The United States promulgated SOX in 2002, which require listed companies to disclose their internal control evaluation reports. And these reports must be audited by Certified public accountants. Many foreign scholars carry out the research about the economic consequences of SOX to internal control. Doyle finds that the internal control defects and accrual quality are the negative correlation (DOYLE J T, GE W, MCVAY S E, 2007; ASHBANGH-SKAIFFE H, COLLINS D, KINNEY W, 2008). Chan investigates the correlation between significant internal control defects and more earnings

* This paper is supported by scientific research fund projects of Wuhan Huaxia University of Technology in 2015.

management behavior or lower income and surplus under the SOX 404 terms. The results show that the companies' internal control defects are significant to handling accrual quality and handling the absolute value of the accrued are significantly greater than the control sample, and also prove that significant internal control defects in lower income and surplus of close sex of (CHAN K C, FARRELL B R, LEE P, 2007). In addition, Donaldson's research proves that the effective internal control has significant function for improving the quality of financial reporting (DONALDSON TESTIMONY W, 2005).

For the research on effects of earnings management on value relevance of accounting information, stock price is affected by the book value and net income commonly. Francis believes that the income statement and balance sheet play an important role in determining the rights and interests of value. Marquardt found that when the companies manage the earnings the value relevance of net profit declines the book value of net profit declines increases. At the same time, the overall value relevance of the book value and the net profit declines (MARQUARDT C A, WIEDMAN C I, 2004).

In conclusion, these papers have proved that the internal control information affect earnings management, but also proved that the earnings management affects the value relevance of accounting information. According to the related provisions of Chinese securities regulatory commission, this article intends to test the influence of the internal control self-assessment report, internal control audit report and internal control defects and the value relevance of accounting information.

3 Research Hypotheses

The higher the quality of accounting information is, the higher its credibility and usefulness. Investors determine the authenticity and fairness of accounting information through a great deal of information. If the financial position and operating results of listed companies can reflect in the accounting information really and effectively, it improves the degree of trust and use for information users to a certain extent. Internal control information is the foundation of decision-making for investors. The parties of the capital markets dependents on accounting information to make a judgment. In capital market, the various stakeholders often can reject untrue and unreliable information, makes the true high quality information to play a leading role, reflects in the company's stock price, thus to guide the allocation of resources and optimize the industrial structure. Therefore, the quality of accounting information and the value relevance of accounting information are the positive correlation.

Internal control is divided into the control environment, risk assessment, control activities, information communication and supervision and so on. These five aspects including the basic situation of the listed companies, operating risk and control measures, production operation, the effective information transmission, the situation outside the effective supervision and so on, are the main content of improving accounting information quality. The quality of accounting information has strong positive influence to the value relevance of accounting information. Therefore, the internal control of listed companies and the value relevance of accounting information are also the positive correlation. With the release of some files, the problem of internal control information disclosure is increasingly important. Investors make the decision by internal control information listed companies released. And it is a significant issue, related to the decision's science if the internal control information is of high quality. On account of the positive correlation relationship between the quality of accounting information and the value correlation of accounting information, the disclosure of internal control information makes a great impact on value relevance of accounting information. These are three hypotheses.

Hypothesis 1: The disclosure of internal control evaluation reports can improve the value relevance of accounting information. Hypothesis 2: The disclosure of internal control audit reports can improve the value relevance of accounting information. Hypothesis 3: The disclosure of internal control defect reports can improve the value relevance of accounting information.

4 Research Design

4.1 Sample selection and data sources

This paper selects Chinese warehousing logistics industry listed companies as samples, and searches and organizes the data according to the information of financial websites and listed companies' official websites.

1) Excluding ST companies. Because the serious defect of ST companies reduces the workability of accounting information, excludes ST companies in the process of research.

2) Eliminating the companies with missing or wrong data, to ensure the scientific and fairness of research results

4.2 Model design

Francis and Feltham define the relationship between the market prices of the stock or the income and accounting information to be the value relevance, and measure the value relevance through the adjustment fitting R2 of the whole model and the significant degree of variable regression coefficient. Ohlson obtains the price model by strict mathematical derivation. He link accounting income and net assets to the stock price directly, then judge the strength of the value relevance of accounting information. This model includes the main factors such as net worth, surplus. Also some relevant variables can be incorporated into the model. The model has undergone major research checkout, and has good explanation ability. On the basis of this model, carries on the model revision to study the relevance between the disclosure of internal control information and the value relevance of accounting information about warehousing logistics industry listed companies.

The original model is $P_{it} = \alpha + \beta_1 EPS_{it} + \beta_2 BVPS_{it} + \varepsilon_{it}$. P_{it} is the share price of the last trading day in April of i listed company in t accounting period; EPS_{it} is earnings per share of i listed company at the end of t accounting period; $BVPS_{it}$ is net assets per share of i listed company at the end of t accounting period. To test the impact of the internal control evaluation reports disclosure to the value relevance of accounting information, adds interactive items of IDE and EPS , IDE and $BVPS$ in the original model. When the listed company discloses the Internal control evaluation report, IDE is one, otherwise is 0. The new model can be used to test whether the disclosure of internal control evaluation report can improve the value relevance of accounting information of listed companies. The new model 1 is:

$$P_{it} = \alpha + \beta_1 EPS_{it} + \beta_2 BVPS_{it} + \beta_3 EPS_{it} \times IDE_{it} + \beta_4 BVPS_{it} \times IDE_{it} + \varepsilon_{it}$$

At the same time, to test the impact of the internal control audit reports disclosure to the value relevance of accounting information, adds interactive items of IDA and EPS , IDA and $BVPS$ in the original model. When the listed company discloses the internal control audit report, IDA is one, otherwise is 0. To test the impact of the internal control defect reports disclosure to the value relevance of accounting information, adds interactive items of IDD and EPS , IDD and $BVPS$ in the original model. When the listed company discloses the internal control defect report, IDD is one, otherwise is 0. The new model 2 and new model 3 are:

$$P_{it} = \alpha + \beta_1 EPS_{it} + \beta_2 BVPS_{it} + \beta_3 EPS_{it} \times IDA_{it} + \beta_4 BVPS_{it} \times IDA_{it} + \varepsilon_{it}$$

$$P_{it} = \alpha + \beta_1 EPS_{it} + \beta_2 BVPS_{it} + \beta_3 EPS_{it} \times IDD_{it} + \beta_4 BVPS_{it} \times IDD_{it} + \varepsilon_{it}$$

5 Empirical Analyses

5.1 Variable descriptive statistics

Carries out the descriptive analysis of the variables in the model, and then observes the overall distribution of variables in samples. Descriptive statistics is shown in Table 1 below.

Table 1 The Results of Descriptive Statistics

variable names	year	mean value	median value	standard deviation	variance value	the minimum value	the maximum
<i>P</i>	2013	7.179	6.385	3.286	10.798	3.530	14.070
	2014	20.925	18.010	10.726	115.037	9.250	47.460
	2015	14.011	13.435	7.073	50.028	5.020	30.370
<i>EPS</i>	2013	0.441	0.334	0.385	0.148	0.055	1.590
	2014	0.337	0.303	0.214	0.046	0.036	0.843
	2015	0.297	0.263	0.294	0.086	-0.369	1.116
<i>BVPS</i>	2013	3.814	3.452	1.762	3.104	1.751	7.075
	2014	3.900	3.360	1.817	3.303	1.892	8.292
	2015	4.035	4.024	1.536	2.360	1.673	8.043

5.2 Correlation test

The results of the correlation test of samples data about the variables are shown in Table 2 below.

Table 2 The Results of Pearson Correlation Test

	<i>P</i>	<i>EPS</i>	<i>BVPS</i>
<i>P</i>	1		
<i>EPS</i>	0.504*	1	
<i>BVPS</i>	0.511*	0.401*	1

Note: * $p < 0.1$

Can be seen that from the chart, the correlation between *EPS* or *BVPS* and the Share price is more than 0.5, and is positively related. This shows that the model is reasonable preliminary.

5.3 Regression analysis

Table 3 The Results of Regression Analysis of the Model 1

<i>P</i>	2013	2014	2015	All the samples
<i>EPS</i>	9.220***	5.670***	1.249***	6.567***
	3.902	5.333	2.120	4.780
<i>BVPS</i>	1.722***	2.432***	4.780***	1.120***
	5.524	6.230	2.112	6.455
<i>EPS</i> × <i>IDE</i>	-0.368***	-0.121***	3.245***	1.298***
	2.769	-0.145	5.670	3.434

	6.445	4.259	3.410	4.680
F-statistic	136.830	211.110	134.125	179.442
Adj R-squared	0.540	0.683	0.577	0.593

Note: *** $p < 0.01$, ** $p < 0.05$, * $p < 0.1$

Table 5 The Results of Regression Analysis of the Model 3

<i>P</i>	2013	2014	2015	All the samples
<i>EPS</i>	11.220***	8.610**	1.229***	6.337***
	3.762	6.433	3.124	5.715
<i>BVPS</i>	1.432***	2.428***	4.330***	2.920***
	6.514	5.210	3.102	5.125
<i>EPS</i> × <i>IDD</i>	-0.318***	-0.021***	4.205***	2.298***
	2.559	-0.545	5.667	4.414
<i>BVPS</i> × <i>IDD</i>	-0.856***	-0.344***	-0.355***	-0.121***
	-0.167	-0.235	-0.544	-0.390
Constant term	47.124***	46.690**	57.130***	49.6128***
	4.433	3.217	5.670	5.090
F-statistic	127.833	246.109	176.335	229.706
Adj R-squared	0.523	0.545	0.617	0.577

Note: *** $p < 0.01$, ** $p < 0.05$, * $p < 0.1$

From the regression results, F value of three models is higher, and the adjusted R2 were over 50%. These show that the three models have good fitting. And the fitting of the sample overall reaches more than 57%, show that the model design is reasonable. From the regression results of all the samples, the explanation of EPS and BVPS to shares is in 1% of cases significantly. It shows positive correlation between the internal control self-assessment report, internal control audit report, internal control defects and the value relevance of accounting information. Three Hypotheses are validated.

6 Conclusions

Listed companies of Chinese Warehousing logistics industry in 2013-2015 as research sample, uses the linear regression model to test empirically the influence of the internal control self-assessment report, internal control audit report and internal control defects and the value relevance of accounting information. The result finds that the listed company internal control self-assessment report, internal control audit report and internal control defects affect the value relevance of accounting information to a certain degree. The disclosures of internal control information will help to improve the value relevance of accounting information of listed companies. For the external stakeholders of listed companies, the internal control information is helpful to make their decisions more scientifically and more practically.

The Linkage of Potential Hazards with Safety Impact: A View from Floating Storage Facility in Malaysia

Tasmin R., Salehuddin M. F.

Department of Production and Operation Management, Faculty of Technology Management and Business, University Tun Hussein Onn Malaysia, 86400 Parit Raja, Batu Pahat, Johor, Malaysia
(E-mail: rosmaini@uthm.edu.my, salehuddinmdfadzil@yahoo.com)

Abstract: Floating storage facility offers one unique and innovative solution for new installation in offshore crude oil industry. However, the system will easily contribute to potential hazards or risks that are difficult to quantify due to shortness of experience. This article gives an overview of the potential hazards during normal activity and relevant safety impact to personnel, asset and environment. The study applied Risk Assessment approach to measure potential hazard levels. Survey on 157 employees of 4 floating oil storage facilities were analyzed with methodological tools of ANOVA One Way, T-Test and Pearson Correlation to evince linkage between potential hazard and safety impact. The result showed that there is significant and yet low level of relationship between potential hazards and safety impact. The findings from the collected experience-based and research survey data can be applied to facilitate the development of rationalized approaches for top management in decision-making on the safety guideline, policy making and investment towards the floating storage facility.

Key words: Potential hazards; Floating storage facility; Safety impact; Occupational accidents

1 Introduction

Prices for crude oil have been plunging since the late 2008 and this seems barely increasing significantly in the past five years. As such, oil industry seeks better economic solutions to its new challenges for business sustainability. Business operation has always been encountering economic challenges and trying unique methods for sustaining competitive advantage, especially through process efficiency (Tasmin *et al.*, 2016). Hence, floating storage and offloading (FSO) crude oil facilities nowadays are becoming one preferred and efficient solution for new installation of oil and gas fields. Wilne (1998) reported that such facilities are suited for both small marginal fields and large deep-water reserves. Due to cost reasons and practical advantages if compared to fixed installation, floating facility is the most commonly used as crude oil storage systems. According to Alford (1997), with the straight forward mechanism of building and conversion basing on the existing ship building technology, the expensive offshore works can be kept to minimum as most of the construction, hook-up and commissioning can be completed onshore, with significantly less cost. The floating facility is a comprehensive system, it subsequently contributes to the potential hazard or risk that is surmountable to quantify due to lacking of experience, when compared to conventional shipping industry. It is reported that global shipping industry has been largely having a safe track record, even though when an incident happens it is expectedly disastrous (Hetherington *et al.*, 2006). As such, there is a typical similarity in terms of potential hazards and safety risks in maritime shipping and floating crude oil storage facilities.

For the construction of floating storage facility, two options can be considered. First option is the conversion of an existing shipping vessel. With the condition of the vessel and approval by the Classification Society, the selected tanker is converted to become floating storage and offloading facility. Related transferring equipment is installed to suite for the facility to receive oil and gas from designated oil well via subsea pipeline. Another option for oil storage is by building a new purposely built floating facility. The concept of this huge oil storage is rather similar with the converted vessel. Such storage facilities are expected to remain on a designated location for up to 20 years with all the environmental conditions taken into system design consideration (Ericson, 2016). Some of the facilities are designed to suite the process of keeping hydrocarbon which is located on top of the vessel. The floating facilities are designed to avoid any dry docking as compared to the practice of conventional sailing vessel. This poses new challenges as on-site repairing can become very difficult and equipment failure may have adverse consequences for vessel safety (Wilne, 1998).

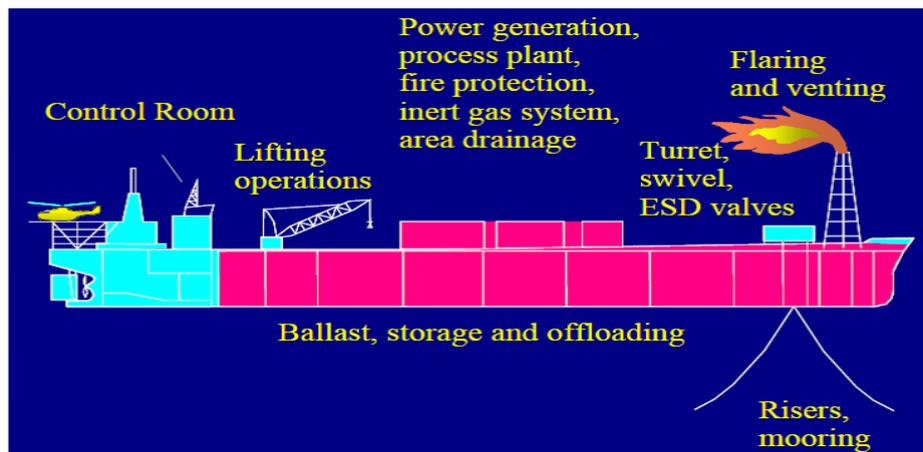

Figure 1 FPSO Compartmentalizing of the Ship

Figure 1 shows the example of Floating Production Storage and Offloading (FPSO) compartmentalizing of the ship, according to Gilbert and Ward (2001). It classified floating crude oil storage vessel in 7 areas, namely control room, lifting operation, ballast-storage-offloading, risers-mooring, flaring-venting, turret-swivel-ESD and power-generation, process plant, fire protection, inert gas system plus drainage areas. Risers and mooring is located at the front part of the vessel, as it is linked to the storage compartments and offloading. Flaring and venting is placed high above at the front part of the facility. Such systematic design has been vital for operational safety and employee safety compliance.

2 Literature Review

Smith-Crowe *et al.* (2003) stated strong and positive correlation between safety knowledge and safety performance, mediated by organizational climate, especially at highly safety guarded facility such as nuclear waste site. As such, studies on safety hazards at acutely safety sensitive venues have been impacting many oil and gas facilities, including floating oil storage terminal vessel. The floating storage structure has been used widely and reliably throughout the oil industry for many decades. The floating storage facility was primarily installed as for storage and offloading activity. Nowadays, with modern technology, the facility becomes offshore producing installation, storage facility and offloading terminal; all rolled into one single unit. Moan *et al.* (2002) described that the floating storage and production unit is a vessel that receives oil and gas from subsea wells through flow lines known as risers. The vessels can be a purpose-built ship or semi-submersible, or a converted shipping line tanker. This facility is commonly known as floating, production, storage and offloading (FPSO). The vessel without production system is termed as floating, storage and offloading (FSO).

Vinnem (2000) explained from the operational safety perspective of FPSOs: based on initial summary report, although the facilities are becoming more common, operational safety performance may still be considered somewhat unproven, especially when compared to fixed installations. Furthermore, floating installations are more dependent on continued operation of some of the marine control systems, during a critical situation. There is accordingly a need to understand the aspects of operational safety for the facilities, in order to enable a proactive approach to safety, particularly in the following areas:

- Turret operations and flexible risers,
- Simultaneous marine and production activities,
- Vessel movement/weather exposure, and
- Production, ballasting and offloading.

Hazard identification is a formal activity to examine all aspects of the operation under consideration using a pro-forma approach. It depends on the quality of the input data available and is typically performed as a table-top exercise lead by an experienced facilitator and the participation by representatives covering the full range of design and operational expertise for the system under consideration (Spies, 2001). The author stated that the hazard identification has considered a total of eleven different hazard categories that exists during the production phase of development. Biasotto and Rouhan (2004) explained that each identified hazard is analyzed in terms of its functional failure, failure

mode, consequences (including the possible different scenarios), existing barriers, control methods and repair strategies. The identified hazards are qualitatively classified on the basis of the likelihood and the related consequences regarding risks to personnel, to environment and to asset and production (Biasotto and Rouhan, 2004).

In the records of history, there have been a number of catastrophic accidents on offshore facility and causes of such accidents have become lessons-to-learn to operators and this has shed more light on the subject matter. While such accidents are undesirable and should be avoided at all costs, the world has benefited in no small measure from these experiences (Omogoroye and Oke, 2007). Chang and Lin (2005) reported that fire which led to explosion account for 85% of the onshore incidents involving petroleum refineries, oil storage and terminals, in the case of 242 oil storage accidents in the last four decades.

Human-related factor, such as manpower and its associated behavior, has been identified as one influential element contributing to fragility of many safety-sensitive industries. Fugas *et al.* (2012) reported that working peers' habitual safety norms and attitudes mediated the relationship between workplace safety climate and proactive safety behaviors, among more than 300 workers in transportation industry. In addition, Hetherington *et al.* (2006) emphasized that monitoring, managing, controlling and modifying the human factors issues of maritime workers could contribute significantly and positively towards safety performance in shipping industry. In February 1986, at Thessaloniki, Greece, cutting torch sparks ignited a tank spill fuel from a dike of a fuel storage tank. As a result, the fire quickly spread to neighboring petrochemical storage areas and causing the destruction of almost all 12 crude oil tanks. Whilst in December, 1985 at Naples, Italy, 24 tanks of marine petroleum products terminal were destroyed by fire that was caused by tank overflow. Fire and explosion totally destroyed the main terminal buildings, neighboring industrial facility and residential homes (Chang and Lin, 2005). Obviously, there are far many more oil storage accidents on the main land, in comparison to the focus of this study which is on floating oil storages in the open sea (offshore).

The major hazard to the offshore oil and gas facility is not much different from others as described in lesson learn of the onshore accidents. They are clearly categorized as: loss of well control or blowout, fire from the process plant, explosion from the process plant, H₂S and naturally occurring radioactive materials from reservoir, extreme weather, ship collision, seismic events and helicopter or other aircraft impact (Galbraith and Terry, 2008). For the past few years, the major accidents happen involving multiples fatalities, equipment damage and environment impact that require high cost to overcome the situation. Khan *et al.* (2004) also pointed out that the main hazards on offshore installation are the processed fluids and processing operations, the sea environment and the process links between the reservoir and other installations. The lesson-learned is part of the process to identify the hazards and mitigate them to as minimum as possible. These unfortunate events have happened to 'Alexander L Kjelland – structure failure during adverse weather condition', 'Ocean Ranger – capsized due to ballasting', 'Piper Alpha – hydrocarbon release' and 'Super Puma Helicopter crash at Cormorant', as described in "The Offshore Industry – Learning from Accidents" by Galbraith and Terry (2008). Due to these incidents, the industry has managed to be sufficiently innovative in coming up with relevant solutions to overcome the challenges (Tasmin and Woods, 2007). Though those unfortunate events happened at oil rigs, such mishaps may have also occurred at floating oil storage facilities due to its similar nature of offshore operations.

The floating storage and offloading facility has the ability to handle changes of oil reservoir and process, as well as offering storage and offloading of the treated crude to other export tankers. With this significant and comprehensiveness of the system, it will easily contribute to the potential hazard or risk which is difficult to quantify due to FPSO's limited experience if compared to long time spanning of shipping industry. The hazard is defined as a situation with a potential source of harm that are causing human injury, damage to the environment, damage to property or any combination of such event (BS EN ISO 17776:2002). It may be a physical situation (such as a shuttle tanker is a hazard because it may collide with the production installation), an activity (such as crane operations are a hazard because the load might drop) or a material (such as fuel oil is a hazard because it may catch fire). The essence of a hazard is that it has a potential for causing harm, regardless of how likely or unlikely such occurrence might be.

3 Data and Methodology

This research study focused on floating storage facilities that have currently been operating in Malaysian waters. Basically there are 4 field owners operated the floating oil facilities, namely Petronas, Murphy Oil, Talisman and Petrofac. These 4 facilities are selected for data survey which represents the

field owner and their facility in Malaysia. The total number of Personnel On Board (POB) for these 4 facilities is 258 people. According to Krejcie and Morgan (1970), the total number of sample should be 154 respondents, in the survey which had been done via stratified random sampling method. In the overall survey, a total of 157 correspondences have been taken as fully usable. This study demonstrated the level of potential hazards, significant differences between the demographic of facility towards the potential hazards and the relationship between potential hazards with safety impact. As such, it described the potential hazards from normal activities that should be considered at the floating oil storage facility. This is essential in order to achieve an overall safety and reliable design to personnel, asset and environment, as shown by the research conceptual diagram in Figure 2.

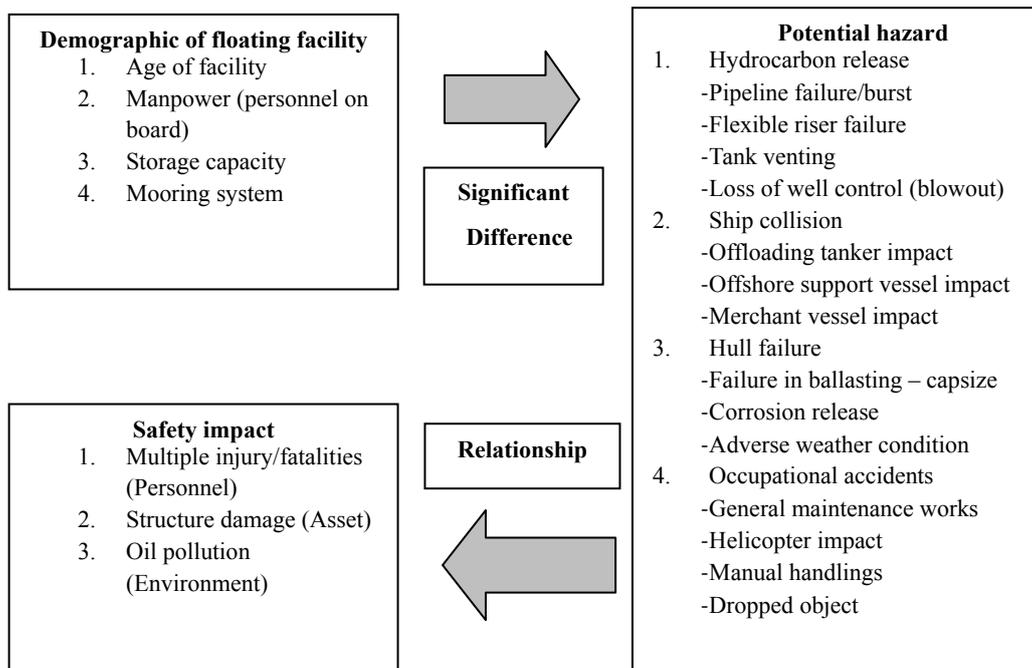

Figure 2 The Research Conceptual Relationship Diagram

This research applies the Det Norske Veritas (DNV) risk assessment approach, which is a step in a risk management procedure. It's a process of gathering data and synthesizing information to develop an understanding of the risk of a particular activity. Guldenmund (2000) stated that the safety climate assessment could be viewed as an indicator for organizational safety performance. Hence, the main purpose of risk assessment is to identify and rank the hazard risks so that they can be adequately managed. The use of risk assessment techniques in major hazard industries has grown significantly in recent years. This is particularly true in the offshore industry in the UK, where many aspects are subjected to full hazard risk assessment (DNV, 2001). Ericson (2016) defined hazard risk management is a discipline that is embedded into system development which is to identify and contain hazards, in order to avoid or alleviate the potential risk. Hazard risk is an assessment metric to forecast the probability and severity of possible incident or accident that will happen. This assessment provides among others, authorities and stakeholders with a sound basis for creating awareness about existing and potential hazards and risks, hence making positive decisions related to how they can prioritize and plan expenditures on risk reduction (Funnemark and Engebo, 2005).

There are two methods used as a tool for the study. The risk matrix and analytical tools are used to measure the level of potential hazard, the significance difference of demographic facility towards potential hazards and the relationship of the potential hazards towards safety impact of the facility. The first method of risk matrix is applied to measure the level of potential hazard whether it is 'low', 'medium' or 'high', based on ISO 17776 Risk Matrix approach. The risk matrix is a convenient method of ranking and presenting the assessment result. The second analytical tools are by applying ANOVA One Way, T-Test and Pearson Correlation, based on SPSS software.

Having set the problem background, literature and research methodology, below are the three

research questions to be pursued in this study.

RQ1. What are the hazard levels of hydrocarbon release, ship collision, hull failure and occupational accidents at the floating storage facility?

RQ2. What are the significant differences between the elements of demographic facility towards the element of potential hazards?

RQ3. Is there any relationship between potential hazards and the safety impact of the facility?

4 Analyses and Results

In this section, the findings from the methodology are discussed and simultaneously, answering the research questions developed for the study. The first research question seeks to determine the hazard levels of hydrocarbon release, ship collision, hull failure and occupational accidents at the floating storage facility; the second seeks to determine the significant differences between the elements of demographic facility towards the potential hazards, while the third intends to determine the relationship between potential hazards and the safety impact of the facility.

RQ1. Level of potential hazards

Table 1 shows the result on each potential hazard to personnel, asset and environment. Tool from ISO 17776 Risk Matrix (DNV, 2001) is applied to study the level of risk rating on each of the potential hazards. The cross reference from consequences and frequency show the risk rating for low, medium and high on each element of potential hazards towards personnel, asset and environment. From the table, it shows the levels of only low and medium risk rating towards the personnel, asset and environment. Fortunately, there is no high risk rating for the element of potential hazards. The level for low and medium level can be applied for ensuring the business continuity of the floating storage operation. If high risk rating appears, few safety steps are taken into consideration to minimize the risk or accident onboard the facility. The new risk reduction measures are implemented and the risk evaluation is repeated. In this particular case, the risk evaluation is defined as risk assessment and to be performed on every task on board facility. The risk reduction or control measures include both those to prevent incidents and to mitigate chronic aftermath of the incidents.

