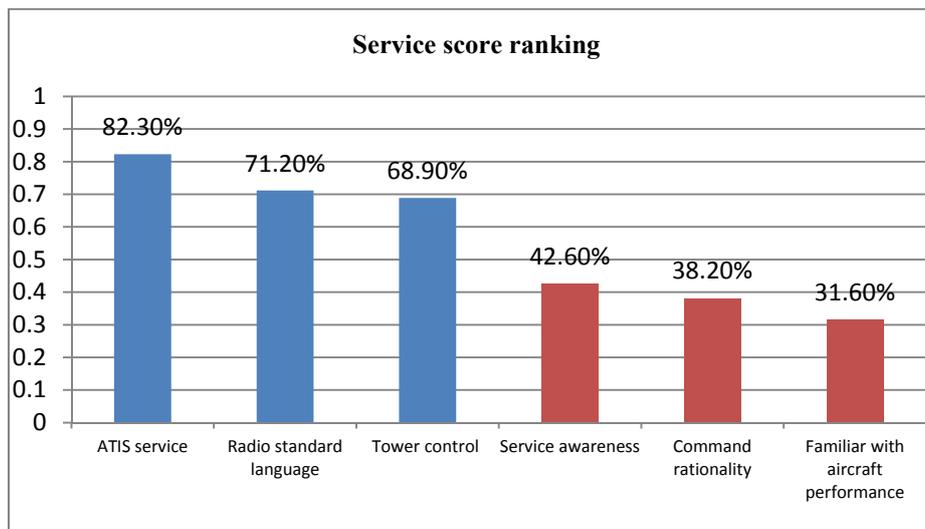

Figure 3 Score Ranking of Service Satisfaction

Area control, approach control and tower control are the three core business of ATC service. Among those three core businesses, the statistical data in Figure 4 show that there is no significant difference among the three service.

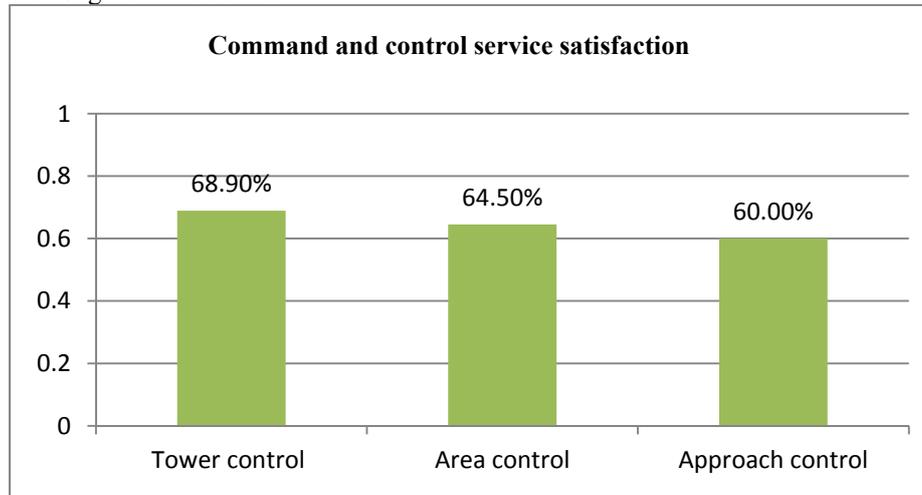

Figure 4 Score Ranking of Command and Control Service Satisfaction

5 Discussions

The paper proposes the evaluation index system of civil air traffic management service satisfaction, which makes the analysis of air traffic management service quality in China. The evaluation index system establishes 31 indices from five factors. The paper takes an ATM bureau from North China as an example and did the empirical research. The analysis results obtain valuable views.

1) The overall service satisfaction need to be improved

The evaluation result of overall service satisfaction is 77.33%. The lowest data among the five factors is command and control service with 73.27%, which pulls down the overall service quality. The data shows that the ATC management service still need to be improved, especially the service quality of air traffic controllers. The main reason why the index of command and control service obtain score can be concluded as the unfamiliar with aircraft performance. Therefore, air traffic controllers and pilots should enhance the business understanding to each other in order to improve the ATC service.

2) Difference customers have difference experience

The survey results are from two difference airlines, one is a state-owned enterprise, the other is a private enterprise. It is can be shown in Figure 2 that the scores of service satisfaction evaluated by pilots from the Air China are all lower than HNA. The reason to this conclusion needs to be explored in depth.

6 Conclusion

The paper focuses on the evaluation index system of civil air traffic management service satisfaction. ATM managers can utilize the evaluation model to estimate the current situation of the air traffic management. The evaluation model can also to be guidance for managers to develop the operational mechanism.

Impact of Firm-Bank Relationship on Dividend Policy of the Client Firm: A Study from Pakistan

Fahad Javed, Jahanzaib Sultan, Chen Xiaofeng

School of Management, Wuhan University of Technology, Wuhan, P.R.China, 430070

(E-mail: mfahadjaved@gmail.com, jzsultan@hotmail.com, cxf2010611@163.com)

Abstract: Firms are always very curious about their dividend policy as it shows the strength of the firm's financial health and attracts or distract the investors. Many determinants in this regards are studied in the past. This research is aimed to find the link between the firm dividend policy and its banking relationships which is quite significant as this is a less addressed issue in these terms. This paper attempts to explain the firm-bank relationship and its impact on the dividend payout of the client firm. For the said cause the data of listed companies in Karachi Stock Exchange were collected from 2008 to 2013. For the bank-firm relationships, two proxies were used. A dummy variable was used for bank relations (1 if number of bank relations is more than 5 otherwise 0) and the second variable is actual number of relations a firm is maintaining with banks. We have regressed these variables among some of largely used determinants of dividend payout as control variables and found that, though the coefficients are low but both proxies taken for bank-firm relationship are significant at 5%. It concludes that the policy makers and investors may also consider this relationship for their decision making as a significant factor and also draw attention for future researches in this horizon.

Key words: Bank relationship; Multiple bank relationship; Dividend payout; Pakistan

1 Introduction

Every business commences to maximize the shareholder's wealth and the decision to pay or not to pay dividend is one of the important decision to be made by the management of the organization (Tahir, S.H., et al.,2016). The development of agency theory and the associated agency problem caused by the difference of opinion between the management and shareholders has given rise to the need for a set of rules, regulations and standards that work to protect the interests of shareholders. (Lintner, J.,1956) had come up with the findings that firms only increase dividends when management believes that earnings have permanently increased, meaning that a dividend increase implies a rightward shift in (management's perceived) distribution of earnings. Fama and Blacomin (1968) had further explored the said issue. Since last few decades, a chain of empirical and theoretical studies have been done which involve three important but divergent conclusions and assertions. First, when there is increase in dividend payout, it positively affects the market value of the firm. Second, decrease in dividend affects the firm's value. And third, the firm value does affect by dividend policy of the firm. Dividend payout policy is an important corporate issue and may be closely related to, and interacts with, most of the financial and investment decisions firms make (Elmi, M.A. and W.M.,2016). Miller and Modigliani (1961) introduced the residual theory of dividends based on the firm's sources and use of funds. Based on this theory, we would expect the following outcomes: firms with higher profits should pay higher dividends; firms with higher investment rates should pay lower (or zero) dividends; firms with higher future growth opportunities should build up cash for future investments and consequently make lower dividend payments; and firms facing higher debt constraints will have less financial flexibility and thus pay lower dividends (Aivazian,Booth,Cleary,2006).

Some researchers tried to explore dividend phenomenon with respect to loans & debts and come up with an argument that the firms with public debt are more likely to pay dividend as compared to the firms financed through banks or private debt (Aivazian,Booth,Cleary,2006). However, there were some limitation of the above mentioned studies as both haven't considered the relationship lending and firm-bank relationship. These few researches raise some questions about the developing markets like Pakistan as there are relatively less transparent information and weak creditor rights. In the same manner, the research should further be conducted by considering the relationship lending and firm-bank relationship as this may affect the dividend payout policy of the firm. Moreover, the consideration of the firm-bank relationship is even more important for such capital markets where the availability of public debt is out of question. This argument further intensifies the significance of our study as the main source of financing in Pakistan is banking and this become even important to study dividend payout policy with reference to firm-bank relationships.

There are numerous theories on why and when the firms pay dividends (Ahmed,Javid,2008) and it

is evident from past literature about the topic that there is vast range of the determinants for dividend policy and dividend payout. Especially in bank-based systems, the analysis of the factors shaping the relationships of banks with non-financial firms assumes a crucial importance and is receiving increasing attention among scholars, policy-makers and practitioners (Aristei, Gallo, 2016)

This is widely accepted fact that the dividend payout is dependent on the firm's performance and firm profitability. Arguing so, one can extract a relation (direct or indirect) between dividend and firm-bank relationship as the structure and strength of firm-bank relationships significantly affect the external financing conditions and performance of firms (Bharath, S., et al., 2007). Accepting the importance of firm-bank relationship, a lot of researchers have opted this topic as their area of interest in order to explain its effect on firm performance and profitability (Berger, Goulding, Rice, 2014). A firm may seek some benefits by developing good banking relations which can be categorized as follows:

- To Enrich business standing and lessen leakage of information to rivals (B.J. Sopranzetti, et al., 2012).
- Shrinkage the damaging impact of distorted information (Thanh, V.H. and N.M. Ha, 2013)
- Remedy against hold up problem (Rosenfeld, C.M., 2014)
- To moderate agency clashes linked to financial intermediation (Cenni, S., et al., 2015)
- To increase accessibility to loans and to reduce the interest cost (Chen, Z., Y. Li, and J. Zhang, 2015)
- To provide monitoring for firms (Campbell, T.S., 1979)

Above mentioned benefits will enhance the firm's standing and repute consequently improving the firm performance and profitability. This increase in performance may also cause a positive shift in dividend payout (expected). The researchers argued different types of effects on the firm's profitability and performance, so is expected about the dividend payout.

2 Methods and Data Analysis

This research is aimed to find out the impact on dividend payout of a firm by its relationship with different banks. For this purpose, we have taken the data of non-financial listed companies in Karachi Stock Exchange of Pakistan. The facts and figures are taken from the published annual reports of the listed firms. The data is ranged from 2008 to 2013.

In order to build our model we have referred to the methodology of (Bolton, P. and X. Freixas, 2000) to investigate the factors of dividend payment. We extend this model to investigate impact of firm's number of bank relationships on dividend payout. For the said cause we have used other determinants of the dividend payout (Size, ROA, Leverage, Market to Book, Liquidity, Liquidity², and growth-rate) as control variables for our study.

1) Size: Previous studies shows large companies pay more dividend as cited by some researchers that the large and mature firms are more likely to pay more dividend than those of growing ones (Bolton, P. and D.S. Scharfstein, 1996).

2) ROA – Return on Assets: Companies having higher profit pay more dividend however, some companies may not just to finance the future investments. These companies maintain a regular stream of dividends to remunerate the shareholders (Deloof, M. and V. Vermoesen, 2010).

3) Leverage: Higher debt level companies anticipates higher future cash flows.

4) Market to Book: Markets are expected to identify companies that offer better present and future cash flows to shareholders.

5) Liquidity: Companies with greater liquidity even increase dividend payout levels. As it depicts the financial health of the company so the better financial health is a guarantee of high payout rate (Houston, J. and C. James, 1996).

6) Liquidity²: however a negative sign is expected as the companies may reach this through dividend restriction or a threshold to restrict dividend payments (Houston, J. and C. James, 1996).

7) Growth-rate: literature shows that the firms with high growth rates are subject to reduce their dividend payout in order to finance their investments (Bolton, P. and X. Freixas, 2000). Investment or growth rate of firm fixed assets is taken as the measurement. Several investments required to retain profits to finance investments.

From the past literature and considering the important variables for our study, we have come up with the following mathematical form of our model to be regressed:

$$div/tasset = \alpha + NBR + MBR + Size + ROA + Lev + MV/BV + Liq + Liq2 + Growth + \varepsilon$$

TABLE 1 Regression Analysis

Variable	Expected Sign	Coefficient	P>t
NBR	-	0.000616	0.03
MBR	-	-0.000738	0.01
SIZE	+	-0.000920	0.424
AGE	+	-0.000925	0.10
LEVERAGE	-	-0.00243	0.0018
LIQUIDITY	+	-0.000228	0.0000
LIQUIDITY^2	+	-0.000727	0.0000
MARKET TO BOOK VALUE	+	-0.000638	0.0000
ROA	+	-0.000016	0.0000
GROWTH	-	-0.0000121	0.53

The regression was run with the panel least squares method and found that R-square is 32.2% with a probability of 0.00 for F-statistics which represents the fitness of our model. The main purpose of the paper was to establish a relationship among bank-firm relationship and the dividend payout. The above table represents the results for the regression and posits that the variables used for the cause are low in coefficient but significant at 5%. The signs for NBR and MBR are found same as expected. Liquidity, market to book value, ROA and leverage are also found significant. While the size and age of the firm, which were expected to impact dividend payout positively, are not significant for our research.

3 Conclusions

The research is conducted in the context of Pakistan and for the purpose listed firms are taken as population. The results show that the firms with more number of banking relationships appears to pay more dividend than those which are having less bank relationships which can be a result of close monitoring by fewer banks. These finding are consistent with the literature which found that the a close or single banking relationship affects the firm performance badly by extracting more rent on the invested capital and financing (Bhaumik, S.K. and J. Piesse,2008). This also implies that the management should reconsider to establish a fewer bank relationship. The decision board should avoid to maintain monopolistic relationship with banks in order to safeguard the interest of the shareholders. Some of our findings are quite different as compared to the previous literature that may be an effect of negative returns for the study period (as most firms reported losses). Future studies can be conducted in this regard by extending the time period of the study and involving some other variables for bank-firm relationship. Moreover, the future researches may also attempt to find out the behavior of such relationships before and after global financial crises.

Dark Side of Leadership Impact on Project Failure: Towards a Model

Hussein Ghaleb Abdo Saleh, Wang Hu

School of Management, Wuhan University of Technology, Wuhan, P.R.China, 430070

(E-mail: h.g2000@hotmail.com, wanghu61@126.com)

Abstract: This paper examines dark personality traits of leaders in the context of entrepreneurs and proposes a conceptual framework for a future study. Based on the personality characteristics identified using Hogan Development survey, the influence of personality traits is hypothesized on employee well-being and consecutively on project failure. The study suggests a negative relationship between personality traits of leaders and psychological well-being of employees and work-family conflict. Furthermore, according to the developed concept a negative impact of work-life conflict and psychological well-being of employees under the supervision of entrepreneurs with negative personality, on business and project failure exists. Most of the studies in this area focused on identifying the positive sides of leaders, limiting the discussion on negative sides of leaders. The originality of this paper can be described in the context of research on entrepreneurs, whose negative traits are linked towards business and project failure. This paper contributes to the leadership literature by identifying the critical importance of negative sides of personality traits and presenting the link towards project failure.

Key words: Dark side of leadership; Negative traits of leaders; Entrepreneurs' personality; Employee wellbeing; Project failure

1 Introduction

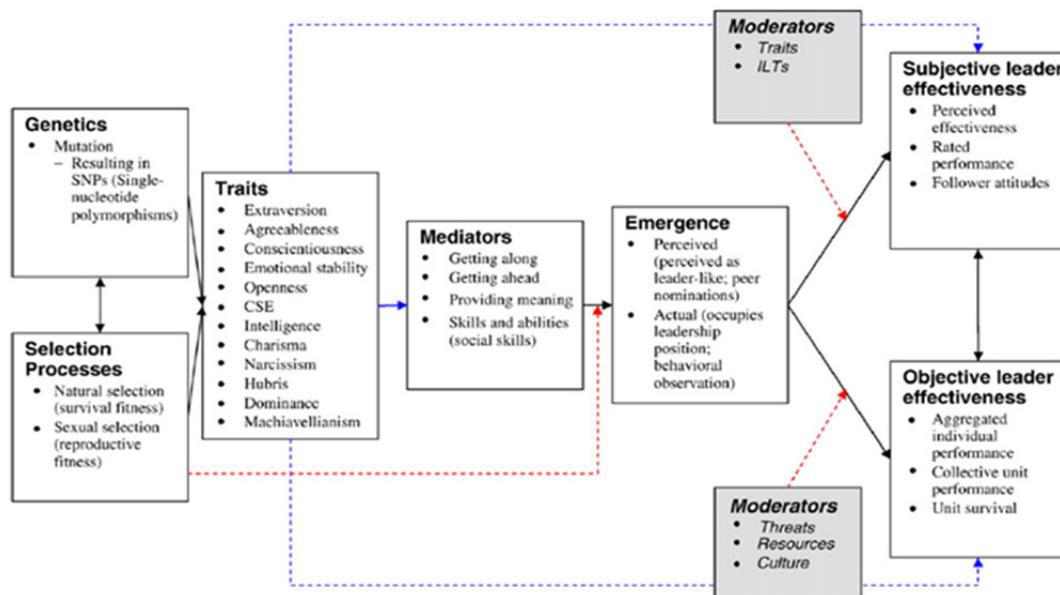

When it comes to related work in corporations' people are divided into the manager functions, executors, office staff, followers, etc. A most scarce and cherished role in such context may be the one of an entrepreneur - a business creator and innovator. Modern entrepreneur is described as an ingenious leader changing the society with own innovative ideas. Steve Jobs, Jeff Bezos, Mark Zuckerberg, Jack Ma are only a few examples of successful entrepreneurs who have translated their vision and values into their project through effective leadership. Leadership is a component that may be naturally inherent in an entrepreneur. Who is better qualified to lead a company than its creator, putting their "blood sweat and tears" into a project? Nevertheless, the questions still stand: Are entrepreneurs, in fact, good leaders? The entrepreneur exhibits dispositional optimism, indicating that entrepreneurs score particularly high on measures of this personal characteristic (e.g., Abdelsamad & Kindling, 1978; Fraser & Greene, 2006; Lowe & Ziedonis, 2006). For example, Cooper, Woo, and Dunkelberg (1988) found that entrepreneurs express high levels of optimism, regardless how prepared they are to lead their firms. Driven and narcissistic is described as a personality that drives a particular type of leadership impacting the work environment and psychological health of the workers. In this regard, it can be mentioned that although entrepreneurship skills can be acquired in academic environment, most of the skills are practiced and developed in real life business/project cases (Sejjaka, S. *et al*, 2015). In this study, a link between entrepreneurship and leadership will be explored. The research will present the leadership characteristics entrepreneurs possess, and whether these features are inherent in entrepreneurs, stemming from their nature and personality, or they are cultivated and grown by individual experiences. The focus of the study is entrepreneur's failure, as a result of their leadership skills, which may or may not be inherent in their nature.

2 Literature Review and Proposed Conceptual Framework

Most of the studies conducted in the area of leadership utilized one-sided approach by focusing only on the positive sides of leadership and not paying enough attention to negative sides of leadership (Hogan and Kaiser, 2015). The downside of leadership known as destructive leadership was mainly tailored to the aggressive character (Ganster & Kepes, 2007). Moreover, psychopathic traits of leaders are also related to destructive nature of leaders (Hogan & Hogan, 2001). Hogan (2001) mentioned that when leaders feel selfish, emotional, aggressive and intensive, they are less likely to make right decisions which will negatively impact on daily operations of the business. The personality trait of leaders is one of the most widely discussed topics in management research. Although it has been debated for such long time, characteristics relative importance has considerably decreased in recent years. The number of conceptual frameworks proposed in this area lacks originality as well. The study conducted by Judge, Picollo, Kosalka (2009) the notion of leader's trait perspective based on

evolutionary psychology and behavioral genetics. The model takes into account source of leader traits, mediators and moderators of their influence on the effectiveness of leadership and differentiates the effectiveness of perceived and actual leadership. In other words, positive sides of leadership are considered as well as its negative aspects. In this regard, the paper considered the Big Five traits, core self-evaluations, intelligence and charisma. Additionally, “dark side” leader traits including narcissism, hubris, dominance and Machiavellianism are conceptualized.

According to the framework developed by Judge, Picollo, and Kosalka (2009) objective leader effectiveness constituting of perceived effectiveness, rated performance, and follower attitudes, and subjective leader effectiveness, encompassing aggregated individual performance, collective unit performance, and group survival, is directly impacted by emergence (perceived as leader like, peer nominations) and actual (occupies leadership position; behavioral position). The framework also suggests that genetics and selection process both are a cause of personality trait development. They also interact to generate certain personality traits. Certain features are more inherent in humans’ biology and genetics such as big five, whereas other are more socially conditioned. In other words, they are a product of SNPs ‘interaction with Natural Selection and Sexual Selection. In a meta-analysis performed by Schyns, Birgit, and Jan Schilling (2013) different conceptualizations of destructive leadership and relationship between destructive leadership and outcome variables are analyzed. These concepts include the leader related concept, job related concept, organizational related concept, and individual follower related concepts. Based on the preliminary critical review of existing studies a research model was constructed linking personal traits and certain workplace and organizational outcomes. The research proposes the relationship between dark side of leadership and factors explaining employee well-being

Source: Judge, Picollo, and Kosalka (2009)

Figure 1 The Leader Trait Emergence Effectiveness (LTEE) Model

(Notes. CSE= core self-evaluations. ILTs=implicit leadership theories. Blue lines represent direct effects of leader traits on mediators and subjective and objective outcomes. Red lines represent moderating influences).

Following propositions are derived from review of literature:

Proposition 1 - Certain negative sides of leadership traits identified within Hogan Development Survey are positively related to the psychological well-being of an employee, which will, in turn, lead to business failure.

Proposition 2 - Certain negative sides of leadership traits identified within Hogan Development Survey are positively related to work-family conflict,

Proposition 3 – As a result of negative sides of leaders, employee well-being is positively related to project failure

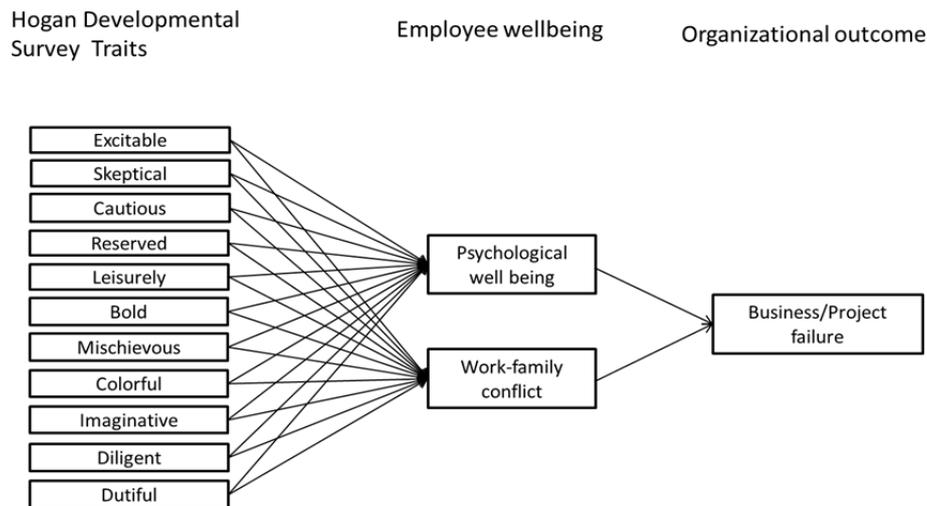

Figure 2 Research Model

3 Proposed Research Methodology for a Future Study

The research question is “Why projects fail and whether the entrepreneur’s dark side of leadership is the primary cause?” For the purpose of answering the research question an explanatory study is required. The study will shed more light on how the negative characteristics of entrepreneurs/leaders impact organizational climate and performance. Based on the analysis of the literature review, we found significant areas for research which should be studied in more detail. For example, no research has investigated the dark sides of entrepreneur’s traits and their consecutive influence on employee performance and direct relationship to company performance. Therefore, using Hogan Development survey in different studies, our study will assess the influence of the dark sides of leaders on psychological well-being and work-family conflict. Consecutive influence of entrepreneurship characteristics will be analyzed regarding their influence on company performance. The questionnaire will be administered online via Survey Monkey tool. www.surveymonkey.com. Questionnaire items are formulated based on a 7point Likert scale questions, with one denoting strongly disagree to 7 strongly agree. SPSS AMOS software will be used for data analysis. GHQ-12 (The General Health Questionnaire 12) consists of a 12-item measure used to identify the symptoms of non-psychotic psychiatric disorders (GHQ-12; Goldberg & Williams, 1991). Having been conducted among employees, the current questionnaire has provided excellent scores of reliability and validity. To test the influence of work on family life, five items related to the family-work conflict were adapted from previous literature on the similar topic. The design of HDS provides information about eleven behavioral traits that lead to success. The scales used in the model are explained regarding risk. Precisely, if a person receives a higher score in this category, it will increase the potential of problems on the work, which should be compensated later.

- Excitable - moody, easily annoyed, hard to please, and emotionally volatile
- Skeptical - distrustful, cynical, sensitive to criticism, and focused on the negative
- Cautious - unassertive, resistant to change, risk-averse, and slow to make decisions
- Reserved - aloof, indifferent to the feelings of others, and uncommunicative
- Leisurely - overtly cooperative, but privately irritable, stubborn, and uncooperative
- Bold - overly confident, arrogant, with inflated feelings of self-worth
- Mischievous - charming, risk-taking, limit-testing and excitement-seeking
- Colorful - dramatic, attention-seeking, interruptive, and poor listening skills
- Imaginative - creative, but thinking and acting in unusual or eccentric ways
- Diligent - meticulous, precise, hard to please, and tends to micromanage
- Dutiful - eager to please and reluctant to act independently or against popular opinion

4 Expected Results and Discussion

This study provides information about different personality traits of leaders according to Hogan Development Survey and identifies those factors which are used to describe the negative side of entrepreneurs. Based on the identified personality traits, their relative importance will be analyzed

regarding their impact on business/project failure. To lead the company as a business manager, the person should have certain abilities, which can be developed and learned. First of all, the manager should have knowledge and experience in the field in which the company operates. It is almost impossible to manage the business by being “blind” and without knowing the situation on the market, competitors, and demands of customers. Hence, the theoretical and practical basis can form the person as a good leader. In this respect, this study provides some insights what entrepreneur traits should pay attention in order to improve project performance. This study provides practical implications for business managers and executives. Some of the identified personality traits should be accurately controlled to prevent their negative impact on employee well-being. On the other hand, the extent of these characteristics and their relative importance will be identified within the study which gives an overall picture of personality traits to business managers. The findings of the planned future study will provide some useful insights to top executives to increase employee well-being and improve work atmosphere will directly influence on their business success. The future research can also include analyses of important demographic characteristics such as comparison of males and female manager’s dark personality (Arami, M, 2016).

5 Conclusions

Despite number of studies conducted in the field of leadership (Hogan and Hogan, 2001; Gangster and Kepes, 2015) and their significant importance in organization in terms of making strategic decisions, empowering employees and maximizing the efficiency of day to day operations, less attention has been paid to investigate the dark sides of leadership which is also critical point that may influence on the short and as well as long run operations of the company. Negative sides of leaders may influence on firm operations through employees who are critical success factor of the project. Therefore, to shed more light on the negative side of leadership, the current study proposes the framework to analyze the relationship between the negative side of personality traits and project failure.

Performance Analysis of Microfinance Institutions in TOGO

Abdel-Menaf Ibrahim, Ye Jianmu

School of Management, Wuhan University of Technology, Wuhan, P.R.China, 430070

(E-mail: blessed09@hotmail.fr, jianmuye@126.com)

Abstract: Performance analysis as a source of information on how good or bad an organization is operating, is quite important for microfinance institutions who want to achieve sustainability. Diverse methods have been used to measure and analyze performance of Microfinance institutions in previous works around the world. This paper focuses on analyzing the performance of a sample of Microfinance institutions in Togo by comparing their performance to that of other institutions in Africa. 12 MFIs were chosen for the study and the difference of means test was selected for the analysis which consisted in comparing 22 performance ratios to the Micro Banking Bulletin Africa performance Benchmark ratios of 2010. Available data was collected from the MIXMARKET website based on these institutions reports from 2007 to 2010. Our study found that, compared to their African peers, Togolese MFIs are better performers in terms of expenses, efficiency and revenues; not doing well when it comes to productivity; and are quite bad performers at managing risks.

Key words: Microfinance; Togo; Performance analysis; Benchmark

1 Introduction

Poverty, defined as - “a general scarcity, dearth, or the state of one who lacks a certain amount of material possessions or money”¹ - was once behind the “poor’s” non-access to formal financial services. In an attempt to fight poverty, help the poor and remedy to this exclusion from having access to financial service, emerged the concepts of Microcredit and Microfinance. These two concepts are interchangeably used but are in fact quite different as microcredit (which includes credit activities only) is a service provided in microfinance (which also includes savings, money transactions, insurance and other banking opportunities). Microfinance can then be simply defined as offering poor people access to basic financial services (CGAP, 2001).

The microfinance industry has grown rapidly during the last decade in breadth, depth, and scope of outreach and has, as matter of fact, recently attracted much attention. From their growth through their mission drift and performance, to their profitability and sustainability; many aspects have been subject to research and studies regardless of the poverty of available data on the industry. As far as the performance aspect is concerned, The Micro Banking Bulletin (MBB) and MicroRate in conjunction with other organizations such as the CGAP, provide some benchmarking reports and tables on regional and global performance ratios. These benchmarks are a means of comparing the performance of Microfinance institutions among themselves or to others based on diverse grouping aspects.

An ideal way of helping the poor have access to financial services will be helping them have access to it permanently and in a long term. This refers to microfinance sustainability. For a microfinance institution; performance is meeting goals and sustainability is meeting goals now and in the long term (Shreiner, 1997a). Thus to effectively serve and help the poor in the long term, microfinance institutions should obviously assess and manage their performance which evidently involves measuring and analyzing it.

Measuring performance sparks better performance and casts light on bad performance (Von Pischke, 1996). The purpose of this study is to assess thus measure and analyze the performance of a sample of microfinance institutions in Togo. Numbers of similar researches have been conducted on countries in Africa and across the world but no such available previous study in our knowledge has been conducted on this industry in Togo. In fact, very few researches have been done on the Togolese microfinance industry. We assume this study has a practical significance in casting a light on the performance of the industry in Togo and helping these institutions become more sustainable in the future.

2 Conceptual Framework

As the concept of microfinance went global, a high variety of definitions have soared to illustrate it.

¹ <http://www.merriam-webster.com/dictionary/poverty>

(CGAP)¹, defined Microfinance as offering poor people access to basic financial services. A broader and much detailed definition of microfinance was provided by (Robinson, 2001) who said that Microfinance refers to small-scale financial services—primarily credit and savings—provided to people who farm or fish or herd; who operate small enterprises or microenterprises where goods are produced, recycled, repaired, or sold; who provide services; who work for wages or commissions; who gain income from renting out small amounts of land, vehicles, draft animals, or machinery and tools; and to other individuals and groups at the local levels of developing countries, both rural and urban.

In fact, regardless of the variety of definitions and of how these definitions of Microfinance are tailored, all of them imply the same ideas of poverty alleviation and helping the poor get access to financial services.

Performance in Microfinance, as defined by (Shreiner, 1997b), is progress toward the mission of making the lives of poor people better. Good analysis uses theory with knowledge of past and present performance to suggest how to improve future performance (IADB, 1994).