Table 1 Level of Potential Hazard for Malaysian Floating Storage Facility According to Risk Matrix

Potential Hazards	Sub section of potential hazards	Impact to Personnel	Impact to Asset	Impact to Environment
Hydrocarbon release	Pipeline failure/burst	Medium	Medium	Medium
	Failure of riser	Low	Low	Medium
	Cargo Tank venting	Medium	Low	Low
	Loss of well control (blowout)	Medium	Medium	Medium
Ship collision	Offloading tanker impact	Low	Low	Low
	OSV impact	Medium	Medium	Medium
	Merchant vessel impact	Low	Low	Low
Hull failure	Ballasting & capsize	Low	Low	Low
	Corrosion release	Low	Medium	Low
	Adverse weather	Low	Low	Low
Occupational accidents	General maintenance	Medium	Low	Low
	Helicopter impact	Medium	Medium	Low
	Manual handling	Low	Low	Low
	Dropped object	Medium	Low	Low

Table 2 evinces that the hazards are at higher risk probability when it comes to the hydrocarbon releases toward the personnel, the asset and the environment onboard. This is depicted by the sums of 8 mediums and 4 lows, as shown by the first row of Table 2 hazards' ranking. It is generally acknowledged that hydrocarbon release is one lethal issue in FPSO/FSO operation, since it is the most probable antecedent that may spark fire ignition onboard. Hence, the facility's top management has to pay higher attention on any eventuality towards issues related to hydrocarbon release. The hydrocarbon release is the first top priority, since this is the most detrimental issue among the four hazards, in relation to the whole safety of the FPSO/FSO facilities. The least potential hazard (ranking fourth) is hull failure, in which the respondents felt that it is the safest hazard issue. This is so because most hulls are double-layered, complemented with safety compartments which are equipped with safety valves and sensors to prevent failures. Furthermore, ship hulls and their coatings are designed to be in operation for very long time, approximately within 20 years.

Table 2 The Ranking of 4 Potential Hazards toward Safety Impact

Ranking	Potential hazards	Mediums	Lows
First	Hydrocarbon release	8	4
Second	Occupational accident	4	8
Third	Ship collision	3	6
Fourth	Hull failure	1	8

RQ2. Significant difference for demographic facility towards potential hazard

Table 3 shows the summary of significant differences between demographic of floating facility and potential hazards by using analytical tools of the Anova One Way and T-Test. The age of facility, manpower and storage capacity are applying the Anova One Way due to ordinal data type being collected ranging from 1 to 5 respectively. The mooring system using tool from T-Test due to nominal data collected for turret system and spread moored only. The result shows that the age of facility having significant difference for ship collision since 'f' probability is ≤ 0.05 . However, manpower and storage capacity are not showing any significant difference towards the potential hazards. The average age of the facilities in this study is below 15 years old and the ship collision is possibly giving an impact to the potential hazards, such as offloading tanker impact, OSV (Offshore Support Vessel) impact and merchant vessel impact. From the experience at the offshore, the OSV is the biggest threat due to the vessel is always at the alongside of the floating storage facility. The impact from the OSV can cause dented damage at the facility hull or worst oil spill to the sea. The sea environment factors, such as wind, swell, wave, and current, could also contribute to the incident, even though the facility have been operating for long period of time.

Table 3 The Summary of Significant Differences Between Demographic of Floating Facility and Potential Hazards by Using Anova One Way and T-Test.

Demographic of floating facility	Potential hazards			
	Hydrocarbon release	Ship collision	Hull failure	Occupational accidents
Age of facility	f=0.329 Not sig.	f=0.043 Sig.	f=0.819 Not sig.	P=0.762 Not sig.
Manpower	f=0.401 Not sig.	f=0.259 Not sig.	f=0.189 Not sig.	P=0.275 Not sig.
Storage capacity	f=0.121 Not sig.	f=0.161 Not sig.	f=0.133 Not sig.	P=0.581 Not sig.
Mooring system	p=0.547 Not sig.	p=0.469 Not sig.	p=0.001 Sig.	p=0.630 Not sig.

Anova One Way for ordinal data type: significant at 'f' probability ≤ 0.05

T-Test for nominal data type: significant at $p \leq 0.05$

The definition of ageing of facility is about its condition and how that is changing over time. Ageing is that effect whereby a component suffers some form of material deterioration and damage with an increasing likelihood of failure over the lifetime (Horrocks *et al.*, 2009). The significance of deterioration and damage releases will potential effect on the equipment's functionality, availability, reliability and safety. Overall, ageing facility is facility which is, or may be, no longer considered fully fit for purpose due to deterioration or obsolescence in its integrity or functional performance. Ageing is not directly related to chronological age. There are many example of very old facility remaining fully fit for purpose and of recent facility showing evidence of accelerated or early ageing, e.g. due to corrosion, fatigue or erosion failures. It is important to recognize that many features which may be subject to ageing, can contribute to health, safety and environmental performance of the facility or could compromise the performance were they to fail or collapse. In this study, the ageing of system and structure should be brought into attention for the potential impact of ship collision to the facility.

The results are also showing mooring system having significant difference for hull failure and it is significant at $p \leq 0.05$. As described by Stiff *et al.*, (2003), some differences between mooring system failure scenarios were identified but many of these scenarios were considered to be low likelihood. The slight differences in risk were driven by the redundancy of the two systems. Since the spread moored system has more mooring lines, which are arranged in closely spread groups, the likelihood of loss of one or more adjacent line escalating to, for example riser damage was considered to be slightly lower than for the turret moored system. However, the close proximity for the mooring lines in relation to the risers was considered a factor influencing the likelihood of mooring failure potentially escalating to riser failure for the turret moored facility. The consequences related to health and safety was also considered to be higher

for the turret system because of the more congested and confined area around the turret which can influence the intensity of an explosion as well as the potential for escalation if a gas leak occurs.

RQ3. Relationship of potential hazards towards safety impact

Table 4 The Summary for Relationship of Potential Hazards Towards Safety Impact by Using Pearson Correlation

Safety Impact	Potential Hazard		
	Correlation Value (<i>rs</i>)	Significant value (<i>p</i>)	Relationship
Personnel	0.385**	0.000	Low
Asset	0.401**	0.000	Low
Environment	0.334**	0.000	Low

**Correlation is significant at the 0.01 level (1tailed)

Table 4 shows the summary for relationship of potential hazards toward safety impact by using Pearson Correlation. Correlation coefficient values show that the influence is at lower level, even though they are really significant. As such, there is a low-level impact of potential hazard on safety impact to personnel, asset and environment, and such impact is very significant ($p=0.000$). This significance means that the potential hazards could severely lower on safety impact towards personnel, asset and environment. From the result, it shows that the asset having higher correlation value (0.401) if compared to personnel (0.385) and environment (0.334) respectively. This finding is relatively acceptable and making sense, as the physical structure of FPSO/FSO is typically huge (big asset). Generally, it is more exposed to the structural effects of potential hazards when compared to personnel and the environment. This finding is in accordance with Gershon *et al.* (2000) who reported the significant relationship, with $P < .05$, between organizational working safety climate and employee compliance with safe work practices (lower workplace exposure incidents). Furthermore, Singer *et al.* (2009) evinced that among 91 American hospitals with better safety climate had lower reported relative incidence of Patient Safety Indicators (PSIs). These supportive findings signify that excellent safety working environment leads to workers' compliance towards safe working practices.

5 Conclusions

In Malaysia, the floating storage is not much different from one to another, except for production unit that is attached to the facility itself. The size of facility and mooring system are depending upon the client/asset owner requirement. From the size of the facility, it will indicate the manpower requirement for the operation and maintenance. The study has shown that the ageing of the facility gives significant difference to the ship collision as a potential hazard. In general, the ageing process will reduce the performance and efficiency of the facility but the management is always taking efforts to maintain the integrity of the facility. The study also has indicated that the mooring system having significant difference to the potential hazard in relation to hull failure. Majority of the floating storages in Malaysia are using turret moored rather than spread moored system. Turret moored system can be weathervaned according to sea current condition. Due to the facility is always exposed to the sea environment and exposed condition, this will be resulting in high chances of corrosion.

The conclusion of overall study has shown that the influence is at lower level even though they are really significant. As such, there is a low-level impact of potential hazard on safety impact to personnel, asset and environment. All levels in the organization, from managers to operational staffs, are responsible towards the safety of the facility. They are and have always been in constant need to effectively control the risks and preventing harm at their facilities and environment. This can be worked out by strict operation and safety regulation and making sure that the personnel involved are giving priority to the work of controlling the risk by effective prevention and control through well-established safety management system and positive working culture.

Key Indicators to Build Country Resilience

Valeria Regina Bertoncelo, Arnaldo Jose de Hoyos Guevara
Pontifical Catholic University of São Paulo, São Paulo, Brazil
(E-mail: dehoyos@pucsp.br, valrbertoncelo@hotmail.com)

Abstract: Building resilience is a long-term process of each country, as it is associated with good governance and the equilibrium of respect for people, planet and profits, which do not deplete natural resources that affect the biosphere. Namely the learning ability, so it is a chance to demonstrate that it is possible under sustainable development. As resulting of applying the statistical method of correspondence analysis to a sample of 132 countries, in which were categorized in AIBER Iberia or American (21 countries); AVECO or advanced economies (28 countries) and others (84 countries) evidenced that resilience manifest as follow: Risk Indices to Natural Disasters for the AIBER Region, Good Government added to EPI and HDI for the AVECO Region and OTHER Region is considered as most vulnerable.

Key words: Resilience; Governance; Vulnerability; HDI; EPI

1 Introduction

For decades, the concept of resilience is becoming common research of several areas of the science and the applied social science. It is common understanding that resilience is the capacity of a system, be it an individual, a forest, a city or an economy, to deal with change and continue to develop (WORLD RISK REPORT, 2014). Based on such a concept it is possible to fit in other fields of knowledge. Moreover, according to the Center Stockholm Resilience, resilience regards more on how to build the capacity to deal with extreme events, unexpected sustainable development changes, including liaisons and ecosystem, i.e., overuse of natural resources, overcrowding in urban centers means the system imbalance. In general, the definition of the hard sciences, especially in engineering that reports that resilience is elastic memory of a physical body back to its normal state after being subjected to some type of pressure. It is noted that the term was adapted for other purposes, but does not differ from its origin in Latin that is ability to return to the previous stable state.

Indeed, the concept of resilience concept has been defined clearly too diverse areas of science; however, it is still part of several studies of social sciences and applied social sciences what is critical for building resilience and understanding of these factors can be applied.

In this study, is analyzed a group of 132 countries, divided in three regions, and based on key indicators including some regarding the concepts of the World Risk Report, a tool used to estimate the disaster risk of each country. For purposes of the statistical application of correspondence analysis, other variables were included in this study in order to assess the similarities between clusters and correlation of these variables with the indicators of the World Risk Report (2014).

2 Theoretical Reference

Considering the notion of resilience held by the exact sciences applied to human sciences as to how a society is able to survive and return to their status quo following an event or social adversity or exposure to natural hazards, The World Economic Forum- WEF (2016) believes that key to building resilience is the stability of societies. In this perspective, they issued on its reports five risks that will stress economies, countries and society as follow: (i) large-scale involuntary migration, (ii) extreme weather events, (iii) failure of climate-change mitigation and adaptation, (iv) interstate conflict with regional consequences and (v) major natural catastrophes. Noting that the Economic World Forum define risk as an uncertain event or condition that, if it occurs, may cause significant negative impact for the economies, in general within the next 10 years.

Evaluation of resilience requires its measurement for performance between communities, cities and countries. In much of the research, there is emphasis of the following: the need for good governance, economic and social development, protection, respect for the environment and respect for people and their communities where they live; that somehow may express the risk exposure, vulnerability, economic and social development and respect for the planet and people. Next are presented the basic Indexes that will be used for this study.

The World Risk Index (RISCN) - NU-EHS - United Nations University Institute for Environmental and Human Security that define the susceptibility to face extreme events of nature to determine country

resilience. Furthermore, makes use of the definition of governance and the connections of social systems to measure the learning ability and its Internationalization strategies: evidence and reflections on Brazilian companies coping capacities in order to reduce the disaster risk of the country or community. The index of risk aversion of natural disasters is the interaction of events such as earthquakes, floods, storms, droughts, sea level rise, and society at risk community (Wisner et al 2006).

The Vulnerability Index (VULV) is the quality of vulnerable when exposed to physical or moral damage because of its fragility. The concept may be applied to people, social groups and, is associated with its ability to prevent, resist and overcome potential impacts.

The ability to adapt, prevent and learning with negative impact of natural hazards are part of the definition of the lack of responsiveness and lack of adaptability. In addition, it refers to the susceptibility of a system, community is exposed to natural disasters and adverse climatic effects caused by social, physical, economic and environmental factors (Birkmann et al, 2010; 2011; Welle et al., 2012, 2013).

Adaptability is the ability of individuals and or the collective in responding and shaping the changes in the social-ecological system (Chapin et al., 2009). The presence of adaptability allows better management of natural hazards and increase resilience.

Vulnerability, adaptability has been used in different areas of research with no consensus about the meaning. Mostly of the concept has been approaching theories and concepts of societal subsystem, ecological, natural, or biophysical subsystems (Adger et al, 2005, 2011; Adger, 2000, 2006; Smit and Wandel, 2006). As for Adger (2006): "The vulnerability is most often conceptualized as being constituted by components that include exposure to perturbations or external stresses, sensitivity to perturbation, and the capacity to adapt."

Governance (GO) - One of the challenges of reducing the vulnerability of countries is through the intervention of state for public risk reduction policies. In fact, puts the concept of good governance for each country, which is able to recognize the vulnerabilities and manages for inclusion, access and sharing of power. In accordance with World Bank (1992), governance is "The exercise of power of each country to manage the resources for economic and social development. Therefore, good governance submit to high development of country".

Environmental Performance Index (EPI) - In contrast to other performance indicators, EPI evaluates countries according to policies protecting ecosystems and human health, including the assessment of the impact of air quality, water and sanitation on the health of people and how protect your assets water, forests, fisheries, biodiversity, climate, energy and agriculture (Global Metrics for the Environment, 2013, 2014). This indicator presents how each country is balancing the use of natural resources without its depletion and the impacts of economic development, such as disposal of solid waste, ozone depletion among others has public policies set for the equilibrium of balance of its ecosystem, but also the planet Earth.

The Human Development Index (HDI) – deal with performance assessment in some key dimensions: longevity and health care, good standard of living and being knowledgeable. Concept build up by UNDP (2013, 2014) and emphasizes that people and their capabilities are the keys for building the development of any country.

3 Results and Discussion

Correspondence analysis is a statistical method applied on this study to explore relationship of the representative variables for 132 countries considering 3 Regions (AIBER, AVECO and OTHERS). To apply this statistical technique - correspondence analysis the following steps were used: 1) Defining the 3 Regions concerning the 132 countries, 2) Using principal component analysis to help to choose most representative variables for the model, 3) Running ANOVA to obtain the mean and the F test for each variable, 4) Preparing the contingency table.

Defining the 3 Regions– the 132 countries were divided into three distinct regions as follows: AIBER Iberamerican region (21 countries); AVECO or Advanced Economies (28 countries) and the rest OTHERS (84 countries).

Selection of Resilience Variables based on Principal Component Analysis - Resulted in choosing five main variables: Human Development Index (HDI), World Risk Index (RISCN) Vulnerability (VULV), Governance (GO) and Environmental Performance Index (EPI).

ANOVA for the Selected variables - Analysis of variance applied to five more representative variables: DHI, RISCN, VULV, GO, EPI to obtain the mean and F-test of each. The data results of the ANOVA is the basis of the contingency table.

Contingency Table. The table shows the means, F-test and the p-value, for each one of the 5 Variables selected form where will be applied the simple correspondence analysis.

Table 1 ANOVAS

Rows	HDI	VULV	GO	EPI	RISC	Columns
AIBER	65,62	41,83	42,48	52,7	27,07	IDH
AVECO	85,11	13,74	83,25	81,39	10,25	VUL
OTHERS	47,46	57,44	33,36	37,95	23,53	GO
F-test	34,45	57,93	97,02	69,68	10,87	EPI
p-value	0,000	0,000	0,000	0,000	0,000	RISC

Source: Prepared by author.

The inertias shows the relative contribution of each variable to explain the differences among the Regions. Clearly Table 2 shows that GOV and RISK are the most relevant.

Table 2 Relative Inertias

	IDH	VUL	GO	EPI	RISC	Total
AIBER	0	0,009	0,023	0,003	0,035	0,07
AVECO	0,011	0,281	0,099	0,042	0,103	0,536
OTHERS	0,019	0,27	0,042	0,033	0,03	0,394
Total	0,03	0,56	0,164	0,078	0,168	1

Source: Prepared by author.

Table 3 shows that the first Axis already explains already 96.51% of the characteristic of the Symmetric Plot of Correspondence Analysis (Figure 1).

Table 3 Analysis of Contingency Table

	Axis	Inertia	Proportion	Cumulative	Histogram
	1	0,1017	0,9651	0,9651	*****
	2	0,0037	0,0349	1,0000	*
Total	0,1054				

Source: Prepared by author.

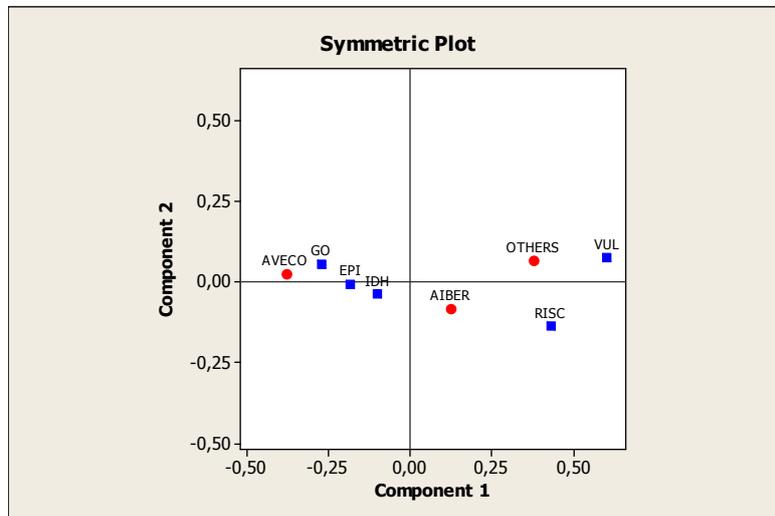

Figure 1 Symmetric Plot – AVECO, AIBER, OTHERS

Source: Prepared by Author.

Figure 1 clearly shows that AVECO Countries are doing much better than AIBER and OTHERS regarding Governance in particular that are the closest and to Vulnerability and where AIBER is in the middle between the two. As a matter of fact North America, Europe, Oceania and Asia: Japan, represented mostly by AVECO demonstrates high governance index, therefore, makes the best management of the investment priorities and allocation of public resources. Furthermore, the absence of good governance has proved that it is extremely detrimental in the fight against poverty, environmental protection because there is lack of public accountability and corruption. Is that what is observed on main

results of this research about Latin and Central America, Africa, Asia that has rates far below that desired, and the variable that has closer correspondence between them is the VULV- vulnerability and high awareness levels of corruption and absence of democracy in each region.

4 Conclusions

The development of resilience of countries is a hard task for governments, but leads to balance and equity to long-term society. Good governance practices includes reducing corruption, one of the greatest evils of society that needs to really foster sustainable development. The corruption occurs in many countries and observed in those where no clear rules, resources are scarce, misallocated, with excessive regulation and punishment is unlikely.

The absence of good governance may produce certain of circumstances that make the country, its cities susceptible to the damaging effects of hazard. This is the vulnerability observed in most of the AIBER sample countries of this study. According to the World Economic Forum (2016) there is a lot of concern regarding Latin America countries, in special the South America, about its capabilities to promote the good governance due to the increase level of corruption and mistrust of the legal institution that impacts the local management of business.

For the United Nations Office for Disaster Risk Reduction (UNISDR), vulnerability's cause may come from different factors, i.e. social aspect, or poverty and inequality, marginalization, social exclusion and discrimination; or there are economic dependence due to single industries, globalization of business and its supply chains and finally but not last, the absence of environmental policies. Poor environmental management, overconsumption of natural resources, decline of risk regulating ecosystem services, climate change etc. are some of impacts of non-reduction risks of disasters done by man-made changes. Beyond those factors, for 2016, the region is facing weak economic growth due to the price reduction of its commodities that affects levels of GDP of each AIBER country and government debts. This might increase the risks of failure of reduction of unemployment or underemployment, infrastructure investments to protect and given access to sanitation, water and health to the population.

Except for a few countries of the AIBER, and most of OTHERS there are issues related to vulnerability that does not seem to be fully solved. One example is China that has a chain of significant supplies, but no policy on greenhouse gas emissions and the use natural resources; on the other hand, the African continent, except by South Africa, has lack of governance and its population is below the poverty line. In this sense, for the World Economic Forum, countries in regions assigned AVECO have other important issues to maintain the resilience of their countries and their economies, however is not the same as development countries, but others called man-made. One of them is the assets bubbles, cyber and terrorist attacks and last but not least is the failure mechanism of financial institution and the contagious of global economies. Finally, to build resilience and vulnerability reduction is a hard but vital task for each country that may be leverage by social-economic and political development, in addition to geographical, historical and cultural aspects that normally permeate the attributes for good governance and social stability.

Abstract: The aim of this study is to examine the influence of two critical antecedents- technical reliability and technology trust of perceived risk on customer satisfaction, and behavioral intention toward self-service technologies (SSTs). A conceptual framework is proposed and its subsequent hypotheses are tested. Results of 95 self-administered questionnaires indicate that when the degree of perceived risk is abated customer have a propensity to be satisfied with SSTs followed by positive behavioral intentions toward SSTs and would like to continue with technology-enabled services. The study also implies that high technical reliability and technology trust are two most important antecedents of perceived risk which help to lessen perceived risk and thus increase the satisfaction. Implications for executives, further research direction and shortcomings of the study have been placed.

Key words: Perceived risk; Technology trust; Technical reliability; Satisfaction; Behavioral intention; SST

1 Introduction

Service industries are increasingly characterized by technology enabled services nowadays. Self-service technologies (SSTs), the way of empowering customer to enjoy their own service encountering by means of the interaction of electronic service interfaces or machines without interacting with a firm's service employee (Shih-Chih et al., 2009), are now widely accepted by the both service providing firms and customers for their tremendous lure. Examples of SSTs include e-commerce, automated teller machines (ATMs), e-stock trading, automated airplane boarding, etc.

The choice of SSTs creates relatively great advantages for firms in terms of productivity and cost-savings (Dabholkar, 1996). Rapid technological development, increasing labor cost, improving productivity of technology and enhancing technical intelligence of customer are influencing the service provider to deploy various technologies. Against a question, why organizations are introducing SSTs at rapid pace? Bitner et al. (2002) identified three most important reasons behind this, namely-(i) to reduce cost, (ii) to increase customer satisfaction and (iii) to reach new customer segments.

Although SSTs is now critical component of services delivery mode, unsurprisingly not all customer enter into the using of SSTs or are ready to embrace them (Lin & Shieh, 2007). Traits of both SSTs and individual customers are considered responsible behind it. From the traits, perceived risk associated with SSTs is mostly responsible one. Johnson et al. (2008) suggest that satisfaction is negatively influenced by perceived risk. Technology or internet behavioral intentions of customers are greatly influenced by customer satisfaction (Taylor, Celuch, & Goodwin, 2002). Since SSTs replacing the way of service delivery tremendously, therefore, the practitioner and researchers need to have insight how to reduce perceived risk and what are its important antecedents to improve customer satisfaction and behavioral intentions toward SSTs.

2 Literature Review

Relevant Literature on technical reliability, technology trust, perceived risk, customer satisfaction and behavioral intentions are summarized below along with the hypotheses and Hypothetical Model.

2.1 Technical reliability and perceived risk with SSTs

Perceived reliability is the belief and confidence of customers that a technology will deliver the services as it is intended to do without embracing any error and inconsistency. A potential user of technology-based services is not likely to use if he or she perceives that new technology is unreliable and believes faulty outcome likely to arise (Dabholkar, 1996). Ganguli & Roy (2010) opined that security and reliability can increase the customers' confidence level and trim down customers' perceived risk in using technology-based banking services as well as play a significant impact on satisfaction. Therefore the hypotheses are.

H1a: Technical reliability negatively affects perceived risk toward self-service technologies.

H1b: Technical reliability has positive impact on customer satisfaction with self-service technologies.

2.2 Technology trust and perceived risk with SSTs

Reliable performance of SSTs and expectation that they will work consistently is trust in self-service technologies (Johnson, 2007), which is one of the outcomes of cognitive assessment of performance beliefs received from using SST (McAllister, 1995). The belief of gains or losses may arise from a transaction is typically known as risk (Mayer et al., 1995; Pavlou, 2003). Perceived risk is consumer’s belief about the e-transaction’s probable tentative negative outcomes (Kim et al., 2008). Trust is obligatory when risk associated (Corritore et al., 2003; Mayer et al., 1995; Pavlou, 2003). Perceived risk has significant negative association with trust (Pavlou, 2003). Thus with the increase of trust perceived risk decreases (Lewis & Weigert, 1985; Luhman, 1979; Mayer et al., 1995). Again Shunzhong (2012) shows positive association between trust and customer satisfaction. Following hypotheses are offered from the above evidence:

H2a: Customers’ trust toward self-service technologies negatively affects perceived risk.

H2b: Customers’ trust toward self-service technologies has positive influence on customer satisfaction.

2.3 Perceived risk and customer satisfaction with SSTs

Customer satisfaction is the realization of customer’s needs, requirements, and goals at expected level from consumption of a product or services (Oliver, 1997). Satisfaction reflects the extent of positives feelings a consumer experienced from a service encounter (Lin & Shieh, 2006). Many researchers (Kim et al., 2008; Cheng & Chen, 2008; France & Lemuria, 2008) found that intention to use e-service or intention to make e-transaction is negatively influenced by perceived risk. Johnson et al. (2008) also identified that satisfaction is negatively influenced by perceived risk. Thus the following hypothesis is proposed for this study:

H3: Customers’ perceived risk is negatively related to customer satisfaction with SSTs.

2.4 Customer satisfaction with SSTs and behavioral intentions toward SSTs

Repurchase intentions, possibility of recommending, devotion and behavioral intentions are significantly and positively influenced by customer satisfaction (Cronin et al., 2000; Dabholkar, 1994). Satisfaction is significantly correlated with technology enabled communication and future intentions (MacDonald & Smith, 2004). Positive behavioral intentions toward technology can be increased by satisfaction (Taylor, Celuch & Goodwin, 2002). Lin & Hsieh (2006, 2007) found that behavioral intentions toward using SSTs are significantly and positively influenced by customer satisfaction. Word of mouth and reuse or repurchase or loyalty intentions towards SSTs are unsurprisingly and positively inclined by customer satisfaction (Taylor et al., 2002; Yoon, 2002). So, the hypothesis is:

H4: Customer satisfaction has positive impact on behavioral intentions toward self-service technologies.

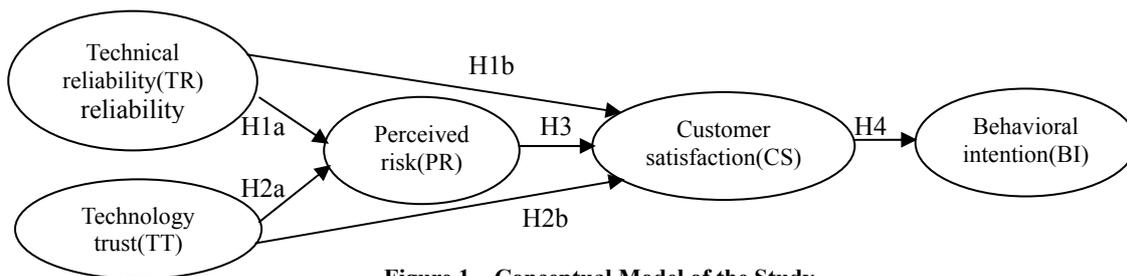

Figure 1 Conceptual Model of the Study

3 Research Methodology

150 questionnaires were distributed in three sections among the Executive MBA students of a University in the Chittagong Metropolitan City of Bangladesh. The primary characteristics of the respondents are they are students. Each section consists of 50 students from whom almost 70-80% students are involved in business or service. The authors considered only the respondents those who have their earning sources and at the same time they are students too. We have found total 107 respondents meet both categories. After eliminating invalid responses, 95 questionnaires were found useable. Therefore, they are predicted frequent users of SSTs like e-stock trading, online shopping, e-banking etc. Survey instrument was developed incorporating five constructs. For technology trust, we used three item scale of Johnson (2007). Five items scale for each technical reliability and perceived risk

were adopted from Walker et al. (2002). Three items American Customer Satisfaction Index (ACSI) scale for customer satisfaction was adapted from Fornell et al. (1996). SmartPLS 2, and SPSS 20 software packages were used for statistical analysis.

4 Results and Analysis

4.1 Demographic profile of the respondents

Table 1 reports the demographic profile of the study respondents and their respective frequency.

Table 1 Demographic Characteristics Respondents

Variables		Percentage	Variables		Percentage	Percentage		Percentage
Gender	Male	64(67.4%)	Previous Education	70(73.7%)	16(16.8%)	Experience of service, business or others	1-3 years	70(73.7%)
	Female	31(32.6%)		12(12.6%)	79(83.2%)		4-6 years	12(12.6%)
Age	25-35 years	49(51.6%)	Occupation	8(8.4%)	65(68.4%)		7-9 years	8(8.4%)
	36-45 years	34(35.8%)		5(5.3%)	25(26.3%)		10 and above	5(5.3%)
	46 & above	12(12.6%)	Others	5(5.3%)				

4.2 Validity and reliability of the data and instruments

Smart PLS 2, a structural equation modeling software based on partial least square, is used for finding statistical results. Bootstrapping results were used to confirm the significance of the results. Hair Jr et al. (2014) has recommended that moving forward the analysis if it holds the calculated values not beyond the threshold limits. It's been reported that internal consistency reliability shown by composite reliability (CR) value should be at least 0.7, and convergent validity measured by Average Variance Extracted (AVE) that should be at least 0.5. For having discriminant valid instrument, the square root of the average variance extracted (AVE) of each construct should always be higher than correlation with other instruments in this study. In addition, Cronbach's alpha (CA) value above 0.60 is just suitable for work (Hair Jr et al., 2014; Urbach & Ahlemann, 2010). The calculated results reveal that minimum AVE, CR, and CA are 0.651, 0.904, and 0.866 respectively which are above the cut off value. Besides, square root of AVE of each construct is above its correlation with other constructs in this study. Therefore, these results are valid and reliable for further study (Hair Jr et al., 2014; Urbach & Ahlemann, 2010).

Table 2 Validity and Reliability of the Instruments

Convergent Validity of the Items							Discriminant Validity of the Instruments					
Latent Variable	Mean	SD	AVE	CR	CA	R ²	Latent Variable	1	2	3	4	5
BI	2.12	0.817	0.817	0.931	0.888	0.648	1. BI	0.904				
CS	1.93	0.539	0.839	0.940	0.904	0.891	2. CS	0.805	0.916			
PR	2.07	0.897	0.651	0.904	0.866	0.729	3. PR	-0.754	-0.884	0.808		
TR	1.94	0.871	0.719	0.927	0.902	0	4. TR	0.813	0.905	-0.802	0.848	
TT	1.93	0.818	0.844	0.942	0.908	0	5. TT	0.753	-0.915	-0.791	0.834	0.919

4.3 Path structural model

Hair Jr et al. (2014, p. 48) mentioned that path co-efficient with a standardized values above 0.20 are good indicator for social and behavioral science research of a sample size below 1000. Figure 2 reports the path co-efficient (β), percentage of variance explained (R^2), and the indicators' loading. In addition, bootstrapping results reported t- and p-values in order to verify the significance of the hypotheses. Reported standardized co-efficient (β s) of path relationships are- CS \rightarrow BI is 0.805 (t -value=10.86, p <0.000), PR \rightarrow CS is -0.350 (t -value=1.845, p <0.06), TR \rightarrow CS is 0.223 (t -value=1.703, p <0.089), TR \rightarrow PR is -0.483 (t -value=3.073, p <0.002), TT \rightarrow CS is 0.414 (t -value=2.293, p <0.003), and TT \rightarrow PR is -0.385 (t -value=2.509, p <0.012) found significant at different p values. Those indicators indicated that all hypotheses are proved significantly. To be noted from the figure (2) that CS explains 64.8 per cent of variance (R^2) of BI, PR explains 89.1 per cent variance (R^2) of CS, and TT and TR explain 72.9 per cent variance (R^2) of PR.

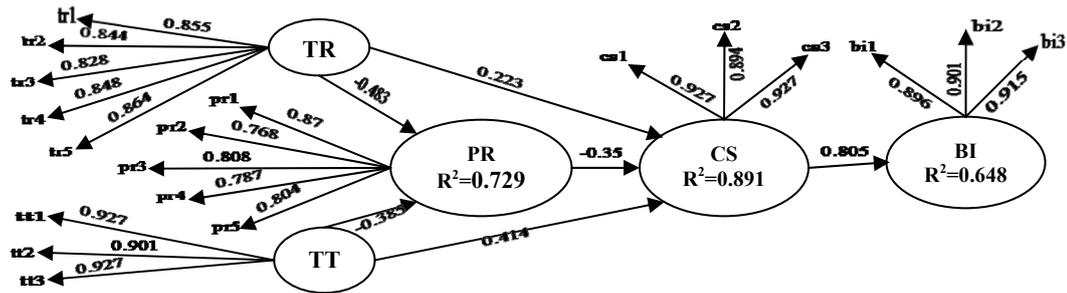

Figure 2 Structural Path Model

5 Discussions and Implications for Management

The study is an effort to demarcate how technical reliability and technology trust influence customer satisfaction and behavioral intention through reducing perceived risk as antecedents of perceived risk. The results of this study are also similar with other studies done in different countries by using same or other instruments. The most important findings of this research is the lack of trust is very high among the SSTs users in Bangladesh. It happens because of low security and lack of technical reliability of SSTs and hence increased the perceived risk associated with SSTs among the service receiver using SSTs in Bangladesh. Result reported negative relationship between technical reliability and perceived risk. Higher technical reliability helps to reduce the perceived risk and also influence to increase customer satisfaction with SSTs. These findings for the propose hypotheses 1a and 1b are similar to the findings with Ganguli & Roy (2010). Technology trust is another important antecedent of perceived risk and customer satisfaction. The research also reveals that technology trust negatively affects perceived risk and also positively influences customer satisfaction. These results of hypotheses 2a and 2b are also affirm the previous study of Pavlou (2003) and Shunzhong (2012). Therefore, higher technology trust would definitely lead to mitigation of risk and thus increases the customer satisfaction with SSTs. A critical factor for customer satisfaction is perceived risk, which influence customer satisfaction negatively. The proposition 3 is consistent with the findings of Johnson et al. (2008). The study also found that behavioral intention toward SSTs is significantly and positively influenced by customer satisfaction. The finding for hypothesis 4 is also similar with the research of Taylor et al. (2002).

Incremental advancement of self-service technology (SST) is dramatically changing the modes of delivering services and services industries' business practices. Moreover, services industries have no other alternative competitive modes of delivering services choice than SSTs. Therefore, services industries must pay attention to the abatement of perceived risk associated with SSTs. The constructs-technology trust and technical reliability identified in this study could work as guiding principles for the management of services industries to reduce perceived risk associated with technology to keep the customer with SSTs. Service industries should focus on how to reduce the risk connected with SSTs. They should spotlight on the mechanisms of building trust as well as to enhance the reliability of SSTs. They are supposed to keep close eyes on malfunctioning or failure of SSTs to increase reliability of SSTs and trust with SSTs. These strategies will help them to reduce perceived risk and thus increase customer s satisfaction with SSTs as well as a changed positive behavioral intention toward SSTs.

6 Conclusions

Small number of sample size could be possible limitation of this study to generalize the findings. Considered only two antecedents- technical reliability and technology trust of perceived risk can be mentioned as another shortcoming of the study. However, future studies can address these limitations adopting large volume of sample size. Other antecedents like quality of SSTs, perceived ease of use, capacity of customer would help future research to verify the research model. Although sample size is not sufficient still this study contribute to the existing literature by focusing how to increase customer satisfaction through reducing perceived risk. This ultimately leads positive behavioral response of customers toward SSTs and to retain customers for the long run business development.

A Study of Politeness Strategies in Corporate Statements in Crisis Public Relations

Xie Ruiting

School of Foreign Languages, Hubei University, Wuhan, P.R. China, 430062
(E-mail: sherryting0716@qq.com)

Abstract: This paper probes into the corporate statements in crisis public relations from the angle of politeness strategies, which serves as a joint study of crisis management and politeness theory. The focus of the paper is to research on the category of politeness strategies used in corporate statements in crisis public statements and shed some light on how to write a concise and polite statements after crisis. In the study, corporate statements in crisis public relations are analyzed by using Brown and Levinson's classification of positive and negative politeness strategies. The results indicate that positive strategies are more often used in corporate statements than negative ones. Besides, some politeness strategies such as exaggerate, make offer or promise, apologies, etc. are quite indispensable in statements issued to cope with crisis, since these strategies endow the statement with its basic functions.

Key words: Politeness strategies; Corporate Statements; Crisis public relations (CPR)

1 Introduction

With the rapid development of economy in recent years, an increasing number of crisis events are faced by different companies, so there is an urgent need for them to deal with these crisis events properly and effectively. Crisis management is a systematic and scientific way to deal with crisis. Sharad Merotra defined crisis management as “activities that encompass the immediate response to a disaster, recovery efforts, mitigation, and preparedness efforts to reduce the impact of possible future crises” (Sharad Merotra, 2008). Crisis management will help those crisis-hit companies to clarify the situation, reduce the damage, and offer apology or make compensation. There are a number of studies at home and abroad on crisis public relations or crisis management. Christine M. Pearson and Judith A. Clair integrated psychological, social-political, and technological-structural approaches with the research on crisis management in order to carry out a multidisciplinary study on it (Christine M. Pearson & Judith A. Clair, 1998). Adam Blake & M.Thea Sinclair and Brent W. Ritchie researched on crisis management in tourism, and Adam Blake & M.Thea Sinclair stated that “Sector-specific targeted subsidies” and “tax reductions” were proved to be very effective ways in managing crisis (Adam Blake & M.Thea Sinclair, 2003). You Changqiao proposed 5S principles in crisis public relations, that is, “speed, system, shoulder, sincerity and standard” (You Changqiao, 2007). Bao Changhuo and Gong Huaping analyzed the process of crisis public relations management and divided the whole process into three steps---before, during and after the crisis (Gong Huaping & Sun Xiao, 2014). Apparently, most studies on CPR are focused on how to cope with the crisis by using some managerial principles or techniques, but few researches are done from other angles. Therefore, this paper pays special attention to the language used in corporate statements released right after the crisis in order to probe into the politeness strategies applied in those statements and give some related tentative suggestions.

2 Politeness Theory and Classification of Politeness Strategies

Brown and Levinson's politeness theory is based on the assumptions that “face” is the public image needed by all adults in the society. Then, “face” can be further divided into positive face (people's need to be appreciated and approved by others) and negative face (rights to none-distraction etc.). In daily life, there will be some acts which threaten the positive or negative face need of either the speaker or the hearer. So these acts can be grouped as face threatening acts.

In crisis public relations management, companies will encounter some problems related to the quality of their products now and then. In order to face these problems, companies have to write some official statements to publicly make their apologies, explain the situation, shoulder their responsibilities and solve the existing problems. Therefore, politeness theory is rather essential in writing those statements which embody the sincerity and politeness of the company and satisfy the positive or negative face need of addressees.

Brown and Levinson proposed five politeness strategies in their book *Politeness: Some Universals in Language Usage*, and these strategies are bald on record, positive and negative politeness strategies,

off-record and non-performance (Brown and Levinson, 1987). While, in this paper only positive and negative politeness strategies will be studied due to the features of corporate statements. Brown and Levinson further divided positive politeness strategies into 15 sub-types, and negative politeness strategies into 10 sub-types as is shown as follow in Figure 1.

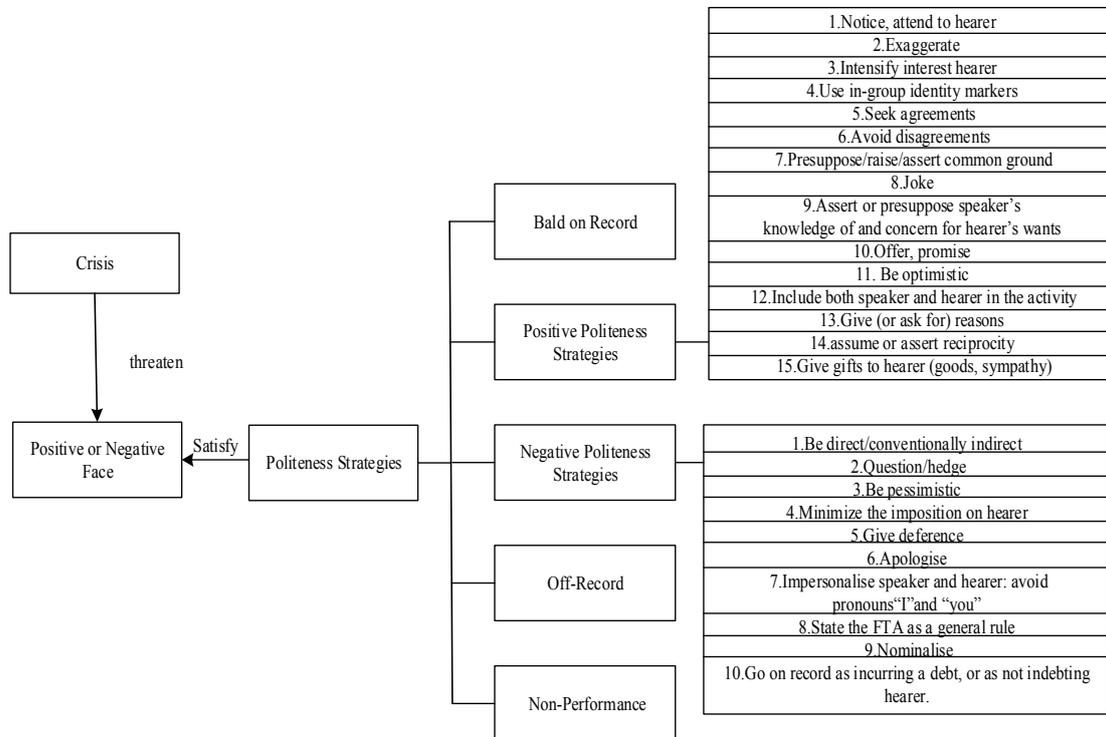

Figure 1 Classification and Function of Politeness Strategies in Crisis Management

Brown and Levinson's classification of politeness strategies will be used in this paper to analyze how these strategies are used in corporate statements to resolve the crisis and rehabilitate reputation.

3 Data Analysis

In this paper, four different pieces of corporate statements are chosen to analyze the application of politeness strategies. The titles of these corporate statements are KFC's statements on White Feather Chickens, Mcdonald's statement on Sanlitun restaurant, Mengniu Dairy's statement on exceeded Aflatoxin M1 in the milk product (Mengniu 1) and Mengniu Dairy's statement on milk product containing Melamine (Mengniu 2). There is no denying the fact that the chosen companies are very famous and influential in China, they are KFC, Mcdonald's and Mengniu Dairy. Their corporate statements used in this paper are collected either from the official websites or mainstream media, and the all the corporate statements used in this paper are the formal original statements without any further modifications or changes. The four pieces of company statements will serve as examples to analyze the politeness strategies applied in corporate statements.

As for crisis public relations management, according to You Changqiao quick reaction is quite critical in coping with different kinds of crises. All these four pieces of corporate statements were issued on the official websites or Micro-blogs within a week after the crisis. As for each statements, there are 217 words in Mcdonald's statements, 519 words in KFC's statement, 559 words and 261 words in Mengniu Dairy's statements. All the corporate statements here are brief and condensed. Compared with other kinds of statements, language used in corporate statements in crisis public relations are much more formal, clear and concise. In other words, words and sentences used in corporate statements in crisis public relations clearly state the company's attitude towards the crisis and meanwhile provide some possible solutions straightforward.

Based on Brown and Levinson's classification of positive and negative politeness strategies as shown in Figure 1, politeness strategies used in 4 pieces of corporate statements can be grouped and

shown in Table 1. In this table, some common patterns in corporate statements can be figured out and analyzed.

Table 1 Politeness Strategies Used in Four Pieces of Corporate Statements

Company	Politeness strategies
KFC	<p>Positive strategies: 9. Assert or presuppose speaker’s knowledge of and concern for hearer’s wants 13. Give (or ask for) reasons</p> <p>Negative strategies: 4. Minimize the imposition on hearer</p>
McDonald’s	<p>Positive strategies: 2. Exaggerate 7. Presuppose/raise/assert common ground 9. Assert or presuppose speaker’s knowledge of and concern for hearer’s wants 10. Offer, promise 11. Be optimistic 12. Include both speaker and hearer in the activity</p> <p>Negative strategies: 4. Minimize the imposition on hearer 6. Apologise</p>
Mengniu Dairy 1	<p>Positive strategies: 2. Exaggerate 10. Offer, promise 11. Be optimistic</p> <p>Negative strategies: 4. Minimize the imposition on hearer 6. Apologise</p>
Mengniu Dairy2	<p>Positive strategies: 2. Exaggerate 10. Offer, promise 14. assume or assert reciprocity</p> <p>Negative strategies: 6. Apologise</p>

In table 1, it is quite obvious that positive strategies are more frequently used in corporate statements than negative ones. Among all the positive strategies, 2. Exaggerate, 9. Assert or presuppose speaker’s knowledge of and concern for hearer’s wants and 10. Offer, promise are more often used than others.

“Exaggerate” can be realized with some adjectives or adverbs. For example, almost all the statements use adjectives or adverbs like “sincere”, “deep”, “earnest” “completely” etc. To exaggerate or intensify the regret and show company’s attitude. These modifiers can build a sincere and responsible image for the company after the crisis. According to You Changqiao, “shoulder the responsibility”, one of the 5S principles, is another important move in coping with the crisis. Therefore, showing the regret properly and shoulder the responsibilities willingly will be an effective and important move in after-crisis statements.

One of the crucial functions of corporate statements in crisis public relations is to resolve the crisis or problems, thus almost all the statements need to make offer or promise. For example, offer to replace for free, refund, and promise the problem will be properly solved. Crises and damages cannot be removed, what can be done now is to apologize, solve the existing problem and make compensations. Therefore, to make offer or promise and apology are far more important and relevant strategies are more frequently used than other ones.

Furthermore, corporate statements are issued to solve the problem and rebuild company’s image at the same time, which makes consideration for hearer’s wants rather necessary. So those statements will show concerns for the infringement of the rights of customers. Some companies in their statements prefer to emphasize the crisis is not a common but an individual case, by this means the damage to company’s reputation may be to some extent reduced.

As for these four pieces of statements, apart from “apologies” a few negative politeness strategies are applied. Apologies in statements should be formal and sincere, and through apologizing the negative face need of hearer can be satisfied. Among the three companies mentioned above, McDonald’s uses

eight different politeness strategies in its statements, almost twice as others. It is hard to say whether it is better to use more strategies in a statement, but politeness strategies can help to make the crisis less face-threatening and meanwhile further the understanding of companies and consumers.

After the analysis of politeness strategies in four pieces of corporate statements in crisis public relations, some politeness strategies such as exaggerate, make offer or promise, apologies, etc. are quite indispensable in a statement, since these strategies endow the statement with its basic functions which are to make apology, to take responsibility and to solve the problem or make compensation.

4 Conclusions

This paper probes into the corporate statements in crisis public relations from the angle of politeness strategies, which serves as a combination of crisis management with politeness theory. In the study, four pieces of corporate statements in crisis public relations are analyzed according to Brown and Levinson's classification. It turns out that positive strategies are more often used in corporate statements than negative ones. Besides, among the 15 positive politeness strategies exaggerate, assert or presuppose speaker's knowledge of and concern for hearer's wants and offer, promise are more often used than others. Meanwhile, apologies is the most frequently used negative politeness strategy. So it can be summarized in this way, some politeness strategies such as exaggerate, make offer or promise, apologies, etc. are quite indispensable in a statement in crisis public relations, since these strategies endow the statement with its basic functions.

However, there are also some limitations in this study. First, in this paper, only four pieces of corporate statements are analyzed, so the statements in the paper cannot be regarded as diversified. Second, only one linguistic theory is used to analyze the statements. The future study can collect more corporate statements both in Chinese and English to form a corpus, so that not only the politeness strategies but also the words and sentences used in these statements can be categorized and analyzed.

Abstract: China's manufacturing companies in Bangladesh are committed to achieve optimal investment policy for investors in different industries. The purpose of this research is to assess the strategic risk, and the research approach involves collecting qualitative data through questionnaire survey and computing variables with programmed Rough Set Theory. Researchers have identified a set of key internal and external strategic uncertainties and also have accessed the most important attributes from strategic risks. Here, Sector regulation, changing the tax law and organizational governance are regarded as the most important risk factors in strategic risk analysis. Overall, the focus of our research is to identify strategic risk attributes and to propose a risk assessment framework via demonstrating empirical study analysis of specific industries in Bangladesh which are directly invested by Chinese investors.

Key words: Risk Assessment; Strategic Risks; Rough Set Theory; Manufacturing Companies

1 Introduction

Risk analysis involves risk identification, estimation, analysis, evaluation and control. Assessing risks is an ongoing process; it typically involves an organization engaging in a rigorous analytical process to identify risks and, where possible, to quantify them and the board of directors or senior management to determine the risk tolerance, based on an assessment of the losses of the organization. Subsequent to risk identification, an assessment of the risks concerning their probability of occurrence and the extent of the adverse effect on the entire business ought to be carried out (Kahn, O. Zsidisin, and G. A., 2012).

In conceptualizing different risk management approaches and their associated limitations, we have identified some important factors that need to be given special emphasis while developing a generic risk management framework. Here, in this research paper, our main focus is to identify of strategic risk factors with RST mathematical theory. Primarily, we have collected the factors decision by questionnaire survey from selected companies which are invested by Chinese investors in Bangladesh. In essence, rough set theory design study is going to be employed to empirically ascertain the extent of such vague attributes. Rough set theory (RST), which is based on knowledge acquisition and discovery, would have brilliant application prospect in the research topic. In many practical systems, there are various degrees of uncertainty, especially in the data collection process which often contains inaccurate and missing data. RST is a suitable mathematical tool to deal with vagueness and uncertainty (Pawlak, Z., 1995). Considering with that the research approach involves collecting qualitative data through questionnaire survey and compute variables with programmed RST theory in this study.

The research process is divided into three stages. Stage 1 involves secondary research in which literature review has been conducted to understand the state of the existing scholarly work related to the topic of interest. The deliverable of the first stage is a tentative list of indicators for strategic risk assessment. The second stage is primary research with the main objective to verify the proposed indicators and data collection. Semi-structured interviews were carried out in recent years to gather opinion and information from the industry. Altogether, 107 usable responses out of around 180 questionnaires from Chinese company's management personnel were returned and have been analyzed and presented in this paper. In this connection, the useful response rate of 62.75% from companies was considered satisfactory and representative of Chinese companies in Bangladesh. The interviewees have given information and opinion on the indicators strategic risk analysis. Then Stage 3 involves modeling by rough set approach. Through a numerical example, RST is applied for obtaining the importance degree of each indicator in quantitative characterization, that is, to obtain the weight vector of each indicator. Finally, based on the output of the evaluation model, result interpretation and judgment on risk mitigation as well as validation are demonstrated. The study will explore relevant strategies needed in managing national manufacturing industry growth and strategic risk assessment.

2 Modeling Through Rough Set Theory

This paper studies strategic risk in the Bangladesh for Chinese manufacturing company which faces high uncertainty and dynamism in a multi-facet environment. After a comprehensive literature review, we propose the Rough Set approach firstly introduced by Z. Pawlak (Pawlak, 1982) as a new solution tool for risk factor identification, which has successful applications in data mining, prediction, control, pattern recognition and classification, mechanism learning, and decision analysis. The concept of rough sets was introduced by Pawlak(1991) as an extension of the set theory, which allows to define an approximate classification of the given set of data objects (data universe) in presence of data vagueness. The method classifies the study objects into similarity classes containing objects that are indiscernible. The condition of company uncertainties and risk management is usually dynamic and hard to predict, which leads to difficulty in finding pre-requisite knowledge. RST does not require any preliminary or additional information about the data, unlike requiring grade of membership or the value of possibility in fuzzy set theory used in previous risk studies.(Grzymala-Busse, J.W ,2014;Kusiak, A., 2001).

2.1 Set information table

$U = \{1, 2, 3, 4, 5, 6, \dots\}$ represents the study objects, i.e. a set of company managers evaluation value about strategic risk factor, R_{ij} represents the all risks evaluation indicators as explained in uncertainties assumption section. Based on interview data, from the evaluation value by the company, regarding probability of occurrence of an event, it is advisable to compare several points of view. They are also assessed on a scale of 0 to 5, where 0 is the lowest and 5 is the highest probability. Assessments based on the worst impact and probabilities are not representative and cannot be used. In addition, the outcome on investment is represented by $D = \{\text{outcome}\}$. Y stands for loss, and N means no loss.

Table 1 Initialized Information ‘S (Sample of Strategic risk attributes)

U	SR1					SR2		SR3		SR4		SR5	
	SR 11	SR 12	SR 13	SR 14	SR 15	SR 21	SR 22	SR 31	SR 32	SR 41	SR 42	SR 51	SR 52
1	5	4	3	2	2	2	*	5	3	2	4	1	3
2	4	3	1	4	1	2	1	5	3	2	2	1	1
3	5	3	1	3	3	2	1	4	3	2	1	1	1

*denotes that data unavailable and/or assessor is unable to give the score

2.2 Similarity relation from information table

(A) Denotes a subset of the attribute, i.e. risk evaluation indicators, a refers to a particular indicator within A. SIM (A) denotes binary similarity relation between objects that are indiscernible with regards to indicator’s value. The similarity relation can be defined as

$$SIM(A) = \{(x,y) \in U \times U | \forall a \in A, a(x) = a(y), \text{ or } a(x) = * \text{ or } a(y) = *\} \quad (1)$$

Where (x, y) stands for pair of study objects. This means, two study objects (x, y) has binary similarity relation if the value of each attribute for object x, i.e. a(x), is the same as the value of the corresponding attribute for object y, i.e. a(y). For any value of attribute which is missing, i.e. a(x) =* or a(y) =*, a(x) and a(y) are considered the same since * can represent any number. $S_A(x)$ represents the maximal set of objects which are possibly indiscernible by A with x.

$$S_A(A) = \{y \in U | (x,y) \in SIM(A)\} \quad (2)$$

Referring to Table 2, we compute the objects’ attributes. No object has the same attribute values as the other object. Hence, o objects are similar in this case. Then the similarity relation is given below.

$$\begin{aligned} S_A(1) &= \{1\} \\ S_A(2) &= \{2\} \\ &\dots \dots \dots \\ S_A(N) &= \{N\} \end{aligned}$$

2.3 Determine all reduces

A reduce is a minimal set of indicators from A that preserves the original classification defined by A. This can be determined by establishing Boolean Discernibility Matrix (Pawlak, Z. and Skowron, A, 2007) with $\alpha_A(x,y)$ for any pair (x, y) of the objects. Attributes $x \in U$ and $\in \{z \in U | d(z) \notin \delta A(X)\}$, where z is a particular object, d(z) is outcome of object z showing in the last column of table 1, $\delta A(X)$ is the outcome of object x. Let $\infty A(x, y)$ be a set of indicators, which $a \in A$ and $(x, y) \notin SIM(\{a\})$. This means, those objects which are dissimilar in terms of outcome. Let $\sum \infty A(x, y)$ be a Boolean expression which is equal to 1, if $\infty A(x, y) = \emptyset$. Otherwise, let $\sum \infty A(x, y)$ be a disjunction of variables

corresponding to attributes contained in $\infty A(x, y)$. Δ is a discernibility function for information table.

$$\Delta = \prod_{(x,y) \in U \times \{z \in U | d(z) \notin \delta_A(x)\}} \alpha_A(x, y) \tag{3}$$

$\Delta(x)$ is a discernibility function for Object x in information table

$$\Delta(x) = \prod_{y \in \{z \in U | d(z) \notin \delta_A(x)\}} \alpha_A(x, y) \tag{4}$$

In the below, table 5.6 shows the Discernibility Matrix

Table 2 Discernibility Matrix (an example)

$x \setminus y$	1	2	3	4	5	6
1				SR11OR22SR31SR42FR51	OR21FR31SR51SR52O11FR22	SR11OR21OR22FR31FR32OR41R61

6						

2.4 Calculate the importance degree of each risk indicator

Then the importance degree of each indicator can be calculated by using the following equation:

$$f(a) = \sum_{i=1}^n \sum_{j=1}^n \frac{\lambda_{ij}}{\text{Card}(E_{ij})} \tag{5}$$

In equation (5), $\lambda_{ij}=1$ when $a \in C_{ij}$, $\lambda_{ij}=0$ when $a \notin C_{ij}$. C_{ij} represents a risk evaluation indicator appeared. $\text{Card}(E_{ij})$ Means the total number of indicators in one entry (Table 2). E_{ij} Represents the element of Boolean Discernibility Matrix in table 2.