In fact, performance in Microfinance has two main aspects a social aspect and a financial aspect. It's important to note that microfinance can't somehow reach their social objective and achieve sustainability without having a good financial performance and outreach. Based on this, numbers of previous researches have been conducted all focusing on the outreach and financial performance of Microfinance institutions using various methodologies. (Abbas Kheder et al., 2013) reviewed number of these existing performance measurement frameworks and assessment criteria before proposing a new performance measurement system to MFIs for assessing performance from the stakeholder perspective. (Lafourcade et al, 2005) conducted a study on the outreach and performance of Microfinance in Africa measuring the performance of the institutions using the scale depth and outreach indicators. Another study conducted by (Cull et al., 2007) shows a deeper analysis and evaluation of performance of Microfinance institutions using much more parameters. (Ledgerwood, 1999), mentioned some parameters for measuring the performance of Microfinance institutions namely: portfolio quality indicators, productivity and efficiency ratios, profitability indicators, leverage and capital adequacy ratios, Scale and depth of outreach indicators and financial viability indicators.

Another means of assessing the performance of microfinance institutions is through comparison with benchmarks. Ratios are generally more meaningful when compared with other financial profitable MFIs in the region particularly in microfinance. (Tucker Micheal, 2001) measured the financial performance of 17 Latin American microfinance institutions by comparing their financial ratios to benchmark performance ratios for the industry and with Latin American banks. Based on his findings he concluded that Comparisons with benchmarks can inform managers and donors on to how good or bad a microfinance institution is performing. (Letenah Ejigu, 2009) conducted a similar study by analyzing the performance of a sample of microfinance institutions in Ethiopia by comparing many indicators such as capital structure, asset allocation, breadth of outreach, depth of outreach, profitability and sustainability, revenue performance, expense management, efficiency, productivity and portfolio quality to the Micro banking Bulletin's microfinance institutions' global performance benchmarking of 2007. He mentioned that the performances of the microfinance institutions don't change with the selection of the benchmark.

3 Data Collection and Methodology

There is a dearth of data on microfinance institutions and this makes research in this field quite challenging. The September 2000 Micro Banking Bulletin (Calmeadow, 2000) had data from only 114 institutions out of several thousand for his study. Not all MFIs may want to publicly reveal their financial data, particularly those that are less efficient or perhaps less capable of complying with reporting standards. Data used for this research is purely secondary data and is collected from the Mix market website (www.mixmarket.org). The Mix market is a data hub where microfinance institutions and supporting organizations share institutional data to broaden transparency and market insight. MIX Market has a deep historical dataset, tracking industry development since the 1990s and it is the most reliable platform where we can collect data on microfinance institutions from all around the world.

The challenge we faced was in choosing the test which best fits for analyzing our data. (Letenah Ejigu, 2009) while comparing the performance of a sample of microfinance institutions in Ethiopia to the global benchmark used a one sample t test. After conducting the data normality test as a pre-requisite

¹ <http://www.cgap.org/p/site/c/template.rc/1.26.1302/>

for the t test, he found that normality assumption was not met and even after Ln transformations for some variables were not normally distributed thus they had to be ignored in the analysis.

As an alternative to a one sample t test, (Arwal and Sinha, 2010) and (Cletus Ambe Shu & Bilge Oney, 2014) used another method to measure the performance of microfinance institutions. Arwal and Sinha measured the performance of a sample of 22 institutions in India based on the data of the year 2008. Cletus Ambe Shu & Bilge Oney measured the performance of six institutions in Cameroon based on the available data from 2007 to 2009. This method consisted in using descriptive statistics procedure to assess the performance considering six financial performance parameters selected from the reporting format of the Mix Market Namely Financial Structure, Revenue, Expenses, Efficiency, Productivity and Risk. Even though this procedure is not as focused on hypothesis testing as a t test, it provides a lot of useful information to conduct a difference of means test. They both used a difference of means test to compare each ratio to a benchmark using a 95% confidence interval. We shall use the same methodology and apply it to analyze the performance of a sample of 12 MFIs in TOGO (CECA, FAMER MICROFINANCE, FECECAV, FUCEC Togo, MGPC DEKAWOWO, MICROFUND, Mutuelle Akwaba, TIMPAC, UCECTO, UCMECF-TO, UMECTO, WAGES) based on their available data during the time period from 2007 to 2010.

4 Data Analysis and Findings

To analyze our data, we are going to conduct the difference of means test using $\alpha=0.05$ and compare the ratios means to the Micro Banking Bulletin's Microfinance institutions Africa performance benchmarking of 2010.

4.1 Financing structure

Capital/ asset: p value <0.05 thus is significant. Based on this we can say that Togolese Microfinance institutions are not operating safely in their environment compared to others institutions in Africa and might not be able to meet obligations and absorb losses.

Debt to equity: There is no significant difference between this ratio and the Africa benchmark with p value greater than 0.05. This means that all institutions rely on leverage to finance their operations and expand loan portfolios and that Togolese Microfinance institutions are as well levered as their African peers but they have different proportions of debts they use to finance their assets.

Deposit to loans: No significant difference here also. P value >0.05 this can be explained by the diversity of funding sources for all institutions.

Deposits to total assets: there is a significant difference between this ratio and the Africa benchmark. We can say that Togolese Microfinance institutions have higher proportion of deposits as part of their assets compared to their African peers as illustrated in figure 1.

GLP to total assets: Significant difference here too, as P value lower than 0.00001 thus lower than 0.05.

Thus higher loan components as part of Togolese Microfinance institutions' asset compared to the other African institutions (Figure 1).

4.2 Overall performance

No significant difference in terms of OSS (p value > 0.05). All microfinance institutions in Africa (Togolese ones included) have achieved operational Self-sufficiency but the difference lies in the nature of operations. No significance also for the ROA and ROE which show negative returns for all the institutions (Figure 2). This must be related to differences in institutions profit status (for profit, non-profit) and to different accounting policies.

4.3 Revenue

There is a significant difference in financial revenues and no significant difference in profits margin between Togolese MFIs and the African benchmark. Togolese MFIs have lower financial revenues per

assets compared to the African average (figure 3). Both Togolese institutions and their African peers have negative average profits margin thus they focus more on addressing social issues rather than making profit but they have different profit statuses.

4.4 Expense

Significant difference has been noticed here in terms of financial and total expenses. We can say that Togolese MFIs have registered lower financial and total costs to assets compared to the African benchmarks (figure 4). This reflects a better efficiency in contrast to the African benchmark. There is No significant difference for PLI.

Table 4 Difference of Means Test for Expenses

4.5 Efficiency

There is a significant difference as for the cost per borrower and for the expense per loan portfolio. The cost per borrower is relatively lower compared to the benchmark which means that it cost less servicing a borrower in Togo compared to the overall Africa average (figure 5). The significance in terms of operating expense to loan portfolio relates the fact that Togolese MFIs spend less on average in managing their loan portfolios in comparison to the African benchmark. This is in line with the expenses analysis.

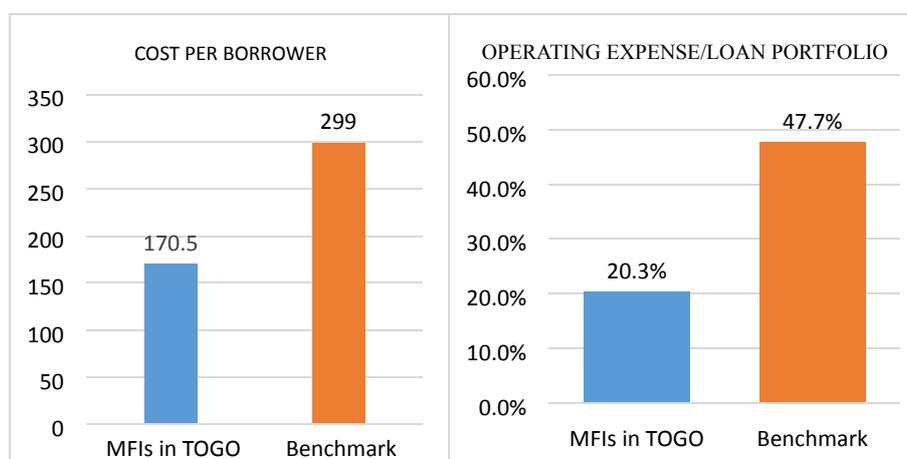

Figure 5 Efficiency Ratios

Source: Author

4.6 Productivity

There is a significant difference for borrower per staff ratio as its p value is less than 0.05. This can be explained by the fact that the number of borrower per staff of Togolese MFIs is lower than the Africa average (figure 6) which might be due to bad lending methodologies. On the other hand there is no significance in terms of deposit per staff member thus all the institutions have different deposit incentives or collection methods.

Table 6 Difference of Means Test for Productivity

4.7 Risk

No significant difference for Loan loss rate PAR>30 & 90 days and write off ratio meaning all institutions have different lending policies. But P value<0.05 for risk coverage ratio thus there is a highly significant difference in risk coverage between Togolese MFIs and their African peers as reflected in figure 7. This can be explained by a high percentage of bad debts trying to be covered by negligible loan loss reserves.

Table 7 Difference of Means Test for Risk

5 Conclusions

Having a look at the findings, we can conclude that Togolese Microfinance institutions are generally good at managing costs and efficient at effectively trying to help the poor compared to the average of other African institutions. MFIs in Togo have higher deposits and loans as per assets compared to the industry average but still don't depend that much on the former as source of funding. This means that they rely on other sources as support to finance their activities. MFIs in Togo are not productive.

Risk management is an issue in the Togolese sector as Togolese institutions have a higher proportion of contaminated portfolio (both PAR>30 DAYS and PAR>90 DAYS) compared to the other African institutions, but provide a considerably low reserve coverage for these contaminated loans. This is quite a risky way of operating for these institutions. This must be due to poor risk management practice and lending policies. Togolese MFIs should have a firm look at this issue in order to improve future performance known thus sustainability.

Our study was based on only of 12 microfinance institutions in Togo during a period of 4 years (2007-2010). A possible increase of the sample size and the period for data collection might give different results and more insights. Future research should consider this.

Abstract: This research work explores the relationship between military spending and stock market capitalization in Pakistan. We employed the methodology of ARDL bounds testing to cointegration over the period 1990-2012. The series stationarity properties were checked via Augmented Dicky Fuller (ADF) test. The conventional measure of military spending has been augmented by a comprehensive index-The Global Militarization Index. We observed cointegration among military expenditure, interest rate, trade openness, growth in GDP and stock market capitalization. Hence, the long run relationship among the variables has been verified. A negative and significant association has been established between military spending and stock market capitalization. The study concludes that military expenditure is a vital determinant of stock market capitalization in Pakistan. To enhance the performance of stock market the authorities need a gradual and systematic reduction in military expenditure.

Key words: Military expenditure; Stock market capitalization; Co-integration; Pakistan

1 Introduction

Since McKinnon's seminal work in 1973, numerous studies have highlighted the importance of capital markets e.g., it enhances economic growth by speeding up the domestic and foreign resources mobilization and facilitates investment Bencivega et al., (1996), furnishes an opportunity for growth driven firms to raise low-cost capital Marone (2003) and reduces the dependency on bank financing which is vulnerable to fluctuations in interest rates Yartey (2008). Apart from the enhancement of capital formation, an efficient stock market will also increase the current stock of capital of an economy. The overall performance of the agriculture, industry and services sector is improved with the help of capital markets—it provides accessibility to financial resources. In nutshell, stock market is a vital element for the enhancement of economic development. In the last decade considerable growth has been shown by emerging markets till 2008 during which the global financial crisis struck the global markets which instigated uneasiness for policy makers. Recovery has been witnessed in the economic activities for the majority of emerging markets in the later part of 2010. Since that time they maintained their tempo to pull an increasing amount of investment.

Pakistan has undergone numerous contrasting developments in the last decade. Political uncertainty has remained very severe throughout the 1990's and the overall economy was impaired by inadequate fiscal control, rapid increase in public debt burden, poverty and higher unemployment. Nine different Governments ruled Pakistan during 1998 to 1999 followed by the military coup in October 1999.

The new millennium brought a fresh period of macroeconomic steadiness in Pakistan. In order to bring financial discipline, economic reforms were introduced in the regime of President Musharraf. The attacks of September 11, 2001 enhanced the economic growth and its steadiness by pulling in large multilateral donors and foreign capital flows based on Pakistan's assistance in the war on terror Khwaja et al., (2010). The unexpected surge in capital inflows combined with the policies of the government pertaining to privatization and monetary policy reforms granted liquidity to the local markets. The stock market capitalization of Pakistan increased from \$5 billion in 2001 to \$70 billion in 2007. The structural reforms coupled with political and economic stability enabled Pakistan to attain consistent economic growth during the course of 2000-2007. It is intriguing to evaluate the primary factors associated with intense stock market growth in Pakistan. A few possible sources have been reported regarding this fact. Some research studies have correlated the growth in the period 2001-2007 with the geopolitical condition of the region. For instance Khwaja et al., (2010) contend that the unexpected event of September 11, 2001 resulted in rise of capital flows towards Pakistan. The rise in capital inflows is partly shown by Pakistan's assistance in the war against terrorism after September 11, 2001, since sanctions were removed and also the loans outstanding were rescheduled. A rejuvenated collaboration with the developed countries provided the opportunity for bilateral and multilateral foreign aid. The

significant growth during the period 2001-2007 is additionally related macroeconomic reforms being launched by the government of Pakistan in the year 2000. These types of reforms not only assisted Pakistan to entice a huge amount of direct foreign investment to Pakistan but at the same time led to a sharp increase in workers remittances and foreign exchange reserves.

After 2007, Pakistan has become the major victim of terrorism and is facing severe consequences. Pakistan has now been considered to be the most dangerous territory all over the world Riedel (2008). Nearly all of the terrible incidents of terrorism happened in Pakistan in the last decade. In comparison to Afghanistan and Iraq, Pakistan suffers from the most number of suicide bombings casualties (Global terrorism database). Terrorism results in investors' uncertainty problem thereby making them more risk averse which has an extremely negative effect on the economic growth of a country. In Pakistan, terrorism has affected nearly every channel e.g., economic growth, volume of trade, GDP per capita thereby resulting in high budget deficit, soaring inflation, and higher military expenditures, which has eventually made the country miserable (Ali, 2010). Significant slump pertaining to economic activities has been observed recently in Pakistan including the decrease foreign investment. Because of terrorism Pakistan has endured the cost of about 33% of real national income Mehmood (2014). In Pakistan terrorism consumes around 1% of growth in real per capita GDP annually Mehmood (2014)

Since 1947, severe enmity continues between India and Pakistan after their separation. The issue of Kashmir is the main dispute between the two countries not to mention the dispute over water as well as border dispute. Both countries set aside a substantial part of their GDP in order to boost their defense sector. Nuclear tests were carried out by India in 1974 which motivated Pakistan go for nuclearization and the arm race between the two countries still goes on. The Pak-India rivalry has directed Pakistan in bigger disadvantage i.e. not only it has to maintain the army of a million men but the country must also assign approximately 40 percent government expenditure to defense sector.

In order to deal with intimidations countries need some level of security but additional funds utilized on these security measures also carry opportunity costs i.e. they can be used for welfare. Each increment on defense spending is linked to trimming down the welfare expenditure such as health and education expenditures; a high budget deficit and rising inflation Dunne (2012). Defense industries attracts skillful engineers and labor which results in draining effect on the availability of human capital for private organizations Melman (1983). Arms accumulations may unsettle foreign investors and may compel them to shift their capital from the country of investment. Doing so will reduce companies valuations. Apart from this if loans are backing the military expenditure, then the debt amount will inevitably rise. In the same way if the import of military weapons will take place then it will affect balance of trade and thus can trouble the local businesses.

Keeping these backdrops in mind it is pertinent to inquire into the effect of military expenditure on stock market development in Pakistan. This research is novel in the sense that pertaining Pakistan's stock market capitalization determinants, it will use a new proxy for military expenditure i.e. the Global militarization index. Previously studies in the literature have used data from Stockholm International Peace Research. Moreover, an improved approach of cointegration i.e. the methodology of ARDL bounds testing to co-integration will be employed in this research study. Compared to other traditional approaches like Johansen and Juselius co-integration and Fully modified ordinary least square (FMOLS), the properties of this method are appropriate for small samples Huang (2002). The variables order of integration needs to remain the same while applying the conventional methods whereas, it is not necessary in ARDL bounds testing to co-integration. This method is also free from endogeneity problems.

2 Literature Review

Literature pertaining to economic consequences of military spending started from the work of Benoit (1973, 1978) who was of the view that military spending and development go side by side. Since then a lot of research work has been done on this subject. Other researchers which are supporting the work of Benoit are (Yildirim and ocal 2016; Yildirim Sezgin and Ocal, 2005). Researchers which are not in favor Benoit's findings and confirmed negative association between defense spending and development are Abu-Bader and Abu-Qarn (2003), Klien (2004) and Chang et al., (2011). According to Dunne and Uye (2010) the results about defense spending and economic growth are mixed.

No consensus has been developed among the researchers regarding the nexus between military spending and debt. For example Smyth and Narayan confirmed positive link between military spending and external debt. On the other side of the coin Dunne, Perlo-Freeman, and Soydan (2004b) found that for Chile military expenditures and debt are positively correlated in the period 1970-2000 whereas,

negative relationship was demonstrated by the results for other two countries i.e. Argentina and Brazil. Friedman (2005) attempted to explore the military-debt relationship. He concluded that pertaining to developing countries the impact of military expenditure on debt negligible.

Since the literature regarding macroeconomic consequences of military spending is vague therefore it is difficult to establish the link between military expenditure with other macro-economic indicators such as stock market development as very few studies have attempted to explore the association between the two. DiPietro, Anoruo, and Sawhney (2008) investigated the association between military spending and stock market growth. The countries included in the study were US and UK covering the period 1914-2001. They established significant positive link between military spending and stock market capitalization. Solarin and Sahu (2014) analyzed the effect of military spending on the appreciation of stock market. The methodology of system GMM was employed over the period 1989-2010 and the sample consisted of 36 countries. Their obtained results showed a negative and significant association between expenditure on military and stock market capitalization for the selected countries.

3 Model

Following DiPietro, Anoruo and Sawhney (2008) and other earlier studies pertaining to factors determining stock market development, the following model has been proposed.

$$LogSMC_t = f (ME_t, INT_t, TO_t, GGDP_t) \tag{1}$$

The linear form of equation is:

$$LogSMC_t = \beta_0 + \beta_{MEXP} logME_t + \beta_{INT} logINT_t + \beta_{TO} logTO_t + \beta_{GGDP} logGGDP_t + U_t$$

Where,

SMC = Stock Market Capitalization (Percentage of GDP)

MEXP = Military Expenditures

INT = Real interest rate

TO = Trade openness (ratio of imports plus exports to GDP)

GGDP = Annual GDP growth

U_t= Residual term

4 Data and Estimation Methodology

Stock Market capitalization data has been obtained from the Global Development Finance. Military expenditure being proxies by Global Militarization Index is obtained from the Bonn International Center for Conversion. The data for trade openness as a percentage of GDP has been taken from World Development indicators (WDI) online database. Finally the data for real interest and GDP growth were retrieved from State Bank of Pakistan.

The technique of ARDL bounds testing to co-integration by Pesaran, Shin, and Smith (2001) is applied for examining the long-run relationship among variables. Compared to other conventional methodologies (Engle and Granger 1987; Johansen & Juselius 1990; Phillips and Hansen) this technique possesses many advantages. For conventional techniques a unique level of integration is necessary for variables. The approach of bound testing is flexible pertaining to integration order of variables. Variables having different order of integration i.e. I(0), I(1) or combination of I(0) and I(1) are accommodated by the bounds testing approach Pesaran & Pesaran (1997). Huang (2002) stated that ARDL is appropriate for data having small range and render good results in comparison with other conventional techniques of co-integration. Linear specification has been used by the approach of bounds testing for dynamic ECM which holds the long-run relationship information Banerjee and Newman (1993). The ARDL unrestricted error correction method is applied for the determination of F-statistic and empirical equations as:

$$\begin{aligned} \Delta LogSMC_t = & \gamma_1 + \gamma_2 LogSMC_{t-1} + \gamma_3 LogME_{t-1} + \gamma_4 LogINT_{t-1} + \gamma_5 LogTO_{t-1} \\ & + \gamma_6 LogGGDP_{t-1} + \sum_{i=1}^p \gamma_{SMC} \Delta LogSMC_{t-i} + \sum_{j=0}^q \gamma_{ME} \Delta LogME_{t-j} \\ & + \sum_{k=0}^r \gamma_{INT} \Delta LogINT_{t-k} + \sum_{l=0}^s \gamma_{TO} \Delta LogTO_{t-l} + \sum_{m=0}^t \gamma_{GGDP} \Delta LogGGDP_{t-m} \\ & + \epsilon_t \end{aligned} \tag{2}$$

$$\begin{aligned} \Delta \text{LogME}_t &= \lambda_1 + \lambda_2 \text{LogSMC}_{t-1} + \lambda_3 \text{LogME}_{t-1} + \lambda_4 \text{LogINT}_{t-1} + \lambda_5 \text{LogTO}_{t-1} \\ &+ \lambda_5 \text{LogGGDP}_{t-1} + \sum_{i=1}^p \lambda_{ME} \Delta \text{LogME}_{t-i} + \sum_{j=0}^q \lambda_{SMD} \Delta \text{LogSMC}_{t-j} \\ &+ \sum_{k=0}^r \lambda_{INT} \Delta \text{LogINT}_{t-k} + \sum_{l=0}^s \lambda_{TO} \Delta \text{LogTO}_{t-l} + \sum_{m=0}^t \lambda_{GGDP} \Delta \text{LogGGDP}_{t-m} \\ &+ \epsilon_t \end{aligned} \tag{3}$$

$$\begin{aligned} \Delta \text{LogINT}_t &= \rho_1 + \rho_2 \text{LogSMC}_{t-1} + \rho_3 \text{LogME}_{t-1} + \rho_4 \text{LogINT}_{t-1} + \rho_5 \text{LogTO}_{t-1} \\ &+ \rho_6 \text{LogGGDP}_{t-1} + \sum_{i=1}^p \rho_{INT} \Delta \text{LogINT}_{t-i} + \sum_{j=0}^q \rho_{SMD} \Delta \text{LogSMC}_{t-j} \\ &+ \sum_{k=0}^r \rho_{ME} \Delta \text{LogME}_{t-k} + \sum_{l=0}^s \rho_{TO} \Delta \text{LogTO}_{t-l} + \sum_{m=0}^t \rho_{GGDP} \Delta \text{LogGGDP}_{t-m} \\ &+ \epsilon_t \end{aligned} \tag{4}$$

$$\begin{aligned} \Delta \text{LogTO}_t &= \psi_1 + \psi_2 \text{LogSMC}_{t-1} + \psi_3 \text{LogME}_{t-1} + \psi_4 \text{LogINT}_{t-1} + \psi_5 \text{LogTO}_{t-1} \\ &+ \psi_6 \text{LogGGDP}_{t-1} + \sum_{i=1}^p \psi_{TO} \Delta \text{LogTO}_{t-i} + \sum_{j=0}^q \psi_{ME} \Delta \text{LogME}_{t-j} \\ &+ \sum_{k=0}^r \psi_{SMD} \Delta \text{LogSMC}_{t-k} + \sum_{l=0}^s \psi_{INT} \Delta \text{LogINT}_{t-l} \\ &+ \sum_{m=0}^t \psi_{GGDP} \Delta \text{LogGGDP}_{t-m} + \epsilon_t \end{aligned} \tag{5}$$

$$\begin{aligned} \Delta \text{LogGGDP}_t &= \Omega_1 + \Omega_2 \text{LogSMC}_{t-1} + \Omega_3 \text{LogME}_{t-1} + \Omega_4 \text{LogINT}_{t-1} + \Omega_5 \text{LogTO}_{t-1} \\ &+ \Omega_6 \text{LogGGDP}_{t-1} + \sum_{i=1}^p \Omega_{GGDP} \Delta \text{LogGGDP}_{t-i} + \sum_{j=0}^q \Omega_{ME} \Delta \text{LogME}_{t-j} \\ &+ \sum_{k=0}^r \Omega_{INT} \Delta \text{LogINT}_{t-k} + \sum_{l=0}^s \Omega_{TO} \Delta \text{LogTO}_{t-l} + \sum_{m=0}^t \Omega_{SMD} \Delta \text{LogSMC}_{t-m} \\ &+ \epsilon_t \end{aligned} \tag{6}$$

In order to check the existence of co-integration among variable the calculated F-statistic will be compared with the critical bounds. To do so we will check the hypothesis of no co-integration in the equation 2 i.e. $H_0: \gamma_{SMC} = \gamma_{ME} = \gamma_{INT} = \gamma_{TO} = \gamma_{GGDP} = 0$, $H_0: \lambda_{SMC} = \lambda_{ME} = \lambda_{INT} = \lambda_{TO} = \lambda_{GGDP} = 0$, $H_0: \rho_{SMC} = \rho_{ME} = \rho_{INT} = \rho_{TO} = \rho_{GGDP} = 0$, $H_0: \psi_{SMC} = \psi_{ME} = \psi_{INT} = \psi_{TO} = \psi_{GGDP} = 0$, $H_0: \Omega_{SMC} = \Omega_{ME} = \Omega_{IN} = \Omega_{TO} = \Omega_{GGDP} = 0$ against the alternative hypothesis $H_a: \gamma_{SMC} \neq \gamma_{ME} \neq \gamma_{INT} \neq \gamma_{TO} \neq \gamma_{GGDP} \neq 0$, $H_a: \lambda_{SMC} \neq \lambda_{ME} \neq \lambda_{INT} \neq \lambda_{TO} \neq \lambda_{GGDP} \neq 0$, $H_a: \rho_{SMC} \neq \rho_{ME} \neq \rho_{INT} \neq \rho_{TO} \neq \rho_{GGDP} \neq 0$, $H_a: \psi_{SMC} \neq \psi_{ME} \neq \psi_{INT} \neq \psi_{TO} \neq \psi_{GGDP} \neq 0$, $H_a: \Omega_{SMC} \neq \Omega_{ME} \neq \Omega_{INT} \neq \Omega_{TO} \neq \Omega_{GGDP} \neq 0$.

Cointegration will exist if the F-statistic (computed) is greater than UCB; the decision will goes in favor of no co-integration if the LCB has been observed to be greater than F-statistic. The decision will be uncertain, if F-statistic is between the UCB & LCB. In this research Narayan (2005) critical bounds values were used instead of Pesaran, Shin, and Smith (2001) because of small sample size—Narayan (2005) values tend to be well suited for data of small sample size. For checking the variables integration order Augmented Dicky Fuller test has been employed in order to clarify that not a single variable is I(2) integrated as I(2) render invalid F-statistic Narayan & Narayan (2005). Furthermore for choosing the optimal lag length Akaike information criterion has been followed. The exact information regarding lag order is critical as the selection of lag length has an effect on the ARDL F-statistic value.

5 Results and Discussion

Although ARDL bounds testing methodology is flexible pertaining to integration order of variables we need to make sure that not a single variable included in the model is higher than I(1) because the F-statistic computations becomes will be deemed invalid if I(2) variable is included in the model. For this reason we have employed ADF test. Table 1 presents the outcomes of ADF test, which show that both stock market development and GDP growth are level stationary i.e. I(0) whereas, the rest of variables are integrated of the order I(1). This means that for empirical estimation the variables selected in the models have mixed integration.

Table 1 ADF Test Results

Variables	Levels		1 st Difference	
	Constant (5% critical value)	Constant & trend (5% critical value)	Constant (5% critical value)	Constant & trend (5% critical value)
SMC	-1.08312 (-3.0403)	-4.6877* (-3.6736)	--	--
ME	-0.551638 (-3.004861)	-2.087918 (-3.632896)	-4.368212* (-3.012363)	-4.240616* (-3.644963)
INT	-1.576983 (-3.004861)	-2.636017 (-3.673616)	-4.066086* (-3.020686)	-3.964465* (-3.658446)
TO	-2.466694 (-3.004861)	-2.563067 (-3.632896)	-6.379784* (-3.012363)	-6.206532* (-3.644963)

Where, * indicates p<.05

Table 2 exhibits the results of ARDL. In this table the calculated F-statistic value for long-run association among variables is (6.1782) which are greater than the upper critical bound by Narayan (2005) at 5% significance level. This result confirms the long run association among variables for the period 1990-2012 in context of Pakistan. Moreover, the classical assumptions related to error term normality, serial correlation and heteroscedasticity hold for ARDL model. Diagnostics tests results have been presented in table 5.

Table 2 Bounds Testing to Co-Integration

Estimated Equation: $LogSMC_t = f(ME_t, INT_t, TO_t, GGDP_t)$			
Optimal lag structure	(1, 0, 1, 2, 1)		
F-statistics	6.178292**		
Significance level	Lower bounds, I(0)	Upper bounds, I(1)	
1 percent	3.74	5.06	
5 percent	2.86	4.01	
10 percent	2.45	3.52	

Where, ** indicate p<.05

The validation of long run association among variables guide us to interpret the effect of our predictors that is military spending, real interest rate, trade openness and GDP growth on stock market development. Table 3 presents the long-run coefficients. Empirical analysis reveals a negative and significant relationship between military spending and stock market development at 5% significance level hence validating our posited statement. A 1% increase in the level of military spending will decrease stock market development by 2.0732%. In the literature these results are similar with the findings of Solarin and Sahu (2014). To cope with terrorism Pakistan government has been compelled to propel the defense Budget. Besides this a substantial amount of funds are allocated for the nuclear weapons advancement in the Budget. Pakistan is doing so because of severe rivalry with India. A significant negative association has been observed between real interest rate and stock market development implying that 1% increase in real interest rate will depress the stock market development by 0.0062%. In the results these finding are found to be consistent with the findings of Akmal (2007). An expected significant positive relation has been noticed between openness in trade and stock market capitalization in the long-run. Although no association has been noticed in the findings of this study between the GDP growth and stock market capitalization, but the long-run coefficient of GDP growth is still carrying its correct sign.

Table 3 Long-Run Analysis

Dependent variable: SMC_t			
Variable	Coefficient	Stand. Error	T-statistic
ME_t	-2.073164	0.915302	-2.265004**
INT_t	-0.810405	0.240108	-3.375165***
TO_t	4.285845	0.740915	5.784529***
GDP_t	0.314248	0.218231	1.439976
Constant	4.8403	1.2816	3.7764***
R-squared	0.923661		
Adjusted R-squared	0.861201		
F-statistics (Prob-value)	14.78813***		
Durbin-Watson	2.625001		

Where, ** p<.05; *** p<.001 respectively

Analyzing the short-run effect of the explanatory variable over the explained variable (stock market capitalization) is the next step. These results have been depicted in table 4. The lagged error term carries a negative and significant sign hence confirming the cointegration association among variables. ECM_{t-1} implies that variations in explained variable i.e. stock market capitalization are function of variations in the explanatory variables (military spending, interest rate, trade openness and economic growth). The ECM_{t-1} standard value lies within the range of 0 and 1 Kremers et al. (1992). In our results the value of ECM_{t-1} is (0.7121) which means that yearly short-run to long-run change will correct stock market capitalization at a rate of 71.21%. Table 4 shows that rise in military spending affect the stock market negatively though the relationship is insignificant. Trade openness is exhibiting a significant positive association with stock market development at 1% significance level implying that it is a vital variable for increase in stock market capitalization. Interest rate and stock market capitalization are linked negatively. The variable of GDP growth and stock market capitalization were found to have no significant relationship.