Thereafter, the importance degree can be normalized for easier comparison, which can be calculated by the following equation; $W_{ij} = \sigma_{cd}(C_{ij}) / \sum_{i=1}^n (C_{ij})$, where $\sum W_{ij} = 1$ (6)

The rough set approach is flexible and can accommodate any number of objects and indicators as long as they are finite sets. Also, other values can be taken according to different cases. For instance,

$$\begin{aligned} \text{SIM}(A) &= \{(x, y) \in U \times U | \forall A \in A, a(x) = a(y), \text{ or } a(x) = * \text{ or } a(y) = *\} \\ S_A(A) &= \{y \in U | (x, y) \in \text{SIM}(A)\} \end{aligned} \tag{7}$$

2.5 Integration with attribute Weight and Expert Opinion

All values are distributed in liker scale 1 to 5. This attribute value is a Qualitative value, so it's important to integrate with the distribution of importance degree. The basic rule of integration is multiply with the average of attribute value. Assessment value of risk = $W_{ij} \times \frac{\sum_{i=0}^n C_{ij}}{n}$ (8)

The comprehensive value of risk factor can be calculated as; $W_j(j) = \frac{\sum_{k=1}^r W_k \cdot x_j^k}{\sum_{k=1}^r W_k}$ (9)

Index $j(j=1,2, \dots, n)$ given by k 'th expert ($k= 1,2, \dots, r$) and W_k is the weight of expert k .

3 Strategic Risk Analysis Using RST

Strategic Risks attributes' literature suggests the core business environment, regulatory environment, brand and communication, Strategic information and behavior of any organization. Particularly it has suggested that firms should create proactive management practices that improve strategic risk-taking by preparing for the inherent uncertainty of strategic. Based on the literature, we have listed all types of risks and coding for our calculation with RST methodology (Table 3).

3.1 Calculate the importance degree of the risk indicators

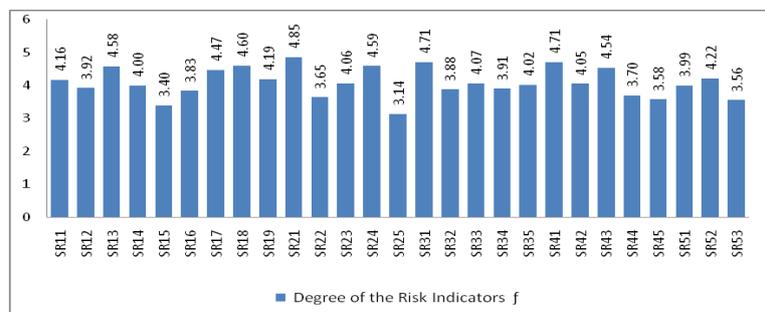

Figure 1 Importance Degree of the Risk Indicators

After identifying the uncertainties and categorizing in major risk types, we set the data table and put in RST software coding to Initialized Information (Table 2). To find out the significant risk attributes, the weighted average function is used (Equation 5) to calculate the most significant risk evaluation indicators. Thereafter, the importance degree can be normalized for easier comparison.

The importance degree of the Risk Indicators is shown in initial value f in Figure 1. We have also calculated the normalized value of all risk attributes of strategic factors for easier comparison. In another word, these factors are the risk indicators from getting the survey result from company managers and calculated with RST methodology. It may give the results of from the company's viewpoints and depends on the industry environment.

To illustrate the degree of risk importance from the above table, we can find the most important attributes from each risk types. As an example, in the risk types of business environment (SR1), the competitive environment is the most degree of important and the economic environment is the second most important factors for business in Bangladesh for Chinese companies which indicates the normalized risk value of SR18=0.042) and SR13=0.042) respectively.

3.2 Risk analysis and comparative risk ranking analysis

As illustrated in Table 3, the relative significance of risk factors can be revealed and quantified. Further risk factors can be valued by calculating $Q_{ij} = W_{ij} \times V_{ij}$ and also with equation from previous parts which derives the expert opinions can be used to calculate and evaluate the risk exposure of Strategic. Like those normalized values obtained from table of the degree of risk indicators which is given by the experts and averaged from informational decision table, that's given as per values of risk uncertainties from lower to higher given risk. Thus the finally risk knowledge expert(s) illustrates a risk importance and compare with risk ranking, that's values having the highest Q value represents the greatest risk in that sectors.

Table 3 Risk Attributes Risk & Analysis Results for Strategic Risks

Table: Risk Attributes for Strategic Risks			Risk Analysis of SR		
Code	Kinds of Risks	Types of Risks	ω	V	Q
SR11	Country Risk	Business environment SR1	0.038	4.095	0.156
SR12	Monetary Reforms		0.036	2.810	0.101
SR13	Economic environment		0.042	3.667	0.154
SR14	Investment capital		0.036	2.810	0.101
SR15	Investment and lenders		0.031	2.762	0.016
SR16	shareholders		0.035	2.952	0.002
SR17	Business partner		0.041	2.857	0.117
SR18	Competition		0.042	3.524	0.148
SR19	Industry moves		0.038	3.286	0.125
SR21	Sector regulations for competitors	Regulatory environment SR2	0.044	3.143	0.138
SR22	Business and tariffs		0.033	3.333	0.110
SR23	Environment regulations and trade		0.037	3.524	0.130
SR24	Changing law tax		0.042	3.524	0.148
SR25	Government Regulation		0.029	3.143	0.091
SR31	Reputation	Brand and communication SR3	0.043	2.333	0.100
SR32	opinion and trend		0.035	2.476	0.087
SR33	License		0.037	3.429	0.127
SR34	New products		0.036	2.714	0.098
SR35	Marketing education		0.037	2.190	0.081
SR41	General strategy	Strategic information SR4	0.043	2.333	0.100
SR42	Strategy analysis		0.037	3.048	0.113
SR43	Investment environment and acquisition		0.041	2.762	0.113
SR44	Substitution of products		0.034	1.762	0.060
SR45	Entry-Exit strategy		0.033	2.048	0.068
SR51	Organizational design	Organization behavior design SR5	0.036	1.762	0.063
SR52	Governance		0.038	2.524	0.096
SR53	Employee Retention		0.032	2.095	0.067

From table 3, we can find the degree importance of risk value which is calculated by normalized risk value and the multiplication of expert opinion or the average of information table value. F

or the simplicity we are using one by one to indicate the risk factors. Same as the first category of risk types, Business environment (SR1; the country risk (SR11= 0.1556) is the highest degree value of risk indicators after multiplying with expert opinion's value. This method is also justified our methodology and more validity of risk factors by comparing with experts' value and with risk degree importance. This country risk factor was the less degree importance in degree indicator table, but here experts give the more importance in the basis of recent country situation in Bangladesh. It was more politically unrest in recent times. Then, in the risk analysis, we can find out next highest value of economic environment (SR13=0.154), which indicates the same ranking value as the degree of importance (ω). The other factors like investment capital, monetary reforms and business partners have the less risk significant in the business of doing in Bangladesh for Chinese manufacturing companies.

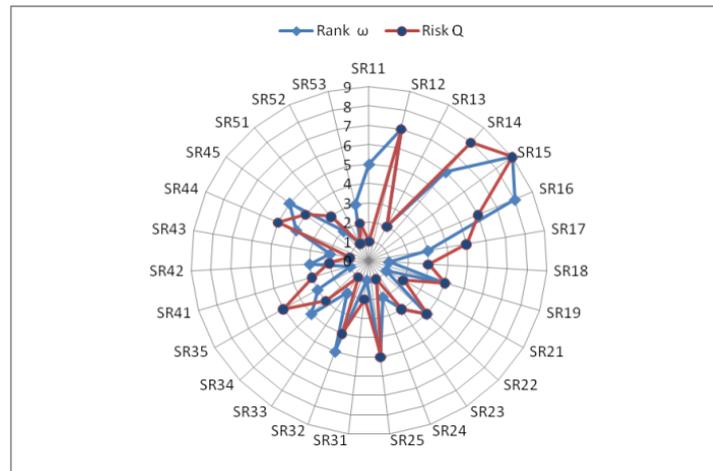

Figure 2 Comparative Images Between the Risk Indicators and Risk Analysis Ranking

It is very important to find the different risk assumptions between the expert's knowledge and company opinion interns of company or industry situation. And we can conclude here with assuming the validity of risk analysis results. In the graphical illustration in figure 2, all the risk attributes are shown for comparison with degree of risk indicator (ω) and the risk analysis with experts' opinion. We can easily compare all the risk factors in that risk mapping figure. In that figure 2, all the attributes are visible as the based on the kinds of risk risks not as the categorized as risk types.

4 Conclusions

The findings provide some support to assessment of strategic risk related to investment in Bangladesh. It implies that such related strategic risks would need to be cared when Chinese manufacturing companies invested in Bangladesh. Managers also imply that country-level efforts to attract capital investment will favor governments in Bangladesh. Risk assessment should involve managers from both the parent and subsidiary levels of the firm. Overall, RST mathematical theory along with fuzzy logic provides new innovative strategic risk assessment methodology to determination of risk analysis for any industry or in international business from its vague huge level of data set that could be computed with a high degree of accuracy. Regarding more future research, the research process and model developed provide a lot of potential that study can be undertaken on other types risk analysis, such as specific company risk attributes or sampling in different countries uncertainties, as well as other risk management topics.

Research on Early Warning Paradigm for Crowd Stampeding Risk in Public Places

Zhu Hong, Zhu Zhenjiang, Liu Shangnan, Zhang Hao
School of Management, Wuhan University of Technology, Wuhan, P.R. China, 430070
(E-mail: 1194429587@qq.com, zhenjiang.zhu@wutnews.net, lsdream@qq.com, zhanghao0610@163.com)

Abstract: With the rapid development of China's economy today, the increasing number of activities is held. Shopping malls, plazas and other crowded places continues to increase, leading to the limited public space and increasing density of crowd flow, which makes the risk of crowd stampede increased. This paper proposes early warning paradigm for crowd stamped risk in public spaces based on the features of stamped early warning process, and puts forward the three pre rule and the principle of two-stage early warning in order to prevent public places crowd stamped risk and enhance personnel evacuation efficiency with the provision of a viable path.

Key words: Stampede risk paradigm; Early warning; Three pre rule; The principle of two-stage early warning

1 Introduction

In recent years, as sustained and stable development of economic, improvement of people's material and cultural needs, the growing size of the public places, are responsible for a variety of commercial activities, recreational activities, cultural activities, transportation activities. Highly dense crowds in public places, when disaster strikes, it will cause serious personal injury or death, and therefore the crowd gathering risk has become the focus of attention. According to incomplete statistics, thousands of people were killed in the incidents occurred in the gathering crowd every year in the world. For example: the stampede occurred in Kunming Ming Tong primary school, six people were killed and 26 were injured in 2014. The crowded stampede occurred on December 31, 2014 in Shanghai Bund Chen Yi Square, resulting in 36 deaths, 47 people were injured. Minas region pilgrims stampede occurred on September 24, 2015, and the accident has killed at least 1399 people, and more than 2,000 people were injured. Thus, once the accident urban in public spaces, usually resulting in greater casualties and serious property damage.

Internationally, it is extremely concerned about the crowd stampede in public places. For the effective prevention of accidents, some developed countries have had a relatively complete laws, regulations and the supporting platform, have established an Incident control system. United States, United Kingdom and other nation, used the means of strictly control number mainly, for example, iron fence, and density control, and crowd to control, and limit admission used in New York Times Square on New Year's Eve; number and bottom line is set by United States in advance, according to physical capacity, comfortable degree and transport situation, concentrating on crowd real-time monitoring, once it is over critical value, they would start plans and force to Implement interrupter and grooming measures. At present, the domestic scholar's studies on a crowd stampede from theoretical perspective, including Tan Rong, Chen Baozhi, Bai Yishang, Zhao Liqun etc. In 2008, Liu Yanfang from the cluster theory, the point of view of social psychology and organization and management of emergency in large mass activities cause of formation and development, points out that in the former fan anti, in supervision and after the disposal of the three links actively respond to emergencies in the large-scale mass activities, construction of emergency warning system. In 2012, Li Tao and others from the safety capacity, safety density, safety speed, density change rate and the rate of change in the rate of five points of view of the large-scale activities of the early warning methods of passenger flow, and compared the advantages and disadvantages of various methods. However, prevention and control of crowd Stampede, our country lack relatively targeted, complete and valid articles and preventive measures.

Based on this, from the theory of crowd Stampede strategy and evacuation strategy, in the view of the domestic situation, this article propose a warning paradigm for crowd stamped risk in public Places, The "three pre" rule of the risk of stepping in public places is defined, as well as studying the principle of two-stage early warning carefully.

2 Early Warning Paradigm for Crowd Stampeding Risk in Public Places

British scholar Margaret Masterman said: "we define paradigm (from a sociological point of view), a known specific scientific achievement, and a recognized set of habits. Paradigm is a mind construct, an artificial, a system, a tool that relies on its own successful demonstration. "Based on the study of crowd stampeding risk, applying "paradigms "to it, early warning paradigm for Crowd Stampeding Risk in Public Places is presented, it is a specification of early warning. Paradigm for early warning is conducive to the systematic understanding of early warning system, only having a comprehensive understanding of evolution of the disaster,can a general idea of the situation, prior to disasters prevention, rapid and comprehensive insight into the situation of disasters at the time of the incident.

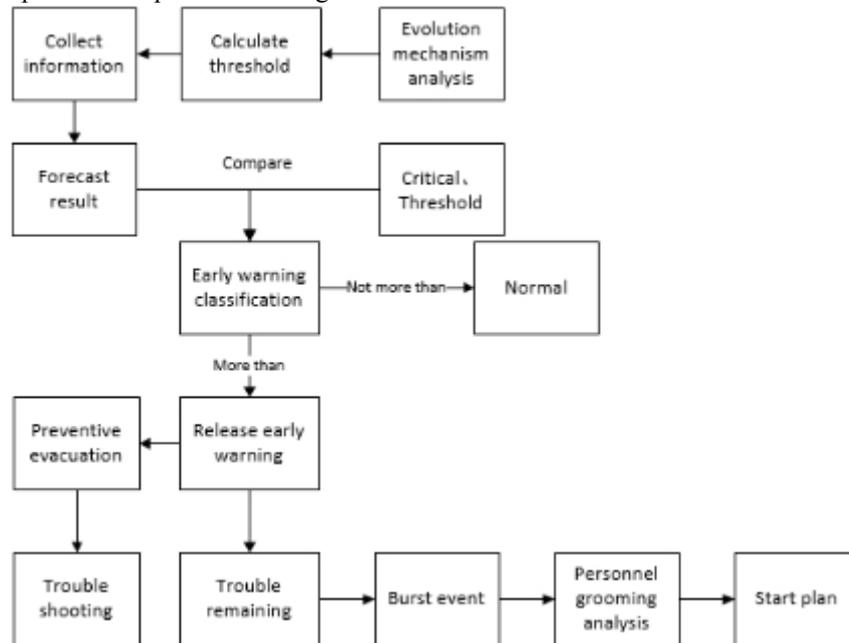

Figure 1 Early Warning Paradigm for Crowd Stampede Risk in Public Places

The subject of the figure 1 refers to the main organizers of public events as well as people, organizations and institutions dealing with emergencies, the object refers to a treatment target, namely all kinds of emergencies.

Mechanism of Evolution is the most important issue to be resolved in early warning. That is to clear mechanism of public emergency evolution of cluster events, to clear what factors will cause the public emergencies cluster and what events will the public emergencies lead to, to provide direction for the recognition and diagnosis of the risk source of the public emergency.

Threshold is a critical state to trig risk. Huqing Mei, who pointed out that the human body tend to have a buffer area, 0.27 - 0.84m², the space needed by pedestrians to step forward and the best density for crowd is 1.3-1.8 persons per square meter. Led by Yanyan Chen from Beijing Traffic University indicated that 1.2m² / person and 0.8m² / person is the vast majority of the passengers began to feel crowded and uncomfortable threshold by long-term observation experiment in the subway station; Ran Lijun, who combined Chinese people's body size, made 9 person / m² as a criterion of a crowded scene of the accident; Kobe, Japan, after the University of North Dr. Akihiko through study the records of the exhibition of Kobe neon obtained when cluster density get 8 persons per square, the crowd began to appear fluctuations, there may be an accident. Density of crowd must be limited at 10 persons per square to avoid accidents. For large events, a reasonable threshold should be based on the type and nature of the events, and set the corresponding early warning level alert. (LI Tao, Jin Longzhe, 2012)

Information is the key factor affecting incident management. To accurately guard against unexpected events, the most important thing is to scan different risk-related information systematically, collect the crisis information, and analyze their potential impact on the emergency prevention. Then prevent the factors that may cause emergencies and try to deal with the emergency before it develops.

After monitoring and scanning the information of the emergency, next action to be taken is to classify, sort, assess and diagnosis this information. According to the evaluation indicator system, analysis and compare the sorted information with various evaluation indicators. And make an appropriate estimates with the possible type, properties and hazard levels of the emergency that may

occur in the future. Evaluation of the accident include: the population density index, the crowd flow characteristic index, the crowd constitution index, unsafe behavior of the crowd, and the environment condition. Indicators of flow characteristics of the crowd include: the population of changes crowd and crowd situation. The crowd constitution index includes heterogeneous population density, quality of personnel, as well as the degree of organization. Crowd unsafe acts include: personnel disputes, vandalism, intrusion, shoving, fighting for crowd violence.

Obtaining the crowd density and crowd triggers data by real-time monitoring and extracting the information. Then comparing the data with the corresponding threshold. When the data exceeds a threshold value, classify the situation. According to experience, to make the management and operation easier, generally can divide the forecast early warning level into 4 levels: I level (appeared emergency status), II level (specially crowded), III level (mostly crowded), and IV level (generally crowded), followed by with red, orange, yellow and blue, dangerous degree followed by for crowd activities freely, more security while a bit dangerous, barely can accepted crowded, seriously risk, cannot accept appeared serious emergency situation. (Xiong Yan, Feng Zhibing, 2009)

After the early warning alarm sounding and exceeding the threshold, the first phase of the preventive evacuation should be launched. If the agglomeration problem is unresolved and produces a wide range of phenomena, the second phase of evacuation of person should be in stage. Cooperate with the prior to formulate relevant crowd shunt guiding plan, put the corresponding population tap guide plan into effect, which is based on the statistics of people's overly populated areas and periods, according to the degree of concentration that the population distribution of early warning system shown.

3 Three Pre Rule and the Principle of Two-Stage Early Warning

Based on research on risk early warning process trampled by crowds in public places, we combined it with Stampeding risk paradigm and tread on the risk characteristics of public to standardize emergency staff grooming behavior of cluster events. This paper considers it necessary to put forward "three" principle and two steps of the precautionary principle.

"Three" principle that is, early warning, preparedness, control. Early warning means the consequences of emergencies and their expectation, prediction, assessment and analysis of results and a condition of emergency response plan for activities, as well as of appropriate measures depending on the event level is based. Plan is to guide some of the events that may occur in the future; the event handling is the process of plan implementation and adjustment process. Plans or events may occur on some regular analysis and forecasting, through the study of links between events, looking for some regular feature, to know the plans of preparation.

Preventive measures, refers to conduct emergency operations rapidly, orderly and effectively, reduce losses, and response to potential emergencies. On the basis of risk analysis and assessment, preparing the relevant plans or programmes in advance. Development of emergency control measures, will help emergency managers in a limited time, limited resources, and limited information for decision-making, and helps to relieve mental tension. Helping for emergencies prior allocation of required resources, laying the foundations for effective emergency management. Preventive measures should include evacuation possible evacuation route analysis, design of programme managers how to disperse the crowd. Also, note the differs from the other sectors, close cooperation and coordination between different professional areas, including fire protection, public security, environmental protection, health, municipal services, hospitals, medical aid, epidemic prevention, traffic and transport management, etc.

Two step early warning refers to the crowds trampling causes early warning and crowd density of early warning.

Crowd stampede incentive early warning, a macro early warning, refers to the evaluation of the environment people live in and the maximum possible to master the global situation. Please find out the key points of weak links and detection in the danger zones. The dangerous area are generally the bottleneck, steps and cross point. The bottleneck is the accident black spot where the phenomenon of multiple arch at the crowd will flock to the spaciousness while narrow entrances or stairs, in addition to the normal flow of people, many people will squeeze people from both sides, and impede the normal flow of the crowd. Due to the increase in the population density clusters formed at the arch of the crowd, everyone who crowds together cannot pass. Arch is an unstable equilibrium, because the constituted vaulted force in all aspects of push each other, which will soon break the temporary equilibrium occurs "arch collapse". A majority of people at this time will be squeezed down due to a sudden loss of balance,

or be stepped on by the people who is eagering to know the truth or out latecomers. Without good evacuation guide, ARCH and repeated crashes will occur in the entrance arch. In case of a little unrest down stairs or steep slope at the evacuation, the general staffs will scramble down, then the field personnel can easily suffer a false step or a step load fell to the ground on steep slopes, followed by audience due to the great flow of people crowded pressure, so he cannot independently move forward and down, and will step on those who have already been fallen. Such deadly "domino" after stepping down before the domino-style makes the malignant casualties inevitable. In addition, personnel disputes arise, incidents of sabotage, violent people invasion, pushing and shoving, jostle, etc. also evoked the crowd stampedes. Therefore, the early warning must pay close attention to these sensitive areas. But once it happened, we must take evacuation measures immediately and reduce the risk to a minimum. (Liu Yanfang, 2008)

Crowd gathers density early warning refers to determine the key points of the density test, and evaluate the alert level is given. Population density had two accidents usually happen, namely a stampede and crowds. In the Stampede, population density is very high, but people can still move, and once the trigger factors, can lead to accidents. Crowded accident, the population density is very high, almost unable to move, squeezing each other leading to asphyxiation. For density of calculation used following method: after moving objects are separated by the optical flow and other methods, for each frame of the video image, using a rectangular scanning box, the entire image is scanned, and scanned continuously together with the frame shrinking. With the set density threshold value, several high-density region could be identified gradually (as shown in the blue region). The image can be projected onto a two-dimensional plane later, with the combination of the temporal information. Then the image can be separated into blocks, improving the accuracy of target recognition and detection of population density.

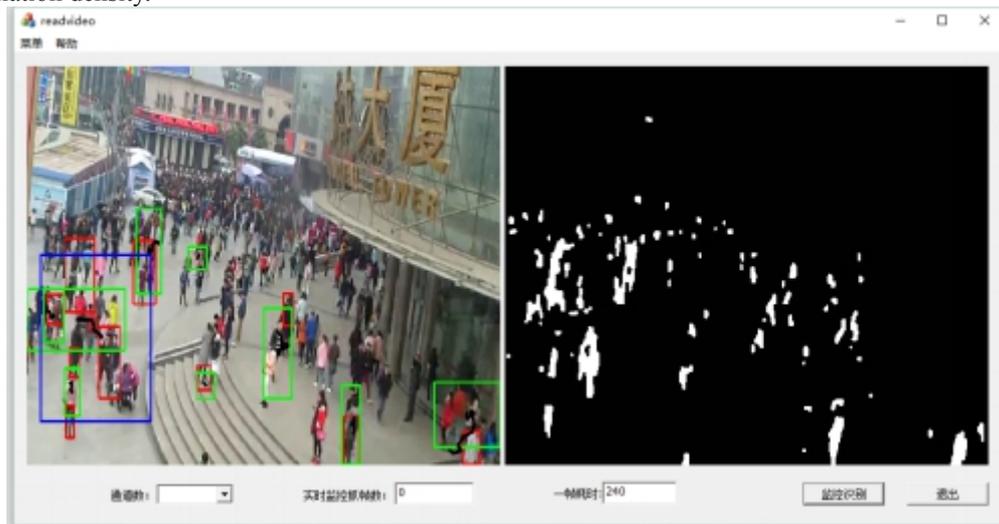

Figure 2 Density Scene Detection

4 Conclusions

Based on the study of emergencies activity in public places, proposed the emergency early warning paradigm and described the classification of early warning, threshold concept. From "three" principle, analyzing early warning, preparedness, forecasting es respectively, introducing crowd trampled of the principle of incentives of the two early warning and crowd gathers density of early warning. To make the current "fragmented" early warning system, which from the overall analysis of tread on the risk, can greatly mitigate the consequences of a stampede. But the current population density of early warning isn't done perfect, reference could not be determined, in-depth studies are needed in this regard, to gradually improve the system.

Research on Listed Risk of Start-ups on the NEEQ Based on the Hall Three-Dimensional System

Sun Jihang, Gao Weiyi

School of Management, Wuhan University of Technology, Wuhan, P.R. China, 430070

(E-mail: 694051490@qq.com, gweiyi@whut.edu.cn)

Abstract: start-ups have been important forces to achieve innovation driven development of the national economy. Start-ups have been important forces to achieve innovation driven development of the national economy. This paper uses the Hall Three-dimensional theory to research listed risk of start-ups on the NEEQ from the stage of Pre-IPO, IPO, post-IPO in order of people system, things system and physical system, and then put forward some advice of listed risk prevention and control from the perspective of law system, management system, financial knowledge and team and so on. This paper is aimed to provide references of listed capacity and listed risk prevention measures for start-ups on the NEEQ.

Key Words: Start-ups; Listed risk on the NEEQ; The hall three-dimensional system

1 Introduction

Scientific and technological innovation have been Established as the core status of the social and economic development since the eighteenth national congress of the communist party of China, then the Prime Minister Li Keqiang put forward the new idea of "public entrepreneurship, peoples innovation", entrepreneurial boom gradually formed, especially in entrepreneurial enterprises, which have formed the typical characteristics of "Two high & Six new" of high growth, high technology content, the new economy, new services, new agriculture, new materials, new energy and new business models, they gradually become a new force of the national economy. The statistical data show that the start-ups only take 3% proportion of the total number of new ventures in China, but they contribute as much as 65% of the patents and 75% of technology innovation products. However, innovation is a systematic project of high inputs and long period, which means the small and medium-sized technology-based enterprise (hereinafter referred to as the Tech SME) cannot afford to effective innovations, for the Tech SME possess limited resources. They must rely on the integration of social resources, which make the social environment risk sensitivity higher, so capital has become an important support for the sustainable growth of start-ups. The National Equities Exchange and Quotations (hereinafter referred to as the NEEQ) as an important financing channel of start-ups, providing the impetus to the development of start-ups, especially since when they overall expanded in 2013, the NEEQ has got into a new stage of rapid development. Up to the end of 2015, the NEEQ has owned 5129 listed companies, whose total market capitalization have nearly been 2.5 trillion yuan and their PE ratio are around 30 to 60 times, which is less than small and medium-sized enterprises board (the SME board) and the growth enterprise market (the GEM) but higher than the mainboard.

However, there are still many risk factors which may restrict the development of the NEEQ. Jing Lu(2012) focused on the rotating plate problems of the NEEQ,she analyzed the importance and the necessity of rotating plate, then put forward some suggestions such as improving laws and regulations, implementing green turning plate, and improving the system of rotating plate. Zhang Ke (2014) thought the listed companies on the NEEQ should be supervised in classification, rotating plate mechanism need further planning, insufficient liquidity need a market-maker system actual implementation, corporate governance and the stock trading tax risk still need to be valued. Moore, Bell and Filatotchev (2010) took the stocks market in the USA and the UK for example, testing the effects of IPO market selection on its performance. Tian Juanjuan, Xing Tiancai (2014) combined with trading rules and ways of the NEEQ, applying liquidity index to the GARCH model to carry on the empirical analysis of its liquidity risk.

It is some of the short board that makes risk management in the market necessary for the start-ups, they should make prevention and preparation in advance to avoid policies risk, institutional risk, legal risk, financial risk etc. This article will analyze the systemic risk which is likely to suffer from on the preparation of market listing, in the process of market listing and financing process after its market listing based on Hall Three-dimensional System.

2 Listed Risk of Start-ups under the Perspective of Hall Three-Dimensional System

American scientist Hall put forward the famous Systems Engineering Three-dimensional Structure (temporal dimension, logic dimension, knowledge dimension) in his published book “System Engineering Method” in 1962, which successfully provided a new method of complex engineering management and operation. Hall divided engineering task into seven stages including planning, designing, development, production, installation, operation, updating according to the time order. The financing model of start-ups involves many factors, which constitute structure combination through time and space, and the combination exchanges material and energy with the outside world to run effectively and make corresponding effects (Wei Shijie, 2013). This paper is aimed to analyze the listed risk on the NEEQ of Start-Ups from the perspective of logical dimension, knowledge dimension and time dimension based on the Hall Three-dimensional System, and establish a new Hall Three-dimensional listed risk management model for the start-ups on the NEEQ as shown in figure 1.

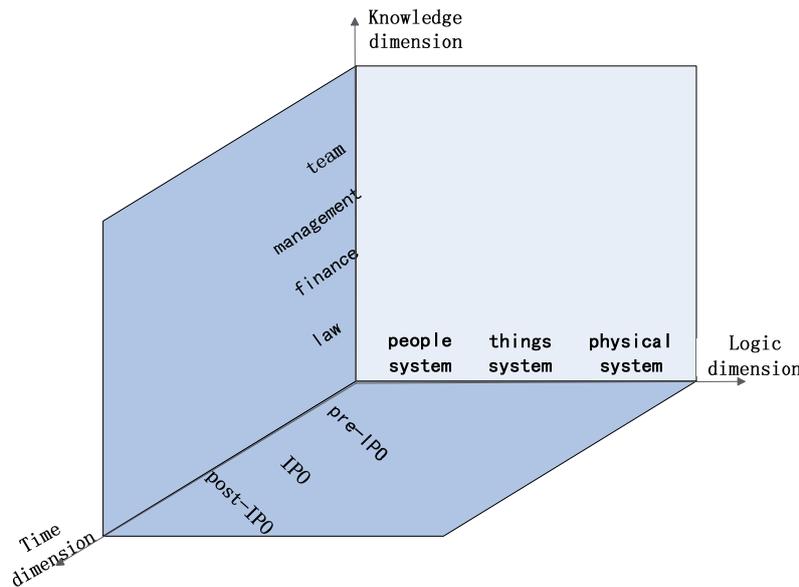

Figure 1 The Hall Three-dimensions Structure of Listed Risk about Start-ups on the NEEQ

Time dimension: The time dimension of Hall Three-dimension Structure is set from project process. According to this principle, the listing process of start-ups can be divided into three stages: pre-IPO, IPO, post-IPO, and listed risk will be very different in different stages.

Logic dimension: Using logic systems of people, things, physical to analyze the listed financing problems of start-ups on the NEEQ, and these three systems are ordered to people system - things system - physical system. People system refers to the stakeholders of start-ups on the market, including start-up, underwriting securities firms, law firms, accounting firms and other subjects. Things system mainly refers to the conversion law of rights and obligations between different listing subjects in the whole listing process, and the integration of the three dimensions will be discussed in this section. Physical system refers to changes of internal and external environment in the listing of start-ups.

Knowledge dimension: knowledge system mainly researches the knowledge reserve capacity of listing start-ups. Start-ups listed on the NEEQ may exist these risks of insufficient governance ability, imperfect equity structure, false information disclosure and so on, which will make negative effects on the interests of the investors and market stability. Thus, the knowledge dimension is also an important source of risk to the listing start-ups.

3 The Systemic Risk of Pre-IPO on Start-ups

3.1 Risk of Financing Goal Orientation

Start-ups can be listed in the New York Stock Exchange, NASDAQ market in the United States, Hong Kong Stock Exchange and Shenzhen Stock Exchange, but there are many differences on financing rules, financing scale, the value orientation of the investors, supervision ways and powers in different

stock markets. Start-ups need to comprehensively consider their own conditions and the corresponding market demand conditions to make the right choice.

3.2 Sustained Profitability Risk of Main Business

Improve the sustained profitability of main business is a top priority of the company in the pre-IPO. They should strengthen independent innovation and management innovation, develop new markets, and control cost and so on to improve profitability to satisfy the IPO requirements. However, it should be paid more attention that the sustained profitability is mainly for main business. A lot of listing companies in the GEM were suspected on their sustained profitability by the GEM Issuance Examination Committee for its tax incentives accounted too much for corporate profit.

3.3 Risk of Financial Planning Ability

Financial index is an important content in the IPO rules, and the corporate financial planning level often determines if it can pass the conference of IPO. Therefore, it is of great value for start-ups in the pre-IPO to strengthen its financial planning. Start-ups in the pre-IPO should make full preparation such as fully analyzing and assessing financial indicators, timely adjust business strategy and financing strategy, etc. In the process of IPO, start-ups should moderate financial packaging for some non-ideal financial indicators in strict accordance with relevant laws and accounting standards under the premise of accounting policies.

3.4 Risk of Corporate Governance

Standard operation is required for all listing start-ups. The premise of long-term development for all the enterprises, especially for start-ups on the pre-IPO, is to be managed legally. In the current, most start-ups are based on a private small and medium-sized enterprises, most of which own "a dominant" equity structure. That means it is not only difficult to form checks and balances mechanism and reasonable corporate governance structure under the dispersive equity, but also make the family enterprises problems which will lower the efficiency of corporate governance continue to be existed.

4 Risk Control in the NEEQ Listing of Start-ups

4.1 Legal risk control

1) Established in accordance with the law and exists at least two years. In practice, the enterprise usually may meet two kinds of problems. One kind of problem is the intangible assets investment problem. And the other is whether the company in the pre-IPO shall handle the relevant procedures in accordance with the law if it is a joint stock system.

2) Business structure is clear and has the ability for continuing operations. Some of the start-ups in the pre-IPO might have trouble in tax assessment in the reporting period. To solve this problem, enterprises should make adjustment as soon as possible to do audit collection according to the views of the CPA and formulate effective financial supervision regulations and regulatory framework to ensure the standard operation of the financial departments.

3) Governance mechanism is sound, business activities are legal compliance. That is to say, the company in the pre-IPO should set up the company's senior management system in accordance with the modern enterprise organizational structure, which includes the general meeting of shareholders, board of directors, supervisors and senior management (hereinafter referred to as the "three layer structure"). Enterprise as well as the members of the "three layer structure" should strictly comply with the relevant laws and regulations of our country, uphold integrity management and obtain operating income legally during the company's continuing operations. At the same time, the company should obtain the appropriate license documents and certificates if the business activities need to be approved by the relevant departments.

4.2 Financial risk control

The NEEQ has not clearly defined the financial situation of enterprises yet. But according to regulations, companies need to truthfully disclose the company's financial information. The company's financial situation is likely to affect investment enthusiasm of investor for the company. This might lead to the failure of the purpose, intending to financing in the NEEQ, of the enterprise. So, in the beginning of the listing, the company must make reasonable arrangements for the financial management of enterprises, thus avoiding the risk. As shown in Table 1, the indicators to measure the financial risks of enterprises are as follows.

Table 1 The Index System of Financial Risk Assessment on Enterprises of Pre-IPO in the NEEQ

Core competence	Evaluation index
Profit ability	sales gross profit rate, earnings per share
	rate of return on total assets, Return of equity
Operation ability	total assets turnover
	accounts receivable turnover
	inventory turnover ratio
Financial growth ability	prime operating revenue
	OPE, net profit growth rate
Financial structure	asset structure
	asset-liability ratio
	long-term debt structure, short-term debt structure
Cash flow	the source structure of the increment of cash
	the net cash flow
	net increase in cash and cash equivalents
	the normal cash flow
Assets quality	inventory backlog ratio
	large venture capital ratio
	the amount and proportion of accounts receivable that over three years
	reasonable and stable cash inflow
	quality of construction and fixed assets
Solvency	cash flow ratio
	quick ratio, flow rate
Financial soundness	intangible assets and the cost of the project
	Off balance sheet liabilities, contingent liabilities
	"eight provision" policy
	Provision for asset impairment and asset quality

4.3 Management risk control

To become a real sense of scale enterprises, the company must give up the original model, regulate the company's management system, so that company is managed by system. Found in contact with the broker, there is lack of management system in most of their underwriting company in the pre-IPO in the situation, there is no explicit formulation of the management regulations, and the daily work of the enterprise always hectic, tedious and lack of efficiency. However, after the successful listed, due to the improvement of management rules and regulations, the work of the company will be carried out in order.

4.4 Team risk control

For some entrepreneurial team, the shareholding system reform may damage the cohesion of the enterprise management team, which is established as the center of the founder, to a certain extent. In the process of companies' listing, it will not only attract strategic investors to join, but also the shares will be diluted due to equity incentives and other shareholders' join-in. The management team and shareholders might have a conflict of interest, which if not handled well, will affect the overall operating efficiency of the company.

5 Risk Prevention of Post-IPO Start-ups

5.1 Improve Core Competitiveness of Start-ups

The core competitive ability of enterprise covers the entire value chain, highlighting its production technology, production capacity, and product characteristics. The ultimate goal of being listed on the NEEQ is to obtain the financing channels and provide funding guarantee for its continuous running. Listed enterprises should reasonably allocate limited resources of manpower, financial and material resources, keep the original innovation ability, design unique products, pushing them to the track of long-term survival and development, and striving to make the enterprise maintain high levels of profitability, thus enhance product innovation ability and competitive advantage of the listed enterprises.

5.2 Strengthen the Management of Internal Control, Clear Shareholding Structure

Most small and medium-sized enterprises are still in the growth period, they often faced with problems such as non-standard internal personnel deployment system and financial system, unreasonable equity structure and imperfect internal control system. Especially the directors, supervisors, senior management personnel and the large shareholders in the private enterprises have become

accustomed to arbitrary way of decision-making, they tend to focus more on the short-term interests of the enterprise, ignoring the long-term strategic development. Due to a lack of understanding of related systems, they are more likely to make the wrong decisions and increase the listed risk. Start-ups should seize the opportunity of IPO on the NEEQ and positively communicate with the host brokerage, accounting firms and law firms, in strict accordance with the listing and trading rules of NEEQ to regulate corporate governance. It is significant important to make full use of the financing function and provide financial support for the enterprise from the NEEQ that have a clear understanding on the NEEQ. According to the stage of IPO, start-ups should consider the following problems:

1) To perform regular investment procedures, rationally reform the share-holding system to establish a clear equity structure.

2) In accordance with the requirements of the company law, establish a modern enterprise organization structure consisting of the board of directors, board of supervisors, general meeting of shareholders and senior management.

3) To perfect rules and regulations of the company and ensure the affairs of the company operating orderly.

4) To reasonably issue and transfer enterprise equity according to the company law and listing rules after listed on the NEEQ.

5) To standardize enterprise financial system according to accounting standards for enterprises and relevant laws and regulations, solve the problem of historical accounts.

6 Conclusions

After studying the systematic risk and risk control measures of start-ups listed on the NEEQ, this paper believes that it is a hard labor for the enterprise to be listed on the NEEQ, which brings the comprehensive innovation of various aspects to the start-ups. However, innovation is to create, it will help enterprises to thoroughly get rid of the potential risks in the process of growth, and focus on all the resources to develop business and make more profit.

The Research of Trust Crisis and Firm Performance Risk: The Mediating Role of Internal Conflict

Wang Xi

School of Management, Wuhan University of Technology, Wuhan, P.R. China, 430070
(E-mail:349287768@qq.com)

Abstract: Trust is a kind of interdependent relationship, all the activities in company cannot do without cooperation and mutual trust. Good trust relationship can promote cooperation, but once the enterprise met trust crisis, it would bring some conflicts between the leaders and workers, which may lead to the decrease of the efficiency of some task and individual performance, more seriously, the trust crisis may also bring risk to the enterprise performance, affect its survival and development. Therefore this study considers that the conflict in company plays a mediating role between trust crisis and performance risk, then builds the corresponding model, and obtains the consistent conclusion.

Key words: Trust crisis; Conflict; Performance; Performance risk

1 Introduction

The German scholar Luhmann once said: "trust can simplify the interpersonal cooperation relationship." As we know, all the activities in company cannot do without mutual trust, so the mutual trust, like lubricant, is the necessary condition to guarantee normal company operation.

But as the Chinese scholar Xia Jiang (2014) thought, good situation of mutual trust in company is not inborn. If companies come forth some problems such as unreasonable profit distribution, that may produce estrangement between managers and employees, and the gap would affect their trust relationship, if let it develop, it could further result in trust crisis, which perhaps bring deeper negative impact to the company. Another Chinese scholar Cancan Gao (2010) also mentioned that, Enterprise mistrust may lead conflicts between the workers. And this conflict could affect the corporate performance; meanwhile, it is likely to cause performance risk, endangering the development of the company. Therefore, as a foreign scholar James (2011) once pointed, preventing trust crisis, avoiding internal conflict, building a harmonious business atmosphere, is also what the managers must to do.

Domestic and foreign researches showed that trust crisis has now become a ubiquitous phenomenon in society, triggering a strong focus on academics. However, most studies just stayed on the shallow discussion of its status, influence and countermeasures, but lacking in some combination with specific problems (such as firm performance) and they are short for some analysis of the mechanism about this kind of problem. So this article wants to study the relationship between trust crisis and firm performance, and discuss the further power which affects the relationship between them. And hope the final conclusion may provide certain reference value to give General Corporation some advice to avoid risk, improve firm performance and promote healthy development of the company.

2 Theoretical Foundation

2.1 Trust crisis

Liangbin Chen (2009) pointed out that, in reality, the distrust is a subjective response to what people to be trusted appear inconsistent with the expectations and feedback in the process of interaction. And Xiaoxu Meng, Wan Wang (2010) who based on this idea, pointed out the concept of trust crisis, they defined trust crisis as a psychological phenomenon, which means the social members have some doubt experience due to lacking of trust. Zhenhua Yang (2011) mentioned that, there exists serious trust crisis in the contemporary society at various fields in China. And Wan Ying (2011) also emphasized that the trust crisis is ubiquitous. Besides, Lei Gao (2016) put forward some similar ideas, she referred that China's traditional morality emphasizes "Wisdom and Faith", but in real life, whether friends or colleagues, the trust between each other becomes less and less. This trust crisis is gradually formed in the process of economic transformation in society.

2.2 Conflict

Foreign scholar Rahim (1986) once said, conflict is a widespread social phenomenon, but the scholars haven't reached a clear agreement on its concept yet. As Thomas (1989) argued, conflict is an occasion when someone is driven to do an incompatible reaction. Joe H. Turner (1997) used a perspective of sociological theory to define conflict as an interaction in some direct ways, and each side

of the action tries to stop the other achieving goals. Wall and Canister's (1996) definition is "conflict is a process, and one always perceiving his interests would be opposed by the other in this process".

Domestic scholars also have done some research on conflict. Fengshu Xu (1989) once in social psychology perspective defined conflict as some behaviors like exclusion, hostility and aggression. Xiaohong Zhou (1996) argued that conflict is a process, in which people struggle, damage and even kill each other for some certain goals or values. Peilun Huang (2001) regarded conflict as behavior contrary states due to the disagreement about the purpose or means between the behavioral agents.

3 Hypothesis

3.1 Trust crisis and the performance risk

The occurrence of trust crisis means that the relationship between people is being threatened, so the team cooperation and the firm performance are bound to be affected. There are some scholars have made co relational studies on the relationship between trust crisis and firm performance risk.

Fengjing Han, Pinpin Fu (2008) pointed out that in certain situations, if the mutual trust degree among the members in the company is low, they would be more likely to make mutual suspect, then reduce the cooperative behavior, and finally they would spend more time and energy to achieve the individual goal, but not the whole goal of the company. Zhenhua Yang (2008) put forward the similar ideas, he considered that the lower mutual trust between members in the company, the lower copulatives power would there be, and there must be litter core competitiveness. Previous studies have confirmed that there is a certain relationship between trust and firm performance, for example, Smith et al. (1994) made a study which suggested that low trust may be more likely to make a contradiction between members, thus to affect work behavior, reduce work efficiency, influence the firm performance and the internal cooperation satisfaction, when serious there would be some firm performance risks. So we put forward the following assumption:

H1: Trust crisis is positively related to firm performance risk.

3.2 Trust crisis and the internal conflict

Trust crisis and conflict as two negative words, which seem to be frequently appear in our life, and there are some scholars analyzed them in recent years.

Xiaoxu Meng, Wan Wang (2010) pointed out that, with the development of the society, the external material conditions become increasingly affecting people's values and the concept of trust, leading to the interpersonal distrust, mainly shown as human indifference, mutual suspicion, promises and so on. As Wan Ying (2011) has noted, the crisis of confidence is a ubiquitous phenomenon, causing the interpersonal conflict from time to time, which we can often see in our life. For example, patients do not trust doctors, they often suspect the doctors of their diagnostic mode. Again for instance, the distrust between both sides of husband and wife, also often leads to the suspicion between each other, so the little things in life can cause many conflicts. So we put forward the following assumption:

H2: Trust crisis is positively related to firm internal conflict.

3.3 The internal conflict and firm performance risk

Conflict means contradiction, once there comes a conflict, the relationship between people would be affected, and when this circumstance appears in work, there must be low efficiency, poor teamwork and firm performance decline, etc.

Many years ago, foreign scholars have proposed their views. Seile (1963) pointed out that the conflict would go against with the tasks completion and the goal achievement. Lewin (1987) also considered that the internal conflict may cause disharmony in the company, while strong conflict is more likely to cause slacking or absenteeism, eventually resulting in a decline in work efficiency, bringing some firm performance risks.

The Chinese scholars also pointed some similar views to foreign scholars. Liu (2007) deemed that, when there is a fierce clash in the company, both sides would try their best to negate each other. Cancan Gao (2010) also mentioned that, in the process of conflict, in order to beat the competition, both sides would thwart each other, decline mutual cooperate, thus influence the work efficiency and give rise to performance risk. So we put forward the following assumption:

H3: The internal conflict is positively related to firm internal conflict.

3.4 Trust crisis and firm performance risk: the mediating role of the internal conflict

It can be seen through the previous discussions, firm performance risks have deep association with trust crisis. The more serious the trust crisis is, the more likely putting time and energy on suspicions the employees are, thereby the work efficiency would be affected and the company would be more easily

getting performance risk. But trust crisis may not directly affect performance risk, it may influence that by means of another variable. Through some related literature reading and thinking, we found that the internal conflict can be one of the most important factors affecting trust crisis and performance risk. According to the above research hypothesis, we speculate that when the internal trust crisis is serious, the members in the company are more likely to “cause more conflicts on the premise of low trust”, and this conflict would affect employees’ personal emotions, and then affect the work efficiency, reduce the individual performance, and ultimately influence the whole firm performance, leading to a certain performance risk. Thus we think the internal conflict may play a mediating role between trust crisis and firm performance risk. And then we put forward the following assumption:

H4: The internal conflict may play a mediating role between trust crisis and firm performance risk.

4 Research Model

Through the analysis of the above hypotheses, we can establish a model as shown below.

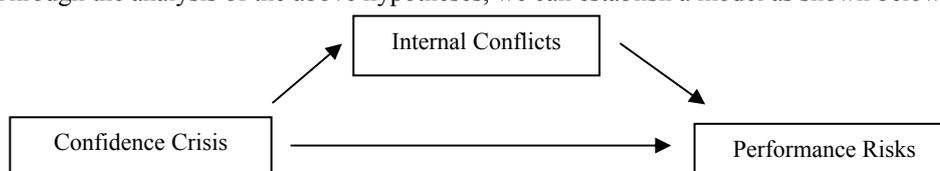

Figure 1 Hypothesis Study Model

5 Conclusions

According to the mechanism of trust crisis on firm performance described above as well as the relationship between internal conflicts and performance risks, this paper presents an integrated research model showed in Figure 1. This study clearly states the process effect of trust crisis’s impact on firm performance by playing the mediating role of internal conflicts. Specific findings include:

1) The trust crisis is ubiquitous, meanwhile it will bring some firm performance risks; 2) Trust crisis may lead to the outbreak of internal conflicts, while strong internal conflicts will cause firm performance risks; 3) the internal conflicts have some mediating effects between the trust crisis and performance risks.

These conclusions may contribute to the company for analyzing reasons for its success and failure, and as a whole, there may be some revelations for companies as following:

1) The companies need to prevent trust crisis in order to obtain a harmonious internal atmosphere. And the prevention can be carried out from the following aspects.

Firstly, from the company perspective. The companies need to establish reasonable policies, and not only emphasize the fairness of the policies but also ensure the developing process is transparent, so that to make the employees have a higher trust degree and prevent the crisis in the first place.

Secondly, from the leaders’ perspective. If the leaders in company want to win more recognition and trust from their subordinates and prevent confidence crisis, they must be strict with themselves and treat each employee equally. Moreover, they should consider the real demands of subordinates in the daily work, communicate with them and listen to their recommendations, they can get increasing respects and trusts by doing these.

Finally, from the employees’ perspective. Since trust is a both-side process, employees should find reasons from themselves. If the employees have some incomprehension or suspicion on the decisions made by their leaders occasionally, they should communicate through formal channels, but not have such sentiments buried in the heart and finally grow into trust crisis, bringing adverse impacts to themselves or even the company.

2) The companies also need reasonable relief on the internal conflicts to improve performance and avoid the performance risks.

Unsmooth communication, or even lack of communication, is one of the main reasons for the conflicts outbreak in the companies, resulting in the ineffective information flow, generating misunderstanding and estrangement and then causing unnecessary conflicts and contradictory. So the most effective way to relieve the internal conflicts is to strengthen the internal communications.

To improve internal communication, the companies should firstly help all the members establish the concept of equal communication and create a nice atmosphere. Then the leaders should establish various channels with the employees for full communication to achieve effective communications.

Thirdly, the leaders should advocate all the members considering problems by transpositional consideration as much as possible, in order to avoid unnecessary conflicts.

Although each company has different specific circumstances, the conclusions obtained in this paper can provide a reference for general companies to improve performance and promote a healthy development. If we could get large-scale sample data in the future, empirical researches can be carried out on the basis of that for the above conclusions.

Abstract: With the increasing severity of food safety problems, it is very important for us to analyze the consumer's risk perception of food safety. In this paper, it's from the perspective of regulating the consumer's risk perception of food safety, analyze how the social media influence consumer food safety risk perception. Through the research on the previous literature, the paper, as a reference, analyzes the effects of social media and the development trend and consumers, thus put forward a new regulation model of consumer food risk perception of social safety based on social media. This study has a great significance on offering a reference of solving the problem of food safety.

Key words: Social media; Food safety; Risk perception

1 Introduction

In recent years, with the improvement of people's living standard and health consciousness, people pay more and more attention on the problem of food safety, and more and more food safety problems have been gradually exposed. For example, British's "mad cow disease", Belgium's "dioxin" and melamine milk powder, clenbuterol pork and other events which had a very adverse impact on our life in China. Despite the implementation of the country's strict food safety management measures, it seems little use to reduce the consumer's panic about food safety. This situation is mainly caused by people's food safety perception. Thus it is very important for food safety problem to reasonable intervene and guide the consumer's perception of food risk. On the one hand, it can improve consumer awareness of food safety by using scientific and effective food safety information to communicate with consumers; On the other hand, it can also help reduce consumers' panic from the exaggerated food safety risks. Therefore, this paper intends to study the regulation model and strategy of consumer food safety risk perception.

2 Literature Review

2.1 Literature review on social media

Social media is a tool and platform for people to share information, opinions, insights, experiences, and ideas (Xiao Rui, 2011). In recent years, with the development of Internet technology, more and more attention has been paid to the social media. In particular, Facebook, Twitter, YouTube and other social media is sweeping the world. "China Internet development statistics report" which reported by China Internet Information Center (CNNIC) showed that Internet users maintain the basic situation of the development trend of the last year till December 2012, especially the instant messaging, micro-blog, social networking sites. Social media creates and gives each person the ability to create and disseminate content. Social media mainly has the following basic characteristics:

1) Available. Social media's threshold for public access is very low, the vast majority of social media can be free to participate and encourage people to comment, feedback and share information. Therefore, social media platform has attracted a large number of social strata.

2) Community. In social media, people with the same interests and hobbies can easily form a community. In this virtual community, people can enjoy and share their anecdotes and pleasure with each other just like in a real life.

3) Interactivity. There is no clear boundary between "media" and "audience" in a social media. In the traditional sense, the "audience" in the social media can often act as a "media" role. The role of traditional media is often similar to the television advertising, the information will be transmitted directly to the audience. However, in the social media, this communication is interactive, the audience can immediately question the message, and spread out the information as "media" after being convinced by the authenticity of information. Thus information is rapidly spreading in a way similar to that of a spider's web.

4) Connectivity. Most of the social media have a strong connectivity, by integrating a variety of media content together through the link and integration. The joint influence such as releasing, video

demonstration and expert analysis can bring audience a more intuitive information.

Social media has impacted on the traditional mode of information dissemination, not only making people become the master of information content, but subverting the traditional concept of information. With the network becoming the main channel of information sources, Information sources are not limited to newspapers, television, radio, and the speed of information dissemination is also more rapidly. People are not willing to be passive recipients of information, instead of expressing their views on the information through the network.

2.2 Literature review on consumers' perception of food safety risk

The concept of consumer risk perception was first proposed by Bauer (1960), Bauer believes that consumer behavior is a burden of risk, consumers bear some of the risks for not sure of its consequences in the process of purchase (Bauer, 1960). Consumer food safety risk perception is that “the consumer perceives the adverse consequences of physical health or the loss of uncertainty in the process of food purchase (Wang Erpeng, 2012)”, In recent years, China's food safety problems occur frequently while the food market information is often asymmetric, in other words, that is “one party has more information than the other (Zhou Yingheng et al, 2008)”, the difference of consumers' perception on food safety risk is obvious. Xu Lingling believes that “consumer gender, age, education level, income levels, food safety concerns and attention on food safety incidents (Xu Lingling et al, 2013)” will affect the consumer's perception of food safety risk. Peng Hailan studied the consumer's overall risk cognition on meat food safety (Peng Hailan, 2006). Different groups have different state of risk perception, including the risk perception too high, the risk perception too low and the risk perception adjustment state. In the face of different perception of the state of the consumer groups, it must take appropriate, appropriate news release to ease the impact.