Table 4 Short-Run Analysis

Dependent variable: SMC_t			
Variable	Coefficient	Stand. Error	T-statistic
ΔME_t	-1.476358	0.988000	-1.494289
ΔINT_t	-0.292403	0.075555	-3.870054***
ΔTO_t	2.015890	0.556652	3.621454***
ΔGDP_t	0.143044	0.118187	1.210317
ECM_{t-1}	-0.712128	0.204066	-3.489688***

Where, *** p<.001

Reliability of the Model:

The results for the reliability of the model have been presented in table 5. Both the issues of auto-correlation and heteroskedasticity have not been observed and the obtained residual were noticed to be normal. Furthermore stable plots were obtained for CUSUM and CUSUM of square tests hence, implying that the model specifications are correct.

Table 5 Diagnostics Check

Diagnostics tests		
	F-statistics	P-value
LM test for Auto correlation	1.4751	0.2792
Brush-Pagan-Godfrey test for Heteroskedasticity	1.4226	0.2560
Jarque-Bera for Normality	1.1921	0.5509

Multicollinearity Check:

Variance inflation factor (VIF) test has been utilized for the detection of multicollinearity. Multicollinearity can be checked via

$$VIF = 1/1-R^2$$

The obtained R^2 value for the model is 0.92 so by incorporating this value in the given formula the obtained value of VIF is (7.28) which is not greater than 10% thereby, indicating that multicollinearity issues were handles during the estimation of the model.

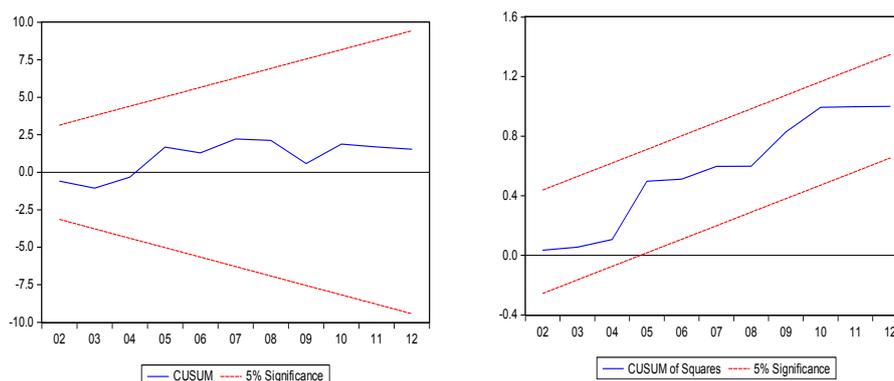

Figure 1 CUSUM and CUSUM of Squares Tests Plots

6 Conclusions and Policy Implications

The principal aim in this research was determine the relationship between military spending and stock market capitalization in Pakistan. The methodology of ARDL bounds testing to cointegration has been applied for this aim. The outcomes of this technique confirmed the cointegration among stock market capitalization, military expenditure, interest rate, trade openness and economic growth. The empirical outcomes of the study revealed a negative and significant relationship with the stock market capitalization in the long run and also in the short run nevertheless, the result is not significant in the short run. A negative and significant association has been established between interest rate and stock market growth both in the short and long-run. Both for the short and long run trade openness has verified the extant research by displaying a significant positive connection with the growth in stock market. No connection has been found between GDP growth and stock market capitalization in this particular study.

When huge amount from the budget will be allocated for the defense expenditures, it means that least amount will allocated to welfare and other development projects. This is certainly wastage of resources. Such kind of practices can also shift the mood of foreign investors to those countries who assign reasonable amount to their defense related activities. Moreover arms accumulation has an adverse effect on foreign relations. Developing countries are of the view that defense sector acts as a strategic tool thereby linking it to national defense or the sovereignty—they set aside large amount from their budget for this sector. Such kinds of policies have a tendency to distort private returns on capital therefore decrease the amount of foreign investment De Mello (1999). In an effort to attain stock market development, military spending needs to be minimized.

A Gradual and systematic reduction in military expenditure will be favorable as private sector will probably not be able to take place of this particular government spending promptly which can have an adverse impact on the economy. In a nutshell, it will be significantly better when the military expenditure cut backs take place over a period of time instead of all at one time which could create a risk of economic downturn for Pakistan thereby, ultimately will affect its stock market capitalization. Apart from military spending, interest rate and trade openness were observed to be significant predictors of stock market growth hence these predictors need to be taken into account together with military expenditure reduction.

Abstract: This pilot study seek to explore the structural characteristics of Islamic Micro-finance and statistically group them in to Products (Independent), Empowerment (Mediator) and Clients' wellbeing (dependent) constructs. This is to conceptualize an Islamic Micro-finance model towards the Clients wellbeing. Empirical data was collected from the staff of eight (8) branches of Amanah Ikhtiar Malaysia (AIM) in the Johor state, Malaysia. The data collected was analyzed by means of an Exploratory Factor Analysis using IBM SPSS Statistics 21, which resulted to the extraction of five (5) factors which upon grouping, defined the variables for this study. The results indicated an acceptable factor loadings and effective grouping according to the conceptualized framework. The Cronbach's alpha of ≥ 0.7 is an indication of acceptable internal consistency and reliability of the five Islamic Micro-finance constructs. This study is part of on-going Ph.D. to proof the capacity of Islamic Micro-finance towards Clients' wellbeing.

Key words: Islamic Micro-finance; Clients' wellbeing; Malaysia

1 Introduction

Over the last four decades, Malaysia has made remarkable achievements in terms of its economic growth as well as its socio-economic development (MWR, 2013). Poverty reduction through increased productivity and income occupies an integral part of all national plans of Malaysia (Hatta and Ali, 2013). While 49.3% of Malaysian households lived below the poverty line in 1970, the poverty rate has reduced significantly to 1.7% in 2012 (Department of statistics Malaysia, 2013). The reduction in poverty rate can be attributed to the rapid economic growth in Malaysia which generated opportunities for employment as well as micro and small-scale businesses (Hatta and Ali, 2013; Henderson, 2002; Al Mamun *et al.*, 2011). Although economic growth has brought significant improvements in the standard of living, there are still individuals living in poverty. Well-being is a positive outcome that is meaningful for people pursuant to good living conditions e.g., housing, employment, family, mental and physical health, and hence of course, there is nothing more seriously important as happiness and wellbeing (Blurton, 2012). There is no consensus on the definition of well-being, but there is general agreement that at minimum, it includes the presence of positive emotions and satisfaction with life, fulfilment and positive functioning. In simple terms, well-being can be described as judging life positively and feeling good in terms of Physical, Economic and Social life (Blurton, 2012). There is no sole determinant of individual well-being, however, it is dependent upon good health, positive social relationships, and availability and access to basic resources e.g., shelter, income (Michaelson, 2012). In general, life satisfaction is dependent more closely on the availability of basic needs being met as well as access to modern conveniences. Pleasant emotions are more closely associated with having supportive relationships which is one of the strongest predictors of well-being, having a notably positive effect (HRQOL, 2016). Countries differ substantially in their levels of well-being but societies with higher well-being are those that are more economically developed. The growing urgency for sustainable development for the entire world has led the idea of targeted efforts gaining ground in order to reach the most vulnerable people (MDGR, 2015). There is the need to achieve a combination of economic development, environmental sustainability, and social inclusion. This typified the triple bottom line approach to human wellbeing, which is in line with the developmental objectives of nations (Sachs, 2012). This new approach seek to offer opportunities to the less privileged in the society toward social, environmental and financial performance. While the benefits from empowerment packages addresses their diverse vulnerabilities, it also help in creating sustainable environment and foster social cohesion. By focusing on this comprehensive perspective, Micro-finance has become an important tool for

improving the lots of the vulnerable poor in the society (Hatta and Ali, 2013; GIFR, 2012). In Muslim countries, Micro-finance is shaped by Islamic principles that seek to achieve prosperity for humanity through opportunities for economic and human capital development. This is perceived as crucial in achieving progress towards greater wellbeing by means of an inclusive growth (Che Rasuli *et al.*, 2016; Al Mamun, Adaikalam and Abdul Wahab, 2012; Mohieldin *et al.*, 2011; Nair, 2010).

The New Economic Model (NEM) in Malaysia promotes a new approach to development, which it defines as inclusive growth, to raise productivity and incomes of the poor and enable them contribute meaningfully to national development (Hatta and Ali, 2013; Xavier and Ahmad, 2012). Another strategy, the Financial Sector Blueprint 2011–2020, was formulated to increase productivity, diversify sources of income and improve the quality of life of the poor. This is a strategic plan that charts the future direction of the financial system as Malaysia transitions towards becoming a high value-added, high-income economy. One of the agenda for this 10-year blueprint is to pursue a financial inclusion that will enable all citizens undertake financial transactions, generate income, accumulate assets and protect themselves financially against unexpected adverse events (FSBP, 2011). This opportunity is expected to contribute to a balanced and sustainable economic growth and development that best serves the Malaysian economy.

Amanah Ikhtiar Malaysia (AIM) is a development program established in 1987 as an NGO with the aim of eradicating extreme poverty. The objective was to offer an interest-free Micro-credit to low-income households to finance income generating activities in order to improve their socio-economic condition. AIM is a replication of the re-known Grameen Bank model established in Bangladesh in the late 1970s by Dr Mohammed Yunus in order to extend Micro-credit to the financially excluded poor. Basically, AIM offers three (3) services to its members/companions. (1) Interest-free Micro-credit with stipulated repayment periods. (2) Saving, which takes the form of compulsory and voluntary saving. (3) Welfare Charity Fund. This is a fund contributed by members to enhance cooperation and improve welfare based on the principles of donation (*tabarru'*) and mutual cooperation (*ta'awun*) to help members of the group when in trouble. This mutual assistance covers areas such as destruction of home and/or project due to accidental fires and natural disasters, accidents, funerals, and all diseases. By far the most popular of the three services is the Interest-free Micro-credit. This is the basic service which is referred to as the Initial Financial Scheme. The Micro-credit is extended to members using the group-lending method as in the Grameen bank model, where five persons of the same gender who are not close relatives are grouped together and provided a small amount of credit without any collateral (Al-Shami *et al.*, 2014; Dusuki, 2006; Navajas *et al.*, 2000). According to AIM (2015), almost 99% of the members are women and the loans tenure ranges between 25 to 150 weeks. After about 30 years of operation, AIM had established 151 branches and provided financial services to more than 80% of the poor households (AIM, 2015). As at February 2015, there are a 356,485 members/companions and RM12, 153,111,093 total disbursements. Therefore the objective of this paper is to explore the conceptual framework on the internal characteristics, structure and relationship between the products of Islamic Micro-finance and the Clients Wellbeing in the perspective of Amanah Ikhtiar Malaysia.

2 The Research Fame and Structural Model

The conceptual model is depicted to show the relationship between the products of Islamic micro-finance (Islamic Micro-credit/Qardhul-hasan, Micro-saving/Wadi'a, Micro-insurance/Takaful) and the clients' wellbeing. Financial exclusion of the poor and their inability to secure employment owing to low literacy level are the major factors that have denied the poor from making a meaningful contribution to national development (Rahman, 2013; GIFR, 2012). To promote a balanced and equitable growth there is the need to have the poorer section of the society to participate meaningfully in the economy (Mohieldin *et al.*, 2011). The conceptual framework consists of five major components: the Micro-credit services, Micro-saving services, Micro-insurance services, Entrepreneurial Empowerment and the Clients' wellbeing.

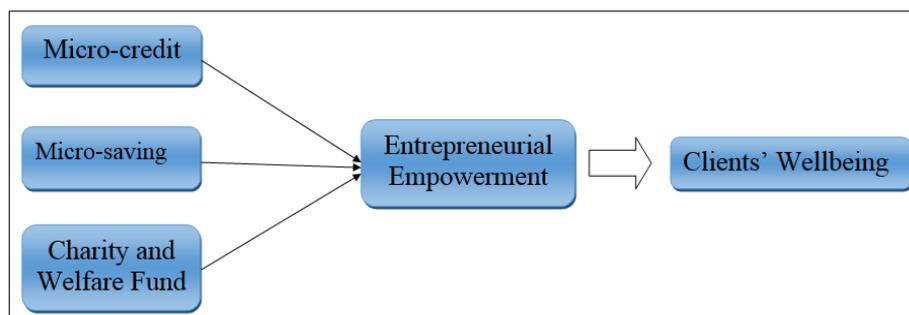

Figure 1 Research Framework and Structural Model

2.1 Micro-credit

This is the initial product offered by Micro-finance institutions. It refers to the small amounts of credit given to the poor people as economic empowerment to enable them generate income through self-employment (Omar et al., 2012). The main objective is to provide low-income people with access to safe, affordable credit to help make them more financially included. Unfortunately, the majority of the programs are unable to cover their financial costs and unable to attain a wider coverage to explore different environments and reach the right people (Rahman & Dean, 2013). Product diversification and the terms of this micro loan are important determinants in meeting the clients' needs (Saad, 2012; Md Saad & Duasa, 2010; Laila, 2010; Praveen, 2009; Rahman & Rahim, 2007). For example, convenient access to a range of Micro-credit products through innovative delivery channels determines that the loan gets to the right people. Flexible Micro-financing terms provides options to the poor. Increasing the size of the loan is important to expand market as well as the size of the micro enterprises. Flexible loan disbursement and repayment facilitates services delivery, time responsiveness and providing adequate information. Moreover, competitive cost and efficiency by the Micro-credit providers all are critical factors for determining the role of Micro-finance services on clients' wellbeing (Kazemian et al., 2014; Nawai and Bashir, 2009). It is important to note that, Micro-credit is the initial offering of the poor which enables them to generate income and entrepreneurial expertise.

2.2 Micro-saving

This is a product that enables the client to enjoy a bigger loan for business expansion and asset accumulation. It takes the form of mandatory and voluntary savings. The low committed periodical savings enable low-income households to inculcate the savings habit towards achieving long term goals such as starting a business, home ownership, education and to have a secure retirement (FSBP, 2011). This is important because capital accumulation is a necessary and sufficient condition for growth and development (Kalu and Nenbee, 2013; Cabraal, 2010). Micro-saving is prelude towards asset accumulation and is a relevant instrument towards future wellbeing (Fiorillo et al., 2014). It is also important for enhancing the capability of the poor to cope with uncertainty shocks, reduce the cost of lending and enhance future growth (Al Shami et al., 2014; Grayson et al., 2013; Tavanti, 2013). More importantly, it provide the saver with the opportunity for enhanced loan repayment and enables easy access to a large size of loan for sustainable growth motives (Rahman, AlSmady and Kazemian, 2015; Fiorillo et al., 2014; Ang, 2010). For sustainability reasons, the poor needs to be encourage towards building future capabilities.

2.3 Micro-insurance/Takaful/Welfare fund

In Micro-insurance offering, concepts such as Tabarru and Ta'awun are important in dealing with unforeseen future uncertainties. The vulnerabilities of the poor people are on how to deal with the deprivations of today and the fears of the unseen tomorrow. Accidents, disasters, diseases are some of the challenges of the poor despite the challenge to break the cycle of poverty (Htay, Sadzali and Amin, 2015; Haryadi, 2006). The Charity and Welfare Fund concepts in the form of Tabarru and Ta'awun that encourages mutual donations are set to address these shocks so as to minimise the tendency of going back to the initial cycle of poverty. This product give protection to the Clients in cases of unexpected emergencies and asset damage or loss (Cabraal, 2010).

However, this emergency coverage needs to be efficient and effective to compliment poverty reduction. Social mission of reaching the poorest poor is still a big challenge for most Micro-finance institutions, and those reached requires more than Micro-credit to solve their problems (Delgado et al., 2015; Prabhakar et al., 2015, Tavanti, 2013). Cooperation among members will go a long way in

subsidising other members and as well serve the social cohesion role in the society (Sharif and Bao, 2013). Some service providers offer Micro-insurance to their clients to achieve this goal. Amanah Ikhtiar Malaysia termed this product as Charity and Welfare Fund, which is contributed voluntarily by clients with religious requirement.

2.4 Entrepreneurial empowerment

Empowerment is increasing the capacity of individuals or groups to make purposeful and effective choices for a better life that brings benefits in terms of greater overall well-being in a society (Smulovitz, Walton and Petesch, 2003). It is the improvement of assets and capabilities of diverse individuals and groups to engage, influence and hold accountable the institutions which affect them (Bennett, 2002; Alsop, Bertelsen and Holland, 2006; Malhotra, Schuler and Boender, 2002). It makes people better equipped to work together, organize themselves, and mobilize resources to solve problems of common interest. Education and training, skills, assets, self-reliance and communal services have been identified to have effect on the clients' performance and improvement in their micro and small businesses (Webster University, 2015; Bartle, 2012).

As outlined in both the New Economic Model and the 10th Malaysia plan, one of the strategies to achieve empowerment is by improving education and providing skills capable of meeting the economic challenges. Eichengreen et al., (2013) have found a positive correlation between economic growth and educational level of the nation. According to Guan et al., (2011), to assure higher productivity and economic growth, there is need to have a critical mass of skilled and knowledge-based workers. It is the key towards a developed country because at its instance, innovation and creative manpower is obtained (Usman and Tasmin, 2015; Othman et al., 2012; Guan et al., 2011). It has been found to be the most significant contributor to poverty alleviation because it reduces the probability of household being poor, regardless of the poverty line being used (Janjua and Kamal, 2001).

The vulnerabilities of the poor people have affected their self-reliance making them with no confidence to contribute towards communal services. This inclusive strategy through Islamic Micro-finance empowerment offer them the ability to reinvent their worth and benefit from increased national growth and as well contribute meaningfully towards national development (Hatta and Ali, 2013). Assets are the stock of wealth that represent the long-term effects of income flows and expenditures, a necessary and sufficient condition for growth and development (Kalu and Nenbee, 2013). They are the foundation of future consumption and wealth, and considered as important indicator of empowerment (Al-Mamun et al., 2012). Quality of life of a household depends on the ownership and quality of household assets. Ownership of asset is an important achievement towards economic viability and self-reliance (Salma, 2004). The more any individual, community or organization has of each of the above elements, the stronger it is, the more capacity it has, and the more empowered it is (Bartle, 2012). Therefore this indicate how successful are initial products offered by Micro-finance in addressing the deficiencies of the poor.

2.5 Clients' wellbeing

There are several varied methods through which Islamic Micro-finance is perceived to have relevance on the client's wellbeing. Rath and Harter (2010) and McCarthy (2010) have outlined that, Career growth, Economic and Social development are key elements in achieving wellbeing. For instance, Islamic Micro-finance Empowerment has been regarded as an important tool for reducing poverty and improving the household's quality of life in terms of better and bigger houses and healthy conditions (Al Mamun et al., 2012). It also plays a vital role in the empowerment of the poor people especially women towards developing their micro enterprises (Omar et al., 2012]. The vulnerability of the poor is reduced and their socioeconomic status improved with better health condition and the education level of their children (Bhuiyan et al., 2011; Md Saad, 2010).

Similarly, it enhances career growth with the significant increase in firm performance especially entrepreneurial values and management practices (Mahmood & Mohd Rosli, 2013; Shirazi, 2012). Therefore, measuring the linkage between Islamic Micro-finance and clients' wellbeing is dependent on both economic and noneconomic dimensions. The empowerment enables the clients to manage the business and make decisions independently and participate in the community with enhanced self-esteem. This status enables them to manage their economic life effectively, reduce stress and increase security (McCarthy, 2010). Therefore, measuring the linkage between Islamic Micro-finance and Clients' Wellbeing is dependent on both economic and noneconomic dimensions. The empowerment enables the clients to manage the business and make decisions independently and participate in the community with enhanced self-esteem.

3 Methodology

In this pilot study, a total number of 32 questionnaires were administered at eight (8) branches of Amanah Ikhtiar Malaysia (AIM) in Johor state, Malaysia. This represent a 10% of the sample population to be used for the field study. A total of 31 responses were retrieved and used for the analysis below, representing about 97% return rate. The descriptors used in the questionnaire for responses were: Strongly disagree, Disagree, Moderate, Agree, and Strongly agree. The pilot data was subjected to three analyses to ensure its normality, reliability and its ability to determine the underline structural pattern of the variables according to the constructs. A descriptive analysis was carried out to examine the normality of the data. The results showed that the data achieved the acceptable normal distribution with skewness and kurtosis within the ranges of +-2 as recommended in George and Mallery (2010). Exploratory Factor Analysis (EFA) was carried out to determine the unidimensionality of the constructs. The unidimensionality was measured by ensuring that all measuring items have acceptable factor loadings. It was also used to identify the underlying data pattern in each construct because there is an inadequacy of research in the area (Gerbing and Anderson, 1988). EFA was also necessary to identify the factors that influence empowerment towards Clients’ wellbeing, and also determine the features that “go together” as components (Ishiyaku et al., 2016; Yong and Pearce, 2013). Based on the nature of this study, PCA was used and the extract was based on Kaiser’s criteria, which is the SPSS default retention method of eigenvalue greater than 1.0.

4 The Results

Reliability test was carried out to provide a reliable measure of internal consistency of the constructs. This is necessary to identify the variables that need to be deleted to improve the alpha value and ensure that the constructs achieve reliable alpha.

Table 1 Reliability Results

Reliability Statistics		
Constructs	Cronbach's Alpha	N of Items
Wfund	.904	7
Empower	.861	8
Mcredit	.896	8
Msave	.810	6
Cwellbeing	.745	4

The Cronbach’s alpha of 0.6 or higher for a component indicates an acceptable internal consistency of items (Awang, 2012). The results in Table 1 indicated that a reliable Cronbach’s alpha of more than 0.8 was achieved in all the constructs except Cwellbeing (.745), which is still above the acceptable mark.

Table 2 Exploratory Factor Analysis Results

Rotated Component Matrix									
Components									
	1	2	3	4	5				
Mcredit2	.834	Msave2	.821	Wfund2	.843	Empower1	.840	Cwellbeing2	.784
Mcredit1	.818	Msave5	.770	Wfund5	.792	Empower5	.722	Cwellbeing3	.741
Mcredit4	.756	Msave1	.714	Wfund4	.753	Empower3	.694	Cwellbeing1	.691
Mcredit5	.719	Msave6	.699	Wfund3	.735	Empower6	.680	Cwellbeing4	.620
Mcredit11	.608	Msave4	.635	Wfund1	.714	Empower4	.662		-
Mcredit9	.593	Msave7	.606	Wfund8	.689	Empower7	.653		-
Mcredit8	.566		-	Wfund7	.570	Empower2	.652		-
Mcredit7	.561		-		-	Empower8	.636		-

The EFA results in Table 2 indicated good pattern distribution among the variables which showed that five (5) constructs loaded effectively. Therefore, the results indicated that the variables can be grouped effectively into the five (5) constructs based on their characteristics Micro-credit, Micro-saving, Welfare fund, Empowerment and Clients’ wellbeing.

5 Discussions

Validity and Reliability defined the adequacy of a data collection instrument. Validity is divided into three (3) namely: content, construct and criterion-related, but at this stages of the study will only cover 'content' and 'construct' validity. The Cronbach's alpha of ≥ 0.7 (Table 1) is an indication of acceptable internal consistency and reliability of the five Islamic Micro-finance constructs.

The extracted factors for the five constructs (Mcredit, Msave, Wfund, EEmpowerment and CWellbeing) revealed the important features that determine Clients' Wellbeing in AIM, which may differ in other studies. The general result revealed that, items which possess similar characteristic are group together, and have satisfied the internal reliability and the construct validity criteria. The analysis of EFA carried out revealed that all the identified factors are relevant and in line with the structural model. The factor loadings of ≥ 0.5 in table 2 is an indication of the accepted variables moving together. It further revealed that the variables have significance in their respective constructs. Therefore, the measurement models that will be developed later in this study will rely on the validation of the Islamic Micro-finance factors using components, Micro-credit, Micro-saving, Charity and welfare fund, Entrepreneurial Empowerment and Clients' Wellbeing as latent constructs. Hence, it can be used to develop a causal effect model or structural equation model with the Clients' Wellbeing construct as the dependent variable. This invariably means under normal circumstances, there is positive relationship between these Islamic Micro-finance products and the Clients' Wellbeing. It is essential for financial managers, the desirability of these group of offering to address diverse needs of the clients. The high loadings in all the factors is a manifest endorsement by the respondents, who are providers of Islamic Micro-finance.

6 Conclusions

The EFA results revealed the extraction of factors for the five (5) conceptualized constructs of Islamic Micro-finance products (Micro-credit, Micro-saving, Charity and Welfare Fund, Entrepreneurial Empowerment and Clients' Wellbeing). The results indicated the factorability of the variables in line with the conceptual model and hence their correlation structure. This pilot survey result has achieved the objectives of EFA. It has recorded an acceptable internal consistency of the instrument, acceptable factor loadings and has established a good relationships among variables. The study is an attempt to proof the capacity of Islamic Micro-finance and propose how to enhance the contribution of the study variables towards Clients' wellbeing for further validation.

Feasibility Study of the Methods of Hydrogen Distribution from Ocean Thermal Energy Conversion Power Plant: An Initial Proposed OTEC-Hydrogen Logistics Roadmap

Chanakan Kaeochuen, Akbariah Mahdzir
Malaysia – Japan International Institute of Technology
(E-mail: sunzoom1@gmail.com)

Abstract: Growing concern over the usage of hydrogen which is anticipated to be one of the promising energy carrier and energy for production platform used in this century. Ocean Thermal Energy Conversion (OTEC) technology will become a large new source of Malaysia energy production for hydrogen whereas hydrogen can be produced via electrolysis using OTEC electricity. OTEC can be a massive alternative to generate large quantities of hydrogen. However, supply and distribution of liquid hydrogen remains a big challenge. There are limit of researches study on liquefied hydrogen distribution from offshore platform to market and end user have been conducted in South East Asia region whereas distributing hydrogen over long distances is one of the most challenging activities, among those related to this energy route. In this communication, this research aim to explore the most suitable and economical mode of hydrogen transportation from OTEC plant to discharging port and to introduces the liquid hydrogen value chain from commercial arrangement until gas transmission and storage by proposing OTEC hydrogen logistics roadmap. This research will adopt a qualitative approach, using the case study method. Information will be collected by semi-structured interview and observation of the expert in industries related area as well as data collected via document analysis. This research shall propose the practical approach to distribute OTEC hydrogen to market and end user together with logistics roadmap as the future guideline.

Key words: OTEC; Hydrogen distribution; Logistics roadmap; Hydrogen

1 Introduction

The progressively high demands of energy usage is growing and fossil fuels are getting insufficient. One of the main problem which impacts our living is global warming which mainly cause by the usage of fossil fuels like coal, petroleum, and natural gas as transportation fuels. Renewable energy, resources which are naturally replaced on a human timescale, such as geothermal heat, sunlight, rain and wind become very significance. Hydrogen is a potential energy carrier which create a sustainable energy value chain(Ball and Wietschel, 2009).

Hydrogen can be produced from several energy sources using means like water splitting, biomass conversion and steam methane reforming. Ocean Thermal Energy Conversion (OTEC) is one of the ways that hydrogen can be produced via electrolysis using OTEC electricity. Generated steam with electrolyte compounds added to improve efficiency is a relatively pure medium for hydrogen production. OTEC can be a massive alternative to generate large quantities of hydrogen(Kazim, 2005).

Pelc and Fujita (2002) mentioned that OTEC can produce fuels via the product electricity including hydrogen, which can be used in hydrogen fuelled cars as well as in the progress of synthetic fuels. For a small city, millions of tons of CO₂ are produced yearly through fossil fuel use, while with OTEC the value is near zero during the operation of devices. OTEC has a high probable to substitute some fossil fuel use.

However, challenge of having hydrogen as by-product for OTEC is transportation, hydrogen can be stored in form of liquid, gas, solid and chemical bonded. Liquefaction of hydrogen commonly use when large volume transport is needed without the use of pipelines(Seifert,2013). Hydrogen is liquefied by cooling it to below -253°C (-423°F). Once hydrogen is liquefied it can be stored at the liquefaction plant in large insulated tanks. It takes energy to liquefy hydrogen—using today's technology, liquefaction consumes more than 30% of the energy content of the hydrogen and is expensive. In addition, some amount of stored hydrogen will be lost through evaporation, or "boil off" of liquefied hydrogen, especially when using small tanks with large surface-to-volume ratios(U. S. D., 2013). Hence, to propose technology in logistics and distribution of hydrogen, as well as improved economies of scale, could help lower the cost of transportation and negative impact of OTEC's hydrogen transportation to environment.

2 Hydrogen Production via OTEC

There are various by-product produced by OTEC, fresh water, aquaculture, electric power and liquid hydrogen etc. Liquid hydrogen is one of the main by-product produced by OTEC. Hydrogen is colorless as a liquid. Its vapors are colorless, odorless, tasteless, and highly flammable. Liquid hydrogen is noncorrosive

Hydrogen produced using electricity and desalinated water generated with OTEC technology. Ryzin illustrated the product would be transported from the OTEC plant ship located at distances of about 1,500 km (selected to represent the nominal distance from the tropical oceans to major industrialized centers throughout the world) to the port facility in liquid form to be primarily used as a transportation fuel(Ryzin).

Electrolysis is the process where water molecules are split directly into hydrogen and oxygen molecules using electricity and an electrolyser device. The two most common types of electrolysers are alkaline that uses a potassium hydroxide electrolyte and PEM which employs a solid polymer membrane electrolyte. Based on the estimated cost ranges by the National Academy of Sciences/Engineering and the US Department of Energy (with close agreement), grid power electrolysis in the US would produce hydrogen at delivered costs of \$6–7/kilogram (kg) at present, with future potential of about \$4/kg. Alternately, the wind electrolysis derived hydrogen would cost about \$7–11/kg at present, with future potential delivered costs of \$3–4/kg, including the full costs of production from the wind power system. Meanwhile, the electric hydrogen splitting would be more expensive, on the order of \$10–30/kg at present, with future delivered costs of \$3–4/kg(Lipman, 2011).

Although, the advantages in producing extremely pure hydrogen/oxygen via water electrolysis is known for around two centuries(Stojić,2003) however its applications are still limited to small scale and for unique situations where access to large scale hydrogen production plants is not possible or economical, such as marine, rockets, spacecraft, electronic industry. Presently, water electrolysis represents only 4% of the world hydrogen production(Zeng and Zhang, 2010).

3 Key Technologies in Hydrogen Energy Storage and Distribution

In general, one of the most important fundamental to measure hydrogen economy is technologies in hydrogen storage and the most critical challenges is to improve the storage of hydrogen to be more effective storage, reliable and to consider safety of storage and distribution as priorities.