2.3 Literature review on food safety information system

In recent years, the frequent occurrence of food safety problems as well as the problem of the food industry has brought a huge impact on our life, reflecting the public system of food information in China has been seriously lagging behind. It became urgent about how to provide consumers with accurate and reliable information on food safety, reduce the damage to the normal interests of qualified enterprises, and establish and improve the food information disclosure system. Zhao Xinlei, Chen Xiuping hold the views that “the weak legal basis, the main dispersion, the backward opening channels, the fuzzy range, the lack of relief system (Zhao Xinlei, Chen Xiuping, 2013)” are all the problem of China's food information disclosure system. Kong Fanhua holds that the improvement of China's food information disclosure system should be implemented between the functional departments of the information bulletin, just like: 1) setting “Information disclosure internal application”; 2) Through the laws and regulations to further clarify the contents of the food safety information; 3) Establishing a unified food safety information disclosure website (Kong Fanhua, 2010). When the food safety information is disclosed, it should pay attention to the information's authenticity, integrity and dispersion. Only when the real complete information response to as many consumers as possible, the risk of food can be minimized and avoid the excessive state of panic from consumer (Zhang Jizhe, 2011).

What we have to admit is that China's food safety information disclosure system is not very perfect, there are many problems such as open the main points, open channels and so on. There are obvious differences in the perception of information among different consumer groups, and it is urgent for us to solve the problem of how to regulate consumers' perception of food safety. It seems that the social media which is gradually into people's life seems to make us find a suitable way to regulate the consumer's perception.

3 Design of Regulation Mode of Consumer Food Safety Risk Perception Based on Social Media

Due to the rapid development of social media, as well as the differences of consumer's perception of food risk, here, we should aim at safeguarding the interests of consumers and the harmonious development of society, and establish a consumer food safety risk perception regulation model in which the government as the leading, the enterprise as the core, and the social media as the means (Figure1). The government plays a role of supervising the information of enterprises and media, and transmitting their information to consumers through digital means. Enterprises should implement strict supervision to sell their products throughout the process, and spread their production information to consumers through social media. The media take responsible for spread the food safety information with some ensure evidence. At last, consumer regulate all the information they already got to make a purchase decision or not.

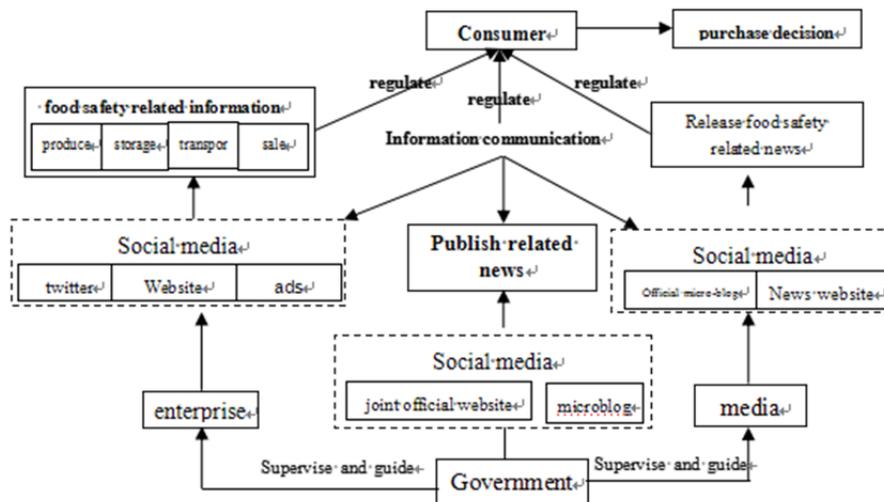

Figure 1 Regulation Pattern of Consumer Food Safety Fisk Perception Based on Social Media

3.1 Taking government as the leading

The government's role of leadership is reflected in that the government strengthen the supervision of all aspects of the production of enterprises by using its function and power, as well as establishing a clear regulatory standard. Meanwhile, government guide enterprises to make the process of production, manufacturing and sales more transparent through social media. At the same time, government also encourage the media and individuals to join the ranks of the regulatory. Supervision of food is harmful to the health of individuals, but when it gets worse, it may be related to the normal development of the country. Therefore, in order to regulate the whole process of food safety from production to sales, we must set up scientific regulatory standards to meet the objective needs. If the safety standards established properly, the government, enterprises, consumers can quickly get the information about food problems, then it can ensure the normal development of the entire food industry.

When the government takes charge in the supervision of enterprises, it should be encouraged for enterprises to use free social media to get consumers access to the information of production, manufacturing, sales. If the enterprises use the social media properly, for example, releasing the information about product or content of some sensitive substances on micro-blog or official website, consumers will easily find the answer and avoid the panic about the food safety.

It cannot be ignored that the important role of the public and the media plays in addition to improving the regulatory system and guide the enterprise itself a good run, the mass media and the government is not a vassal, they can actively play the third role of balancing market forces. For a long time, because of the lack of participation of the public and the media, our country has always maintained the structure of the government - market, which leads to many problems. Now with the emerging of social media, the strength of public and media is more powerful, the government should fully encourage these forces to play a role in the formation of the government - market - public structure. It is more conducive for the healthy operation of the entire market if the three-party structure operates in the food market.

3.2 Taking enterprises as the core

After all, the government can only play the role of legislation and supervision, the food production rely on the enterprise itself. Enterprises must fulfill their social responsibilities, and strictly control their production, sales, storage and other sections. What the enterprise should do is to establish information disclosure system and use social media platform to enhance the transparency of food safety. Enterprises, in the process of production, should not only meet the requirements of the government, but also form a good relationship with the consumer. So it plays the role of the real core in this regulation pattern. Enterprise as the core is mainly reflected in the following two aspects:

1) Taking the social responsibility

It is a basic social responsibility that enterprises should take into account the interests of workers, consumers, the state and the public in the realization of profit maximization. However, mostly the enterprises ignore the responsibility just focus on the profit maximum. Mohr and Webb's research on

corporate responsibility shows that the low level of enterprises' social responsibility will greatly weaken the purchase intention of consumers (Gao Yang, 2010). Therefore, social responsibility is not only the social responsibility of the enterprise, but also the responsibility for their long-term development. In order to take the most basic responsibility, enterprises should strengthen the internal management of enterprises to ensure that food are in line with the requirements of the National Quality Supervision Department in the all process from raw materials to the final sales to customers.

2) Strengthening ties with consumers

Enterprises should Strengthen their ties with consumers besides focusing on their own food production, it is very important for enterprises to release their information about food safety on their official website or on the micro-blog, which can not only help companies understand their own products, but also can help enterprises to supervise the sales channel, and then further ensure that food in the sales channel is not damaged.

3.3 Taking Social media as a means

The core of social media is "information" and "relationship" (Wang Ming, 2011). Enterprises and the government should grasp the core of social media to be used. With the rapid development of Internet technology and mobile terminal technology, social media has made rapid development. This rapid development has not only promoted the development of the times, but also greatly changed the way people access to information. Therefore, government can not only strengthen the education of the consumer's daily food safety problems through the social media platform, but also can government release food safety information in a timely manner. Enterprises can use social media platform to strengthen the publicity of enterprises, keep ties with consumers and strengthen the supervision of products after the factory. What's more, it can help establish a good brand of enterprises through social media.

4 Conclusions

This paper focuses on the food safety issue in the society of economic law, and then by introducing social media's features and analysis how information influence consumer behavior, we construct the social media consumer food safety risk perception regulation model based on the use of theoretical analysis, model construction and system construction.

Social media has the characteristics such as public, community, interactive, connectivity, so that the groups who use social media expand rapidly in a short period. At present, the social media platform replacing the traditional newspapers like television and other media has become the main channel for people to obtain information. In order to correctly guide the consumer groups with different risk perception and to avoid the emergence of the risk perception of consumers, we should establish a suitable model of consumer food safety risk perception. Considering the relationship between government, enterprises and the social media as well as what they can play, it's suitable to establish a consumer food safety risk perception regulation model in which the government as the leading, the enterprise as the core, and the social media as the means.

The Correlation Analysis about Impact of Government Subsidies and Enterprises Growth on Credit Default Risk

Qi Jiarong

School of Management, Wuhan University of Technology, Wuhan, P.R. China, 430070
(E-mail: 3049893064@qq.com)

Abstract: Commercial banks should consider influence factors from different ways when evaluating the credit and loan default risk of small and medium-sized enterprises. This article first proceeds from the researches of relative theories and then proposes the assumption. It then takes collected data of small and medium-sized enterprises as an example to construct relative models. The researches mainly include descriptive statistics, correlation analysis and regression analysis, which study respectively on the influences of government subsidies and growth of the firms on credit and loan default risk. The result indicates that government subsidies and growth of the enterprises both have a negative correlation with credit and loan default risk, which means credit and loan default risk could be reduced by raising government subsidies and promoting the growth of the firms.

Key words: Government subsidies; Enterprises growth; Credit default risk; Regression analysis

1 Introduction

In China, commercial bank has strategically set the credit business of SMEs as the development goal, such issues as the stability of the SMES have brought many risks into the credit business.

Foreign scholars got some remarkable achievement. Altman set up a model named "ZScore", whose principle is to establish discrimination functions by the use of multivariate financial indexes and then classify the borrowers to judge whether to have the ability to repay the loan. Scholar Dutta and Shekhar first made use of neural network to analysis; Scholar Haltin and Ohison established regression model LoHit to forecast the probability that the borrowers break the contract and so on.

Domestic experts are combined with the relevant data of our country to introduce the method of commercial bank credit, and demonstrate the feasibility of the credit risk prevention measures. In 1990s, the domestic scholars began to study the credit risk of commercial banks to guard against. (Edward I Altman, 2009) In 2015, Zhang Xin, in *Chinese commercial banks credit risk management company industry thinking* made a detailed discussion of the bank risk management and the need, update the management philosophy to cope with rapidly changing situations and complicated situation.

2 Theoretical Analysis

In 1997, the Basel committee in the core principles of effective banking supervision determining the three risks of the Banks needed to pay special attention to: credit risk from the customer, external risk from the market, operating risk from the internal bank. This page considers credit extension related objects and influences factor by the review of bank.

2.1 National macro policy

At present the China is in the adaptability of the macroeconomic policy in the field of economy. First, the national monetary policies have a direct effect on difficulty degree of corporate finance in a period. As the means of macroeconomic regulation, Government subsidies can promote the development of SMEs to a certain extent and have important influence of the repayment capacity.

In summary, put forward the hypothesis H1: government subsidies and the credit and loan default risk of SMEs is negatively correlated. (M. S. Weisbach, 2004) in another word, the more government subsidies, the smaller the probability of credit default.

2.2 Middle and small-sized enterprise

The enterprise growth ideas can date back to the classical economic which classical economists represented by Adam Smith considered the economic interests of the scale realized by the division of labor and professionalization as the main cause of enterprise growth. Corporation growth measures the running development status of an enterprise for some time and the ability of an enterprise's expansion and development for some considerable time to come. It determines an enterprise's future growing trend and possibility. The growth of an enterprise has great significance for its decision of capital structure.

Therefore, we come to the hypothesis H2: the growth of small enterprises show negative relation with the venture of credit default, which means that the higher growth, the less venture.

3 Data and Methodology

3.1 Sample selection and data source

Based on SMEs listed in Shanghai and Shenzhen in China from 2013 to 2015, except for st listed companies and listed companies which are lack of key variables, the article finds 480 samples in the end. Enterprise data mainly come from Cninfo and the CCER database. This article uses SPSS to complete data processing and statistical analysis.

3.2 Variable definition and model building

In order to test this research hypothesis, we construct the following model:

Model one: $P = a_0 + a_1GS + a_2HY + a_3ICI$

Model two: $P = a_0 + a_1TobinQ + a_2HY + a_3ICI$

3.2.1 Explained variable

Default probability (P) is the degree that the debt or counterparty breaks the contract and will not be able to pay off his debts. There are only two cases for bank credit for enterprises: will default or not. If assign a value of one to the default, an event will occur. If assign a value of zero to the success in meeting the debt obligations, an event hasn't occurred yet. It can be assumed that the probability of the event that would happen is PD and the probability of the event that hasn't happened yet is 1-PD. If we regard PD as a linear function of the independent variable, its forms are as follows.

$$P = \alpha + \beta_1 X_1 + \beta_2 X_2 + \dots + \beta_n X_n + \xi$$

Put P into Logistic model, we can get:

$$\logistic(p) = \ln\left(\frac{p}{1-p}\right) = \alpha + \beta_1 X_1 + \beta_2 X_2 + \dots + \beta_n X_n + \xi$$

After deformation, there is the result:

$$P = \frac{EXP(\alpha + \beta_1 X_1 + \beta_2 X_2 + \dots + \beta_n X_n + \xi)}{1 + EXP(\alpha + \beta_1 X_1 + \beta_2 X_2 + \dots + \beta_n X_n + \xi)}$$

α is a constant, β_n is regression coefficient, X_n is explanatory variable, ξ is a random error term, and $p/1-p$ is the odds. The formulas can explain intuitively the impact of factor change on default rates. Logistic model does not require the normality assumption of the sample, which conforms to the sample features of researching the credit-default risk of the small and medium enterprises in this article. Therefore, the article uses the logistic model to do empirical research. (R. M. Stulz, 2010)

3.2.2 Explaining variables

1) Government subsidy(GS)

Based on the financial reports notes of SMEs, concerning about the government subsidy, the government subsidy data is summarized and organized manually. High-tech enterprises are subsidized mainly by the financial subsidies, incentives and tax rebates that the government provides enterprises with. Therefore, the government subsidy measure = the government subsidy/income.

2) Corporation growth

Q determines the level of company investment and represents the value of company benefit. However, we often use Tobin's Q approximation to measure the enterprise value. (Snežana Dičevska, 2012) The article uses the net asset value per share as the approximate prices of non-tradable share and uses the asset book value as the approximate of the replacement cost of company assets. Therefore, the approximate value of Tobin's Q = (circulation market value + the number of non-tradable shares × book value of the net assets per share + debt) / book value of assets.

3.2.3 Controlled variable

1) Industry type (HY): different industries are assigned different numerical values. 1=manufacturing industry, 2=construction industry, 3=transportation industry, 4=catering industry, 5=business service

2) Industry cycle index (ICI): Choose the industry cycle index reflects bank’s credit risks.

3.3 The summary of variable definitions

In sum up, we get all variable definitions, as shown in table 1:

Table 1 Variable Definitions

variable	abbreviation	Assignment instructions
Explained variable	PD	0 or 1
Explaining variables	GS	GS =subsidy/income.
	TobinQ	TobinQ
	HY	different numerical values
	ICI	industry cycle index

4 Results

4.1 Descriptive statistics

Before the regression analysis, we carry out descriptive statistics for all variables at first, so that we can intuitively understanding the data distribution of each variable. As shown in table 2.

Table 2 Descriptive Statistics

variable	the whole sample		No default sample		default sample	
	mean	variance	mean	variance	mean	variance
GS	0. 2773	0. 0048	0.5926	0. 0691	0.1238	0. 018
TobinQ	2. 6224	7. 9615	2. 8778	8. 6512	1. 8404	6. 5240
HY	3.40483	1.9744	3.8241	1.5880	4.1667	2.7340
ICI	69.9703	398.8135	107.2916	552.963	43.7082	65.813

Form government subsidies, no default the sample mean is 0.5926, the default sample averages of 0.1238, it reveals government subsidies have great influence on SMEs credit and loan default risk.

From TobinQ value, which is an index about the perspective of a measure of enterprise growth, no default sample mean is 2.8778, the default sample mean is 1.8404, the growth differences of sample companies. Because enterprise growth is different, so the enterprise's financing conditions are different and the credit default risk is different, all these provide support for the research.

4.2 Correlation analysis

This article aims to analysis the correlation between government subsidies, enterprise growth and the probability of credit default. Therefore, it is necessary to carry out Pearson correlation analysis of each variable, as shown in table 3.

Table 3 Pearson Linear Correlation Analysis Table

		GS	TobinQ	HY	ICI
GS	Pearson Linear	1			
TobinQ	Pearson Linear	0.122**	1		
HY	Pearson Linear	0.063**	0.174	1	
ICI	Pearson Linear	-.031	-.010	0.201**	1

From the above table, we can see the correlation between variables selected in this article is not obvious, and there is no need to eliminate the multiple col-linearity between the independent variables. Therefore, the original variable can be put into the model, gone through the regression test and analysed.

4.3 Regression test and analyses

4.3.1 Regression result of hypothesis H1

Take the Probability of Default (PD) and the Government Subsidies (GS) as the explanatory variables, Industry Type (HY), Industry Climate Index (ICI) as the controlled variables. Then Linear regression analysis is carried out between the two kinds of variables. As shown in table 4.

As seen from the above table, the F value of the regression model is 3.521, and the significance level of F value is 0.010, which shows that the regression effect of the model is significant, and there is a significant negative correlation between government subsidies and verifies the hypothesis 1 in this article. Therefore, the business obtained more government subsidies, the probability of default will be lower, and the business is more likely to get bank loans. In other control variables, industry type and industry climate index has a negative correlation with credit risk. When the industry climate index goes

high, it represents that the business development future is good, and the bank will increase the credit rating of the business, also, the business' s probability of default will be lower.

Table 4 Regression Result of Government Subsidies and Credit Risk

Mode		Sum of square	df	average square	F	significance
1	Regression	368.883	4	92.221	3.521	0.010
	Residual	2933.586	111	26.193		
	total	3302.469	116			

Model		Unstandardized coefficient		standardized coefficient	T	significance
		B	standard error	Beta		
1	Constant	14.033	7.766		3.101	0.002
	GS	2.457	0.573	0.230	2.555	0.012
	HY	-1.954	2.262	-0.077	-0.864	0.389
	ICI	1.781	0.328	-0.213	-2.379	0.019

According to the coefficients in the table, expressions can be obtained:

$$P = 14.033 + 2.457GS - 1.954HY + 1.781ICI$$

The final regression equation is:

$$\ln\left(\frac{P}{1-p}\right) = 14.033 + 2.457GS - 1.954HY + 1.781ICI$$

Restore the linear relationship between the variables, and the result is:

$$\frac{P}{1-p} = EXP(14.033 + 2.457GS - 1.954HY + 1.781ICI)$$

4.3.2 The regression result of hypothesis H2

Take the Probability of Default (PD) and the business growth (TobinQ) as explained variable, industry climate index as the control variable. Then Linearregression analysis is carried out between the two kinds of variables. As shown in table 5.

Table 5 Regression Result of Government Subsidies and Credit Risk

Mode		Sum of square	df	average square	F	significance
2	Regression	1577.499	4	394.375	25.606	0.000
	Residual	1724.971	112	15.402		
	total	3302.469	116			

Model		Unstandardized coefficient		standardized coefficient	T	significance
		B	standard error	Beta		
2	Constant	13.469	3.457		2.217	0.029
	GS	3.338	0.021	0.648	9.465	0.000
	HY	-2.059	1.831	-0.081	-1.189	0.237
	ICI	1.710	0.351	-0.198	-2.882	0.005

As seen from the above table, the F value of the regression model is 25.606, and the significance level of F value is 0.000, which shows that there is a significant negative correlation in the hypothesis 2. Business with high growth has much development potential, and will be more likely to get the expected excess incomes. The better financial situation is, the stronger the ability to repay debts will be. Bank as a creditor, will be more willing to provide loans to the business with high growth. But because growth is an indicator of the evaluation of the future condition, and the regression coefficient of industry climate index is still negative, it will increase the credit risk. So banks in debt financing must consider these three factors as far as possible, thereby reducing the rate of loan default and obtain the loans.

According to the coefficients in the table, expressions can be obtained:

$$P = 13.469 + 3.338TobinQ - 2.059HY + 1.710ICI$$

The final regression equation is:

$$\ln\left(\frac{P}{1-p}\right) = 13.469 + 3.338TobinQ - 2.059HY + 1.710ICI$$

Restore the linear relationship between the variables, and the result is:

$$\frac{P}{1-p} = EXP(13.469 + 3.338TobinQ - 2.059HY + 1.710ICI)$$

5 Conclusions

5.1 Research Conclusion

First, the empirical research suggested that government subsidies and credit and loan default risk has significant negative correlation. That is to say the more the government subsidies, the lower default probability of credit and loan. Because the government subsidies for the enterprises in financial support and reduce the credit risk. Thus enterprises are more likely to get credit loans. Second, the enterprise growth and credit and loan default risk has significant negative correlation. That is to say high growth can effectively reduce the credit risk in a certain extent. Because high growth of enterprises has a potential future, can obtain the expected excess revenue and corporate profitability and debt paying ability is stronger, the credit default probability will be reduced accordingly.

5.2 Research Proposals

First, from the aspects of government, bank loans to small and medium-sized enterprises not only need to focus on enterprise's solvency, but also focus on government subsidies and support policies for SMEs. Second, from the aspects of enterprise growth, Banks can provide loans for high growth companies as far as possible. Because of the high growth of enterprise credit default rates are relatively low. When Banks make loans, they can raise the loan interest rate and charge a fee to urge enterprises to avoid the credit risk.

Research on the Risk Responding Mechanism of Network Public Opinion in the Era of Big Data

Zhang Wuqiao

School of Management, Wuhan University of Technology, Wuhan, P.R. China, 430070

(E-mail: 892260268@qq.com)

Abstract: This paper makes an analysis of the current technology platform modes of the monitoring system of network public opinion, pointing out the existing problems of “two emphases and two neglects” in the monitoring institutions of network public opinion: they value the data but neglect the analysis, and they emphasize the technology but ignore the response. This article holds that scholars should grasp comprehensively the internal mechanism and evolution law of opinion transmission in the era of big data. Furthermore, the monitoring managers of public opinion have to analyses, identify, judge and evaluate the information and the data of public opinion through the monitoring technology platform of network opinion. It concludes that we should give full play to the initiative, enthusiasm, and involvement of behavior subjects like government departments, experts and scholars, the network media and the public, etc., forming internal and external force, and construct the linkage mechanism of the risk response of network opinion. Only in this way, can we effectively improve the ability to deal with the network public opinion.

Key Words: The era of big data; The risk of network public opinion; Responding mechanism

1 Introduction

When certain social events spread through network media, online masses will initiate heated discussions, comment and pass on others' posts of these events. And the social events will evolve into the risk of network public opinion without proper guide in this process. So the events will not only bring adverse impacts on the event clients, but even affect social stability and the security and harmony of the country. Especially under the background of today's era of big data, any event can instantaneously spread all over the world, and network public opinion has become an important force to influence national security, social stability and people's life. Therefore, the key problems of the current guide work of network public opinion include following aspects: adapting to the change of era, ensuring the guide work in order, strengthening the routine monitoring, exploring the risk judging method, and constructing the guiding linkage mechanism.

At present, the research abroad mainly focuses on the theoretical study of monitoring analysis and dissemination evolution of network public opinion, especially the analysis of survey data, text data and network data and complex social network, such as Aghdam(2016), Galam(2015), Frasca(2013), Chkhartishvili & Gubanov(2011), Pasttor-Satorras & Vespignán(2001), Larson(2000), etc. However Chinese scholars mainly study hot events of network opinion monitoring, technology platform, alert and response, such as Song Yuchao, Chen Fuji (2016), Sun Feixian, et al. (2015), Li Xiguang (2014), Huang Yonglin (2014), Wang Qing, et al.(2011), Tan Guoxin, Fan Yi (2010), and so on. As what have been discussed above, the study of how to make full use of current monitoring technology of public opinion for effective daily monitoring and disposal is very weak. And more studies should be done in this field to improve the ability to guide public opinion and dispose of the public opinion risk.

2 Current Problems in Network Opinion Monitoring

From the view of our present concern, these fields closely related to people's basic necessities become the focus of public attention, such as food, medicine, environmental protection, education, housing, transport, industry and commerce, safety in production, journalism, publishing, etc., followed by these fields like “fighting against pornography and illegal publications”, the agriculture (the price). In addition, the sectors like environment, family planning, finance, electric power, religion, land and resources, tourism, sports, etc. have increasingly become the focus of public attention. So these relevant departments have set up specialized agencies to monitor and manage public opinion to effectively curb the signs of opinion risk influencing the image of the government or the unit. But with an overview of the current monitoring situation, there mainly exists such phenomena of “two emphases and two neglect”: they value the data but neglect the analysis, and they emphasize the technology but ignore the response.

2.1 Data emphasis but analysis neglect

At present, data support and statistical argument are highly regarded under current time's background. Throughout the daily monitoring modes of network opinion, Chinese monitoring agencies and departments of network opinion not only quest for the scale and the quantity of data, but also make full use of monitoring technologies and software for data mining to facilitate monitoring platform to analyses and use the data. However, the complete data mining and collection methods without analysis not only affect the accuracy of data analysis, but make the task harder and increase the workload of monitoring network public opinion, sometimes even a waste of manpower, material and Financial Resources. From the perspective of current monitoring agencies, monitoring personnel of different levels can only use the monitoring software of public opinion without data analysis combined with the social practice. There won't be scientific analysis report of public opinion if without identification, delectation and analysis of the data samples. To a certain extent, this monitoring service with data but without data analysis reduce the practical applied value in the technology platform of monitoring public opinion.

2.2 Technology importance but response neglect

Owing to the different purport of the monitoring position of network public opinion, the monitoring platform cannot be a great intersection of technology, data, and service. There are main three kinds of service organizations of monitoring network public opinion. One is the academic type, whose representatives are the Tsinghua and UU Watch Laboratory of News Public Opinion, Public Opinion Academy, RUC, Tianjin Public Opinion Academy of Social Sciences, and other colleges and Universities and search institutes. This type of organizations put too much emphasis on theoretical study without strong resources guarantee which have weakened the disposal efforts in solving the public opinion crisis of social public events to a certain extent. Another one is the technological kind, whose representatives are Barfoo Software, Goonie International Software, THNWIN, Meiya Pico and other tech enterprises. As these enterprises are in the pursuit of profit model, they take selling software as the core. So the data results obtained by the server show that there are few professional analysis reports of public opinion, let alone feasible disposal plans. The last one is the media type. And the Public Sentiment Monitoring Room, the media platforms of all newspapers, etc. are the representatives. And these media platforms often have a huge amount of data resources and powerful influence of public opinion. But as the application problems of the analysis report from these platforms are not implemented in place, they do not have good decision reference value.

Just as a scholar pointed out, the monitoring system of Internet public opinion, in which theoretical study is divorced from the practice of social governance, public opinion monitoring is out of step with the intervention of public opinion crisis, and data information collection is disconnected with professional data analysis, to a certain extent, has been the bottleneck and the shackles to cope Internet opinion. (Bao Xianping, et al.,2015:37-43)Therefore, the monitoring institutions should not only make efforts in constantly strengthening server construction, improving data mining ability and enhancing the experience sense of monitoring platform, but further consider the operability, practicality and reality of the analysis report of public opinion, and correctly handle the relationship among data, technology and service. Only in this way, can they dig up some useful data with the advanced and scientific technology to better serve for the society and people which is the ultimate goal of developing and designing monitoring platform of network public opinion.