In transportation industry, hydrogen shall be stored in a light weight and high density. There are three possible mode of hydrogen storage;

In the form of compressed gas as physical storage

In the form of liquefied hydrogen as physical storage

In the form of solid under material based storage(Zhang,et al, 2016)

Table 1 Target and Current Status of H2 Storage Technologies

Storage targets	Gravimetric kWh/kg (kgH ₂ /kg system)	Volumetric kWh/L (kgH ₂ /L system)	Costs \$/kWh (\$/kgH ₂)
2017	1.8 (0.055)	1.3 (0.040)	\$12 (\$400)
Ultimate	205 (0.075)	2.3 (0.070)	\$8 (\$266)
Projected H ₂ storage system performance	Gravimetric (kWh/kg)	Volumetric (kWh/L)	Costs (\$/kWh)
700 bar compressed (Type IV)	1.5	0.8	17
350 bar compressed (Type IV)	1.8	0.6	13
Metal hydride (NaAlH ₄)	0.4	0.4	TBD
Sorbent (MOF-5, 100 bar)	1.1	0.7	16
Chemical hydrogen storage (AB-50 wt. %)	1.7	1.3	16

Source: U.S. Department of Energy (US DoE)

The technical and economical targets for hydrogen storage was set by U.S. Department of Energy (US DoE) to standardize the target for storage system of hydrogen. It is crucial to achieve 7.5 wt.% of gravimetric density and 7.0 wt.% of volumetric density, while the cost of hydrogen should be reduced down to \$266 per kilogram(Stetson,2012).

4 Proposing OTEC Hydrogen Logistics Roadmap

Strategic planning is defined as, “the process by which a system maintains its competitiveness

within its work environment by determining where the organization is, where it wants to go, and how it wishes to get there” (Katsioloudes, 2012).

Foresight definition is offered by (Loveridge and Cox, 2013) who describe foresight as ‘the act of looking forward’. This is contrary to forecasting, whereby the end-point is a finite forecast, without guidelines or methods for how these will be achieved. Foresight on the other hand, seeks to identify technologies that have a strong influence on the future.

There are various methods for foresight, which should be selected based on their suitability to achieve the activity goals and resources available. The different foresight methods which depicts the different methods according to their inclination level of creativity, interaction, evidence, and or expertise. These methods may be classified as qualitative, semi-qualitative, quantitative, or others.

It is an urge to have appropriate guideline of OTEC hydrogen logistics roadmap which indicate the timeline, compliance and achievement in order to develop logistics flow of OTEC industries. A roadmap made at the level of the industry. “..At the industry level, technology roadmapping for logistics involves multiple companies, either as a consortium or an entire industry (industry technology roadmap). By focusing on common needs, companies’ can more effectively address critical research and collaboratively develop the common technologies” (Bray and Garcia, 1997)

Table 2 Proposing OTEC Hydrogen Logistics Roadmap

	Timelines	Short Term (2015-2019)	Medium Term (2020 – 2029)	Long Term (2030 – 2050)	
Trends and Drivers	Social:	Public & stakeholder awareness, Safety concerns, Pollution (from cars), Health risk assessment			
	Technology:	Intelligent infrastructures evolving, Alternative powering technologies= Improvements in conversion tech favour H2 as energy carrier			
	Economic:	Economic Growth, Oil/Bunker prices, Market outlook of each transportation mode			
	Environment:	Technological solutions, adopt Health Safety and Environment awareness as a first priority in Hydrogen logistics & distribution			
Applications	Industrial	Semiconductor, electronic, Steel, food-value added	Ammonia (fertilizer industry), Methanol production, oil refining	Cost effective H2 tanks & pipelines→ advanced material such as carbon nano tubes	Full industrial usage via centralized pipelines
	Transport	Bus/Truck	Unmanned plane, deep ocean vessel	Ships	Cars (Mass acceptance)
	Domestic			Cooking gas	Hydrogen pipeline
	(Wild Cards)			Hydrogen bomb ▲	Hydrogen for normal fusion, cold fusion ▲
	Supplying heat & electricity				
Technology (Storage and Transport)	High Pressure Gas Cylinders	To increase the energy density	storage at 200-350 bar (H ₂ =350 Kg/truck)	storage at 500 bar (H ₂ =1,100 Kg/truck)	Weight of storage ▼
	Liquid Hydrogen	Energy density is much higher than the gaseous form	large amounts and/or long distances (-253° C)	LH ₂ Container Truck	LH ₂ Vessel FY2020 – Pilot vessel LH ₂ Vessel FY2025 – Commercial vessel Cheaper (\$/MT)
	Chemical (LOHC)	Storage medium dibenzyltoluene – store in ambient pressure	Safety compliance		Cheaper (\$/MT) ▼
	Solid Metal Hydride	Safety compliance volume efficiencies ▲	COST Expensive material ▼		
Programs/ Projects	Government Support	Government financial incentive for Malaysia based Hydrogen logistic provider		Port & Terminal Authorities	
	Research	UTM-OTEC Center	Industrial Joint Research	Port & Terminal Establishment	
	Strategic Alliance	Hydrogen Producer /OTEC	Logistics Service Provider	Shipbroker/ship agent	
	Advertisements/ Promotions	Hydrogen Logistics Roadshow	Industries Health Safety and Environment talk	Potential Customer & Target Market	
Resources	Financial:	Financial support from Government & potential beneficial parties(Loan)			
	Regulatory:	Policy & Industry incentives to encourage OTEC technology adoption and clean energy distribution			
Human Resource and Logistics & Distribution Department: H₂ logistic experts, H₂ engineers, SCM					
	Strategic Planning:	Procurement:	Port & Operation:	Delivery Management:	
	<ul style="list-style-type: none"> ❖ Sale & Marketing (CTS) ❖ Decision Making ❖ Channel/Distribution 	<ul style="list-style-type: none"> ❖ Logistics Contract ❖ Negotiation ❖ Service Provider ❖ Performance 	<ul style="list-style-type: none"> ❖ Execution ❖ Port Restriction ❖ Monitoring - >Customer 	<ul style="list-style-type: none"> ❖ Customer Satisfaction ❖ Order Fulfillment ❖ On-time Delivery ❖ System & tools 	

VISION:
To be the leading Malaysia based for OTEC hydrogen logistic provider¹
VISION:
OTEC hydrogen to serve rising future demand of hydrogen economy

5 Conclusions

This significance of this conceptual paper is that it proposes OTEC Hydrogen Logistics Roadmap for OTEC industries in Malaysia. This OTEC Hydrogen Logistics Roadmap aims to assist OTEC industry in evaluating the achievement of logistics & distribution of hydrogen produced by OTEC technology. OTEC Hydrogen Logistics Roadmap is useful to provide a guidance consisting of economic and social perspectives to establish and start for hydrogen commercialize.

Abstract: The world is being more open, the power of freedom is being more decentralized, and the main value of the individual receives unprecedentedly shown underneath the atmosphere of the Big Data era, which is also quietly changing our thinking, behavior and the external environment. The college media gradually develops a communication concept "Data Democracy" and "Self Quantization" on the basis of big data and cloud platform, so that teachers and students could be affected-conducted-served by it, and a more convenient information system has been built as far as possible. College media that triggers a vigorous blossom of "Smart Campus" through the internet and further integration, called High-dimension paradigm.

Key words: Big data; Colleges; Media effects; System

1 Introduction

February 2016, China President Xi Jinping went to People's Daily, Xinhua News Agency, CCTV to inspect, which was a historic event occurred in the field of news media. He said, "The work of the Party's press and public opinion need innovative ideas, content, genre, forms, methods, means, format, structure, mechanism, enhance the relevance and effectiveness."¹ This means that the country attaches great importance to the decision-makers who are constantly exploring the news media's rule in the new age. Media is the easiest digitized industry, also in the forefront of the digital age (Ma Huateng, 2015). As new media technology was reformed and people's right to use the media enhanced, the polymerization and development of media has brought a more powerful media phenomenon - the user has a great deal of participation, can do exchanging of ideas, innovation and information, share things through the network (J.Charles Sterin, 2014)¹⁸⁵, O2O (Online to Offline) mode is developing fast, these factors push the world towards Web2.0, so that millions of users are connected through the network to form a growing, global, interconnected innovation engine. With the growing information data, "big data" have become national and government level development strategy. Data of the "big" lies not only in high-capacity, more significance is that through data exchange, integration and analysis, people can discover new wisdom to create new value and bring great development.

Media Effects Studies emerged with the development of democratic political activity, whose theoretical results are widely used in presidential elections, opinion polls and other political and ecological aspects. From the early "magic bullet theory" view to the "People's Choice" (Lazarsfeld, 1944) and then to Neumann's "Spiral of Silence: Public Opinion - Our Social Skin" (Neumann, 1980), no exceptions. These theories focused on the audience research. In 2009, US President Obama appointed an Indian immigrant dimension Vivek Kundra as the US federal government's first chief information officer, he established an open data government website, for the full liberalization of government-owned data which offers unprecedented convenience for the general public. As Kundera himself has said, "This is a data democratization movement, we are bringing the power of information into the hands of the American people." (Kundra, 2010) Xi Jinping said at China's eighteenth Politburo Standing Committee to Chinese and foreign reporters: "The people's yearning for a better life is our goal." (Xi Jinping, 2014) People (the audience) is not just the user or consumer of information, they constitute the basic members of the society, they enjoy the "right of communication", "right to know" and "right of access to the media." (Guo Qingguang, 1999). College medias effects research should focus on the study of the effect of the audience, a central issue is how to make information powerfully affect, guide and serve everybody in college.

¹ Jiang Xiao, etc. General Secretary Xi Jinping important speech at the forum on the party's news media caused a strong reaction [N]. Xinhua, 2016.2.20, http://news.xinhuanet.com/politics/2016-02/20/c_1118106502.htm

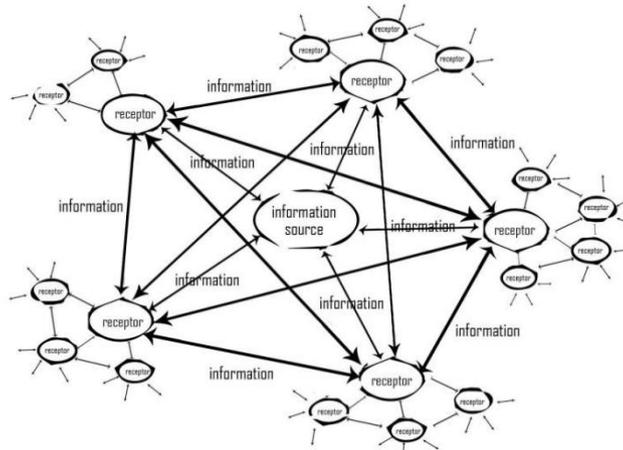

Figure 1 Information Dissemination Mode in Big Data Era

How strong can college media's influence be? And whom does it affect? How can the traditional communication theory explain college internet media effects in big data era? In the famous American media scholar's words, one of the agenda-setting theory creator McCombs, "The play has only just begun." (McCombs, Shaw & Weaver, 2014)

In this paper, we are trying to build a scientific and advanced communication system on college campus based on the media awareness of "Data Democracy" and media behavior of "Self Quantization" through the methodologies of observation, literature study, quantitative research, interdisciplinary research, case studies, etc.

2 College Media Awareness: Data Democracy & College Media Behavior: Self Quantization

2.1 "Audience oriented" -- data democracy

In the 21st century's media-rich world, we have unprecedented demand on the media, because the media content can meet the needs of most of us, both in individual and social aspects, and will choose to keep in touch with the medias who meet these needs. So Internet media launched "Subscription" or "Focus" and other functions, in order to avoid being missed by their users. Some media organizations also use data collection, surveys and other methods to analyze how they can attract the target audiences' attention. Our statistical analysis such as gaming enthusiasts, sports enthusiasts, people with mental illness and other different groups in college aimed the same. Audience "status" has undoubtedly been pushed to a new height.

Have to admit, the digital era influenced a generation and this effect is definitely not in the way of "preaching." Marc Prensky(2001) call the generation grows together with digital media as "Digital Native", and their parents be referred to as "digital immigrants"(Prensky M,2001) We can say that the disseminating way in the digital age gives a profound impact on China's 90's or 00's, who surrounded by computers, digital audio players, smart phones and a variety of electronic games since they have consciousness. Some scholars said, "They touch the screens as a touch at the foot of the land and the mother's skin " (Yan Yan, Wuhan University, 2014), but the migrants are "still using old, former power era that fragmented time and space model to think."(Marshall McLuhan,2011) These phenomena is also because of this era -- inter-generational conflict, shaking culture, concept changing, "Knowledge Gap" theory has been further explained.

"Knowledge Gap" hypothesis originally proposed based on a series of empirical research by the US communication scientist P.J.Tichenor (1970), that the high socio-economic status of people access to information much faster than those of low economic status, the more the mass media deliver information, the deeper the knowledge gap between them will be (Tichenor,P.J,1970).This hypothesis reflects the social conflicts brought by information polarization. "Knowledge Gap" is also reflected in the gap between China's urban and rural, coastal and inland, east and west. When the use of new media focused on the youth group of highly educated, the old-aged, low-income groups are less likely to use computers and the Internet. As new media technologies emerging, replacement cycles are getting shorter, the trend can be described as "Old channel" is not flat, "New valley" is underway.

General Secretary Xi Jinping on the construction of new media, said, "To solve 'skills panic'

problem, and truly become experts by new means in the use of modern media.”(Wan Peng,2015) "skills panic" is the word used to describe the part of Digital immigrants' psychological traits who are not "arousal"¹ Educators born before the digital age "stumbling to explore in digital age and how can they get ability to educate the digital natives growth in the digital age like duck to water?" (Yan Yan, 2014). In this sense, the challenge of digital media technology progress of educational systems and the concept is far greater than the contribution of educational tools and educational tools(Yan Yan,2015).

2.2 “Let data speaks” --Self quantization

“Historical records·The prime minister Chen” recorded a story, Chu war, King of Han Liu Bang was besieged by place of overlord Xiang army. Prime minister Chen Ping offered an advice to Liu, "King, 20 kilograms of gold be given, you can set the world." He believes and took 20 kilograms gold to Chen. Chen used the gold to buy Chu soldiers, spread rumors in Chu, as a result, he successfully drove a wedge between Xiang Yu, counselor Fan Zeng and general Zhong Li Mei, which helped Liu win the war. 20 kilograms gold, this seemingly insignificant sum of money in the eyes of Liu Bang, played a key role in the war.Chen Ping used a coup and let the strength of the data work for them. The ancient sages paid much attention to the role of data, not to mention the era of big data today? In recent years, smart phones and other new medias become popular, people not only can recorded their information at any time, but also can transfer it to the "vital records", the result, "Self-Quantized" technology came into being(Wu Jianzhong,2015) Now many groups and institutions have begun trying the "digital revolution" and their purpose is self-evident.

China has no shortage of famous person who maximizes numbers, but China's status falling behind in modern history mainly because of the lack of figure spirit. Famous thinker Hu Shi wrote a fable "Mr. Almost"1919, shows his concern about Chinese people's attitude "Everything almost or generally true." An American missionary Arthur Smith wrote a book pointed out Chinese people "ignore precision, think ambiguously" (A.Smith, Chinese Characteristics, 1894).Some scholars believe that it's mainly because Chinese people have a lack of ability to make data speak, as a reason of "heavy in quality and light in quantity" in Chinese language characteristics(Tu Zi Pei,2013). As of December 2015, Chinese netizens reached 688 million, Internet penetration rate of 50.3%, the scale of China's mobile phone users reached 620 million, the proportion of people using mobile among Internet users increased to 90.1%, online education, health-care network, network of car renting and so have become the scale, the Internet effectively enhance public services². We can say that in the modern era, mastering data is an urgent need for every one of us Chinese people, especially for university medias.

A university in HuBei China made an annual survey on campus media, collected all the data of how they are being operated and explore the law. Information Office of the Ministry of Education published College medias public opinion heat charts in December 2015, provided analysis and reference for universities. The following table (The total heat based on the number of network media reports, the number of print media reports, the forum posts, blog articles, microblog weighted statistics, in which the total heat error does not exceed 0.02).

Table 1 Directly under MOE Positive Public Opinion Heat Top Ten Universities

Ranking	Universities	Network media	Print media	Forum	Blog	Microblog	Total heat
1	Tsinghua University	6286.41	480.00	114.15	95.85	262.60	7239.01
2	Beijing University	3864.90	326.50	69.15	71.65	872.47	5204.67
3	Fudan University	1689.09	171.00	36.85	35.45	54.86	1987.25
4	Zhejiang University	1534.26	193.50	71.05	22.05	36.14	1857.00
5	Renmin University of China	1565.07	122.00	19.60	18.90	27.24	1752.81
6	Wuhan University	1444.56	137.00	36.85	20.85	73.25	1712.51
7	Beijing Normal University	1041.69	95.50	16.75	21.65	77.99	1253.58
8	Tongji University	925.08	95.00	8.85	10.80	30.85	1070.58
9	Zhongshan University	860.34	93.50	12.10	10.55	29.45	1005.94
10	Shanghai Jiaotong University	862.29	66.00	10.05	13.00	29.31	980.65

It may be noted from the table that, network media and print media is still the positive reports

¹ "Arousal"defined in cognitive psychology as "Individual physical and mental alertness" (Psychology Glossary, 2014a),arouse allows people to find the things needed to survive, and to learn from different survival skills.

² source: CNNIC: 2015 37th statistical report on Internet development in China [R / OL] (2016.1.22).

medias on which colleges rely heavily, only the number of Beijing University using the microblog reported more than paper media, and forum that gradually fading remains schools' public opinion work force to be reckoned with. Also it has a similar effect when these college medias were in a negative public opinion response. This tells us that colleges are committed to building a media data platform, so that teachers and students state of mind can be concerned, information be sorted and date be analyzed, then the public opinion in some of the hot spots be edited and submitted to the school decision-making department, and timely feedback be given through the appropriate media channels, as a result, campus media become the communication link and teachers and students can be better served.

Some scholars have also carried out research on students' credibility to part of new medias. They used a Likert scale¹ to count the fairness, unbiased, completeness, accuracy, reliability, and other five indicators perception to the medias, to examine young students' credibility of new media for different types of secondary channel, results are as follows:

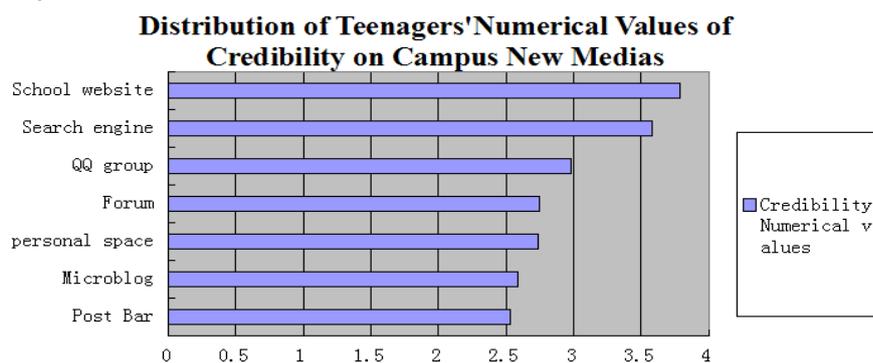

Figure 2 Distribution of Campus New Medias' Credibility to Teenagers²

It shows, school website has the highest credibility to teenagers, in addition to the school sites and search engines, the other medias' credibility scope is lower than 3, which is indicating that the students' attitude towards web information is cautious. For the information on the school website, they are either participants or witnesses, which greatly improved their reliability. Search engines are tools teens actively searching for information, they tend to get more credible in information on their own initiative rather than passively pushed information. QQ group's credibility shows the teenagers' rationality among human interaction online, neither blind trust nor excessive suspicion. Representatives as Microblog, post bars whose information are anonymous or semi-anonymous have the lowest credibility, they are more inclined to entertainment. Of course, the young students' media reliability value is also affected by many subtle influence of demographic factors and media technology environment. On campus media itself, in order to establish credibility among the students, it is necessary to make overall arrangement and functional orientation according to the merits of the various campus media, and avoid weaknesses, to meet the personality traits, experience and habit of college students, "take the lens down" and come close to life, so that let media and information be really into students.

Some universities have begun to use Wechat Communication Index (WCI) to evaluate campus Wechat public account's spreading power. WCI utilizes 7 indicators: total reading number(R), average reading number(R/N), max reading number(Rmax), total thumps-ups(Z), average thumps-up number(Z/N), max thumps-up number (Zmax) and thumps-up rate(Z/R), each be given different weights, then compare and operate with each other, logarithmically standardized them, so that to arrive at a comprehensive evaluation. The weighted WCI is calculated as:

¹ Likert scale is one of most commonly used sum formula Rating Scale, which improved by American social psychologist Likert based on the original sum scale in 1932. The scale consists of a set of statements, each statement contains "strongly agree", "agree", "not really", "disagree", "strongly disagree" Five answers, each recorded as 5,4,3, 2,1. The Total score of each respondent's attitude is the answers resulting scores summed, the scores may indicate strength or the different states on this scale's attitude.

² The data is extracted from the "Digital Native Aggregation and Differentiation - Hubei Teenagers New Media Using Report" Yan Yan, 2015.

$$WCI = \begin{cases} [65\% * \ln(60\% * R + 30\% * \frac{R}{N} * 5 + 10\% * R_{\max} * 3) + 35\% * \ln(60\% * Z \\ + 30\% * \frac{Z}{N} * 4.5 + 5\% * Z_{\max} * 2 + 5\% * \frac{Z}{R} * 1000)]^2 * 10, R \geq 1000 \\ [65\% * \ln(60\% * R + 30\% * \frac{R}{N} * 5 + 10\% * R_{\max} * 3) + 35\% * \ln(60\% * Z \\ + 30\% * \frac{Z}{N} * 4.5 + 10\% * Z_{\max} * 2)]^2 * 10, R < 1000 \end{cases}$$

WCI indicators quantifies the spreading heat of school's Wechat public accounts, staff of campus media workers can easily notice the rule of deeper propagation via comparative analysis. Affected by communication content, speed, student preferences and other factors, WCI of each Campus Wechat public account may exhibit alternating cycles, the numbers shifting quickly, an obscure account may become famous by a public event.

2.3 Media aggregation

2014 can be the first year of China's media convergence strategy, mainly due to the strong call and mobilization of Media aggregation issued by the center of CCP media(Cui BaoGuo,2015). The ultimate aim is to enhance cyberspace culture building capacity by both traditional and new media. Many colleges tried hard to integrate the campus media, however, so far most of this integration is still in its simple form restructuring, because of the influence of the media content, the traditional mode of transmission, media workers' ideological views and other factors. Industry specializing in surgery, each media's unique business model cannot be replaced completely by others, for example, although videos can be widely spread on the web, it still cannot replace TV's audiovisual effects and wide-screen, microblog's debris information cannot replace the information on the website with depth and breadth in content. However, no matter how difficult of the integration, campus media eventually moving towards Internet technology. It's better to say aggregation rather than integration.

The BBC has integrated its radio, television and websites editorial departments into a unified newsroom, reporters implement unified management, all medias operations as one. After the interview, the reporter received a task of feeding all the medias of BBC, and its different editors take different "deep processing" and then make new "permutations and combinations" again, produce various news products. Content sharing has become a trend in campus media today. On the same news content, the newspaper can do depth reports; official news network carry out online publishing; radio and television focus on audiovisual effects; microblog, Wechat use their fast-oriented, short and interactive features, build new media matrix and present the news to teachers and students timely ... The traditional campus media's news gathering ideas, channels, platforms have been put higher requirements, in addition to master the internet technology, colleges and universities should take content development as a fundamental, use their own advantages, to create a fully compatible open media platform, and to match their sustainable development.

Although media aggregation brought incalculable disseminating result to campus media, the negative effect is also worth considering. Aggregated media has greatly improved the user's active participation in the new media that tend to blur the boundaries between professional and amateur (media content producers). Many young students often feel more privacy in the web circumstance than in real life social situations. But unfortunately, this perception about anonymous widespread neglects a very real problem: Any content published on the web will be forever existed. The information they published might be obtained by any people, if it is considered to be "inappropriate", then the information is likely to bring them trouble even disaster. Besides growing up in the digital world, how much can these young "Digital Native" sense that negative information on the network? New media makes it possible that any member of a school can be a reporter, and campus media "gatekeepers" teams mostly composed by students, at the premise of mobility, improving the campus media student workers' checking abilities and media literacy is emergency.

Tencent has launched the "Smart Campus" program, in cooperation with colleges and universities to carry out these attempts, which refers to an intelligence working, living and researching integrated environment based on big data and internet of things. What we must thoroughly consider are: education policy-makers need to possess modern technology and advanced educational philosophy; how can students participate and occupy a certain position in the entire process, and let it close to the students' daily life; how does interscholastic mutual coordination and sharing of resources make sense. "Smart

Campus" ultimate goal is: make continuous development of science and technology as a means to improve the efficiency and quality of education step by step, to make the perfect combination with media and school teaching, to achieve a "high-dimensional" phase of campus media communication effect, truly fulfill what General secretary Xi Jinping said - "Innovative, Harmonious, Green, Open, Sharing"¹

3 Conclusions

Media effects is the "core" issue of mass communication research(Wei Ran ,2016) In addition to the teachers for their knowledge dissemination, campus also filled with all kinds of media, teachers and students intentionally or unintentionally receive and convey vast amounts of information via media. Universities in a sense is a media agency, which spread the culture, wisdom, Concepts, ethics, communication effects research is particularly important. Scholars divided the effect of media transmission into three levels: the effect of environmental awareness, effect of values formation and maintenance, effect of social behavior demonstration¹⁸⁹.From Comprehension to reaction, this process is an accumulating process of effect. This paper gives a brief idea on building a scientific communication system in college based on the media awareness of "Data Democracy" and media behavior of "Self Quantization".

Media effects based on audience research is an important topic at colleges and universities in the data media background, the media should play an important role in university education, in addition to improve the hardware and technical "Time Match", but also need innovate the media awareness and education mechanism. Although the "All Media Campus" is the form students loved, but if you do not consider the needs of the audience, just use rigid, step by step ads, you cannot walk to teachers and students, and get them accepted. In the era of big data, universities should play the superiority of "data democracy" in an important role, so that information can be owned and used by teachers and students which as a result benefit them all.

At big data era of renewal, our understanding on campus media effects paradigm has been unable to stay fully on the theoretical basis of the traditional communication studies, it must be judged on the point of development and transmission. We carry out our research on the angles that, put the audience in their living social environment, put campus media in the whole society and entire Internet perspective, so that make data promising.

An Empirical Research on the Effect of Emotion on Consumers' Repurchase Intention under the Service Recovery Situation

Liu Mingfei, Sun Qian

School of Management, Wuhan University of Technology, Wuhan, P.R.China, 430070

(E-mail: liumingfei5223@163.com, sq110821@163.com)

Abstract: With the accelerated development of the Internet, the Internet driving force on economy is strengthening, a series of new changes have also been made in the service industry. At the same time, marketing homogenization, weakness of customer relationship management, service failure and other issues also continue to appear. Based on the questionnaire survey, this paper uses the method of scene simulation, exploring the emotional response mechanism of consumers under different recovery situations, the results show that: the difference of service recovery combination is the main factor that leads to different emotional responses, and the economic recovery is the most influential factor.

Key words: Service recovery; Emotion; Customer satisfaction; Repurchase intention

1 Introduction

In 2016, a survey was conducted by China Central Television on consumers' rights and interests. "Are you hungry" takeaway platform enterprise was exposed, it had the problem of guiding the businesses to show the false location and photos and other problems. This event not only received extensive attention, but also made the consumer seriously doubt its service quality. With the rapid development of modern service industry, the service concept has been increasingly integrated with the factors of the times, which constantly gives its new connotation. Homogenization of services has intensified the competition in the market, and customer loss caused by service failure is an urgent problem to be solved by service providers. In the case of shrinking profit margins, how to improve the purchase intention of consumers is particularly important. As a new form of service industry, the network catering takeaway, due to the timeliness, virtualization and other features, is more prone to service failure.

As for the relevant research, the first definition of the emotional infection: people in interaction, will be unconsciously influenced by other people's facial expression, voice, movement, etc. and imitate, will continue to grasp the feelings of others (Hatfield, Cacioppo and Rapson, 1993); The method of scene experiment was used, verified that the theory of emotion in the service process would have a impact (Henning-Thurau, Groth, Paul and Gremler, 2006); The emotional response of consumers would be triggered by service failure (McColl-Kennedy and Sparks, 2003); Based on the context of network retail, scholars analyzed the effect of relationship quality on consumer's behavior intention, emotion and several aspects of fairness (Zhang Chubing et al, 2014); Taking an hotel as an example, scholars set up the same service failure scenarios to study the effects of customer relationship and service recovery measures on customer's behavior and emotion (Zhang Shengliang, Zhang Xiaobing, 2013); The study of the effect of the service recovery quality on consumers' behavior intention was conducted under the online shopping environment (Ma Peng, Xia Jiechang, 2014). Through the review of relevant literature, scholars verified the effect of consumer sentiment on service recovery after service failure from different angles. But the research of the relationship among service recovery, emotions and purchase intention is not much, especially in the network takeaway food, the related research content is less, so this paper has certain research value.

2 Research Assumptions

Combined with existing research conclusions, this paper divides the dimensions of relationship benefits under the service recovery into three categories: social benefits, psychological benefits and economic benefits. From the interests of customer relations, the service recovery is divided into social recovery, psychological recovery and economic recovery. These three remedial scenarios contain the different specific remedial actions. social recovery: apology; psychological recovery: initiative, timing of recovery, fairness; economic recovery: compensation. Each of these three remedial dimensions can be subdivided into two intensities of the remedial quality, and can be divided into the following 4 groups:

Group1: high social, high psychological and high economic recovery (three high recovery scenario);
Group2: low social, low psychological and low economic recovery(three low recovery scenario);

Group3: high social, high psychological and low economic recovery/low social, high psychological and high economic recovery; Group4: high social, low psychological and low economic recovery/low social, low psychological and high economic recovery.

In these 4 different recovery scenarios, consumers' emotions and repurchase behaviors will be significantly different, thus this paper has put forward the following assumptions:

H1a: the positive emotion of consumers is the highest in group 1, is the lowest in group 2, is higher in group 3 than group 4; H1b: the negative emotion of consumers is the lowest in group 1, is the highest in group 2, is lower in group 3 than group 4; H1c: the repurchase intention is the highest in group 1, is the lowest in group 2, is higher in group 3 than group 4.

Some scholars believe that, in the context of service recovery, customer perceived justice will affect customer satisfaction and behavior, and will ultimately lead to two extreme emotions: happy and anger, and ultimately influence the repurchase intention. Therefore, we can put forward the following hypothesis in each dimension:

H2a: social recovery and the positive emotions after recovering are positively correlated; H2b: psychological recovery and the positive emotions after recovering are positively correlated; H2c: economic recovery and the positive emotions after recovering are positively correlated; H2d: social recovery and the negative emotions after recovering are negatively correlated; H2e: psychological recovery and the negative emotions after recovering are negatively correlated; H2f: economic recovery and the negative emotions after recovering are negatively correlated; H2g: social recovery and the repurchase intention are positively correlated; H2h: psychological recovery and the repurchase intention are positively correlated; H2i: economic recovery and the repurchase intention are positively correlated.

Finally, about the relationship between service recovery and consumer repurchase intention, some scholars proved that positive and negative emotions have a significant impact on satisfaction. The following assumptions can be obtained:

H3a: the positive emotions after recovering and the repurchase intention are positively correlated;

H3b: the negative emotions after recovering and the repurchase intention are negatively correlated.