3 The Study Principle and Method of the Risk of Network Public Opinion

In today's era of big data, the monitoring institutions should not only put forward the specific implementation plan after deep analysis of the collected data and careful study of the development trend of public opinion, but also make comprehensive use of multidisciplinary theoretical knowledge, such as communication science, politics, computer science and technology, linguistics, management science, sociology, information science, and so on. "Through the Internet and the technology platform of computer software, they adhere to the principles of the quantitative judgment and scientific decision, multiple simulation, man-machine integration. And they not only make prediction, early warning and intervention of the risk of network public opinion, but apply virtual reality technology to make simulation and prediction of warning sources, warning signs, warning situation."(Li Xiguang, 2014:10-16) They should make some key measures to promote the guidance work of network public opinion to and construct clear network space environment from following aspects: to make real-time monitoring of network public opinion, to timely grasp the dynamic state and development trends of

network public opinion, to closely observe the people's ideological trends, to take timely and effective measures to process the events results to a minimum.

3.1 The study principle of network public opinion

3.1.1 The propagation subjects of network public opinion---netizens.

We need to have a comprehensive understanding of behavior subjects involved in the propagation process of social hot spot information through technical means and association data. Only when we really grasp the identity of behavior subjects, can we comprehensively grasp the focus of information and the process of information flow, because Internet users are one of the most important and critical parts in the spread process of public opinion, and their behavior attitude, psychological cognition, knowledge level determine the propagation and evolution process of network public opinion. So we have to carefully analyze how the behavior subjects spread information through the circle of friend of the social media circle to bring out emotional resonance, behavioral interaction and resonance between the behaviors subjects of public opinion.

3.1.2 The objects of the transmission of network public opinion: problems

The spread of network public opinion is occurred under the background of social hot events. Since the events themselves are closely related to the interests of social public or easily arouse public's interest and attention, so they can stimulate Internet users to search and spread network public opinion. Some social hot spots are more likely to become the focus of network public opinion, particularly some issues associated with the social public interests like education, environmental protection, corruption, traffic, prices, housing and other areas. Of course, the current technology platform makes it possible to achieve real-time monitoring of public opinion on the network space. And the most critical point is to carry out a professional analysis of these data and then form the research report of public opinion. Furthermore, it is necessary to search net citizens, click on the hot information for data analysis, timely grasp the attention tendency of the cyber citizens on the hot issues so that the monitoring departments can effectively guide network public opinion in advance.

3.1.3 The network communication platform: media.

Nowadays, mobile social network media, especially the popularized application of smart phones, provide very convenient hardware of network participation for the public. All kinds of social software such as QQ, WeChat, micro-blog, etc., have become common media for the contemporary public, who can participate in online discussion and comment the social events anyplace and anytime. Compared with the traditional media, these social software of strong relation network, breaking previous linear propagation, have the transmission features of diversity, group nature, and interactivity. So they are easy to form mainstream opinion orientation of the network group events. Accordingly, monitoring these social media and other Internet forums should be the monitoring focus in the assessing process of network public opinion.

3.2 The judging Method of Network Public Opinion

3.2.1 The browsing method of massive human resources.

It is a kind of artificial judgment method which gains the corresponding results from the investigation of current social media or public. It is the most basic, natural and common judging method of network public opinion. However, it has many shortcomings in the face of ever changing technology of network media, such as data missing, mechanical repetition and so on. Thus it is often unable to achieve expected judged target. But it still has certain feasibility and operability in the judgment process of network public opinion because it is intuitive, convenient and simple.

3.2.2 Keyword search method

It is a method which makes massive search of the keywords of opinion information through Internet search engines, and then judges' hotspot information of public opinion from the search result. It is effective, accurate and practical. But this method is mainly dependent on network search tool, and the quality of its search database and information bank determines the quality of the method. Especially some commercial sites will also decide the search scope according to their interests in the face of the current large amounts of information. Therefore, it affects the search results in a certain extent.

3.2.3 Multi document selection method.

It is a judgment method which gets the research result from analyzing target web documents of Internet public opinion in the judgment process. It is artificial in nature, and it forms the judgment method system combined with browsing method of massive human resources, keyword search method. It is of important significance to help the public opinion judge understand the ins and outs of the events, and enhance their judgment level. Generally speaking, it is used in the occurrence period and diffusion stage of network hot events, and help users know the trend of public opinion because of fewer number

of target documents.

3.2.4 Templet factor method

It is a means of intelligent analysis of judging Internet public opinion through modeling paradigm. It needs to take a historical review of the events of network opinion, make an overall objective analysis of occurrence regularity, and undertake a comparative study of the development templet and the corresponding factors. Hence, it is theoretical, reflecting the scientific understanding of the people on the events of network public opinion. Moreover, public opinion events often influence the results and quality level of this method because of the complexity of the events development, the areas of event occurrence and event categories. So it needs to perfect and repair.

3.2.5 Network experiment method

It is an important supplement to the reality judgment of public opinion. It is a judgment method which makes scientific experiment analysis of network events by means of simulating the network environment, and then obtains the judged result of the events development and change. In general, it is mainly used for scientific research institutions to analyses the complex, sensible, diversified events of network opinion to know their main trends, grasp their developing rule. So it is of great research value in improving people’s cognition of network opinion and their overall judgment level.

Indeed, the judgment of network public opinion is mainly based on the technology platform of the monitoring system of Internet public opinion. Besides the methods mentioned above, there are other methods, such as the comparison method of case base, the analysis method of network hot words, etc. They form the method system of comprehensive use and mutual support in the process of the implement operation. But these methods are based on artificial analysis, and the monitoring sectors wholly grasp the developing progression of the network opinion events via platform technology and methods of the monitoring system of network public opinion. And they regard some basic information and text data as the analysis objects so that they can make scientific, rational and comprehensive grasp of the occurrence rule, trend and results of the Internet events. Therefore, the study can provide strong theoretical support for the government in the decision reference and action guide.

4 The Response Linkage Mechanism of the Risk of Network Public Opinion

The dissemination of network public opinion is actually a spread process of the social public events in the network space. And its multiple elements and changeable virtual space environment increase the complexity of the risk response of network public opinion. Consequently, the managers should not only firmly grasp the internal mechanism and evolution law of public opinion communication, but also fully mobilize the departments to coordinate work and work together so that they can construct a linkage mechanism and break through progress, as follows figure 1.

From the Table we can see that the response mechanism of network opinion risk mainly includes two mechanisms: “internal linkage mechanism” and “external linkage mechanism”, among which “government sector” and “information resources sharing” play key important roles in the whole process, because high development of the media provides a great convenience and possibility to share information resources in the era of big data. As an important organization of network public opinion, government sectors have strong power on organization, authority and execution, which other social groups cannot go beyond.

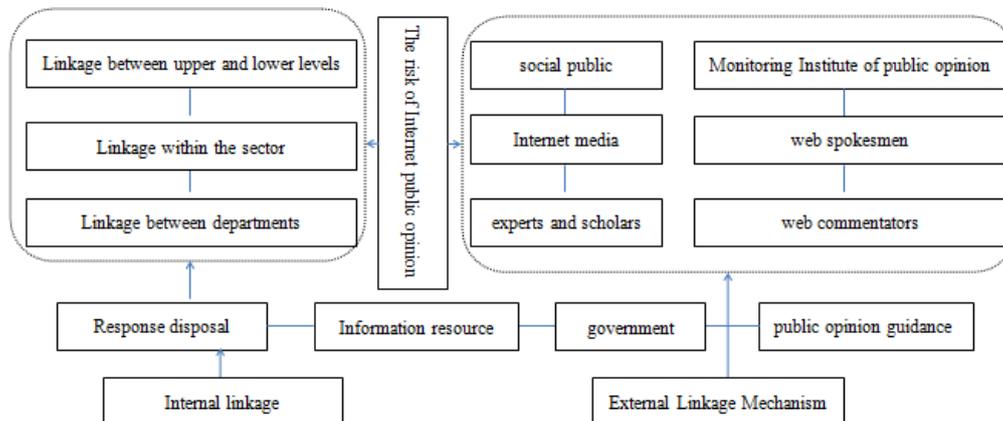

Figure 1 The Risk Response Mechanism of Network Public Opinion

4.1 Internal linkage mechanism

After spreading public emergencies by means of network media, government departments and the administration subjects must form a joint force between higher and lower levels, between departments or within the sector on the first time to constitute a leading group to deal with public opinion and seek the best contingency plans with mutual coordination via sharing the information resources. Because network emergencies, which are different from general emergencies, spread in time and fast, they will threaten to grow into the crisis of public opinion and further aggravate the malignant development of the events if not promptly treated. Thus government departments have to deal with and dispose of these events timely and effectively. For example, the illegal vaccine case on March 18, 2016 had aroused great concern of Chinese people, and the Party Central Committee had attached great importance to it. And Premier Li Keqiang made some important instructions that relevant departments such as the Food and Drug Administration, the Ministry of Health, the Ministry of Public Security and so on, must properly coordinate and make a thorough investigation of the flow direction and usage of these problematic vaccines so as to respond to people's concerns promptly. We can find that the whole incident was handled very timely, upper and lower levels, internal department and interstates are in joint forces. So the internal linkage mechanism can effectively put an end to the spread of Internet rumors.

4.2 External linkage mechanism

As the network emergencies are often sudden and accidental, it cannot be effective to respond to the events if relying solely on government departments in today's mobile Internet era. And the modes like "fighting alone", "working each for himself" cannot adapt to the governance model of current network space. So the response linkage mechanism can achieve its aims only through sharing of information resources and full cooperation of the media, experts and scholars and the public. On the one hand, the web spokesmen and the web commentators can actively guide the events, timely release the authoritative and reliable news for the first time in the platform of we media such as the micro channel, microblog, to respond to social concerns and the questions of the public in time. On the other hand, the response linkage mechanism can effectively monitor the events through technical means. Only by combination of guidance with confinement, can the main tone of network public opinion move toward the healthy direction. In addition, government departments have absolute power in event processing and decision making, and the media industry is the executer of information selection and dissemination.(Yang Bincheng, Li Juan,2014:20) Various linkage departments and organization personnel should raise their awareness up to the level national stability, social harmony and people's harmony, strengthen their awareness of coordination and communication, improve their social responsibility, actively disseminate social core values and increase social positive energy.

It is true that there is a huge gap between virtual space governance and real social governance because of wide and boundless network space and the ever changing network technology, which brings a serious challenge to the rulers. Especially during the transition period when the commercial tide sweep the world and media industry go through reorganization and transformation, many network media industries are lack of social responsibility, coupled with the lack of public media literacy, which are easy to aggravate the risk occurrence of network public opinion and increase the difficulty of the guide work. Thus, the construction of harmonious ecological environment of network public opinion will be a long historical process. And scholars need more comprehensive theoretical knowledge of multidisciplinary and technology design, such as communication science, psychology, linguistics, sociology and information science, etc, and the cooperation of research teams. Only is this way, can they better control the study of network opinion management, and effectively put forward the scientific plan to guide, intervene and dispose of the risk crisis.

5 Conclusions

With the high development of information technology and the wide application of the smart phones, it has become an important task and time mission to efficiently and timely deal with the risk of network opinion and scientifically and reasonably guide public opinion towards a healthy and harmonious direction. Under the background of the times when the network governance and the news ruling are vigorously promoted, the construction of sunshine and efficient platform of government affairs has become the shared aspiration of various government departments. Furthermore, it has become a touchstone to test the government's ability to govern network whether the government can effectively deal with the network emergencies and dispose of the crisis of network opinion. Therefore, the linkage

mechanism includes not only internal linkage mechanism between the administrative subjects, government departments, upper and lower levels, and departments, but also external linkage mechanism between government departments, social public, the media industry, experts and scholars so that it can promote the positive communication of social events in network space.

Abstract: This paper puts forward a financial management system of enterprise risk conduction recognition approach, modern means of identification and scientific recognition method by using the method of theoretical analysis. Moreover, the paper builds up a recognition system of financial management system of enterprise risk conduction, which includes effective recognition paths, modern identification methods, and scientific identification methods. In details, the effective recognition paths include risk factors to identify pathways and risk conduction principle recognition approach; the modern identification methods are composed of financial indicators, business process and historical experience, and internal control means of identification form; the scientific identification methods include financial report analysis method, screening method, risk conduction tree search method and trigger method. Furthermore, this paper provides a theoretical and empirical guidance for the efficient and accurate identification of enterprise financial system risk conduction.

Key words: Enterprise financial system risk conduction; Effective identification way; Modern identification method; Scientific recognition method

1 Introduction

The risk conduction identification of enterprise financial system is different from the risk identification of enterprise financial system. It is not only of financial system of enterprise risk identification, and identification of elements of financial system of enterprise risk conduction, namely of business financial system risk source, risk conduction load body, risk conduction path to understanding, identification and confirmation process. Thus, for recognition of business financial system risk source, interception financial system of enterprise risk conduction carrier, cutting off the financial system of enterprise risk conduction path, and effective control of the financial system of enterprise risk conduction play a key role.

The risk conduction identification of enterprise financial system, including the effective identification approach, modern identification method, the scientific identification method.

At present, the current research status of risk conduction is mainly focused on two areas of financial risk conduction and enterprise risk conduction, and there are few scholars who study the conduction of enterprise financial risk from the micro level. The scholars who study and discuss the problem of enterprise financial risk conduction are mainly: Bensten (1986) views on enterprise's financial risk conduction is when the system in a certain number of business failure at the same time, systemic risk will happen. Davis et al (1999), Jarrow, (2001) from vulnerable point of enterprise's financial risk conduction, they think of a business failure will lead to failure of other enterprises, so common financial fragile will. Helwege Jeen (2010), had a more comprehensive study on the enterprise bankruptcy and systemic risk, after the sub loan crisis. The scholars who earlier specialized in enterprise's financial risk conduction of China have Li Bingxiang, Tian Zhanjun, (2006), on the basis of analysis of the relationship among enterprise financial risk and the elements, structure and environment of accounting and uncertainty of management, they constructed analysis framework of enterprise financial risk formation and transmission. Shen Jun, Deng Mingran (2007) researched the enterprise financial risk conduction and the carrier. Yin Li (2009) researched on the effect of corporate collective financial risk conduction in the framework of organizational failure. Chen Aijun (2009) researched on the enterprise financial risk conduction from the perspective of the supply chain. The research on the enterprise financial system risk conduction identification has not yet been found, and this paper fills the gap in this area.

2 An Effective Approach for the Identification of Risk Conduction of Enterprise Financial System

An effective approach for the identification of risk conduction of enterprise financial system is

shown in Figure 1.

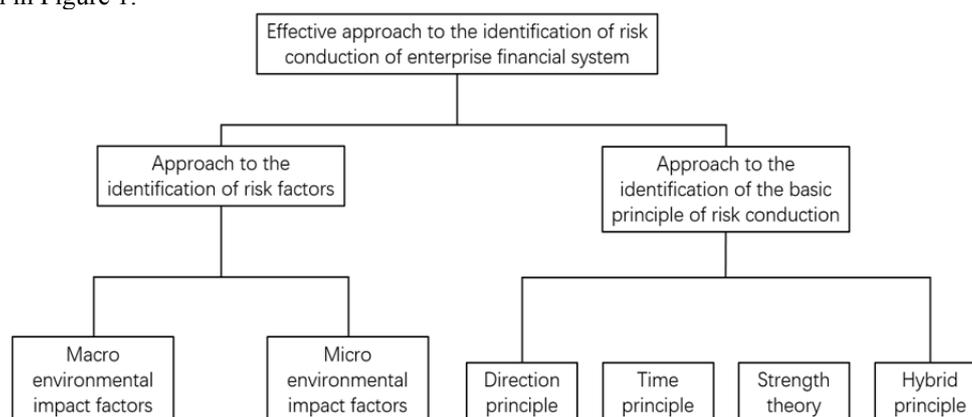

Figure 1 Effective Approach to the Identification of Risk Conduction of Enterprise Financial System

2.1 Approach to the identification of risk factors of risk conduction of enterprise financial system

Enterprise financial system of the existence of objective uncertainty and subjective uncertainty, which is caused by the factors of macro environment and micro environmental factors. Therefore, starting from the factors of macro environment and micro environmental factors, is the way to identify the financial system of enterprise risk conduction.

1) From the macro environmental factors identification. It mainly refers to the political environment, economic environment, legal environment, technical environment and international environment.

Macro environment changes will bring the system, global impact, resulting in business, fluctuations in the industry, and even the entire national emergency expected target and uncertainty. The influence of macro environment is to lead to the occurrence of the enterprise production and management target of the origin of the uncertainty, is the source of the risk of financial system of enterprise risk conduction. The risk of enterprise financial system is not only influenced by the macro environment, but also influenced by the social and cultural factors, the types of enterprises and stakeholders.

Enterprise financial system risks resulting from the sources of risk, from the risk source of the dominant carrier (capital, personnel and Technology) or contact carrier (information, behavior and concept) along the business process chain and value chain or capital supply chain transfer and spread and spread.

2) Identification of influencing factors from micro environment. The influencing factors of enterprise financial system by the micro environment, mainly with enterprise production and business activities and financial activities of enterprises is closely related to the enterprise production management, enterprise financial capability, enterprise financial management organization structure and enterprise financial personnel quality elements. The volatility and uncertainty of these factors will directly lead to the expected target of enterprise financial system to change, which is the source of enterprise risk management system risk.

Arising from this kind of risk source of business financial system risk, the dominant carrier or recessive carrier, along the enterprise financial management contents cycle (namely fund raising, long term investment of enterprises, corporate cash flow and profit distribution or corporate finance cycle (that is, financial prediction, financial decision-making, financial budget, financial control, financial accounting, financial analysis) or in the enterprise funds raising activities, activities of corporate liquidity in the process, enterprise profit distribution in the process of transfer and spread and spread.

2.2 Approach to the identification of the basic principle of risk conduction of enterprise financial system

The risk conduction of enterprise financial system follows the direction principle, the principle of time, the intensity principle and the mixed type principle. Therefore, from the perspective of these principles and anatomy of corporate financial system risk conduction, is the identification of corporate financial risk conduction and an important way.

1) Identification of the direction principle of risk conduction from the enterprise financial system.

Enterprise financial system, the direction of risk conduction theory, refers to the enterprise financial risk conduction has a clear direction and path dependence. For example, elaborated in enterprise funds raise risk of conduction between the risk conduction, enterprise long-term investment risk conduction,

conduction of enterprise liquidity risk, enterprise profit distribution risk conduction respective involves the risk of conduction as well as has obvious directivity and size dependent, and risk conduction according to business process chain.

And in the enterprise funds raise way conduction risk, project risk conduction, reserve fund management risk conduction, finished the fund management risk conduction respective involves risk conduction is according to the value chain, chain of interest, the capital supply chain direction and path of risk conduction.

From direction recognition principle of the risk conduction of enterprise financial system is from the influence of factors of macro environment and micro environment of factors analysis identify sources of risk, from the direction of the principle of risk conduction path, from the financial system of enterprise specific business gap identification risk transfer vector, in order to realize the control of financial system of enterprise risk conduction.

2) Identification of the time principle of risk conduction from the enterprise financial system

The financial system of enterprise risk conduction time principle is referring to the financial system of enterprise risk conduction in the conduction process, follow certain regularity in the time, the specific performance for the interval of risk conduction, continuous risk conduction, delay risk conduction and periodic risk conduction. For example, conduction of interest rate risk, exchange rate risk conduction with certain interval, which is because of interest rate and exchange rate by the influence of the objective environment, the interest rate, exchange rate rising or falling, but rising or falling after will be stable for a period of time, to belong to an interval of risk conduction. These changes in interest rates, exchange rate is the source of risk, and interest rates, exchange rate related interests of the chain, the value chain, capital supply chain is the path of risk transfer, a variety of credit business is the risk of conductive carriers. After identifying the elements of interest rate risk conduction and exchange rate risk conduction, and taking corresponding measures, we can effectively control the risk of conduction. However, this type of risk conduction after the regulation, can be stable for some time, the production and operation activities of enterprises may be relatively stable development. And credit risk conduction, market risk conduction, policy risk conduction of enterprise production and management activities influence, may is continuous and persistent, a full range of risk conduction, brought to the interests of the chain, the value chain of enterprise loss is serious. From time recognition principle of The risk conduction of enterprise financial system, because the risk source and risk conduction path, risk transfer vector with the complexity and diversity, which requires us in the process of recognition, identification method and means to have flexibility and pertinence.

3) Identifying the intensity principle of risk conduction from the enterprise financial system

Financial system of enterprise risk conduction intensity principle, is refers to the financial system of enterprise risk conduction in the conduction process, from the risk of risk of risk conduction path on each node of the incoming and outgoing is dynamic, specific recession risk conduction, stable risk conduction and enhancement of risk conduction, or from the degree of coupling and weak coupling, pure coupling and strong coupling. This situation, depending on the level of risk conduction path on each node capacity for internal control strength, risk threshold, from the financial system of enterprise risk conduction intensity recognition principle, mainly enterprise financial management to constantly improve its anti-risk ability, to resolve the risk, made the risk of the strong coupling, pure coupling to the weak coupling changes.

4) From the perspective of the mixed type principle of risk conduction of enterprise financial system

From the financial system of enterprise risk conduction hybrid identification principle is refers to the financial system of enterprise risk conduction of risk source, risk conduction path, risk conduction carrier identification, take the identification methods, means to diverse, comprehensive and overall, the specific situation specific analysis, so as to improve the recognition of pertinence and accuracy, improve the effectiveness of the financial system of enterprise risk conduction control.

3 Modern Identification Method of Risk Conduction of Enterprise Financial System

The modern identification method of risk conduction of enterprise financial system is shown in Figure 2.

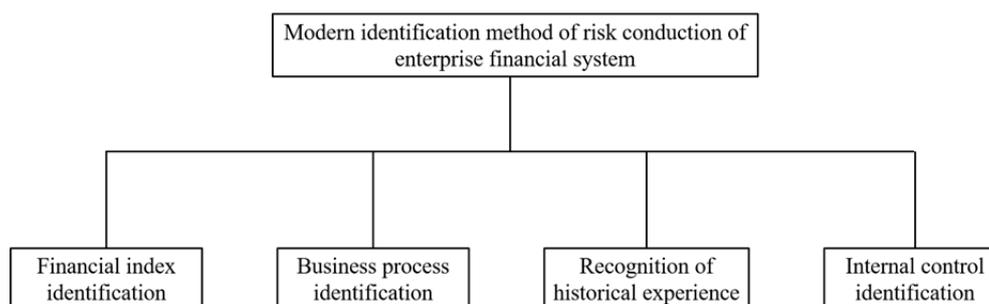

Figure 2 Modern Identification Method of Risk Conduction of Enterprise Financial System

3.1 Financial index identification method for risk conduction of enterprise financial system

In order to evaluate the business performance and the quality of financial status of the people, in practical work, summed up a lot of meaningful financial indicators mainly reflect the enterprise Solvency Index (current ratio, quick ratio, asset liability ratio), reflect the enterprise operation ability index (inventory turnover, accounts receivable turnover, working capital turnover rate, fixed capital turnover ratio, total asset turnover), profitability index (rate of return on assets, rate of return, net profit rate of sales, cost profit rate, profit rate, earnings per share), reflect the enterprise growth ability index (liquidity growth rate, the growth rate of fixed assets and the growth rate of total assets, sales revenue growth rate). By changes in the size of these financial indicators, analyze the influence degree of the macro factors and micro factors, we can reveal the degree of risk and risk source, risk conduction path and the risk of conduction carrier, providing the evidence for the prevention and control of financial system of enterprise risk conduction.

3.2 Business process identification method of risk conduction of enterprise financial system

The financial system of enterprise risk conduction business process identification method, is refers to the enterprise financial system fundraiser, long-term investment activities and distribution of profit, follow certain business processes. Therefore, the analysis of all aspects of the business process node, induce each link node risk factors to find out, business and management flow chart flow chart drawing, establishment of risk observation point and formulate related control measures and early warning criteria, you can effectively identify the source of risk, risk conduction path and the risk of conduction carrier.

3.3 The historical experience identification method of the risk conduction of enterprise financial system

Financial system of enterprise risk conduction the historical experience of the means of identification, is refers to the enterprise in the financial management practice of year after year, from the wealth of experience and many failures, discovery and the incentive for risk identification, so as to reveal the risk sources, risk conduction path and risk conduction carrier, to achieve the purpose of effective pre control of business financial system risk conduction.

3.4 Internal control identification method of risk conduction of enterprise financial system

The financial system of enterprise risk conduction internal control means of identification, is refers to the enterprise internal, through give full play to the wisdom and talent of the staff, mobilize their enthusiasm, regularly scheduled or unscheduled meetings, incentives for analysis and study of corporate financial system risk, identify potential risk and the stakeholders and experts (such as internal and external auditors) provide information to identify potential risks, to achieve the enterprise financial management and orderly, effective work management process to find sources of risk in the bud, to achieve the effective control of financial system of enterprise risk conduction.

4 Scientific Identification Method of Risk Conduction of Enterprise Financial System

The scientific identification method of risk conduction of enterprise financial system is shown in Figure 3.

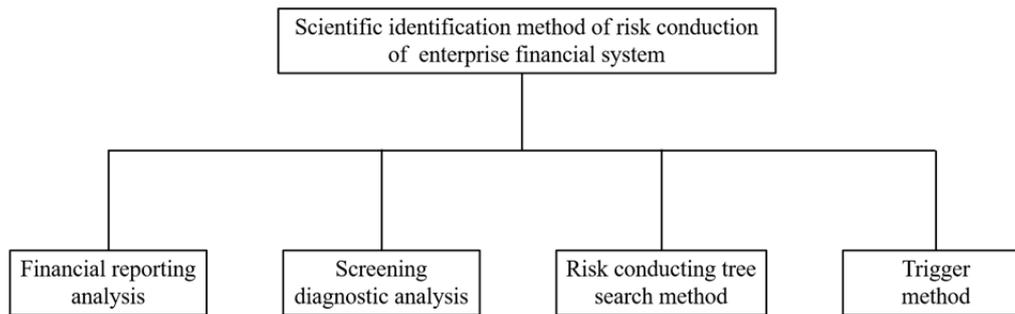

Figure 3 The Scientific Identification Method of Risk Conduction of Enterprise Financial System

4.1 Financial report analysis method of risk conduction of enterprise financial system

The financial reports of the financial system of enterprise risk conduction analysis method, is through to the enterprise's financial report which reflects the enterprise's financial position and operating results of written documents, including static analysis and dynamic analysis of the main accounting statements, schedule, report notes and financial status of the instructions to find the financial system of enterprise risk conduction of risk source, risk conduction path and the risk of conduction carrier.

Static gap of financial reporting is to analyze the financial reports of enterprises in a certain period, including structure analysis and ratio analysis; dynamic analysis of financial report is to the several stages of enterprise's financial report according to the time sequence analysis, from the dynamic research enterprise financial characteristics and the change trend, including comparative analysis of accounting statements, comparative financial ratio analysis, trend analysis of the percentage of. Through these analyses to identify the reasons for the decline in performance, and to business as the main line to find the source of risk, risk conduction path and risk conduction carrier.

4.2 Screening and diagnosis analysis of risk conduction of enterprise financial system

Financial system of enterprise risk conduction screening diagnosis analysis method, is to classify the financial system of enterprise risk conduction, confirm what financial system of enterprise risk conduction is the dominant risk conduction, which is the potential risk of conduction, which is can eliminate the risk of conduction. Through the diagnosis analysis and screening, eliminate interference, to seize the main contradiction, concentrated effort to identify a dominant risk conduction of risk source, risk conduction path and the risk of conduction carrier, and the potential risk of conduction prevention and control, to avoid the internal and external environmental conditions trigger, so as to fully and systematically control financial system of enterprise risk conduction occurred.

4.3 Risk conducting tree searching method for risk conduction of enterprise financial system

Financial system of enterprise risk conduction of risk conduction tree search method, is the financial system of enterprise risk conduction be multi-layer decomposition, according to the logic of "the reason", from the final result of, looking for the reasons, which lead to the influencing factors of risk conduction of risk source, risk conduction path and the risk of conduction carrier. The intermediate layer is the result of the upper layer and the lower layer is the cause. Step by step pursue, until the original cause, the shape of tree like, so called risk conduction tree search method. Using this method can more clearly and accurately judge the financial system of enterprise risk conduction risk source, risk conduction path and logical relation of, thus easily and quickly take measures of prevention and control of financial system of enterprise risk conduction.