3 Research Design

3.1 Questionnaire design

The whole idea of this paper is to design the questionnaire, the questionnaire is divided into four parts: the first part is the basic information of the investigators, which is used for the descriptive statistics analysis; the second part is the description of the service failure scenario; the third part is the description of the service recovery scenario; the fourth part is the questionnaire item, which uses the seven volume table.

3.2 The table design

In the questionnaire, the dependent variables and mediating variables were measured. In order to improve the scientificness and effectiveness of the questionnaire, it can reflect the real situation of the respondents. This paper has consulted a large number of related literature, which is used for reference in the design of the scale. As shown in table 1-3.

Table 1 Service Recovery Situations

Variables	Dimensions	Measurement items
Social recovery	Apologize	When complaining, the seller will take the initiative to admit
		After complaining, the seller will apologize sincerely
		After complaining, the seller's attitude is good
Psychological recovery	Recovery initiative	I will be informed in advance the possibility of failure
		Before I complain, the seller is able to take the initiative to inform me and make a remedy in time
		I will be informed of the progress and results
	Recovery opportunity	After complaining, the seller's response is very fast
		The seller can solve the problem quickly
		Web design can make it easy for me to contact the responsible person
		The recovery system is simple and clear, the implementation process is reasonable
Fairness	After communicating with others, find the seller's recovery make me fair	
Economic recovery	Monetary compensation	The seller provides a reasonable compensation scheme
		The compensation scheme will be adjusted because of my request

Table 2 Consumers' Emotions

Variables	Dimensions	Measurement items
Emotions	Positive emotions	The service recovery experience made me feel happy
		The service recovery experience made me feel excited
		The service recovery experience made me feel relaxed
		The service recovery experience made me feel touched
	Negative emotions	The service recovery experience made me angry
		The service recovery experience made me regret
		The service recovery experience made me disappointed
		The service recovery experience made me mad

Table 3 Consumers' Repurchase Intention

Variables	Dimensions	Measurement items
The repurchase intention	Expectations and performance	I would like to patronize the business again
		When friends and relatives consulting me, I would like to recommend this seller
		I would be very willing to buy more things in this seller

3.3 The description of scenario simulation

This paper is a study of the emotional changes, need to have a better understanding of the emotional response mechanism, so choosing the scenario simulation method as the main method. This method has good internal validity and is suitable for different situations. It can avoid the memory bias caused by time factor. According to the description and classification of the service recovery scenarios, the service failure and recovery scenarios are designed as follows:

The service failure scenarios focusing on network takeaway food logistics distribution, is designed for 2 * 2 * 2, mainly through apology, service attitude, response speed and economic compensation to show the quality of social recovery, psychological recovery and economic recovery.

Network takeaway food logistics distribution service failure scenario: This is a weekend at 11 o'clock in the morning, cold and windy winter, lying in a warm bed you don't want to braved the cold to go out to dinner, so you pick up the phone, open a takeaway app, after some careful selection, you find a good business, then you choose the favorite dishes, and immediately distribution, then wait for the arrival of the delicious. But half an hour, an hour, two hours later, suddenly you find that now is already at 1 o'clock in the afternoon, at this time you have been hungry very much, you are angry and finding the business phone to make a complaint.

Network outside catering service recovery scenario (group 1): you pick up the phone and dial the business phone, the telephone soon put through, a beautiful sound "Hello! Thank you for calling XXX restaurant, what do you want me to do for you? "You say your problem and then she quickly says "I'm very sorry, your meal was in the delivery, I will immediately contact the staff and ask the reason, and make him send as soon as possible, to express our apology, we will present you with cash coupon, for the inconvenience caused to you we are very sorry." After hanging up the phone, you browse the website, and find that most of the customers thought that the service attitude was very satisfied, the compensation was reasonable, then less than five minutes you receive a call from the delivery service, and receive the cash coupon.

3.4 The pre-investigation and questionnaire adjustment

After the completion of the preliminary design of the questionnaire, selecting the Wuhan University of Technology as the investigation site, 20 college students were randomly selected, communicating with them when they filled in the questionnaire, to learn about their views on the questionnaire. Through them, some problems were found in the questionnaire items, such as: the repetition of meaning. For example: in the table of the consumer repurchase intention, the last item "I would be very willing to buy more things in this seller." and the first item "I would like to patronize the business again.", the meanings of these two items are a little bit repetitive, so deleting the last item.

4 The Model Validation and Analysis

In this paper, we selected three universities in Wuhan, in which 90 students were randomly selected as the research object, making sure that multiple grades were involved to ensure the validity and the scientificity of the sample. Recovery of 250 questionnaires, excluding invalid questionnaires, 230 questionnaires were kept, 113 boys and 117 girls.

4.1 The reliability analysis

The premise of ensuring the real and effective statistical data is the reliability and validity analysis, the results of repeated measures need to be consistent. In this paper, we selected the alpha coefficient, and found that the design of the scale of the alpha coefficient were above 0.7, indicating that the questionnaire design has a good internal consistency, the reliability is high.

Table 4 Reliability Analysis

Variables	Alpha	Survey items
Social recovery	0.812	3
Psychological recovery	0.855	8
Economic recovery	0.901	2
Positive emotions		
Q1	0.902	1
Q2	0.885	1
Q3	0.927	1
Q4	0.912	1
Negative emotions		
Q5	0.875	1
Q6	0.918	1
Q7	0.890	1
Q8	0.902	1
Repurchase intention		
Q1	0.916	1
Q2	0.935	1

4.2 The validity analysis

Validity is that the results can reflect the level of the content of the survey, the closer to the results obtained and the content to be investigated, the higher the validity of the results. In this paper, the variables and items designed were making full reference to the previous research results, based on a large number of literature and the actual situation of online catering takeaway and consumers, with a certain content validity. First, KMO test and Bartlett test of the spherical degree.

Table 5 KMO Test and Bartlett's Spherical Degree Test

KMO and Bartlett's Test		
Kaiser-Meyer-Olkin metric for sampling sufficient degree	0.756	
Inspection of Bartlett's degree of roundness	Approximate chi square	1082.621
	df	32
	Sig.	0.000

From the above test results, KMO value is 0.756, and through the s' Barlett spherical test ($P < 0$), which indicates that the data has the condition of factor analysis. Then, using the variable degree of test to evaluate the effect of factor analysis, common degree of variables can reflect the influence degree of the various items, generally speaking the value greater than 0.5 indicates that the effect of factor analysis is ideal. Through the analysis, it is found that the index of these items are all more than 0.5, which is more than 0.7, which shows that the factor analysis is more ideal. Therefore, the design of each item in the questionnaire is reasonable, and can clearly reflect the problems to be studied.

4.3 The variance analysis

According to the hypothesis condition H1a-H1c, the method of multivariate analysis of variance and variance analysis is used to test. Test results are shown in table 6.

Table 6 The Multiple Factors Variance Analysis of Customer Emotion after Service Recovery

Independent variables	Service recovery scenarios				
	III type sum of squares	df	mean square	F	Sig
Dependent variables					
Positive emotions after recovering	705.264	3	235.088	194.566	0.000
Negative emotions after recovering	588.963	3	196.321	163.233	0.000
Consumers' repurchase intention	871.695	3	290.565	275.695	0.000

As can be seen from table 6, the impact of service recovery on the positive emotion, the negative emotion and repurchase intention is significant. In different service recovery scenarios, these variables will be significantly different, and then continue to carry out a number of variance analysis to do further tests, test results as shown in table 7.

Table 7 The Variance Analysis of Emotion and Repurchase Intention after Service Recovery

Positive emotions after recovering				Negative emotions after recovering				The repurchase intention			
Group2	2.67			Group1	2.33			Group2	2.23		
Group4		3.13		Group3		3.28		Group4		3.04	
Group3			4.23	Group4			4.12	Group3			3.98
Group1			4.69	Group2			4.57	Group1			4.69

Results can be seen from table 7, by comparison, the figures of groups in the table by size sort, and then divided into a number of groups. Three variables in different recovery situations fall in different groups, indicating that in different recovery situation, three variables appeared significant differences. Through analyzing of the size of the variable value, the figures of the positive emotions after recovering and customer repurchase intention consensus ranking, and the figures of the negative emotions is sorting by reversals, which is consistent with the hypothesis, so verifying the H1a-H1c.

4.4 The correlation analysis

For H2a-H2i and H3a-H3b, in order to verify the relationship among the variables in the hypothesis, conducting the Pearson correlation analysis method by using the SPSS17.0. The value of r is generally between - 1 and + 1: if $r > 0$, two variables are positively correlated; if $r < 0$, two variables are negatively correlated. The greater the value of the absolute value of r, the stronger the correlation between variables.

Table 8 The Correlation Analysis

Variables	Dimensions	Social recovery	Psychological recovery	Economic recovery
	Positive emotions		0.668	0.789
Negative emotions		-0.68	-0.738	-0.856
Repurchase intention		0.723	0.698	0.836

From the table 8, we can see that in the 0.01 significant level, the three dimensions of service recovery are significantly positively related to the positive emotions after recovering; The three dimensions of service recovery have a significant negative correlation with the negative emotion after recovering. Among them, the correlation coefficient of the economic recovery and the emotions after recovering is the biggest. And, the three dimensions of service recovery are significantly positively correlated with the repurchase intention of consumers, which can verify H2a-H2i.

Table 9 The Correlation Analysis of Emotion and Repurchase Intention after Service Recovery

Variables	Dimensions	Positive emotions	Negative emotions
	Repurchase intention		0.889

As can be seen from the table 9, in the significant level of 0.01, the positive emotions after recovering and repurchase intention are positively correlated, the negative emotions and repurchase intention are negatively correlated, which can verify H3a-H3b.

5 Conclusions

Based on several different dimensions of service recovery, this paper exploring the emotional response mechanism of consumers under the service recovery situation in different recovery situations. Through the method of scene simulation, it is proved that the emotional display of the merchant will affect the customer's emotion, and it will also affect the customer's repurchase intention directly. The difference of service recovery combination is the main factor that leads to different emotional responses, among which the economic recovery is the biggest influence factor, and the emotion will have a big impact as the middle factor. Therefore, this paper puts forward the following suggestions, enterprises should combine the use of a variety of remedial methods, and strengthen the emotional control and response training of employees, should develop and improve the service recovery plan in advance. Hope in the future, be able to collect more comprehensive sample data, and be able to conduct a comprehensive analysis of different industries.

Financial Inclusion in Rwanda: An Overview

Bigirimana Moïse, Xu Hongyi

School of Management, Wuhan University of Technology, Wuhan, P. R. China, 430070
(E-mail: mosebigirimana@yahoo.com, steven_64@163.com)

Abstract: Financial inclusion is a major policy concern with governments across the world. Rwanda as a country with fast development averaging to 6.9% from 2011 to 2015 has done an improvement in financial inclusion as well. This country with stable growth interested the researchers to know whether this development goes hand in hand with financial inclusion. This paper is an attempt to show the overview of financial inclusion in Rwanda. Secondary data from Rwanda Fin scope survey 2008, 2012 and 2016 were used in this study. Apart from that, this paper uses data from Banque National du Rwanda from 2011 to 2015. Many researches were conducted on financial inclusion in different countries but none of them took Rwanda as a special case. The results show that there is an improvement in financial inclusion in Rwanda as the number of financially excluded dropped from 52% in 2008 to 11% in 2016. The problem is that the number of banked adults did not increase from 2008 to 2016. Banked adults in Rwanda were 14% in 2008, 23% in 2012 and 26% in 2016. This shows that many Rwandan adults are not banked. The government should continue to mobilize citizens to join banks. Mobile payment improved tremendously and this should be strengthened and more regulated as it is serving many Rwandans.

Key words: Financial inclusion; Financial exclusion; Rwanda

1 Introduction

Rwanda has got high economic growth from 2011 to 2015. The economic growth is averaged to 6.9% from 2011 to 2015 (BNR, 2016). Financial inclusion which is considered as a key enabler of achieving development and poverty reduction objectives is of paramount importance in both developing countries and developed countries. Many researches have been conducted worldwide to know the financial inclusion in different countries. Likewise, there are many researches about financial inclusion in Africa (Triki & Faye, 2013; Demirgüç-Kant & Klapper, 2012) as a continent. This paper is an attempt to show the financial inclusion in Rwanda as a particular country which has come from terrible genocide to fast economic growth.

The Government of Rwanda has set the target of formal financial inclusion at 80% of adult population by 2017 and 90% by 2020 (BNR, 2015).

Globally, financial inclusion is a major policy concern with governments across the world. The lack of access of a large percentage of working age adults to the formal financial sector is a genuine global policy concern (Arun & Kamath, 2015).

The world bank defines Financial inclusion as the proportion of individuals and firms that use financial services¹. This is again defined as the process of ensuring access to financial services (savings, insurance, remittance, payments, etc.) and timely and adequate credit where needed by vulnerable groups such as weaker sections and low-income groups at an affordable cost (Bhanot, Bapat, & Bera, 2012). According to Sharit, financial inclusion means making financial services accessible to the poor, giving them credit facilities that suit their needs and generate self-employment opportunities for them (Bhowmik & Saha, 2013). Lastly, financial inclusion can be defined as delivery of banking services at an affordable cost to the vast sections of disadvantaged-aged and low-income groups (Dev, 2006).

Considering the points of views of the above authors, we can briefly say that financial inclusion is the access to financial services. Those who do not have access to financial services are financially excluded.

Financial exclusion is defined as 'the inability to access necessary financial services in an appropriate form (Carbo Sntiago, Grdener Edward, 2005). This is again defined by Leyshon and Thrift as cited by Koku as "those processes that serve to prevent certain social groups and individuals from gaining access to the financial system" (Koku, 2015).

It is evidenced by many authors that financial inclusion is of paramount importance. Demirgüç-Kant & Klapper said that without inclusive financial systems, poor people must rely on their own limited savings to invest in their education or become entrepreneurs—and small enterprises must rely on their limited earnings to pursue promising growth opportunities. This can contribute to persistent income inequality and slower economic growth (Demirgüç-Kant & Klapper, 2012). Financial inclusion

¹ World Bank. (2014). Financial Inclusion (Vol. 133). Retrieved from <http://doi.org/10.1016/j.sbspro.2014.04.203>

leads to female empowerment (Ashraf, Karlan, & Yin, 2010).

Continuing showing the importance of financial inclusion, Demirgüç-Kant said that access to the formal financial system can increase asset ownership and serve as a catalyst to greater economic empowerment among women (Demirgüç-Kunt, Klapper, & Singer, 2013); Financial inclusion brings many welfare benefits to individuals (Allen, Demirgüç-Kunt, Klapper, & Peria, 2016); building financially inclusive societies can lead to reduction of income inequality (Pais, 2011); financial inclusion is important for improving the living conditions of poor farmers, rural non-farm enterprises and other vulnerable groups (Dev, 2006);

Much of literature has shown financial inclusion worldwide. Examples include: Understanding financial inclusion in China (Fungáčová & Weill, 2014); financial inclusion in north-east India (Bhanot et al., 2012); Financial inclusion and social financialisation: Britain in a European context (Stephen Sinclair, 2013); Consulting the community: Advancing financial inclusion in Newcastle upon Tyne, UK (Fuller, Mellor, Dodds, & Affleck, 2006); Financial inclusion of the poor: from microcredit to Islamic micro financial services (Hassan, 2015); Financial inclusion and its determinants: evidence from India (Kumar, 2013); Integrating financial inclusion and saving motives into institutional zakat practices: A case study on Brunei (Md, 2015) to cite little.

In Africa researches on financial inclusion have been conducted for a continent as whole.

For example: Financial inclusion in Africa (Triki & Faye, 2013). Not only Triki & Faye but also Demirgüç-Kant & Klapper wrote on financial inclusion in Africa (Demirgüç-Kant & Klapper, 2012). To the best of researchers knowledge, there is no scientific research conducted about financial inclusion in Rwanda.

According to the Finscope survey in Rwanda conducted in 2008, only 14% of adult Rwandans were formally banked (Finscope Rwanda, 2008). This has led to setting strategies of improving financial inclusion in Rwanda. As said by Triki & Faye, financial inclusion is necessary to ensure that economic growth performance is inclusive and sustained (Triki & Faye, 2013). This paper has the purpose of showing financial inclusion in Rwanda. It is significant for decision makers especially the government of Rwanda, as it highlights the real image of formally banked adults in Rwanda and non-banked, the formally financially inclusive and informally financially inclusive. This will help in making decisions based on real facts. It is in this regard that this paper attempts to show the overview of financial inclusion in Rwanda. To achieve this general objective, the following specific objectives were formulated:

To know the number of formally banked adults in Rwanda from 2011 to 2015; To identify the number of adults in Rwanda with credits at a regulated institution from 2011 to 2015; To identify the number of modern payment users in Rwanda from 2011 to 2015.

This paper is divided into Abstract, introduction and literature review, data and methodology, results and finally conclusion and recommendations.

2 Data and Methodology

Secondary data from Finscope 2008, 2012 and 2016 were used in this research. Finscope is an independent survey conducted after each four years for the purpose of knowing the financial inclusion in a country. This is approved and published by the National Institute of Statistics in Rwanda and it is on its official website. The same surveys are approved by Banque Nationale du Rwanda. In addition to this, data from Banque Nationale du Rwanda were used in this paper. Monetary policy and financial stability reports were used for the year 2011 to 2015. The five years were chosen because there was a reform supporting access to finance in Rwanda which resulted in starting UMURENGE SACCOs.

3 Results

As said above, data used in this research are secondary data from Banque Nationale du Rwanda and Finscope reports. Finscope Rwanda was conducted for the first time in 2008. The second was conducted in 2012 and the third was conducted in 2016. Finscope Rwanda 2008 revealed the following: only 14% of adult Rwandans were formally banked. That is only 518,423 people among more than 3.7 million adult people¹.

In addition to this, Finscope 2008 revealed that: More than half of the Rwandan adult population

(52%) manage their lives without using any kind of financial product (formal or informal). This is to say that 52% of Rwandans were financially excluded. More than half (54%) of the 47% of Rwandan adults who used financial products, used informal products.

¹ FinScope Rwanda survey 2008

Over the four years, an improvement has been done to have more financially included citizens in Rwanda. This is highlighted by Finscope 2012.

Financial exclusion has dropped by 46% since 2008.

1) In 2008 52% of adults (i.e. individuals 18 years or older) were financially excluded; in 2012

28% (1.3 million adults) are excluded and 72% (3.2 million adults) of Rwandan adults have or use financial products or mechanisms.

2) In 2008, 21% of adults were formally served; this proportion increased to 42% in 2012.

The increase in formal inclusion was caused by an uptake of banking products, and of products offered by non-bank formal financial institutions (such as Umurenge SACCOs and insurance companies).

3) The banked population increased from 14% of adults in 2008 to 23% in 2012.

4) The establishment of Umurenge SACCOs has significantly changed the landscape of formal access in Rwanda. This intervention has been successful in providing formal financial services to Rwandans who would otherwise not use formal financial services.

5) 22% of adults benefit from Umurenge SACCO products¹.

As shown by highlights of Finscope 2012, there was an improvement in financial inclusion from 2008 to 2012.

Finscope 2016 shown a tremendous improvement of financial inclusion in Rwanda.

Following is the summary of Finscope 2016:

In total, 89% of adults in Rwanda are financially included (including both formal and informal financial products/services, around 5.2 million individuals). About 68% of adults in Rwanda have/use formal financial products/ services (around 4 million individuals), including banked and other formal (non-bank) financial products/services. About 26% of adults in Rwanda are banked (around 1.5 million individuals). About 65% of adults in Rwanda have/use other formal (non-bank) financial products/services (around 3.8 million individuals). In total, about 72% of adults in Rwanda use informal mechanisms (around 4.2 million individuals). About 11% of adults in Rwanda (around 0.7 million individuals) do not use any financial products or services (neither formal nor informal) to manage their financial lives, i.e. they are financially excluded. Note that financially excluded citizens are more in villages than in cities (FinScope, 2016).

All the above are summarized from Rwanda Fin scope survey 2016. As said by Gwalani, it is important to understand that a person with a reasonable access to all essential financial services is considered 'financially included' and merely one off access to some financial services for the sake of fulfilling the mandate of financial inclusion does not construe inclusion in the true sense (Gwalani & Parkhi, 2014).

Considering this, it is clear that only 26% of Rwandans are having bank accounts. Through bank accounts people can get bank loans, this means that 74% are not even eligible for loan application. Other formal (non-bank institutions) users are 65% and the informal users are 72% of adult population in Rwanda. Concluding that only 11% are financially excluded as said by Finscope report will be misleading. That depends on the definition given to financial inclusion. As many authors link financial inclusion with bank account holding, then only 26% would be considered as financially included.

The numbers that are shown in Finscope surveys are not sufficient to conclude that Rwandans are financially excluded or not. For this reason, data from Banque Nationale du Rwanda from 2011 to 2015 have been used for deep analysis of financial inclusion in Rwanda.

Formally banked adults in Rwanda

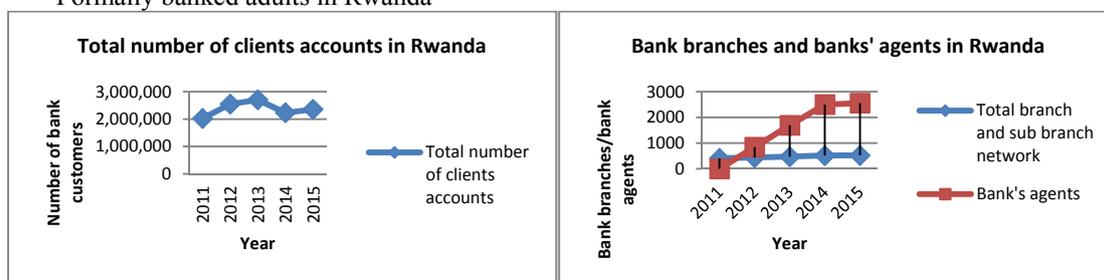

Figure 1 Number of Clients' Accounts, Branches and Sub Branches and Number of Banks' Agents

Source: BNR financial stability report 2011 to 2015

¹ Idem

Many authors defined financial inclusion as access of financial services to the poor¹(Bhowmik & Saha, 2013);use of formal accounts(Allen et al., 2016).Based on this we have shown the accounts penetration in Rwanda from 2011 to 2015.As shown in figure 1, the number of Rwandans having bank accounts was 2,026,738,which increased by 26% in 2012 and 6% in 2013.The number of accounts decreased by 17% in 2014 and increased by 5% in 2015.The total number of accounts holders in 2015 is 2,355,008.Branches serving these customers have been increasing over the five years but at a very low lever as shown in figure 1.The number of branches and sub branches was 408 in 2011;438 in 2012; 471 in 2013; 515 in 2014 and 521 in 2015.The agency banking which started in 2012 have increased over the 4 years as shown in figure 1 (b).Banks’ agents were 844in 2012; 1,696 in 2013 ;2,499 in 2014 and 2,555 in 2015.These agents continue to support financial inclusion in Rwanda as they reach regions that cannot be easily reached by banks.

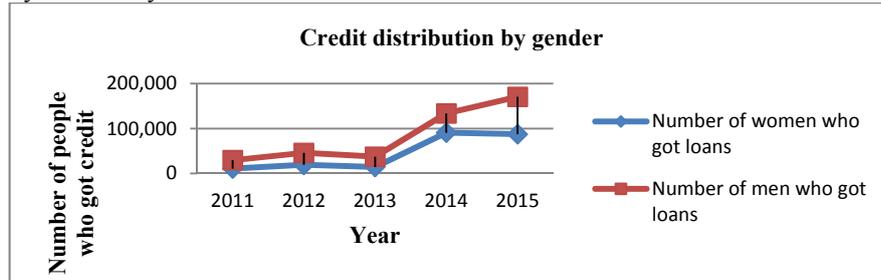

Figure 2 Credit Distributions by Gender
Source: BNR financial stability report 2011 to 2015

One of the main indicators of financial inclusion is access to loans. In Rwanda, the number of men who get loans is greater than the number of women. In 2011 the total number of customers who got loans was 40,515. Women who got loans were 10,920 i.e. 27%. The number of women who got loans continued to increase over the years but still are less than the number of men who got loans. These were 27%,30%,28%,40% and 34% from 2011 to 2015 respectively.

Figure 3(a) shows that the number of automatic teller machines kept on increasing from 2011 to 2015.The number of point of sales kept on increasing as well. We cannot say that these machines are enough as they were only 385 in a country of 26,338km².Looking at figure 3 (b), it is the number of debit cards kept on increasing but still this number is too low in comparison to the total number of bank accounts. In the year 2015, the number of debit cards were 650,924 while the total number of clients accounts was 2,355,008 that means only 28% have debit cards. The number of credit cards is too low and not increasing from2011 to 2015.

¹ Bhowmik S. K. & Saha D. Financial Inclusion of the Marginalised (First edit). New Delhi: Springer 2013. Retrieved from <http://link.springer.com/10.1007/978-81-322-1506-6>

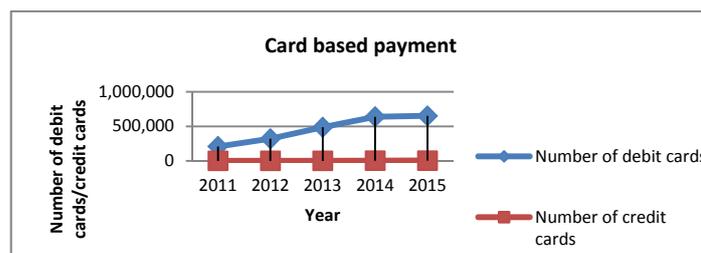

Figure 3(b)

Figure 3 Credit Based Payment

Source: BNR financial stability report 2011 to 2015

Table 1 Mobile Financial Services and Internet Banking Developments

Year	2011	2012	2013	2014	2015
Number of accounts for mobile payments(subscribers)	639,673	1,440,541	2,538,651	6,480,449	7,663,199
Mobile banking users	155,986	297,537	412,007	659,712	828,799
Internet banking users	NA	3,411	8,869	29,840	36,597
Number of Transactions with mobile payment	4,323,490	22,191,674	57,147,777	104,773,115	168,612,455
Number of transactions with Mobile banking	527,300	1,458,063	2,538,820	4,637,849	5,617,368
Number of transactions with Internet banking	1,494	10,036	89,260	312,262	566,152

Source: BNR financial stability report 2011 to 2015

The above table shows the comparison of use of Mobile money, mobile banking, internet banking and respective number of transactions for each. It is clear that the number for mobile payments have increased from 639,673 in 2011 to 7,663,199 in 2015. This shows an improvement in mobile banking. This has contributed at a great extent to showing that financially included Rwandans increased up to 89%.

4 Conclusions

The main objective of this paper was to show the overview of financial inclusion in Rwanda. Through reports of the three Fin scope surveys in Rwanda for 2008, 2012 and 2016, we have found that there was an improvement in financial inclusion. In 2008, 52 % of adults Rwandan were financially excluded. The number decreased to 28% in 2012 and 11% in 2016. Looking at these numbers only will lead to say that there is a great improvement in financial inclusion in Rwanda. But considering the fact that banked adults did not increase at the same extent, it is seen that Rwanda still have a long way to go as far as financial inclusion is concerned. Only 14% of adults in Rwanda were banked in 2008, 23% in 2012 and 26% in 2016. This shows that although many people are claimed to be financially inclusive, most of them don't have access to banks. This is a problem that can lead to slow development. Mobile payment got many users as compared to any other payment method. This should be innovated to help this number of users to have access to more services. The government of Rwanda should continue the good initiative of encouraging people to open bank accounts and save as well as borrow for their development. In addition to this, policies should be set to regulate mobile payment as it serves many Rwandans. Innovative financial products should be developed to reach financially excluded citizens and fully serve the informal financially included.

Abstract: With the flow of emerging information dissimulation channels and data generating models such as social networks and cloud computing, the sudden explosion of information and data models witness the emergence of Big Data Era. In this era full of opportunities and challenges, universities must take advantage of big data technology to innovate university funding programs and systems to improve funding work with better reasonability, pertinence and efficiency so that funding programs can be given full play to education. In this article, big data mindset is applied to university funding programs and specific proposals for innovation i.e. The platform construction, personnel training, system construction etc. to get funding work out of current predicament.

Key words: Big data; Innovation; University; Funding

1 Introduction

With the constant advancing of information technology, data is expanding and acclimating at an unprecedented speed, which witnesses the coming of big data era (Xiaofeng Meng,2013). In February 2011, the special journal “Dealing with Data”¹ by Science elaborates on the importance of big Data for scientific research. In the report “Big Data: The Next Frontier for Innovation, Competition, And Productivity” (Manyika J,2011) released by world famous consulting agency McKinsey June 2011 gives a detailed analysis of the influence of big data in application for key technology fields. The report “Big data, big impact: New possibilities for international development” (Schwab K,2012) released on Davos World Economic Forum in Jan 2012 analyses how to make use of big data to generate better social benefit in the era of big data. In 2014, Big data appears in the Chinese government work report from NPC & CPPCC for the first time, which indicates China has raised the importance of big data to national level. Big data technology can obtain valuable information from various data quickly. Through technology innovation and development, we can have overall perception of data, collection, analysis and sharing to help people with decision-making behaviors (Jie Ji,2014). As big data technology is still at emerging phase, it's not applied widely yet. As the frontier for new ideas and new technology, universities will undergo profound influence by the spurge of big data in all aspects. Out of which, how to innovate funding work both in theory and in practice will be an important research priority.

2 Difficulties in Current University Funding Work

As an important measure to ensure equals rights to education, only by promoting university fund work in a healthy way, can we ensure students from disadvantaged families to enjoy equal rights to education. The key content of university fund work is to help the most needy students within limited resources (Qiang Tao,2015). However, a range of factors lead to difficulties in current university funding work.

2.1 Under-staffed for university funding work

University students with financial difficulties come from all over the country with complex family background. When it comes to funding policies, it entails a lot of details, but university funding is generally under staffed, it's hard to know about every students' family situation to optimize funding strategy for each student.

2.2 Incomplete information construction platform of university funding

With constantly endeavor, information construction in China Universities has achieved some progress but still faces issues like lack of overall planning and obscure service goals (Junqing Tao,2015). In most provinces and cities, universities set up their own management funding systems out of their need and usage conventions, the uniformed data standard and content in these different systems can't be shared which constraint interconnection among systems and hinder efficient application for those

¹ Science.Special online collection: Dealing with data [EB/OL]. [2012-10-02]. <http://www.sciencemag.org/site/special/data/2011>

funding data. Besides, students and staff have to switch over among the existing systems which can't be shared, not to mention to enjoy the convenience and efficiency of informatization (Xiaofeng,2015). On the other hand, in some universities information platforms are designed from university managerial perspective, more about propaganda and statics, less about students' practical usage and demand. Meanwhile, no innovation in mechanism and mode by integrating internet resources are involved in designing the platforms. These platforms are just electronic version of paper materials which burden users instead.

2.3 Imperfect verifying criteria system for students with financial difficulties

A reasonable and manageable criterion for students with financial difficulties is the precondition for university financial support. Currently, under the auspices of the joint report from Ministry of Education and Ministry of Finance, Instruction for verifying criteria of university Students with Financial Difficulties in earnest, universities from all provinces release verifying measures of students from disadvantaged families. The Family Financial Compliance Questionnaire with Bureau of Civil Affairs stamp from students' residential district serves as a main reference in together with student's personal statement and democratic evaluation on students' family background by teachers and students (Donghong Wang,2014). But the questionnaire can't guarantee the authenticity of the financial status and personal statement and democratic evaluation from teacher and students tend to be subjective. Under the imperfect verifying criteria systems, inaccurate verification cases occur now and then.

2.4 Difficulties in guiding students from disadvantaged families

Under financial stress, external circumstances can affect lifestyle and concept of value of students from disadvantaged families, sometimes this mindset can turn into inferiority. In interacting with other classmates, some students would get too sensitive proud as to disguise themselves, some even have a attitude and lifestyle that their financial ability can't support. On the other aspect, some students develop dependence psychology on the subsidy from government, society and university, they even take advantage of being poor and take the subsidy as granted. Not being gratuitous, some grumble if less subsidy is granted. As current subsidy pattern is to only grant a fixed allowance to students without proper educational guidance, the goal of funding for education is hard to achieve.

2.5 Lack of continuous follow-up management for students from disadvantaged family

Currently all sectors of society are actively involved to promote a fair and just education environment in which students can focus on their study without worrying financial issues. However, most funding work focus is laid on evaluation before the release of stipend, once stipend is granted, there is no follow-up afterwards. Thus, students' obligation for contribution to society is neglected. Worse, some students with financial difficulties don't study hard instead they fall far behind. Some just indulge themselves in pleasure by arbitrarily squandering the stipend, some obtain the stipend in a fraudulent way in disregard of creditability and obligation of contributing to society. Therefore, without follow-up management action for the aided students and without established code of conduct and constraint mechanism, it's hard for those students to build up grateful and enterprising spirit which goes against the goal of funding.

3 The Significance of Big Data for University Funding Work

3.1 Innovation for data access to sponsored students method

University funding work can be reevaluated in the perspective of big data technology—all related data about the sponsored students should be gained. Traditionally, evaluation mainly relies on non-qualitative measures such as, documents certification, and funding staffs' experience. Usually, recipients' information is not accurate enough that some students from disadvantaged families can't get stipend due to policies or procedure formalities. With the big data, every student's information can be tracked, recorded and analyzed, such as grades, attendance rate, frequency of borrowing library references, hours of voluntary service, living expense in campus and seminar attendance etc. Through tracking students' behaviors in a comprehensive way, multi-evaluation on students can be conducted and more accurate picture of students' family financial condition, personal characteristics, learning attitude and mental status etc come to clear. University can also monitor students' dinning and daily expenses to further integrate relevant information so as to reach out to students who really need customized financial aid in time.

3.2 Innovation for data collection mode

Big data technology can minimize the false data effect on real situation and effectively prevent some inaccurate data affecting the final result. Traditional funding work features in sifting and checking

materials provided by students. Due to limited quantity and ineffective verification measures, some false data can hardly be detected that leads to mistakes and unjust results. In application with big data technology, by collecting instead of checking data, students' correlative data like cash flow, frequently visited locations, online consumption, social network can be fully analyzed in time. With this comprehensive analysis, the specific false data effect on funding work is reduced to minimum level.

3.3 Innovation for fund resource distribution

Big data technology can effectively mine multivariate data and demonstrate relative financial status of all students in the same campus. This totally changes the traditional funding policy by checking application paperwork submitted by students with financial difficulties and can ensure financial aid granted to the most needy students accurately within limited resources. In the old-fashion way of evaluating family financial status, orphans or children of revolutionary martyrs can enjoy priority according to national policies, but those students may not be the most needy recipients, instead some in real hard situation may not be able to receive enough stipend. Even though it's almost impossible to be absolute fair, but reasonable distribution within limited resources is one core of university financial aid. With the application of big data technology, students with financial difficulties can be effectively identified and reached out to with reasonable aid.

3.4 Innovation for educational guidance mode

Big data technology can track and process multi-type data and analyze students' behavior patterns in different situations so as to come up the most beneficial development pattern for students in any circumstances. With effective educational guidance to students and in-time intervention in abnormal cases, funding for education effect can be enhanced. Based on the data of sponsored students such as character, grades, hobbies and skills, university can provide them proper career instruction and proposals, internship recommendation when granting financial aid. With proper career planning and guidance, the employment rate of sponsored students goes up and they can make better for their future themselves, which is the gist of funding for education.

3.5 Innovation for assessment system of funding work

Big data technology can help better track development situation of sponsored students and achieve quantified analysis hereafter which can serve as an assessment basis for university funding work. Big data technology can give full play of evaluation system's encouraging and inspiring functions and guide university to optimize funding work and realize the philosophy of funding for education. Traditional funding work assessment involves institution set up, resource input, stipend distribution, social effect etc, which can't not reflect sponsored students' development progress. Funding work promotion does not equal to students' progress. Therefore, sponsored students' performance, like grades, awards, paper publication, graduate recommendation, work-study, community service, start-up activities, disciplinary action etc. should be included into student development assessment system. By deploying big data technology, a picture of sponsored student progress shows up, which is also an index for funding work assessment to propel the funding work forward.

4 Application of Big Data in University Funding Work Innovation

4.1 Establishment of information management platform based on Big Data technology

Application of big data comes along with an infrastructure that meet the requirements of big data technology application. This infrastructure is highly reliable, manageable and secure for data integration and concentration. University funding staff should enhance knowledge of big data technology and emphasize the connections among students' data. By mastery of big data and actively improve their analysis skills, funding staff can not only gain more reliable information about students but also adapt themselves better to work requirement in the era of big data (Hui Wan,2014). Universities should build up the infrastructure according to big data era, improve the infrastructure platform and properly manage the logic of up-to-date and historical data, coordinate the technological convergence of statics actuarial and data mining, fully tap the value of relevant historical data, and proactively enhance data analysis capabilities with big data technology, establish a unified student information management platform, transform thinking patterns and emphasize big data strategically to promote university funding work advancing continuously.

4.2 Cultivating interdisciplinary personnel with Big Data skills

Big data technology entails technicians to participate in infrastructure construction, data analysis, system maintenance and also data conclusion and interpretation. With the conclusion from the data, technicians need to understand departments inter-relationship and work flow to customize a feasible

management and evolution funding system for the university. With the new challenges and requirements, universities need to build a professional team for data application and management and cultivate professionals in big data application field systematically to foster integration of advanced technology and funding work. Meanwhile, universities need to enhance funding staffs' big data awareness and technical skills, have training courses like statics and internet technology to cultivate staff with funding expertise and big data skills.

4.3 Improve the information management system in era of Big Data

Big data means massive data out of which most data involves people's privacy, thus it's necessary to establish a specific management system for data. Security comes first when university processes and analyzes big data. When processing external data, distributed cloud computing comes to play for pre-preprocessing data to prevent leakage. For internal data processing, there are some polices to follow to prevent leakage: specific computer for specific purpose, strengthen the information responsibility implementation, enhance information security training, promote information security awareness, improve emergency response mechanism and pre-alert for information security, Standardize the use of big data method and process, intensify routine supervision for key field database (Rongbing Zhong,2014). In era of big data, university funding staff should establish a comprehensive standard flow for data processing based on previous experience. By regulating data processing and usage, all departments from the universities work together to ensure funding work move forward (Rui Zhang,2014).

4.4 Establishment of fund evaluation mechanism based on Big Data

Application of big data technology helps university funding workers to gain more authentic and comprehensive understanding of students, to promote and follow up student' development, which should be the purpose for fund evaluation mechanism. With big data application, quantitative analysis for development can be conducted on sponsored students which serves as the basis for evaluation funding work output. This analysis work together with agency construction, resource input and funding implementation as an evaluation mechanism to help fund workers to achieve goal of helping and education students.

5 Conclusions

Compared with traditional data analysis mode, big data technology can carry out effective analysis on massive data with unparalleled advantage. University funding workers should keep up with the big data era to improve big data technology application skills and make innovation of work methods. While protecting the rights of students from disadvantaged families to equal education, university funding workers can better achieve the goal of funding for education. In this article by stating difficulties in university funding, analysis is conducted on significance of big data application in university funding for innovation while also demonstrating of application cases. Currently big data technology application is still under groping stage, the specific methods for integration of big data in funding work are still relies on relevant experts and scholars to further study.

Abstract: In this paper, a method of evaluating the value of electronic commerce enterprise based on EVA is proposed. It is considered that the reasonable value of the electronic commerce enterprise has become an urgent problem to be solved, and the evaluation model of evaluating enterprise value is built. According to the case analysis method, the electronic commerce enterprise value evaluation method based on EVA is applied to the enterprise value evaluation of eBay company, the applicability of the model is tested, and the conclusion is drawn that the value of electronic business enterprise can be evaluated reasonably.

Key words: Electronic commerce enterprise; Value evaluation; EVA; eBay

1 Introduction

Electronic commerce refers to how to use Internet to establish the enterprise internal management activity, and to keep the coordinated with the business development of electronic commerce activities. Due to the higher proportion of intangible assets of e-commerce enterprises, innovative, high risk and high income characteristics, it is difficult to apply to the evaluation method of the electronic commerce enterprise, which makes the evaluation method suitable for the traditional manufacturing industry. How to evaluate the value of electronic commerce enterprises, and to obtain the reasonable value of the electronic business enterprise has become an urgent problem to be solved.

2 Literature Review

2.1 Research status in abroad

Roger. Maureen Rogera and Cheryl. Jerry, in the value of the company (enterprise management publishing house, 2002), introduces the American popular evaluation methods: discounted cash flow method, comparison method, real options evaluation method. The book introduced the discount cash flow method, and according to different evaluation objects and the availability of financial data, divided into free cash flow, cash flow rights and adjust value method.

Voss. Odamo to let in the in-depth evaluation (Peking university press 2005), mainly introduces the technology company's value evaluation method, the author in view of the emerging technology company's sales revenue growth speed but not the phenomenon of profit, by adjusting the capital spending, operating income, capital flows, such as concept, makes the evaluation for technical company. In this book is mainly introduced the discounted cash flow method, the relative valuation method and real option evaluation method, and analyses the control management options, and liquidity, cash flow and investment return at the same time with the introduction of economic added value to the traditional valuation model is improved.

2.2 Research status at home

In China, Run Su (2001) pointed out: when the network enterprise value assessment method can make use of the user value. Because of the development of electronic business enterprise in our country, a relatively short time, lack of financial data, to use some easy determination of statistical data as the standard, the electronic commerce enterprise value assessment is a more realistic choice. Such as web site hits, visitors and search engine data indicators such as volume of receipts.

Zhu Chao (2005), analyzes the influence on the value of e-commerce enterprises, according to the particularity of e-commerce enterprise value factors affecting e-commerce enterprise value evaluation method is proposed, laid a theoretical foundation for the future research work. Fang Xiaocheng (2008) in the traditional evaluation method on the basis of point out its limitation of application in the network enterprise value evaluation. Research shows that: when evaluating network enterprise value, if use traditional evaluation methods, is a lack of data. So, he thinks that the network enterprise customer resources is an important determinant of the network enterprise value, enterprise value assessment network should be combined with theory of customer value. By studying the correlation between

customer and enterprise value network, namely customer resources to effectively promote the development of Internet companies. Value driving factors can be divided into three kinds, namely "customer number", "customer adhesion" and "customer unit income".

Fu Yi, Zhang Ping (2010) wrote the company value assessment and securities investment analysis analyzed in detail the importance of promotion value investment of enterprise value assessment in China's securities market. Ye Caiwen (2010), University of International Business and Economics, master thesis electronic commerce enterprise value evaluation analysis, the core competitiveness of e-commerce enterprises, the traditional pricing model applicability is analyzed.

3 Value Evaluation Model Based on EVA

Based on economic value added (EVA), this paper proposes a method for evaluating the value of e-commerce enterprises. Stern Stewart Company's definition of EVA accounting, enterprise net operating profit after tax (NOPAT) minus the existing capital cost (COC) balance is the enterprise economic value-added (EVA). The existing COC of the enterprise is the product of the total capital (CE) and the weighted average capital cost (WACC). Therefore, the formula can be expressed as:

$$EVA = NOPAT - COC = NOPAT - WACC * CE \tag{1}$$

3.1 Construction process of value evaluation method based on EVA for electronic commerce enterprise

According to the characteristics of the electronic commerce enterprise, the traditional income method based on the EVA theory is adjusted appropriately. E-commerce enterprise value assessment methods to build the flow chart:

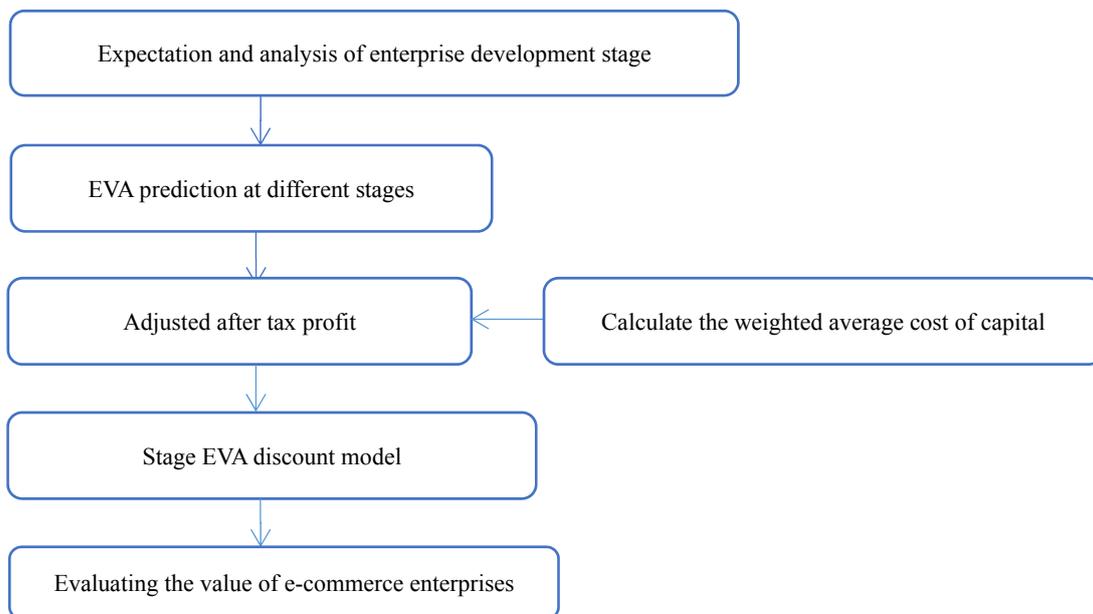

Figure 1 Flow Chart of Construction of Electronic Commerce Enterprise Value Evaluation Method Based on EVA

3.2 E-commerce enterprise value evaluation model based on EVA

3.2.1 The present value of EVA in the unstable growth stage

The period of initial growth and rapid development of electronic commerce enterprises belong to the unstable growth stage. In the unstable growth phase of e-commerce companies have a higher rate of return. The model assumes a growth rate of G, and this growth phase will last for M years. The EVA method is used to evaluate the electronic commerce enterprise in this period, it is necessary to carry out the EVA to get the present value of EVA.

$$P_1 = \sum_{i=1}^m \frac{EVA_i}{(1 + R)^i} \tag{2}$$

Among them: EVA_i represents the expected i year EVA;

R indicates the discount rate;
i represents the expected annual yield.

3.2.2 The present value of EVA in the stable growth stage

After m+1 years of development, e-commerce business EVA growth is expected to stabilize, which marks the company's entry into a stable development period.

The stable growth stage of the EVA present value model is based on the following two assumptions:
1) the sustained growth of the economic value added EVA, the fixed number of years (I) tends to infinity;
2) the economic value added EVA growth rate is a constant value G.

$$p_2 = \sum_{i=m+1}^n \frac{EVA_i}{(1+R)^i} = \frac{EVA_{m+1}}{R-g} - \frac{EVA_{m+1}(1+g)^{n-m}}{(R-g)(1+R)^{n-m}} \quad (3)$$

Among them: G said the fixed rate of growth of EVA;

N represents the number of years of operation;

Assume permanent business of e-commerce enterprises:

$$p_2 = \lim_{n \rightarrow \infty} \left(\frac{EVA_{m+1}}{R-g} - \frac{EVA_{m+1}(1+g)^{n-m}}{(R-g)(1+R)^{n-m}} \right) = \frac{EVA_{m+1}}{R-g} \quad (4)$$

3.2.3 EVA discount model of electronic commerce enterprise

To sum up, the economic added value of the electronic commerce enterprise is the economic value added in the unstable growth stage and the stable growth stage, the formula is as follows:

$$p = p_1 + p_2 = \sum_{i=1}^m \frac{EVA_i}{(1+R)^i} + \frac{EVA_{m+1}}{R-g} \quad (5)$$

In the valuation of electronic commerce enterprises, it is usually used to evaluate the development period of the reference date and to choose the appropriate value evaluation system and model for the future value growth forecast.

3.2.4 Calculate the discount rate

When determining the discount rate, the discount rate must be greater than the opportunity cost of the investment. When the value of the enterprise to assess, focus on the valuation of corporate shareholder wealth, and in the company is expected to profit will be based on the economic value of the enterprise. The so-called discount rate is the rate of return on the investment of the shareholders.

The calculation formula of the discount rate is as follows:

$$R = R_f + \beta(R_m - R_f) \quad (6)$$

Among them: R represents the discount rate;

R_f indicates no risk return;

R_m indicates the market average rate of return;

β indicates the risk coefficient of the industry's equity system.

3.2.5 EVA adjustment

After tax net operating profit (NOPAT) is the business income tax deduction of enterprise income tax, is an important indicator of enterprise management, it can be recognized in accordance with the accounting standards accrual basis and prudent principle. Therefore, the actual work, in accordance with the accounting standards for financial processing, there will be a difference in the actual costs arising from the handling of operations and depreciation and amortization. Enterprise capital income theory will be less than the creation of all created by the corporate earnings, the evaluation of the results of the assessment will not be able to truly reflect the value of the enterprise. NOPAT can be adjusted as follows:

$$\text{NOPAT} = \text{net profit} + \text{bad debt to increase} + \text{last in first out of the stock under the first out of the increase in the amortization of goodwill} + \text{other operating income} - \text{cash business tax} \quad (7)$$

4 EVA Case Analysis - A Case Study of eBay Company

eBay company was founded in September 1995, is currently one of the world's largest network trading platform, for individual users and business users to provide an international network trading platform. Over ninety-five million eBay members from all over the world have traded on eBay and a

pricing auction model, and buyers and sellers are trading on the price.

4.1 NOPAT

2015 for the statutory income tax rate 35%. based on the formula after tax adjusted interest expense = interest expense x statutory income tax rate = 137 x 35% = 48;

Investment income tax = pre tax investment income x statutory income tax rate = 185 * 35% = 65.

Deferred income tax adjustment: excludes the deferred income tax assets from after tax net profit, while the deferred income tax liability increase to add the amount of net profit after tax.

According to the definition of net operating profit after tax, using the formula (7) combined with the actual operation of eBay company and the financial situation, the calculation of NOPAT:

Table 1 NOPAT Calculation (unit: million dollar)

project	2015	2014	2013	2012	2011
Net profit	46	2,856	2,609	3,229	1,801
Profit	2,808	-31	-35	17	350
Increase in bad debt reserves	-4	17	2	1	-16
Increase revenue	30	21	27	14	-3
Return on equity capital	2,834	7	-6	32	330
Interest expenses	123	100	63	25	4
Interest cost	14	14	12	7	6
Adjusted interest expense	137	114	75	32	10
Interest expense tax benefit	-48	-40	-26	-11	-3
Adjusted interest expense after tax	89	74	48	21	6
Loss of marketable securities	-52	-9	-	-	-
Interest income	-133	-111	-134	-111	-87
Pre tax investment income	-185	-120	-134	-111	-87
Investment income tax	65	42	47	39	30
After tax return on investment	-120	-78	-87	-72	-56
NOPAT	2,849	2,859	2,564	3,210	2,081

4.2 Cost of equity capital

The cost of equity capital can be calculated by the method of risk premium.

The so-called risk premium method, refers to on the basis of the bond investment rate of return, a certain increase in equity investment risk premium. The theory of this method is based on the theory of risk and return, the shareholders bear a certain risk of the natural requirements of the corresponding return. In general, equity investors bear the risk of higher than bond investors. Therefore, enterprises must provide higher expected equity for the rights and interests of investors than corporate bonds.

Table 2 The Cost of Equity Capital (unit: million dollars)

	2015	2014	2013	2012	2011
General reporting obligations and leases	8,046	8,046	8,046	8,046	8,046
Equity capital	3,478	3,478	3,478	3,478	3,478
Adjusted total shareholders' equity	22,213	22,213	22,213	22,213	22,213
Securities	-9,322	-9,233	-5,308	-3,502	-2,813
Investment capital	20,937	20,937	20,937	20,937	20,937
Capital cost	11.64%	12.18%	12.08%	12.19%	12.30%

4.3 Economic profit EVA

2015 EVA eBay = NOPAT - capital costs x investment capital = 11.64% - 2849 x 20937 = 412 (million dollars)

Table 3 Economic Profits in the Past 5 Years (unit: million dollars)

	2015	2014	2013	2012	2011
NOPAT	2,849	2,859	2,564	3,210	2,081
Capital cost	11.64%	12.18%	12.08%	12.19%	12.30%
Investment capital	20,937	18,691	20,315	17,016	14,177
EVA	412	582	109	1,135	338

5 Conclusions

More and more electronic commerce enterprises, the instability of e-commerce enterprises can

calculate the economic value added in a single year. The research and development expenses of the enterprise as the capital processing accord with the characteristic of the capital structure of the electronic commerce enterprise, can make the electronic commerce enterprise operator make the decision better, and have certain advantages compared to other valuation methods in the completeness of the parameters, the practicability of the model and the demand of the market .A method of evaluating the value of electronic commerce enterprise based on EVA, hoping to provide a reference value for B2C e-commerce companies in mergers and acquisitions, listed or investors to invest.

Analysis of the Influencing Factors and Countermeasures of the Management of Scientific Research Funds in Colleges and Universities

Wang Yan

Financial Department, Wuhan University of Technology, Wuhan, P.R. China, 430070
(E-mail: 1402798710@qq.com)

Abstract: The management of scientific research funds is an important part of the financial management in Colleges and universities. Under the background that the source of scientific research funding is increasing and the channels are diversified, funding management for scientific research, standardization, rationalization of management become more significant. In this paper, various factors affecting the financial management of the research study by fishbone diagram, and elaborate measures to be taken in the future, in order to strengthen the management of research funding of universities, improve the university autonomy, enhance efficiency of funding research.

Key words: Scientific research funds; Colleges and universities; Fishbone diagram

1 Introduction

Recently, with the rapidly development of Chinese economic, Colleges and universities own more and more scientific research projects, research funding increase greatly too. Recently, an important factor to measure the strength of colleges and universities is the number of scientific research. However, how to strengthen the management of scientific research funds is a serious problem faced by many colleges and universities. How to manage the scientific research funds efficiently, how to use the scientific research funds and stimulate the enthusiasm of scientific research workers, and create more social value, these have become the problems that the university administrators must think about.

2 Research Status

2.1 Overseas research on management of university scientific research funds

Through the research results of domestic and foreign related research funding, found that it is mainly related to four points. First, the source and management; second, control and motivation; thirdly, system associated with the use; fourth, supervision and evaluation mechanism. The experience of the United States, Britain, the Netherlands, Japan and other countries more involved in the macro description, which has a good reference to supervision of research funding for macro-control.

L. R. Jones, Fred Thompson, William Zumeta propose that in the United States, the availability of a scientific research funding must be free competition, so the project's practicality and reality is the key to the funding achieved. (John, Michael, 1996)

G. Altbach Philip, a famous expert in the United States, said: 'the management of scientific research lies in the management of the project contract, and the strict implementation of the funds during the project execution is the essence of the fund management.' (Alison Abbott, 2010)

US experts Tharman said: 'Research Universities fee shall be divided into direct and indirect costs calculation according to the range, and its scope will be specifically defined. The distribution ratio of the cost of the College shall be determined by the state, this will ensure the orderly costs used.' (Jin-Hyo Joseph Yun, 2009)

Since research funding study overseas began earlier and its associated management model, constraint system and supervision mechanism construction has been more mature, there are very few situations such as abuse violations, and thus less use of research funding related research.

2.2 Domestic research on management of university scientific research funds

With the expansion of the growing strength of scientific research and college academic career, research funding for its research system has been basically formed. For some of the key issues has become more unified view, focusing on content sources and expenditures, regulatory university research funding, the process of balance research funding, audit of research funding and so on.

He Defang (2007) clearly pointed out the experience which t China's scientific research institutions can learn form: (1) government supporting as the main channel of access mechanisms. (2) strengthen project management contract. (3) improving the management of funds based on the protection of the law and regulations.

Jiang Zhuo (2011) suggested that the flow of university research funding should be made clear division, and proposed some common problems on the basis of practical purposes.

Cui Huirong, Bao Yang (2010) suggested to improve the audit mechanism of university research funds from the legal policy, budgetary mechanisms, independent and outside the control system, and cultivate professional personnel audit, diversified sources of funding and other aspects.

Shen Yu, Tong Rencheng (2009) found the deficiencies in current research funds management mechanism in universities, though that the evaluation of the performance mechanism of scientific research funds in Colleges and universities should be comprehensive, so as to explore more ways to improve performance.

3 Analysis of Factors Influencing the Management of Scientific Research Funds in Colleges and Universities Based on Fishbone Diagram Method

3.1 Fishbone diagram analysis

A fishbone diagram is the method of finding problem's 'root cause', it can also be called 'Causality Diagram'. It is the use of "brainstorming" and find out the cause and effect benefit by mutual discussion, and according to the correlation, consolidation of structured, coherent, and marked the important factors of the graphics, which is a kind of analysis method see through the nature.

The fishbone usually has three distinctive features:(1) Fishbone diagram is a visual representation of the phenomena observed effect or impact study of the cause; (2) Fishbone can clearly display the inherent relationship between these possible causes; (3) The internal relations fishbone establish are generally qualitative and assumptions.

3.2 The influence factors of scientific research fund management based on fishbone diagram analysis

The distribution of scientific research funds has a wide range of objects; scientific research activities also have a strong professional and uncertainty, which results show a certain lag, so there is great complexity and difficulty in the management of scientific research funds. Scientific research funding runs through the whole process from the beginning of the research project to the transforming into the social productive forces. Therefore, in the management of scientific research funds, often involves many aspects of the problem. In order to study the specific factors influencing the management of scientific research funds in Colleges and universities, this paper analysis the influencing factors by fishbone diagram. The factors affecting the management of scientific research funds in Colleges and universities are mainly divided into four types. Namely, from the system, uncertainty, management efficiency and the use of funds to explore the management of scientific research funds to explore the impact of factors, as shown in figure 1:

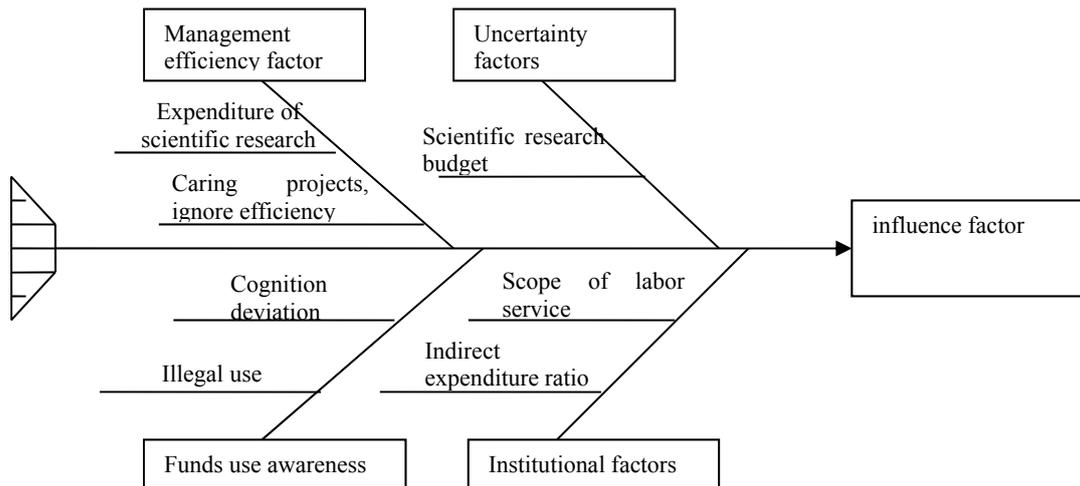

Figure 1 Fishbone Diagram of Effects of University Research Funding Management

3.3 Institutional factors in the management of scientific research funds in colleges and universities

3.3.1 Accuracy of scientific research funding budget

The first principle of management of scientific research funds is earmarked, all funds must comply

with the budget. But because the budget is planned in advance, and tends to be more and more strict, not only to list the project content using the budget, but also to added the strict timetable, which makes some researchers at a loss.

For many researchers, the project budget is a matter of trouble, not only reflected in the complex and cumbersome forms of writing. At present, the research budget need to be list, but the rule contains only a limited number of economic classification, such as equipment, materials, processing and test of travel, meetings, services, expert consulting fees, international exchanges and cooperation, management and so on. However enumerated type method can't exhaust realistic research activities, some expenses belong to the research but without budget accounts are excluded from the budget accounts and beyond the scope of funds use. And the classification of economic subjects such as equipment costs, required to detail the name of the device, the purchase price, etc.

The same to the material cost. It is difficult to predict the number of specific needs and unit price because of the various types of test materials. Science and engineering teachers often said that do the test has never been one-time successful, once the test fail, you have to start from beginning, which need to invest in new raw materials, reagents, etc., so the original budget is likely to double.

3.3.2 Limitation of labor expenditure

May 2015, the newly revised "National Natural Science Foundation of China fund management approach" expanded expenditure range of labor costs, increased no wage income of temporary staff employed. But all items are not allowed to the wages of members of the project group, namely the members of the project group can't have any service fee, and if hire other members of the project group temporary, they should volunteer because of their wage income, so invite the members of the project group is not easy. This limitation artificially fragmented the link between the scientific research work and reward, make the normal rules of labor reward, economic incentive impossible to play a role in the scientific research activity.

Or indeed, labor proportion of scientific research personnel budget will be "self-handicapping." Although the teachers know that there is no upper limit, but do not dare to plan with an enlarged, fearing that the high proportion of projects would not approved by the audit and will be cut and delete. But more important reason is that the expenses does not go out much spent. General pay the master's ¥800 per month, Dr. ¥3000 per month. Therefore, when the project budget is reported, it is still controlled by only 10 percent to 15 percent of the proportion of the cost of labor.

At the same time, the National Social Science Fund and the Ministry of Education, Humanities and Social Sciences made strict rules in the proportion of labor costs account of the total funds, major projects is limited to 5 percent, other projects is 10 percent. At fact, it is 'low' in some cases, the labor costs of specialized personnel who are paid to maintain the daily operation of the project. While labor costs which paid to specialized personnel who maintain the daily operations of the project is actually 'low'. The basic disciplines of humanities research projects mainly rely on mental and manual. Because the vast majority of projects require manual collection of data, and there are a large number of basic data collection and finishing work can't obtain invoices to reimbursement. Some researchers have no way, in specific aspects of financial reimbursement, they take various methods arbitrage funds. It has happened a joke that of a project to buy a thousand boxes of paper in the audit.

3.4 The uncertain factors in the management of research funding

In 2011, the "Adjusting the National Science and Technology Program and certain provisions of the public service industry research and special funds management approach on notice" is promulgated, which is the first time indirect cost appear. Performance expenditure reflects the mental compensation for scientific research projects, but the scale and scope of spending are limited. Internationally and generally, implementation of indirect compensation system more compensate necessary cost of human source which undertake major scientific research tasks of the country, rather than simply providing equipment and housing, water, electricity, gas and other related management costs for the project subsidy expenditures, as well as performance costs and other.

3.5 The efficiency factor in scientific research funds management

3.5.1 Problems in university research expenditure

University research funding in terms of expenditure, due to the dispersion of its scientific research resources, unreasonable funding, innovative funding mechanisms are not perfect and other reasons, not achieve the expected efficiency of scientific research funds. Scientific research resources are not shared in all areas, and the utilization rate of equipment and instruments is low. Although some research programs, scientific research has established a search system, but it is a small part, most of the resources

are still repeated and serious waste. Although there are relatively more funds in some popular areas, there are also many issues that need to be invested, and there is a fierce competition, which is not conducive to the research of scientific research personnel. For innovative funds, financial funds only according to the mode of innovation and stage to give financial support, not from the various aspects of the chain of innovation and effective convergence, which result in funds can't be effectively configured.

3.5.2 Pay attention to the project establishing, and ignore the efficiency

If the performance management of scientific research funds can be effectively implemented, it can avoid the waste of a part of the funds. At present, the performance evaluation of scientific research funds in colleges and universities is still in the exploratory stage, there are few places to carry out performance evaluation. There is a long way to go in order to solve this problem, which is to pay attention to the problem of establishing and neglecting efficiency.

3.6 The awareness factor in scientific research funds management

3.6.1 Research group has the deviation of the understanding of scientific research funds

The research group members and the management of some departments are always lack of scientific research funds management practices related to the university, or not equipped with financial staff to guide the research process of the expenditure, or deliberately misinterpreted scientific research funds. Project Leader's understanding of nature of research funding will be biased, that the provision is a member of economic subsidies to the research team, is a source to improve the income level, is the way to improve the material life level of the project team members. It is because of the nature of the understanding deviation of scientific research funds, that resulting in some scientific research funds become personal consumption fund of the members of the project group. Spending a considerable part of personal consumption from research funding, resulting in some of the research funding is not really applied in the research of scientific research.

3.6.2 Illegal use of project funds

The establishment of the accountability system of China's scientific research funds is still not perfect, although the supervision system has been established for the use of scientific research funds management. But without illegal costs, recently in the audit process, the misappropriation, misuse of false claims and other illegal action of scientific research funds not drastically reduced, the scientific research personnel have not been more effective.

4 Countermeasures to Improve the Management of Scientific Research Funds in Colleges and Universities

Factors Affecting College research funds management effectiveness are varied. It is necessary to improve research fund management from the following in order to improve the efficiency.

4.1 Perfecting the actual demand system in the management of scientific research funds in colleges and universities

4.1.1 Establish a scientific and rational budget management system

In budget management of university research funding, it is more scientific and reasonable to work together by scientific research management department, financial management department, project responsible person. Scientific research management department should establish a unified management system of scientific research funds, develop a reasonable and workable budget process. Accounting department should provide financial services and financial supervision, enable researchers to obtain financial information in a timely manner to prepare a more scientific and reasonable budget.

In the other side, it is necessary to simplify the project budget management, dilute the details of the control. Scientific research project budget preparation should not be sloppy, which can be divided into several categories, and allows the adjustment in the various categories. In basic research, the major cost of natural science projects is the purchase of research equipment, and social sciences should be research and data collection, humanities are mainly books and data finishing, so the management system of scientific research funds shall be arranged separately.

4.1.2 Expand the scope of labor expenses

Wang Yanjue, director of the Department of science and technology of the Ministry of Education said that "The use of scientific research funds to encourage scientific research team did not play out. Foreign labor costs accounted for 50% of research funding, in addition to the use of subsidies for graduate students, more is to be used in full-time researchers, postdoctoral, visiting scholars and laboratory technicians. This is the reason why many universities in foreign countries have a high level and stable scientific research team."

Therefore, the domestic colleges and universities should also conform to the trend, gradually relax the labor expenses scope and scale according to rules. Let graduate and grassroots researchers more benefit from research funding, inspire the scientific and technological workers to innovate and optimize the academic environment.

4.2 Strengthen the uncertainty analysis of the use of scientific research funds

It is an effective way to increase the proportion of indirect costs and to broaden the scope of expenditure by referring to the international practice and domestic related experience. To improve the proportion of performance, because the proportion of personnel costs is to recognize the value of talent and intellectual labor. To innovate the mode of distribution and improve efficiency, colleges and universities should co-ordinate the scope of scientific research expenses. At the same time to realize the incentive, management of research funds should also play a role in the formation of a stable scientific research team, give greater autonomy to the scientific research team.

4.3 Strengthen the management of scientific research funds in Universities

4.3.1 Establish information sharing platform to avoid duplication of investment research

The whole country should establish a unified scientific research project database and research project information sharing platform. In compliance with the provisions of national security conditions, the information of financial supporting scientific research projects should be involved into the database, from the declaration, review, approval, implementation and acceptance. Integration of all kinds of scientific research project information, can facilitate the scientific research personnel and scientific research management personnel to understand the information of the national research projects, avoid the waste of investment and repeated research, so as to improve the efficiency of the use of scientific research funds.

4.3.2 Establishing performance evaluation system of scientific research expenditure

The ultimate goal of the management of scientific research funds is to improve the efficiency of the use of funds, the scientific evaluation of scientific research and its use efficiency is an important basis for measuring the level of scientific management of funds. On the conduct of performance evaluation to research funding can effectively avoid the use of funds in violation of discipline phenomenon.

4.4 Raise the understanding to the scientific research funds of the research group and the management department

4.4.1 Group members should correct the attitude of scientific research funds

Task group members should correct attitude at first, clear that special funds and horizontal research funding is devoted to scientific research with special purpose or special purpose funds, is not a source to raise the income level of the research team, is not the way to improve the material life level of the project team members. So the group leader and the members of the project group shall not be misappropriated and research funds, not expend research group rewards from the project, not expend personal consumption in research funds etc. The research team should thoroughly study and implement the relevant measures for the administration of national research funding, with rigorous scientific attitude towards scientific research funds, so that research funding in the scientific research to play a benefit.

4.4.2 Establish the system of accountability for the use of scientific research funds

Our country should establish and perfect the evaluation system of the efficiency of the use of scientific research funds in Colleges and universities as soon as possible. Based on the evaluation results, implement the accountability system and policy of incentives advanced and spur backward. The accountability system shall include all personnel in the use and management member of scientific research funds, including the task group responsible person and the member of project undertaking unit, and it also includes the accounting firm to perform the audit issues related to scientific research funds, to participate in the field of scientific research funding and the acceptance of experts and other relevant personnel. Establishment of the system of accountability for the use of scientific research funds in colleges and universities, achieve the goal of management tasks, strictly prohibited misappropriation and other illegal behavior, ensure the standardization and effectiveness of scientific research funds, and accept social supervision.

5 Conclusions

The management of scientific research funds runs through the whole process of scientific research work. Therefore, it is required that colleges and universities should comprehensively improve the level of scientific research management, continuously enrich the management, strengthen learning, train

modern management capabilities, update the traditional management concepts, improve the efficiency of scientific research funds, to promote the sustained and rapid development of scientific research work in Colleges and universities.

Selection Criteria of Software Packages for Projects Accounting

Victoria Lucas Mkonya

School of Management, Wuhan University of Technology, Wuhan, P. R. China, 430070
(E-mail: vmkonya@yahoo.com)

Abstract: The emergences of software packages have increased accountability in projects organization. The challenging part of an organization is the selection of these software packages that meet an organization's needs. Users of these software are facing difficulties in locating and selecting the software package that best suits their particular needs. Selecting the wrong software packages may impact the project financially which might lead to financial losses, and possibly even bankruptcy. The purpose of the study is to review the factors for selection of software packages for project accounting and how they contribute to the accountability and sustainability of the organization. This study conducts an interview in different projects centering on non-governmental organizations (NGOs) determining the factors on selection of software package for project accounting and thematic analysis was employed for data analysis. The findings reveal the criteria for selection of software package, importance of considering criteria for selecting of software packages for project accounting, knowledge of workers and their opinion on software package selected and the impact of software package for project accounting for project sustainability.

Key words: Software package for projects accounting; Non-Governmental Organizations (NGOs); Accountability

1 Introduction

International support provided to developing countries is managed by projects, (Diallo & Thuillier, 2005). Project organizations most of which are the Non-Governmental Organizations (NGOs) are known for effectiveness in delivering services and cost efficient. In many developing countries, the cost effectiveness of these organizations has significantly contributed to reforms in the government operations for wider accountability and openness. NGOs are assessed on efficiency and transparency of their resource usage, the reach and scale of their beneficiaries and the impact that they have upon society (Venkatagiri, 2006).

Development of Enterprise Resource Planning system (ERP) which is regarded as information technology solution for business have changed the way of doing business, working practices and even lead to innovations in the entire NGOs sector. A simple and cost effective ERP system can automate management of human resources, financial resources and share essential resources easily among the NGOs (Sharma & Deore, 2015). ERP systems, whilst not accounting systems in the sense that are necessary investigated, designed, or controlled by accountants, are fundamentally bound up with organizational processes of accounting (Chapman, 2005)

The computerization of accounting activities in projects has increase the demand for software package for project accounting. Varieties of software packages for project accounting were produced by the software firms in response to the demand. There is a large number of software packages for project accounting available on the market and potential users were in the dark as to what their needs are, what these software packages have to offer, and which package best fits their requirements.

In projects accounting, these software packages are thought to be effective in promoting accountability for sustainable institutional development through proper records and reports produced by the software package. Despite of using of software packages for project accounting in accounting records, many projects have lack sustainability as reflected into the collapse of the registered and immersing organizations on the daily basis. The remaining successfully organization are notably seen to have the quality project financial reports as a common factor. Selection of appropriate software package for project accounting has become one of the serious resolutions in promoting accountability in projects organization. The software packages for project accounting selected should be able to serve the current needs and can most easily be adapted to its future needs. The organization will allocate great deal of time and money to purchase new software if the wrong choice is made. Therefore, improper selection of software packages for project accounting may result in wrong strategic decisions with subsequent economic loss to the organization. Organization should spend more time searching for the appropriate software packages for project accounting before purchasing.

This study aims to review the factors which projects organization considers in selecting the software

packages for projects accounting and provides a basis to improve process of the software packages selection. The research questions addressed in this paper are as following:

RQ1: What are the factors an organization considers in selecting software packages for projects accounting?

RQ2: What prior knowledge and opinion do workers have on the selected type of software package for project accounting?

RQ3: what is the effect of the selected software package for project accounting on staff composition and project sustainability?

2 Literature Review

This section briefly summarizes criteria for selecting of software packages for project accounting based on non-governmental organizations. An organization should account for the use of its resources and its achievements to its stakeholders, including beneficiaries through publish their financial reports as the concept of NGOs financial stability (Zakrevska & Kotov, 2009). The mechanism of accountability identified by (Ebrahim,2003) are reports and disclosure statements, performance assessments and evaluations, participation etc. These NGOs has different accounting and reporting requirements and are dissimilar from those of municipality or library and it has been more expensive in money and time in electing the right software and vendor, Needle (2013).

According to Kontio, *et al.* (1995). The main problems of the software selection are not taking into consideration system requirements and not using appropriate decision models in decision process. The selection of the accurate software is often a nontrivial task and needs careful deliberation of multiple criteria and careful balancing among system requirements, technical characteristics, and financial issues, Sen., *et al.* (2009). Most of the researchers in their study of selecting software for nonprofit analyze organization requirements through consider the business size and type, current and future needs and scope of the organization such as staff resources, organization capacity and growth, system function ability, cost, customization, vendor factors ,system security and reporting system to determine the system that will meet the organization requirements.

Muhrta & Ogundeji (2014) in the study of determining accounting software choice, examine primary determinants of commercial accounting packages acquisition among non-financial quoted companies in Nigeria. The survey was made on 5 industries listed on the Nigeria stock exchange with a sample of 178 participants. Factors found as primary determinants of accounting software deployment from the logistic regression model formed are operational, commercial strategic technical and security.

In the study of nonprofit accounting software by Needleman (2013), indicate factors for selection of software package for nonprofit accounting are the clear understanding of the organization needs will enable the software selected to meet its needs, vendor factors, staffing resources available, capability of the software to be customized by the members of the organization, easy to be used by the staff, ability of coding the charts of accounts to make easy preparation of reports and documents needed , compatibility between the accounting software and other application in the market, system hardware, cost and find out what your peers are using , the capability of being back up when changes are made in the system.

A theoretical framework on the study of criteria for selecting accounting software is influenced by Abu-Musa (2004) which identified users current and future needs, business types, business size, vendor, information technology and infrastructure and accounting software features ought be taken into consideration before obtaining software package. Also mention the most important software features that should be considered in selection of appropriate accounting software package are the ability of the software package to be customized and satisfy an organization needs. Other features are capable of preparing financial reporting, account number structure contain, web features and e-commerce, capable of handling multi-currency, number of customers using the accounting software, size of the vendors' company and reliability.

Wieggers & Beatty,(2013) in identifying the requirements for selection of packaged solution for projects, point out factors to consider in acquiring a commercial package that meet organization needs. Understanding of the business activities such as identify the user needs for the software, develop the needs for the software by listing the features you need from the package, consider the business rules required by commercial off the shelf (COTS), identify data needs, system quality such as performance, usability, interoperability, integrity and security termed as the right way to choose the right packaged solution. Other is evaluation solution through market research which evaluates cost, vendor experience

and capability, vendor support for product, external interface that will enable extension and integration.

The ability to quickly generate and deliver software that meets customers real needs has become an unquestionable competitive advantage (Leffingwell, 2007). In review of these diverse views and recently many NGOs use accounting software package for project accounting through the emergence of ERP, there is a need to study and assess how these software are selected and how effective are in promoting accountability and sustainability in the projects.

3 Research Methodology

The study was designed using a qualitative approach, where interview method was used to collect information. Interview guides tools moderated a discussion with the participants in this study. The study was concerned with exploring the fact behind the selection of software packages for project accounting in Tanzania. To answer the above research questions, primary data were collected through face to face “open interview” direct from project managers, head of finance department and other staffs who especially are the fundraising and monitoring & evaluation teams for projects studied in Tanzania. Thematic and discourse analysis for interviews was used to handle data (Chandra and Sharma, 2016).

Table 1 Distribution of Interviewees

Interviewee	Number	%
Project manager	9	15
Executive director	13	21.67
Financial controller	20	33.33
Project Officer (fundraising, M&E)	18	30
Total interviewed	60	100%

4 Results and Discussion

The interview was conducted in different NGOs in Tanzania in the fields of wildlife, environmental, legal rights, good governance, educations, health, economic empowerment and agriculture. The research shows that 60% of the NGOs interviewed have used more than one software package because the earlier software didn't meet the requirements of the organization due to most of the packages need to be customized according to the nature, needs, size, type and the environment of the organization.

4.1 Accounting software packages in use for project accounting

The software packages for project accounting identified during the study are quickbook, oracle, sun and naviation. The NGOs used these software packages depending on the size of the organization. Functions of the software differ some are capable for small and medium organizations and lack some facilities which can suit in large organizations. The study finds that, certain NGOs used quickbook have changed their software as the projects grows because it's unable to function with the current situation. According to interviewers, quickbook software suits for small and medium organizations. This shows that during the selection of the software packages the organizations didn't take into consideration its future needs.

4.2 Factors considered in selection of software package for projects accounting

In identifying how do these NGOs go through selecting their software packages for project accounting, the study noted that selection of accounting software in the organizations and project is based on two main factors. One factor being donor interests and conditions and the other is internal environment. The former is linked to reporting requirement for accountability purposes, while the latter is associated with financial stability. With financial stability an organization can establish an interested on accounting software based on current and future needs building on the past experience.

Other factors in the context of this study were remarkably, the ability of the system to integrate with other system; produce reports according to the organization needs, capable of being customized, security of the system, system support from the vendor, cost i.e. the acquisition, installation, training, testing and support, ability of the system to handle multicurrency and more digits, functioning of the system, accuracy and compatible. Others are identifying the requirement of the organization, user friendly and the ability of the system to review data. Most of these factors are supported by the literature review according to (Abu-Musa, 2004, Wieggers & Beatty, 2013, Needle, 2013 etc).

4.3 Prior knowledge and opinion do workers have on the selected type software package for project accounting

These two elements in this thematic area were distilled through data analysis tools to form the following subcategories:

4.3.1 Prior knowledge of workers on the selected type of software package for project accounting

In answering the research question on what prior knowledge do workers have on the selected type software package for project accounting we note that workers /staff were not familiar with the software package which are using rather than past experience of using any accounting software package. According to interviewer, experience of workers on software package selected is not a deciding factor as the organizations are going to provide normal training before the use of the software. According (Jadhav & Sonar, 2011), knowledge of software support decision makers not only in software selection but also increase efficiency, and brings consistency and transparency in the process of software selection. In building capacity to the staff on the software package selected, donors conducted in house training, invite consultant to run training to the staff, and provide practical user guide/ manuals of the system after deciding the accounting package to be implemented.

4.3.2 Workers opinion on the selected type of software package for project accounting

Through the interview indicate that although the accounting software produce the required reports for the projects after customization but some of the software selected need to be upgraded to meet some of the additional requirements which were not considered during the acquisition. The software also require competent person due to many posting code, the improvement of infrastructure because the data base is very huge its challenging to control, and need best hardware to run the system (Abu-Musa, 2004) if it's old need to be reinvested .The organization needs to stabilize internet services because the software to function there is need of internet facilities for better performance.

4.4 Effect of the selected software package on staff composition and project sustainability

4.4.1 Effects of selected software package for project accounting on Staff

The software package selected in different projects interviewed has positive and negative impacts to staffs. The positive impacts which were common are reports for a given period of time are produced in time which reduces time, work load, errors and other related costs which could have being incurred using manual accounting. It provides more internal control on the transactions made, accessibility of retrieving what have been done easily, the system allows to spend according to budget (tool to control annual budget) and it is integrated and every staff has accessibility of logging in to his/her part.

The challenges on software packages for project accounting have to staff is its usability. The software uses codes in its transaction which require competent staff and concentration in data capturing otherwise errors will occur. There are many changes occurred in the software such as upgrading the software which is costly because they have to pay the supplier for the changes to be made. This led the supplier to become strategic partner because users still must rely on continued support regardless the goodness of the software package (Abu-Musa, 2004).The research also find some software require license number for different user, which is very expensive to add new user.

For donors funded projects in which the software packages for project accounting are recommended by the them, has implication to the projects because the size and environment where the projects are conducted differ and some are not supported with in the environment which led to a lot of customization, time consuming because it require several processes before it is implemented and it is cost full. This supports the argument from (Jadhav & Sonar, 2011) that the selection of software package that meets specific needs of the organization is complicated and time consuming decision making process. It also tied up with the supplier because for any improvement within the system, the organization should consult the supplier.

4.4.2 Effects of selected software package for project accounting on project sustainability

Nonprofit organizations are usually accountable to stakeholders such as their donors and clients (Van Puyvelde, Caers, Du Bois, & Jegers, 2012). The implementation of software package for project accounting in projects enable the projects to grow through attaining more funds from donors because of the reliability of the accounting information being reported. There is increase in number of donors from outside and inside the county as well due to the accountability of accounting information through the use of the software package for project accounting. In worldwide NGOs are challenged with an increasing demand for accountability and improved financial transparency and its financial reporting has become a rule (Verbruggen, Christiaens, & Milis, 2011). The information through the system is safe and there is timely and error free of information provided. The report produce complies with the donors requirement and standard and make easier for donors to access information and decision making

5 Conclusions

This paper identifies factors to consider in selection of software package for project accounting in Tanzania focusing on NGOs. The factors help the user of the software package for project accounting to focus on the actual needs for better efficient and effective operation of the organizations. The research finds that, NGOs have used more than software package for project accounting so as to find the one which will suit/ meet the requirements of the organization, better. Users faced challenges in using the accounting software packages. Some NGOs still need to upgrade their software packages for project accounting in order to meet the requirements which were not adhered during the acquisition of the software package. Despite of the challenges faced, the software package has increased accountability of information required by the stakeholders through the financial reports produced with the system which led to the growth of the projects. Donors used the software package for project accounting to access information and the reports produced for decision making which increase transparency and sustainability of the projects.

Organizations should seek on improving information technology environment and infrastructure in finding the software package for project accounting that meets the current and future needs of the organization and then find the best hardware to run it. This will reduce the cost of purchasing new hardware if the current hardware can be utilized but if it is inadequate its costly to the organization. This gap was as well argued by Musa (2004), highlighting the fact that organizations focus so much while giving less weight to the supporting infrastructure. This should include as well vendors and supplier conditions and compatibility with the supporting IT infrastructure.

NGOs ought to continue taking necessary steps in selecting software packages for project accounting to maintain standard reporting system and give awareness and training to the staff/users of the software package so as to be equipped with enough skills and knowledge about criteria for software selection in order to increase efficiency and transparency in the selection process. There should be continuous seminars and training to staff about the advantages of using software packages for project accounting and how to overcome challenges to maintain quality reporting system.

Research on Influence Factors of Financing Choice of Small and Medium-Sized Enterprises in China

Xing Wenjia

School of Management, Wuhan University of Technology, Wuhan, P.R.China, 430070
(E-mail: 178013491@qq.com)

Abstract: In this paper with SPSS software analysis, it creates variables and model building, and derives an important factor affecting SME financing choices. It selects sales margin, total asset turnover, current ratio, total asset growth, total assets of the natural logarithm and asset-liability ratio as the explanatory variables, and chooses equity financing, debt financing for the explanatory variables. It investigates six variables through empirical analysis of different ways of financing and their correlation. Regression analysis is based on the results that it is obtained for each of the various factors. Finally, it finds relevant factors that ultimately affect SME financing, and corresponds countermeasures.

Key words: SME; Financing; Listed Companies; Analysis

1 Introduction

Foreign scholars Financing SMEs corresponding research. Modigliani and Miller proposed financing structure theory (MM) in 1958. In an absence of uncertainty and lack of information asymmetry in the world, no matter what kind of business financing structure will not affect the value of the enterprise (Modigliani Franco,1958). Jensen proposed that the moral hazard issues affect the financing structure between the principal and the agent. He thought the best financing structure that allowed companies to minimize the cost distributor(Jensen,1976). Williammson thought that can cause adverse selection and moral hazard problems because of information asymmetry between the bank and Financial Institutions (Williammson,1996).

At present, the academic research mainly from the three aspects in china: First, it is about the outside area of financing at the operational level of experience and introduces comparative reference. Second, the domestic small and medium enterprises are formed for the study of SME financing research monograph. Third, when the domestic SME financing problem occurs, it has been numerous articles.

Xu Xuexia studied the solvency, management capacity, growth, profitability and asset-backed ability to analyze the relationship between these variables between financial indicators. The existence of a negative correlation between asset-liability ratio and solvency of enterprises. There is a positive correlation between the asset-liability ratio and other factors (Xu Xue Xia, 2009). Wang Hong Bo analyzed the impact of industry on the difference between assets and liabilities of SMEs, reveals the Capital Structure of Chinese SME board industry which has sustained significant difference(Wang Hong Bo, 2009). Ma Guang Qi considered to be the SME development cycle that is divided into four stages, and the financing requirements also differ according to the characteristics of different periods (Ma Guang Qi ,2009).

2 Factors of SME Financing

Strong profitability of enterprises is often not easy to be out of market, and it is able to occupy a seat in today's fierce competition in the market, a higher profitability of the enterprise, the more likely a positive impact on the financing (Qin Guo Lou,2012). Operating capacity reflects the safety, profitability of a business finance degree of capital preservation and assets. The higher a company's operating capacity, the more likely a positive impact on the financing (Sun Wu, 2013). Solvency refers to the business capital chain once broken, whether a company has the ability to repay principal and interest capabilities. The higher the solvency of a business, the more likely a positive impact on the financing (Shen Bo Ping, 2015). Growth of the enterprise is one whose operating efficiency continues to improve, have been expanding, occupy market share is growing. A business growth, the better, the more likely a positive impact on the financing (Wang Xuan, 2012). The larger the size of the business, the ability to achieve diversification, a higher size of the business enterprise, the more likely a positive impact on the financing (Wu You Hong, 2015).

3 Analysis of Sample Selection and Data

3.1 Research methods

In this paper, it uses qualitative analysis and quantitative analysis method of combining. Qualitative analysis section, the first use of descriptive study, which will be described current research. Next, it chooses the 2015 -2016 years of relevant data GTA (CSMAR) database 136 listed companies in the SME sector. In the quantitative analysis section, it establishes multiple linear regression models with SPSS regression analysis, analysis of selected indicators for the impact of financing mode selection mechanism. Finally, according to the analysis, the current situation of SME financing policy is recommended.

3.2 Sample data

This article is about the choice of the sample in 2015 and 2016 in the SME sector Stock Exchange listed company. Select samples in accordance with the following conditions were excluded: 1) the exclusion of the company ST and * ST companies; 2) Excluding financial companies. The data used in this paper are from the GTA (CSMAR) database, to overcome monthly, quarterly effect of accounting indicators, analyze data are used annual data.

In this paper, the company financing as explained variable, referred to as Y. This paper selects selection factors can affect behalf of the company characterized as a financing explanatory variables, each variable and select the appropriate indicators, study variables constructed as shown in Table 1:

Table 1 Study Variables Definition Table

Variable Types	Variable name	Variable Code	Variable Definition	
Explained variable	Financing	Equity financing	Y ₁	0/1
		Debt Financing	Y ₂	0/1
Explanatory variables	Profitability	Sales profit	X ₁	Net Income / Revenue
	Operating capacity	Total asset turnover	X ₂	Sales / average total assets
	Solvency	Current Ratio	X ₃	Current assets / current liabilities
	Growth	Total asset growth	X ₄	(End of period total assets - beginning of period total assets) multiplied by beginning total assets
	Company Size	Natural logarithm of total assets	X ₅	In(Total assets)
	Debt Structure	Assets and liabilities	X ₆	Total liabilities / total assets

NOTE: 0 means the company no equity financing, debt financing, 1 for Equity financing, debt financing

3.3 Analysis of data

Reference herein equity financing and debt financing Methods of financing of the factors that may affect the way, drawing Deng Qingyang LI Ning basis and should examine all aspects of domestic literature financing of SMEs affected by the formation of the expected financing model, as follows:

$$Y_1 = \beta_0 + \beta_1 X_1 + \beta_2 X_2 + \beta_3 X_3 + \beta_4 X_4 + \beta_5 X_5 + \beta_6 X_6$$

$$Y_2 = \beta_0 + \beta_1 X_1 + \beta_2 X_2 + \beta_3 X_3 + \beta_4 X_4 + \beta_5 X_5 + \beta_6 X_6$$

NOTE: β_0 represents the constant term, β_1 represents the regression coefficients

Table 2 Regression Results 2016 Year Data

variable	Equity financing	Debt Financing
Profitability	0.445	-7.807
Operating capacity	-3.647	-0.029
Debt paying ability	-0.962	-3.230
growth	-3.024	2.484
Company Size	-1.487	1.344
Debt Structure	-3.294	-34.875
constant	33.704	-15.042
-2 The logarithmic likelihood value	28.482a	17.885a

Cox & Snell R value	0.54	0.77
Nagelkerke R value	0.237	0.407

Table 3 Data Regression Results In 2015

variable	Equity financing	Debt Financing
Profitability	29.410	-12.907
Operating capacity	-4.475	-8.850
Debt paying ability	-2.353	-0.722
growth	-10.570	5.040
Company Size	-4.202	2.162
Debt Structure	10.016	-40.080
constant	86.414	-34.504
-2 The logarithmic likelihood value	7.411a	14.209a
Cox & Snell R value	0.093	0.047
Nagelkerke R value	0.663	0.338

From Cox & Snell Nagelkerke R and R value, you can see that in 2016 the fit of the model 1 and model 2 and model 3 can accept everything. Eventually build expected financing model is:

$$Y_1 = 33.704 + 0.445X_1 - 3.647X_2 - 0.9623X_3 - 3.024X_4 - 1.487X_5 - 3.294X_6$$

$$Y_2 = -15.042 - 7.1807X_1 - 0.029X_2 - 3.230X_3 + 2.0484X_4 + 1.344X_5 - 34.875X_6$$

From Cox & Snell Nagelkerke R and R value, you can see that in 2015 the fit of the model 1 and model 2 and model 3 can accept everything. Finally expected financing model is:

$$Y_1 = 86.414 + 29.410X_1 - 4.476X_2 - 2.353X_3 - 10.570X_4 - 4.202X_5 + 10.016X_6$$

$$Y_2 = -34.504 - 12.907X_1 - 8.850X_2 - 0.722X_3 + 5.040X_4 + 2.162X_5 - 40.080X_6$$

4 Results

Based on the analysis of data, shows that in 2015 and 2016, the regression model analysis showed that the expressed as a return on sales profitability and equity financing is significantly related to the enterprise's profit ability is strong, for which the enterprise external investors are more willing to be the corresponding investment, in this way, the enterprise can more capital and issuing new shares; Have enough savings to meet the demand of enterprise investment, does not need to be by way of borrowing to the world, so enterprise debt ratio is not high. With total asset turn over, operating capacity and that there was no significant correlation between equity financing and debt financing. The enterprise operation efficiency and benefit of current assets and fixed assets is difficult to judge, which expressed as a current ratio of solvent and no significant relationship between equity financing, liquidity ratio and debt financing that has significant negative correlation, according to the original data more than 90% of the corporate liquidity ratio more than one, which means that the creditors of the margin of safety is big, full recovery of high reliability, creditor's rights debt financing can get the financing needs of the enterprise, in the growth of small and medium-sized enterprises, need a steady stream of funds support. Consider the perspective of growth rate of total assets, whether it does the company further growth and take equity financing is not obvious relationship, on the contrary, it was significantly positively related to growth rate of total assets and the debt financing. Subject to the conditions of the market, equity financing is not good to satisfy the business enterprise growing demand. Total assets growth rate is high, in a certain period, the enterprise assets increase rapidly, the profit is higher. With total assets of natural logarithm of firm size and equity financing is no significant relationship. Total assets of natural logarithm and was significantly positively related to debt financing. Of small enterprises scale is not big, because of the lack of mortgage assets ability and financial statements, which is not true and so on a series of problems, makes them difficult in seeking equity financing and debt financing. Internal financing is enterprise capital source of the main channel. Also it shows that the enterprise ability to resist risk and financial information transparency and the expansion of enterprise development presented the positive correlation.

Asset-liability ratio, has negative correlation with creditor's rights financing and equity financing. Enterprise high debt ratio, mean that the future need to repay debt, risk big, the company issued shares or financing by creditor's rights is difficult to obtain expected goals, financial institutions and commercial Banks worried about close not back to the principal and interest due and contribution to the enterprise financing.

5 Conclusions

How to further improve the local small and medium-sized financial institutions, the need to pay attention to the following: first, the organization must have a clear property right structure and scientific system, establish a standardized corporate governance structure. Second, at present, China's financial industry profit is high, at the same time risk big, prone to dishonest behavior, it must further improve the supervision system for small and medium-sized enterprises, strengthen the supervision strength of small and medium-sized enterprises, in order to better control the market risk, to the whole financial market regulation system is increasingly perfect. Especially senior managers must strengthen audit, assets and liabilities in the financial statements of the enterprise management, loan risk management etc.

Predictors of Acceptance of Electric Cars in Malaysia: Moderating Effects of Driving Experience and Voluntariness of Use

Hamed Khazaei

Malaysia – Japan International Institute of Technology, University Technology Malaysia
(E-mail: hamed_k55@yahoo.com)

Abstract: With the rising attention in saving our earth, and fear of soaring gas and oil prices in next decades, numerous companies have produced electric and hybrid cars. These aspects have attracted people to have intention of using electric cars. In countries having high contribution of renewable energies in electricity production, electric cars have direct effect on healthier environment. In other hand, electric cars have to deal with concerns like battery range or range anxiety, infrastructures, maintenance and spare parts. Also, any new technology, has a very low market share at its initial stage, it is important to study important factors influencing potential consumers of new technology (Rogers, E. M, 2003). In overall, low empirical researches have studied these factors in a single framework for electric cars. This research is going to fill these gaps by examining the association among social influence, perceived enjoyment, anxiety, facilitation condition, attitude toward use and intention to use, along with moderating effects of driving experience and voluntariness in the electric vehicle market in Malaysia.

Key words: Electric cars user interfaces; Technology acceptance model; Electric vehicles

1 Introduction

Although electric cars are still in initial stage, automotive makers are producing more and more electric vehicles with more interesting designs. Many researches have been done, or ongoing about substitute fuels like bio diesels, hydrogen and others, with hope of possibility of widespread usage of them in society. Though, numerous of these unusual fuels will necessitate too many resources for the world's populace to entirely convert to within the close future. (Beliveau, n.d.)

It has been shown that inspiring the acceptance of environmentally responsive products by changing behavioral intention is a big challenge. In any product development, the most important consideration is customer needs; in initial stage of life cycle and product expansion. Detection of consumer necessities is indispensable too, in marketing. This is recognized that buyers have complex desires that determine the buying process (e.g. Elliott and Wright 1999, Shiv and Huber 2000). Global warming and possibility of increasing energy prices in next decade made a transformed attention in expansion of electric cars. Current auto exhibitions feature more and newer electric vehicles; models are increasing and being more popular (like Nissan Leaf and Tesla S). Countries policies are also shifted to support usage of EVs: in many countries, governments give subsidies or offer tax inducements for buyers of electric vehicles. Augmented consideration of manufacturers and governments for EVs is comprehensible; though, widespread acceptance of EVs is expected to encounter tough challenges. Uncertain or limited battery range, long time charging, and insufficiency of charging stations, price, and maintenance, may be barriers for widespread EVs adoption. Moreover, expansion of substructure on behalf of charging EVs, (which includes together construction charging stations and improvement of home facilities for charging of electric vehicles, might enforce extra problem on the electric network, possibly causing the need to upgrade the latter too, forming encounters for the electricity markets, besides leading to enlarged environmental damage in countries where oil is used to produce electricity. (Bilotkach & Mills, 2012) Usually, economists and market examiners have been attentive in recognizing the aspects that affect the buyer's intention to predict market share, and for that reason, they have introduced number of models for car type choice. (Beliveau, n.d.).

2 Social Influence

Social influence represents the degree of what a person believes that other people who their idea are important for him or her, think the same way about a new technology (Miao, Xu, Zhang, & Jiang, 2016). The construct called subjective norm, in the Theory of Reasoned Action model. In technology acceptance model 2 or TAM2 and unified theory of acceptance and use of technology, social influence characterized as subjective norm, or social factors in some other models. Thompson et al. (1991) used the term social norms in defining their theory, and recognized its correspondence to subjective norm

within Theory of Reasoned Action model. Although they have dissimilar tags, each of these concepts comprises the obvious or implied concept that the person's behavior is influenced by the way which they believe that society will view them as a result of using the technology. (Venkatesh, Thong, & Xu, 2012).

Accepting from (UTAUT 2 model) or Unified theory of acceptance and use of technology, following hypothesis was proposed:

H1. There is a positive significant relationship between social influence and intention of use of EVs.

3 Facilitating Conditions

Facilitating condition is someone's perception about infrastructures or technical support existed for using a technology or system (Venkatesh et al., 2003). About the electric vehicles, it can be interpreted as availability of batteries, learning tools or maintenances, charging infrastructures in home and roads, or after sale services. This relationship adopted from extension of unified theory of acceptance and use of technology theory. (Venkatesh et al., 2012)

H2. There is a positive significant relationship between facilitating condition and intention of use of EVs.

H3. There is a positive significant relationship between facilitating condition and attitude toward using of EVs.

4 Anxiety

Anxiety in the car industry is a degree of how a person responds to a situation with uneasiness or arousal (Osswald et al, 2012). Anxiety is an important factor in behavioral intention in social cognitive theory. (Compeau and Higgins 1995). Range anxiety in using EVs is about fear that EV has insufficient battery range to reach to a destination (Yang & Forney, 2013). Considering that EV technology comprises of innovative technology and comes up with extreme changes comparing with combustion engine cars, consumer anxiety about using EVs may be higher than anxiety about other cars. Consumers may also perceive risks when there is batteries with limited ranges and lack of technology infrastructures like charging stations. This anxiety may be also increase when consumers are sensitive to spare parts or EVs repair. So, these anxieties may hinder potential consumers accepting the product and may have direct negative effect on EV approval. Sundaravej, T (2010) found a significant negative effect of anxiety on the intention of use. Thus:

H4. There is a negative significant relationship between anxiety and intention of use of EVs.

5 Perceived Enjoyment

It embodies the enjoyment deriving and ownership of an EV. Since EVs are very smooth and have high acceleration comparing with cars with combustion engines, might have an enormous effect on the enjoyment of the passengers and driver. (Miao et al., 2016)

Liao et al (2008) and Venkatesh et al., (2012) view perceived enjoyment as a fundamental source of motivation. This factor has effect on both attitude and intention of use of a system. A system perceived to be easy to use, considered to have further fun to use, foremost to a sturdier association between perceived fun and attitude toward using, and consumers' behavioral intention. (Liao, Tsou, & Shu, 2008). Based on above discussion following hypothesis was proposed:

H5. There is a positive significant relationship between perceived enjoyment and intention to use of EVs.

H6. There is a positive significant relationship between perceived enjoyment and attitude toward using of EVs.

6 Environmental Concern

By increasing global issues, environmental concerns become more significant for purchasing decisions. Public argument on global warming regarding to Co2 emissions, produced by cars, is impacting purchasing decisions of car consumers (Razak, Yusof, Mashahadi, Alias, & Othman, 2014). Using or driving a "green car" lets people to adopt a responsible rule in the social order. Based on an empirical investigation in Malaysia by (Razak et al., 2014) there was a significant relationship between environmental concern and intention to use of a hybrid car. Thus:

H7. There is a positive significant relationship between environmental concern and intention of use

of EVs.

7 Attitude Toward Using

The factor “Attitude towards using” or “Attitude towards the Act of Behavior” indicates the belief of an individual that certain behavior, will lead to certain outcome. (Alain, 2010) relationship between attitude toward using and intention to use introduced by Davis et al. (1989), and widely used for technology acceptance researches. Based on above discussion hypothesis below is proposed:

H8. There is a positive significant relationship among attitude toward using and intention to use of EVs.

8 Intention to Use

Davis, Bagozzi, and Warshaw (1989) defined the behavioral intention to use technology as a degree that an individual has considered cognizant plans to act or not to act certain behavior in future. This study assumed that determine the consumers positive or negative feelings towards using EVs. The attitudes of potential customers toward the use of EV technology along with the association among attitude and intention of use of EVs are the key interests of this specific research. Although many studies reveal a positive relationship between the attitudes of use, and actual use of technology. (Alain, 2010)

9 Moderating Effects of Voluntariness of Use

Voluntariness is a degree of which use of technology is perceived as voluntary, or of self-determination (Venkatesh, Davis, & Studies, 2000). Though voluntariness was not a part of innovation model proposed by Rogers (2003) in diffusion of innovation model, but Venkatesh et al. (2008) have proposed voluntariness as a moderator in the relationship between social influence and intention behavior. Based on this call, this research proposes the following hypothesis:

H9. Voluntariness of use of EVs, effectively moderates the relationship between social influence and intention of use of EVs.

10 Moderating Effects Driving Experience

More experience of using technology will lead to more awareness and better knowledge of structure of system, therefore decreasing user dependency on outward support. (Yang & Forney, 2013)

Customers' driving experience is operationally defined as their driving experiences with EVs. Customers who drive an EV for one or more are identified as experienced, which are distinguished from non-experienced customers with no driving experience. In model UTAUT 2, Venkatesh et al. (2012) showed that the experience of system can have moderating effect on relationship between, social influence and behavioral intention. Thus:

H10. Driving experience of EVs, effectively moderates relationship between social influence and intention of use of EVs.

Experience can moderate the relationship between facilitating conditions and behavioral intention. (Venkatesh et al., 2012).

H11. Driving experience of EVs, effectively moderates the relationship between facilitating condition and intention of use of EVs.

Rauh et al, (2015) investigated the relationship between driving experience and range anxiety toward EVs acceptance. The study showed that experienced drivers had less range anxiety on the cognitive and emotional level than inexperienced drivers. (Rauh, Franke, & Krems, 2015). Base on above discussion, this study generate this hypothesis:

H12. Driving experience of EVs, effectively moderates the relationship between anxiety and intention of use of EVs.

11 Conceptual Framework of Study

The conceptual framework shown in figure 1, describes variables and relationships between them base on empirical studies discussed in literature review. The framework has two main features, first, it explores the links among social influence, perceived enjoyment, facilitating condition, anxiety of use, environmental concern, attitude toward using and intention to use. Second, the framework explores the moderating effect of voluntariness of use and driving experience as moderator on formation of switching intention.

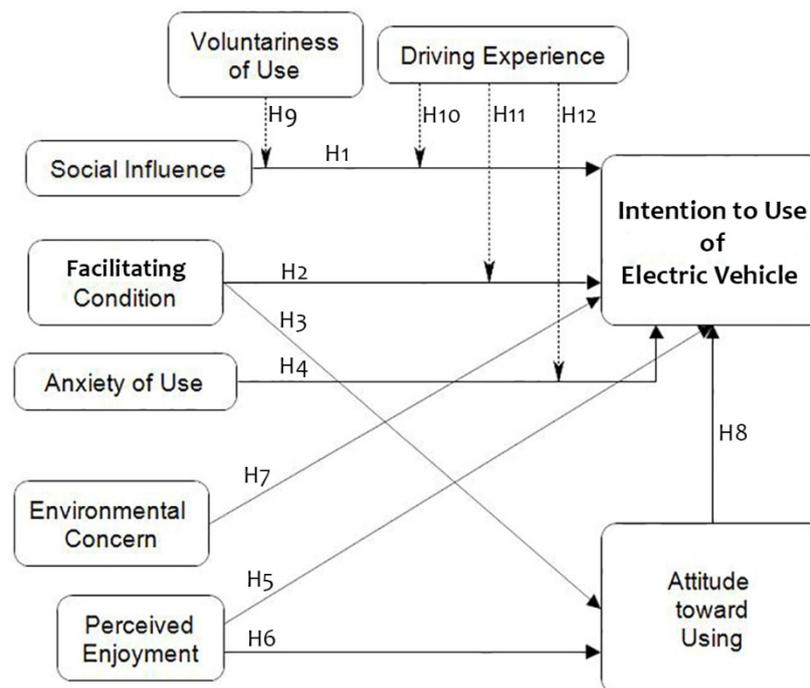

Figure 1 Conceptual Framework of Study

12 Conclusions

One of the major encounters is adoption of electric cars as new technology that needs new aspects of consumers. According to this, this research describes and defines electric car acceptance factors and proposes a new conceptual framework. The framework synthesizes different technology acceptance models such as TAM and UTAUT model's to clarify and predict electric vehicles adoption. This study introduced range anxiety and perceived enjoyment as relevant additional factors in the proposed model for future study.

Implication of Natural Language Comprehension on Machine Intelligence: A Perspective of Neural Network Mechanism of Intelligence Emergence

Xu Xuetao

School of Foreign Language, Wuhan university of technology, Wuhan, P. R. China, 430070
(E-mail: xuxuetao@whut.edu.cn)

Abstract: Intelligence emerging out of the brain neural networks without outside manual instructions or software supports is not due to that brain can automatically adjust the weights of the neural network nodes, but because conceptual information(s) of vision and audio are respectively resolved and dispersedly stored according to their similarities and discrepancies in large quantity of adjacent neurons structures which forms a conceptual monolithic network by correlating language-centered network with image-centered network. Not like action must be learned through the motor feedbacks and through BP algorithm to adjust the weights of the deep neural network, intelligence emerges out of the brain from vertically classifying and horizontally interacting of concepts, from optimal choice of the empirical relationship between the upper concept of the behavior object and the behavior itself. This paper analyzed the differences between natural language and artificial language and expounded the comprehension process of two languages. Moreover, it elaborated the existing problems in deep neural network technology. In the end, the paper proposed suggestions for AI innovation directions on the neural network mechanism.

Key words: Language; Concept; AI; Neural network; Similarities; Discrepancies; Emergence

1 Introduction

Linguistics has an indissoluble bond with Artificial Intelligence (AI). Language and intelligence are positively correlated, so the study of natural language comprehension is a way to understand the essence of intelligence, and therefore of crucial importance to solve the current AI problems and develop the deep learning robots. Since 1956, natural language comprehension has integrated into the study of language information processing. Chomsky introduced inference and logic analyzing into the study of language deep structure, but his sentence generation theory proved to be useless to machine intelligence. We are not without good programmers, but without good linguistic theories. With the rising of deep neural network technology, the current situation for AI technology is old problems stayed, new problems keep appearing.

As for old problems, since people treated natural language as a semiotic system, everything is of great complexity. The structures of natural language and its semantic representations have a complicated hierarchical relationship. The first is the sentence structure complexity. Especially for phonetic languages such as English, the sentence has a hierarchical structure, so the grammatical relationship sometimes can be very complicated. But for Chinese sentence, it has no this hierarchical structure phenomena, or at least it shows not on the linguistic level, but shows like an expression habit of concept sequence on the semantic level. The second is the relationship between symbols and its semantic representations. It is believed there are no the isomorphic relations with one-to-one correspondence in the natural language. But artificial language usually has a strict one-to-one corresponding relationship between its structures and semantic representations. How to make machine be able to understand natural language and have language intelligence is not an easy job.

New problems keep appearing. A common criticism of neural networks, particularly in robotics, is that they require a large diversity of training for real-world operation(Hinton,2006). And you have to preserve past training diversity so that the system does not become over trained. "Although neural nets do solve a few toy problems, their powers of computation are so limited that I am surprised anyone takes them seriously as a general problem-solving tool" (Dewdney, A. k. 1997).

A recent study found that visually indistinguishable images that are truly identical to human eyes, but not for the deep neural networks, they will be misclassified. This suggests potential deep flaws in all neural networks. (Collobert, 2008). A further study by researchers from Google, New York University and University of Montreal has found this flaw in almost every deep neural network.

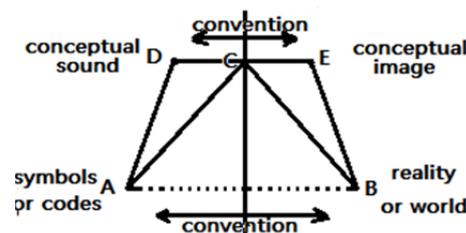

Aside from their utility, a fundamental objection to artificial neural networks is that they fail to reflect how real neurons function. Back propagation(BP) is at the heart of most artificial neural networks

and not only is there no evidence of any such mechanism in natural neural networks, it seems to contradict the fundamental principle of real neurons that information can only flow forward along the axon. How information is coded, stored by real neurons is still unknown. (Bengio, 2003). To use natural neural networks as an inspiration for an approach to computing that is inherently parallel and which provides solutions to problems that have up until now been considered intractable. (Ngiam, 2011). Since people can skillfully speak their mother language without realizing the grammatical, expressional and pragmatic rules, is that necessary to treat the computer understanding of language rules as the precondition for computer understanding of natural language? If the answer is no, how to endow machine with that intelligence that human have?

2 How Intelligence Emerges Out of Brain Neural Networks

2.1 The essence of modern computer is still unchangeably a codes breaking machine

Intelligence, no matter how it is defined, is based on concepts, thoughts and behavior feedbacks. Concept, as the basic unit of language and thought, possesses duplicity in nature, therefore can be broadly divided into two types as image concept and sound concept. It is misleading that Saussure viewing language as symbols, because treating language as symbols or actually codes' linear relationship will naturally lead to a decision that sound and concept are the two sides of a code. (see picture 1, Saussure part of ABC). Part C is in the mind, actually consists part D and part E, while part D and E are in the mind correlated. Hjelmsev's ladder-shaped theory (see picture 1, part of ABED) is better than Saussure's triangle theory. Linear sequence might be true when language is uttered from mouth or transferred in the air, but it does not mean the same is that when language is processed (heard) or produced (uttered) in the mind. Since our brain is a cubic neural network, the structure of network itself suggests that all the information processed in our mind is multiple line processed. So, viewing language as codes and codes' linear relationship is meaningless. Saussure only saw the superficial phenomena. Moreover, a stronger evidence from linguistics also suggests treating language as codes and liner's relationship is wrong. The phenomena of linguistic discovery that similar sounds share similar meanings, not only indicates that language processing (understood) in the mind is multiple line processed, but also suggests that the information of sounds and images are dispersedly stored according to their similarities and discrepancies. Because only when the information of sounds and images are dispersedly stored according to their similarities and discrepancies, can it be possible that the similar sounds share similar meanings. We mean that both language and image have no integral existence in the brain, so the dispersedly stored information(s) are impossible to be processed by the code's linear model.

Pic 1: Saussure-Hjelmslev Contrast

Figure 1 Saussure-Hjelmslev Contrast

Therefore, treating language as codes or codes' linear relationship is misleading, that was why Alan Turing invented a codes breaking machine to break the Enigma, later called Turing machine, because anyone treated language as codes or codes' linear relationship, will naturally design a codes breaking machine. Until now, the essence of modern Von Neumann computer, is still unchangeably a codes breaking machine. The only difference is that modern computer can decode the whole world. This doom decided that modern computer of its design can only imitate intelligence, but with no intelligence. A computing machine can only relay on artificial instructions. Computer can restore and transfer information, but it lacks of the ability of creativity. But human brain, take translation and answering question as examples, different person has different translation or answers, which one is the best, our brain can compare, to choose the best option according to the situation.

Alan said that he defeated God, but God's creation of human intelligence doesn't need any software to support. So God gifts him one bite of a poisonous apple, for God's attitude is clear that computer and AI machine are totally different. Treating language as codes is a terrible idea, that can only develop a codes breaking machine.

2.2 Image intelligence and language are two independently correlated neuron network existences

Obviously, it is concepts not symbols that build up the towers of language and thought as well as intelligence. How can symbols build up the towers respectively of language, of thought and of intelligence? like a Barbie doll to be built up by clothes, but without soul? Apparently, concept is the soul of language, not on the contrary, language has a soul of concept. Symbol itself has no soul. To say symbol has concept and sound as its two sides is to say clothes has man and clothes (as its two sides). What's the difference between symbol and sound? Smart man will immediately find there is a problem of infinite loop of circulated inclusion. Philosophy tells us that the world, no matter psychologically or physically, can only be binary relationship or quaternary the like, it is impossible to be ternary relationship or the like. Therefore, the essence of language is concepts not symbols. After all, while concepts are stable in all languages, symbol is arbitrary and a variable, the fact that language can be translated also suggests that concept is the basic unit of language, because so-called language translation is just to transform the language forms, not concepts themselves.

When we treat language as consisting of concepts, and take sound and image as its two sides, then everything is simpler and clearer. Wolf's hypothesis can be explained. Because language and thought are connected two different things, they are equivalent in effectiveness, activating each concept or sound can activate its related opposite side, they are connected as if they are the two sides of the same paper, while they are relatively independent. Here we must clarify why language (or conceptual language) and intelligence(or image concept) are positively correlated, but not the same thing. Because natural language is not human's patent. Different natural languages have been used by different races: humans, dolphins, whales, gorillas, though only human intelligence and languages are advanced. Since language and intelligence are both naturally evolved, their relationship is obviously parallel to each other and positively correlated. The evolution of language and intelligence are interacted and all the way paralleled. Language is the knowledge carrier, it is helpful to develop and build up intelligence, without inheritance of those language concepts like "agriculture, industry, molecule, bacterial, nuclear, etc.", modern man will not be more intelligent than primitives or animals. The process of language learning is the process of children establishing concepts and building intelligence. Since animals with no language also have been spotted basic intelligence, of course image intelligence is comparatively independent of language intelligence and they have their own nerve neural network existences that are vertically paralleled and horizontally correlated.

2.3 The essence of machine language and machine comprehension of natural language

Compared to natural language, machine language is a set of instructions expressed in binary codes. Machine language is not CPU used language but CPU produced language, since different CPU uses different assembler language. Because natural language and machine language are counter-parted, we can compare them while exploring the characteristics of natural language.

Machine has largely substituted human physical strength, but the substitution of machine for human mental activities is still a fantasy. For the hardware part of computer, an attempt of imitating the brain neuron network has witnessed a thrillingly preliminary success in imitating preliminary intelligence, but by computing 0 and 1, and by adjusting the value of each variable of the network nodes, the mechanical imitating on human intelligence cannot lead to real intelligence. The secret human intelligence can automatically or naturally emerge out of the neuron network lies not only in the network itself. Real intelligence, as we know, like that natural language of human beings, is acquired not only by laboring itself, but by interacting with outside world and with information feedbacks.

Alpha-go must behave like a man to be able to actively explore and collect the information he needed, and be able to judge the quality of the information he acquired excepting for imitating a man to play Go games. Alpha-go should be able to like a man knowing to ask why as well as do more works simultaneously and be experts in all works. Alpha-go leaning to play Go game by manually selecting and feeding him with data, this training process is time consuming, and by software adjusting it weights to learn appears to be awkward.

3 Problem of Machine Intelligence is Defined in Advance

Until now, the study of machine intelligence is still progress and difficulty coexisted. Some of the achievements have been put into practical use. For example, answering questions or settling a matter according to the information in the data base, completing a part of easy jobs according to the natural language instructions. However, machine understanding of natural language has not realized the breakthrough in essence. It still faces great challenges in technologies in order to endow computers with

the intelligence that human being have. One of the challenges is that people seldom realized that natural language is a sounds and situation coordinated conceptual system, and the weights of the neural network can be automatically adjusted by the feedbacks of the action. Human brain don't need software to support, the software (if it has) are self-generated and self-exerted.

Computer can better understand non-language instructions than language instructions, for example, our intelligent cell phones, every morning it alarms, but on Sunday morning it does not. It is because the button of alarming on the Sunday morning has been shut down by us, the button instruction can be perfectly understood by computer, but not a language instruction. To respond to behavior language is approximate to respond to stimulus.

Responding to stimulus is animal level of intelligence. In this sense, although Alpha-go defeating human being seems amazing, but it is conditional response level of intelligence. It's like children to learn from watching cartoon, they know the solar system and the USA, but their knowledge of USA is only on the tellurion. Therefore, the problem of Alpha-go is as same as that of the children. All its knowledge is from cartoon or from button instructions, if the knowledge the cartoon spooned is wrong, everything will be wrong, it can not make the right judgment by itself. If we input the Alpha-go with wrong collection of illustrative plates of a Go game, the computer will like that reported stupid children burning their playmate by binding him on a tree to imitate the cartoon of a happy goat. Child never realized danger until the burnt painfully crying. All in all, intelligence is not an accumulation of input knowledge, but the ability to judge and analysis the input knowledge on its quality and usage, this is the knowledge about knowledge, and it can only be acquired from reality instead of from "rule-input". Human beings can use their mother language perfectly without realizing any rules of their mother language, because their intelligence is based on situation not on rules-input. Skill and experience come from practice and feedbacks, this is where real intelligence comes from.

4 The Innovation on the Neural Network Structure

4.1 Both current computer and deep learning neural network are going on the wrong way

In retrospect, computer can do a lot of works, but every work it does needs different software to support. We have too many software to write and to be fixed up, it is a burden and unnecessary for both programmers and users. Although the emergence of windows and assembler language respectively make the computer using and program writing a little convenient than before, but generally speaking, they are not making things easier, but going on the wrong way much further. Different CPU requires different assembler language, so we are always busy with learning new assembler languages. The problem is not we are unwilling to learn, but the inspiration of machine intelligence has proved and would prove the learning of writing program, with time abiding, will be abandoned.

Writing program is out of date. Deep learning technology has been used in the area of image recognition and speech recognition. While reducing the program writing to a negligible degree, it still has great improving space.

The principle of the image recognition technology itself is wrong.

Firstly, large quantity of images of the same type have to be feed to the system, then according to different output results, adjust the weights of each neural network nodes, although this process of adjusting can be realized automatically by using software, but it is still time consuming. In contrast, our brain is not working in such a way. Secondly, from the network training process, we can see software is still needed. In contrast, our brain does not need any software to support. Thirdly, the image recognition training process although can realize the image recognition work, but the image recognition ability is a simulation of intelligence, it is not real intelligence. Intelligence simulation is impossible to create real intelligence, because real intelligence, no matter what it is, it is at least a kind of image combination ability instead of image recognition ability.

All in all, both writing software and adjusting weights are to give instructions to computer, both two methods are to get machine language the 0 and the 1. While assemble language is various, machine language is only 0 and 1. To get weights for the sake of getting weights is unnecessary. If all human works are required to be done by the same robot at the same time, how the weights should be adjusted or assigned by software? Therefore, adjusting weights for different work in essence is equivalent to writing programs, that is to give every step of instructions to computer or to decide the 0 and 1, different work need different weights, that is unnecessary since our final purpose is only wanting to get the binary codes of the world. Why can't we reform the hardware part especially the structure of the neural network to make the complete intelligence to be possible? But how? The answer lies in the conceptual

classification methods.

4.2 Linguistic inspiration on the intelligence emerging mechanism

In the morning, my daughter waked up, began her baby talk: Papa, did you sleep well tonight? Actually she referred to last night for her absence of the word of “last”. Here, she is actually not asking a question, but saying a hello to me. Salutation is a behavior of human intelligence. Firstly, in the dialogue, does the right word used in the situation need the adjustment of weights in the brain? The answer is negative. Language expression is no more than an utterance habit. The reason that language must adapt to situation and to meet the pragmatics standard is that every word is a concept, the words “tonight” and “last night” are concepts, their meaning are decided by situation. Grammar, syntax, world-building, and even context itself can be counted as language situation that match to image reality. Language rules is not passive input but active contracting with image reality. Secondly, we can see, the development of human intelligence is in fact comparatively independent of language development. Their relationship is parallel related, but not absolutely synchronous. Human intelligence is decided by something else beyond language, and that can only be the neural network of conceptual information store mechanism.

Another example illustrates the intelligence emerging mechanism and the conceptual information store mechanism.

Mama: Are you willing to bring the perfume to me?

Snow white: No. Mama: Why not?

Snow white: Because I am afraid of pepper!

Snow white said No to her mum, it is an intelligent behavior. Her intelligence tells her not to do because her brain classifies perfume, wind medicated oil and cooling oil into one class as pepper! Pepper is an upper concept!

Language is not only a series of distinctive astronaut symbols, but the concepts behind every symbols. Concept mainly refers to images, it is not an aggregated collage of vision, audition, touching, smell sense, taste sense, and emotions, etc. Without vision or image, audition, touching, smell sense, taste sense, and emotions, etc. are all meaningless. Without vision, mum is just milk, because we do not know who is the milk giver, so we don't know mum. Who bite me? Who sting me? Without image schemas, next time, dog and bee come, we still do not know escape. So, both conceptual world and real world are binary, and image schemas represent for intelligence.

5 Conclusions

Intelligence emerging out of brain neural networks is not due to that brain can automatically adjust the weights of the neural network nodes, but because conceptual information(s) of vision and audio are respectively resolved and dispersedly stored according to concept similarities and discrepancies in the adjacent neurons structures which forms a conceptual monolithic network by correlating language-centered network with image-centered network. Intelligence emerges out of the brain from vertically classifying and horizontally interacting of concepts, more specifically, from optimal choice of the empirical relationship between the upper concept of the behavior object and the behavior itself. Human intelligence is decided by the neural network of conceptual information store mechanism. We need to reform the neural network structure to change the conceptual classification methods. The reality is 0 and 1, our eyes can automatically acquire the information in nature of 0 and 1 from acquiring image and sound of the reality.

Abstract: Internal control information is the foundation of decision-making for investors. It reduces the information asymmetry, and improves the degree of trust and use for information users. Through illuminating the current situation of internal control information disclosure of Chinese listed companies, this paper analysis the effect of internal control information disclosure and the value relevance of accounting information, and puts forward the research hypothesis and builds a mathematical model. According to the data of Chinese warehousing logistics industry listed companies in 2013-2015, this paper has the regression analysis and puts forward corresponding countermeasures and suggestions to perfect the internal control information disclosure of listed companies.

Key words: Internal control; Accounting information; Value relevance of accounting information

1 Introduction

2586 listed companies disclose the internal control evaluation reports in 2014, 98.29% of overall disclosure. But only 80.74% has the normative form about these reports. In terms of the standards of internal control disclosure, 2141 listed companies disclose the standards, but the rest do not. 351 listed companies disclose the internal control defects, but only 8 listed companies disclose the rectification of internal control defects in the first half of 2014. In terms of disclosure of internal control audit reports, it is 77.88% in 2014. And the disclosed proportion are 92.43%, 86.79%, 56.49% and 92.43% respectively for Shanghai Stock Exchange main board, Shenzhen Stock Exchange main board, Shenzhen SME board and Shenzhen GEM board. However, in terms of the standardization of the disclosure of internal control audit reports, 30.50% of the listed companies do not disclose the normative internal control audit reports. At present, the internal control information disclosure of listed companies is mainly the following three aspects.

1) The disclosure of internal control evaluation report and internal control audit report format are not standard. 19.26% of listed companies do not carried out the latest specification. The disclosure of internal control audit reports is not good either. There is any undisclosed or nonstandard disclosed phenomenon.

2) The disclosure of internal control defect information is incomplete, loosely and poor availability. 32.10% of Chinese listed companies discloses incomplete internal control defect information. And Internal control evaluation reports of 17 listed companies are serious different to the internal control audit reports Issued by Certified public accountants. Internal control defect information is not rigorous and not strong availability. Its use value needs further evaluation.

3) The professional quality of internal control audit of Certified Public Accountants remains to be improved. The internal control auditing opinions and financial statements auditing opinions of listed companies exist significant differences in 2014. The internal control auditing reports of 286 listed companies does not have a valid digital signature from Certified Public Accountants.