4.4 Trigger method for risk conduction of enterprise financial system

The trigger method of risk conduction of enterprise financial system is a method to identify and pay high attention to the potential risk of enterprise financial system. Risk of the enterprise finance system in the controllable range is enterprise financial system, risk pooled form of risk not more than the risk threshold, breakthrough risk source, there is a potential risk. A potential business financial system risk once triggered, break through the threshold will spread, spread, this case, it should be to potential risk for risk source, the potential risks of business risk conduction carrier, the potential risk of business process for risk transfer path accurately and rapidly recognition financial system of enterprise risk conduction to comprehensively and systematically control financial system of enterprise risk conduction.

5 Conclusions

The risk conduction identification of enterprise financial system is the premise of the prevention and control of risk conduction of enterprise financial system. For the control sources of risk of enterprise financial system, the risk transfer vector interception, cut the risk conduction, and explore a path to provide a guarantee. The risk conduction identification of enterprise financial system by effective identification ways, modern means of identification, scientific identification method constitutes a mesh layout recognition, the systematic, comprehensive and accurate recognition of risk conduction to become a reality.

Research on Engineering Risks Aversion from the Perspective of Engineering Ethics

Yin Ziwei

School of Marxism, Wuhan University of Technology, Wuhan, P.R. China, 430070

(E-mail: 364459135@qq.com)

Abstract: Engineering is a “double-edged sword”. Apart from promoting human development, it has also brought about multiple problems and risks to the society. From the perspective of engineering ethics, the article aims to analyze the causes of engineering risks which mainly include the unpredictability of future, the lacked sense of responsibility among engineering participants and the divergence of risk perception. In order to avoid engineering risks in a comprehensive way, the article suggests three countermeasures which are namely cultivating the awareness of ethic and responsibility among engineers, establishing codes of engineering ethics by Association of Engineers and risk data bank, as well as safeguarding the public’s rights to be informed in order to promote active participation.

Key words: Engineering risks; Engineering ethics; Awareness of responsibility; Green development

1 Introduction

Engineering activities are likely to stimulate social development. However, the subsequent accidents resulting from engineering risks also do harm to human beings. As a result, it is essential to study engineering risks from various perspectives. The first research on engineering risks in the light of engineering ethics originated in the United States, where Professor Paul Durbin (2013) contended that the quantitative method of “Cost-Benefit Analysis” ignored human values of equality and justice. Therefore, engineering must be included in the discourse system of engineering risks evaluation and research. Mike W Martin (2005), a famous expert in engineering ethics, also claimed that engineers are responsible for predicting engineering risks and minimizing it, and they should also safeguard the public interests by their sense of morality and responsibility. Scholars in Great Britain and Netherlands also made their contributions to the study of engineering ethics. Carohne Willtheck (2012), a scholar from Great Britain, emphasized that in face of risks, engineers have the obligation to impeach the misbehaviors. Michael C. Loui (2014), a scholar from Netherlands, believed that “the studies on risks from the perspective of ethics are of great scarcity”. All these embody the close attention of European and American scholars to engineering risks. China was comparatively lagged behind in the research of engineering ethics, but with the implementation of sustainable development and the conception of “Green development”, engineering ethics have been laid more and more emphasis. Zhu Baowei, a Chinese scholar, argued that engineering risks can be avoided through dialogue and negotiation system, with an emphasis on “Ethics of the other”. Professor Cao Nanyan contended that the security issues caused by engineering risks should be paid close attention, especially to the issues of who should be responsible, what environmental problems might it cause and how the evaluation should be implemented (Zhang Henli, 2016). On the basis of the current researches in different countries, it is effective to analyze and avoid engineering risks from the perspective of engineering ethics. Therefore, this article aims to analyze the causes of engineering risks from the perspective of engineering ethics and to put forward suggestions to more effective risk aversion.

2 Analysis on the Causes of Engineering Risks

2.1 The Unpredictability of Future

Haris (2000), an American scholar contends that unpredictability is the major feature of risk. During any stage of a project, such as deciding, designing, implementing, using or after-sales service, engineering accidents may occur due to some unpredictable factors. For instance, during the using of planes, flight accidents caused by bird strike may take place. In China, the frequency of bird strike accidents is growing by year, which leads to enormous economic costs. (Table 1, 2) (Li Yuhong, 2011)

Table 1 Estimated Direct Maintenance Costs of Civil Aviation Caused by Bird Strike in China in 2008

Degree of damage	Times	The standard of loss (10,000 yuan per time)	Subtotal (10,000 yuan)	Total (10,000 yuan)
Serious damage	3	800	2400	4500.8
Moderate damage	51	40	2040	
Slight damage	7	0.8	60.8	

Table 2 Bird Strike Accidents of Civil Aviation in China from 2004 to 2008

Year	The times of bird strike accidents			
	Total		Airport bird defense area	
	Accident	Accident proneness	Accident	Accident proneness
2004	119	27	8	3
2005	180	39	13	6
2006	227	44	13	1
2007	326	50	9	5
2008	432	46	42	2

According to the table, in 2008, the direct maintenance costs of civil aviation caused by bird strike in China reached 45,000,000 yuan. The number of bird strike accidents even increased rapid by year. The number of bird strike in 2008 was four times of the number in 2004. The flight of bird is an unpredictable factor. Although people can accurately predict and control the air route and speed of planes, the route of bird can never be determined. Therefore, accidents seem unavoidable. Although human beings can conduct the project to the best, the unpredictability of future will never be reduced. As a result, the unpredictability of future is the primary cause of engineering risks.

2.2 The lacked sense of responsibility among engineering participants

Charls E Halse, an American philosopher, claims that “all the topics about ethics are based on responsibility” (Mike W Martin, Roland Schinzinger, 2005). The cause of engineering risks is also inevitably associated with the lacked sense of responsibility among engineering participants. Engineer is the soul of a project, who is in charge of its design, operation, management and evaluation. IF an engineer is in lack of sense of responsibility and only concerned about his or her own benefits rather than the public security and welfare, this may certainly result in engineering risks. Apart from the engineers, the government official lack sense of responsibility, seek instant benefits and quick success, instead of focusing on the security and rationality of the project, this may also result in engineering risks. For example, the government of Yongning Village in Ningxia Province of China illegally occupied land and developed villa under the name of new rural construction. Consequently, the project benefiting the villagers turned out to be harmful to them. Eventually, the local residents made concerted efforts to prevent the construction of the villa, which forced the project to come to an end. As a result, the lacked sense of responsibility among engineering participants is another cause of engineering risks.

2.3 The divergence of risk perception of different subjects

Different subjects have divergent perception of engineering risks. Engineers evaluate risks from professional techniques, and they mainly focus on the extent to which the engineering risks are acceptable. Government managers consider engineering from the overall interests of the public. Compared to engineers and government managers, the public may seem not so “rational”. A majority of the public only try to protect themselves from the risks. They may not accept the project only because of the substantial social or economic benefits it may bring about. For instance, in 2011, the government of Wuhan in Hubei Province of China intended to build a large substation in Hongshan district. The professional engineers had done a rigorous investigation. It was proved that the probability of the risk could be controlled within the acceptable range. But local residents believed that the substation will cause radiation which was harmful to health. So they resolutely resisted the substation building, eventually leading to the abortion of the project (He Jing, 2016). Obviously, divergent perceptions of engineering risks may lead to the conflict between various groups, which may finally result in engineering risks.

3 Analysis of the Countermeasures for Risk Aversion

3.1 Engineers should cultivate a strong awareness of ethics and responsibility

Engineers are the experts who have been trained with professional knowledge about a specialized domain. They play an indispensable role in a project. They should be responsible for the public and the society and promote public benefits within their professional field. If an engineer lacks sense of ethics and responsibility and is indifferent to his or her project and human society, it may lead to disastrous consequences. If a scientist or engineer specialized in studying cloning techniques conducts experiment about human cloning without caring about social ethics, the social ethics will fall into a mess. When an engineer is endowed with a strong awareness of ethics and responsibility, human health, security and welfare will be given the priority during engineering, which is essential for risk aversion. As a result, in

order to avoid engineering risks, it is urgent to cultivate a strong awareness of ethics and responsibility among engineers. In addition, engineers should also be drilled with a rigorous attitude toward work. During the engineering, engineers always need to make various choices when they should constantly keep rigorous. Otherwise, a wrong choice may cause enormous loss. The world-shocking explosion of the Challenger, a space shuttle, is a good case in point. Before the launching of the Challenger, an engineer had found that a circle to fix the assistant fuel compartment on the right was hardened. If the launching continued, the probability of failure was one in ten thousands. In the end, the engineers and decision-makers were convinced that the probability of failure was so scarce and continued the launching as planned. However, the space shuttle ended up exploding. If the engineers had been rigorous enough to make cautious decision rather than take their chance, the tragedy could have been avoided.

3.2 Association of Engineers should establish codes of engineering ethics and risk data bank

Human beings live in society and do various activities in the society. Human beings are connected with other social members and form a group. The same goes for engineers. In the year of 1884, the Institute of Electrical and Electronics Engineers of the US, the first professional association for engineers, was founded. Subsequently, the engineers around the world set up their own associations and made up their codes of engineering ethics. For instance, the German association of engineers carried out *Basic Principles of Engineering Ethics* in 2002. Association of engineers in Taiwan also set up “the Creed of Engineers” which denotes four major responsibilities. Codes of engineering ethics provide a certain standard for the professional practice of engineers, which plays a critical role in risk aversion. As for mainland China, the codes of engineering ethics are relatively lacked. In spite of the existence of association of engineer, there is no standardized code of engineering ethics. As a result, it is urgent for mainland China to set up those codes.

The codes of engineering ethics exert preventative effect on risk aversion. In order to avoid risk more effectively, engineering groups should also set up risk data bank besides coders of engineering ethics in order to better complete post-risk analysis and summary to avoid similar accident in the future. When building engineering risk data bank, the group should take into full consideration the experience of engineering practice and the accumulated material. Even if the engineers are fully experienced, they are not able to take part in every particular project. Hence, the groups of engineering should cooperate to set up an all-rounded risk data bank. The analysis and summary of previous accident should be integrated with knowledge gained from practical experiences in order to avoid risks more effectively in the future.

3.3 The public should safeguard their right to be informed and take active and rational part in engineering

When it comes to engineering risk aversion, it is widely believed that this is only the task for engineers. However, in fact, the modern engineering is becoming increasingly complicated, which involves more diverse groups. The corresponding issues of accident and risk responsibilities assumption also become more sophisticated. These responsibilities should not only be assumed by engineers. Risk aversion is not only the duty of engineers and engineer groups, but also the responsibility of engineering technology users and the public.

On the one hand, the public should safeguard their rights to be informed about engineering risks. As engineering risks are social, the public who bear the risks should be given the rights to be informed and the rights of permission. The rights to be informed include two aspects: for one thing, risk information should be disclosed sufficiently. For another, the public bears the engineering risks voluntarily rather than being deceived or forced. The realization of the public rights to be informed can effectively avoid potential conflicts and risks. On the other hand, the public should be encouraged to participate. The public scientific literacy should be improved to ensure a scientific and rational perception of risks. The divergent perception is one of the major causes of engineering risks. Because of the lack of professional training, the public are not able to treat risk as rationally as engineers. In practice, the acceptability of risks may not be understood by the public, who may prevent the implementation of the project in a violent way. Therefore, in order to avoid risk effectively, the public should acquire more scientific knowledge and understanding of engineering risks. They should take active part in engineering, and negotiate in a more reasonable way rather making disturbance (Dai Liang, Shi Yumin, 2015).

4 Conclusions

Various factors, including the unpredictability of future, the lacked sense of responsibility among

engineering participants and the divergence of risk perception lead to engineering risks and accidents, which do great harm to human beings and impede social development. In order to avoid engineering risks more effectively, from the perspective of engineering ethics, this article suggests three countermeasures, namely cultivating the awareness of ethic and responsibility among engineers, establishing codes of engineering ethics by Association of Engineers and risk data bank, as well as safeguarding the public's rights to be informed in order to promote active participation. In the future, engineering risk avoidance from the perspective of engineering ethics will attract more attention and research around the world, especially in China. With the conception of "Green Development", engineering risk aversion in China will be more closely integrated with engineering ethics, as a result of which the "double-edge sword" of engineering will bring more benefits to human beings.

Research on the Radar Transfer Path of Supply Chain Risk

Qiu Yinggui, Yang Liuqing

Management school, Hubei University of Chinese Medicine, Wuhan, P.R. China, 430065
(E-mail:qiuyinggui@126.com, ylq79421@sina.com)

Abstract: Cooperation among node enterprises of supply chain makes supply chain risk (SCR) transferring easily, while study on the transfer path of SCR can be helpful to the effective management on SCR. Based on methods of theoretical analysis, the radar transfer path of SCR is interpreted in this paper. According to the transfer direction of SCR, two radar paths which are irradiation transfer of SCR and concentration transfer of SCR are concluded. Furthermore, the characteristics of every transfer path are deep explored correspondingly. Meanwhile, the energy measurement model of each radar transfer path is constructed. When crisis occurs, the risk source in the supply chain can be found easily along the risk transfer paths of supply chain.

Key words: SCR; Risk Transfer; Radar Transfer Paths; Risk Energy

1 Introduction

The relationship of agency by agreement in supply chain makes SCR exist inevitably. The independence of the enterprise legal person and increasing cooperation among the supply chain enterprises promote the risk transfer in the supply chain (CHOI,2005).

Researches on SCR transfer home and abroad mainly concern the following three aspects: the transfer mechanism of SCR (Guo-Ping Chen and Ying-Gui Qiu,2009;MA Li,Zhang Guang-ming and Li Ping,2007), the utility of SCR transfer(Denis R,2005) and the control of SCR transfer (Charles,2007;Ying-Gui Qiu,2010;Jae-Hun Kang,Yeong-Dae and Kim,2010), among which studies on supply chain management by applying the adaptive system theory are in the majority(Surya, Jamisonm and Anand,2007; Gonca Tuncel,2010). However, there are few researches studying the paths of SCR transfer and loss measurement of SCR. This paper attempts to construct an energy measurement model of SCR transfer by adopting some concepts in physics as reference, analyzes the different paths of SCR transfer and measure the risk energy of every path on the basis of the model, thus explore the evolution rule of the SCR transfer, hoping to provide some reference for the effective management of risk of the supply chain enterprises.

2 Radar Transfer of Transfer Path of Supply Chain Risk(TPSCR)

Every node enterprise is an integration of both risk receiver and risk sender just like a radar collecting risks and emitting risks at the same time. According to the two systems of both emitting risks and receiving risks, radar transfer of TPSCR can be divided into two types, namely irradiation transfer and concentration transfer just as embodied in figure 1.

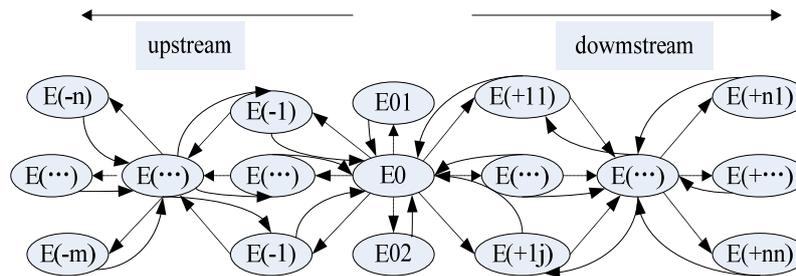

Figure 1 Radar Transfer of TPSCR

In figure 1, E0 means risk source, symbol “-” means the upstream enterprise of the risk source, symbol “+” means the downstream enterprise of the risk source. E01, E02 respectively refers to the node enterprises at the same level in the supply chain. Arrow refers to the transfer direction of risks. Dashed line refers to irradiation transfer and solid line refers to concentration transfer.

2.1 Irradiation transfer of TPSCR

Irradiation transfer means risk starts to diffuse synchronously from one node enterprise along the direction of downstream and upstream. On one hand, the risk sender may send out many risks

simultaneously and the different risks may transfer along different directions. On the other hand, even if the risk sender sends out only one kind of risk, this risk maybe release all the risk current at the same time, or it may release the risk current in turn along different directions. So the irradiation transfer of TPSCR can be further divided into two types, namely continuous transfer and pulse transfer. Continuous transfer means the risk sender releases all the risk current form all risks at the same time. However, pulse transfer means the risk sender releases all the risk current from all risks in a batch diffusion. Irradiation transfer of TPSCR is expressed just as the dashed arrow in figure 1.

In irradiation transfer of TPSCR, the transferred risk may be or not be the same risk. The beginning transfer time of every risk may be the same or different. Risk carrier in every transfer path may be the same or different. All secondary risks release risk current again in the way of irradiation. All these factors together with the impact of the irradiation transfer of risk source increase the complexity the transfer of SCR. The major characteristic of irradiation transfer of TPSCR is explained as the following. 1) Complexity. It is embodied from tree aspects. Firstly, one node enterprise is both the risk sender and risk receiver. Secondly, risks carrier and risk catalyst between two node enterprises may be different. Thirdly, the original risk may evoke other new risks, while the original one may or may not disappear. 2) Concentration. In the irradiation transfer of TPSCR , risk source is the core enterprise,emitting all the risk information. 3) Dynamics. On one hand, risk type may change during the process of risk transfer. On the other hand, SCRC (supply chain risk current) of the supply chain varies all the time during the process of transfer due to the reflectivity, absorptivity, and transmittance of every node enterprise and the risk current of themselves. 4) Snowball effect. Risk irradiation makes the original risks diffuse in a greater scope and the SCRC after diffusion will become bigger than before according to the measurement indexes of the energy of SCRC. Furthermore, original risks will induce new secondary risks, which will consequently produce bigger risk current. Then the snowball effect occurs.

Taking automobile industry in China as an example, in order to avoid risks, whole-car firm transfers' risks to its upstream suppliers of parts components and downstream distributors. When the whole-car firm declares its zero inventory management, the warehouse of parts components suppliers is full. Zero inventory decreases costs of the whole-car firm, but it makes the inventory of the parts components suppliers an irreversible cost. The substance of zero inventory of the whole-car firm is to avoid the risks from plan changing. On one hand, the whole-car firm requires the suppliers to improve safety stock rather than making a good plan by using the advantages of supply chain. In fact, a good plan can decrease product fluctuation, thus the integrated inventory. On the other hand, price of automobile decreases gradually year by year. Whole-car firm, in order to transfer the pressure of decreasing price to the suppliers of parts components, will require the suppliers to decrease the price of parts components every year, doubtlessly bringing a sever cost test to the suppliers of parts components. Meanwhile, by using the authority of agency as a decoy, the whole-car firm signs unequal contracts with the distributors, which include unreasonable high inventory and no mention of quit clause of the distributors, making the distributors lack of guarantee. Finally, the whole-car firm radiates all the risks to distributors and suppliers.

2.2 Concentration transfer of TPSCR

Different from irradiation transfer, concentration transfer of TPSCR means that risk currents from different types of risks or the same type of risks are concentrated on one node enterprise just as embodied by the solid line in figure 1.

Major features of concentration transfer are explained as the following. 1) Influence of external environment. External environment has a great influence on SCRC transfer. As node enterprise receives all the risks concentrated on it passively and all the risks received by the node enterprise come from the external environment rather than from the enterprise itself, concentration transfer of TPSCR is greatly influenced by the external environment. 2) Complexity of risk source. Risk sources of the concentration transfer of TPSCR may come from both the external or internal system of the supply chain. The complexity of the supply chain system determines the complexity of risk source checking during the process of concentration transfer. 3) Dynamics. The uncertainty of external environment and variation of risk transfer process make risk transfer vary all the time. For example, some node enterprises occupy great funds from both the downstream and upstream enterprises. Unstable financial situation will make the supply chain destroyed seriously. In this kind of financial risk, the catalyst of the risk is credit between node enterprises and the risk carrier is fund. Once one node enterprise encounters fund crisis, products from the upstream enterprise cannot be sent out timely. Then the production of the downstream enterprise will be influenced due to untimely input supply. Ultimately, it is possible to make the supply chain breakdown for the dis-junction of one link.

Taking the core enterprise of manufacture industry as an example, suppliers transfer risks to the manufacturers when supply fails, which will restrict the output of the manufacture's production. Delayed transfer of information between distributors and retailers leads to an inadequate communication between upstream and downstream enterprises and misunderstanding on commodity production and market demand, making the products of manufacturer not able to meet the market demand. Excess inventory brings the Bullwhip effect. Finally, risks are concentrated on the core enterprise.

2.3 The measurement of risk current in radar transfer of TPSCR

In radar transfer of TPSCR, original risks are concentrated on one node enterprise, so the SCRC is determined by the original risks, which depends on both the types of the original risks and their risk currents (Qiu Yinggui, 2013).

1) The effect of original risk type on TPSCR

According to the probability of inducing new risks, original risks can be divided into three levels, namely low, middle and high. Two major indexes are referred to judge the classification: the probability of inducing new risk, expressed as P , and the induced risk current, expressed as RC_I , then which induced risk level the original risk belongs to is given as equation (1).

$$RC_E = p \times RC_I \quad (1)$$

In equation (1), RC_E (Evaluation of Risk Current) means the measured value of the induced risk current. Supposing that RC_{EL} , RC_{EH} is respectively expressed as the low and high thresholds of the induced risks. Then the judgment standard is given as equation (2).

$$\begin{aligned} RC_E < RC_{EL} & \quad \textcircled{1} \\ RC_{EL} \leq RC_E < RC_{EH} & \quad \textcircled{2} \\ RC_E \geq RC_{EH} & \quad \textcircled{3} \end{aligned} \quad (2)$$

When the measured value of induced risk current satisfies inequality ① of equation (2), then the original risks can be viewed as low inducing risks. Similarly, if the measured value of induced risks current satisfies inequality ② of equation (2), then the original risks can be viewed as middle inducing risks. If the measured value of the induced risk current satisfies inequality ③ of equation (2), then original risks can be viewed as high inducing risks. Where, probability (P) can be gained from the empirical data.

2) The effect of original risk current on SCRC

The bigger the original risk current, the larger the released risk current to the supply chain, then the higher probability of crisis occurrence. Any supply chain has an endurance limit of risk current. When the risk current is close to the threshold, risk is inclined to become crisis. Subsequently, destruction occurs.

3 Conclusion and Further Study

Through judge TPSCR and evaluating the energy of SCR, risk source can be found and the value of SCRC can be measured to compare the measured value with the value of risk carrying capacity (RCC). When the measured value of SCRC is less than the value of RCC, the SCR can be controlled. When the measured value of SCRC is close to the value of RCC, the supply chain needs to release energy and crisis is occurring in it, or seriously it will disintegrate. It is urgent to adopt some countermeasures to control the risks to avoid the crisis. Further study will focus on the quantization of the three evaluating indexes, namely L^E, L^F, L^S .

Abstract: Food safety has become a global livelihood problem, in order to solve this problem, people from all over the world are exploring the theory and methods of food safety management constantly. At the same time, using governance theory to solve the problem of social development, especially food safety related issues, has been the trend of the development of public management. In this paper, we clear the main problems facing the food safety supervision by sorting out the literature of China and other countries. At the same time, this paper constructs the basic framework of food safety supervision mode based on the governance theory, and based on this, some suggestions about government system reform, information technology application and the construction of legal system are given.

Key words: Food Safety; Governance Theory; Supervision Mode

1 Introduction

Food industry is the pillar of China's national economy, it is also the basic industry to protect people's livelihood, which related to the people's health and life safety. And, the frequent emergence of food safety issues, makes food safety gradually evolved from technical problems into economic problems, and even social problems while it causes widespread concern at China and abroad. In order to solve these problems, the state and society have made a lot of efforts. However, due to staggered problem, multiple interests and wide range of subject in food safety field, it makes food safety management, especially the regulatory work face various problems. In this case, how to solve the problem of food safety, especially food safety regulatory problems have become the focus of attention.

The Global Governance Council (1995) believes that governance is the sum of the various public and private institutions to manage their common affairs. The definition is clearly separate governance and rule, emphasize a kind of governance mode of management institutions or organizations and other social forces, involving multiple subjects.

Actually, food safety itself involves multiple subjects, and their interests are staggered. The governance theory involves multiple subjects and their interest too, which just fit the food safety situation. In addition, the application of governance theory to food safety field, can change the government's single role in the traditional food regulation. Based on governance theory, this study explores the food safety regulatory model, not only has the significance of the above, it also expands the pattern of food safety supervision.

2 Current Situation of Food Safety Supervision

An effective food safety regulatory system, not only can curb the frequent food safety incidents, but also can foster a good pattern of food safety. The research on food safety regulation in developed countries and China is both different and similar.

2.1 The same point in food safety regulation between developed countries and China

1) Foreign developed countries and China have a consistent view of the causes of food safety issues, and they all agree that food safety issues are closely related to the asymmetry of food information.

Hennessy scholar believes that the cause of food safety issues is the asymmetry of information (Hennessy, 1996). On the one hand, it will generate moral hazard, namely food raw materials suppliers or manufacturers deliberately reduce the quality, even shoddy, fake productions; on the other hand, it will lead to adverse selection. Actually, it is difficult for consumer to identify the quality of the food enterprises, so the enterprises which provide high quality food would be driven out of the market, or are forced to produce low quality food (Akerlof, 1970; Stiglitz and Weiss, 1981). At the same time, most researches in China believe that the information asymmetry in food market provide space and conditions for the implementation of stakeholder's opportunism behavior, and consumers often have a passive acceptance of food, resulting in many food safety problems (Wang Keshan, 2012).

2) Foreign developed countries and China both think that the perfect legal system is an important guarantee for food safety supervision.

The United States food safety regulatory focus on the construction of legal system. In 2011, the United States revised *The Federal Food Drug and Cosmetic Act*, and on the basis of it formed *Food Safety Modernization Act*, *Food Safety Modernization Act* and other related secondary laws form a complete and unified food safety supervision law (Chen Rongyi, 2011). Germany established and improved the legal system of food hygiene, and this legal system covers the whole food industry chain from production, sales to after sales supervision, mainly involves 4 areas: production system, market system, monitoring system, evaluation system, and ensure the safe operation of food market (Tian Cheng Gang, 2009); Japanese has two basic laws for food safety, they are *Food Hygiene Law* and *Food Safety Basic Law*, and they established the basic legal supervision framework of food safety (Sun Hangsheng, 2006).

China also attaches great importance to legal construction of food safety. In 2009, China promulgated *Food Safety Law*. In June 2012, China published *Decision of the State Council on Strengthening the Work of Food Safety* (Zhang Fang, 2015). In addition, scholars are exploring actively in order to improve the legal system of food safety in China. Xu Jingbo (2013) hopes to improve food safety regulatory system through the formulation and revision of food safety related laws and regulations. Zhu Guangxin (2014) explained that punitive damages are a kind of special punishment system from the perspective of law, which breaks the monopoly of the state's right of punishment.

2.2 The differences between developed countries and China in the aspect of food safety regulation

1) The supervision model proposed by foreign scholars is more inclined to a cooperative model of governance, and China's food safety regulation is too single for relying on the government.

Henson (2001) proposed common governance model, that the collaboration of public and private sector can improve the efficiency of food safety management. Elodie (2012) construct a concept framework of food safety governance, and found that the common governance model has been gradually realized transformation from the traditional punishment oriented to modern prevention oriented.

Liu Peng (2010) believes that over reliance on administrative means of supervision has become one of the factors that restrict the performance of China's food safety regulatory. Liu Xiaofeng (2010) thinks that we are used to letting the government regulatory authorities ensure our food safety, which put the food production operators into a passive position.

2) Foreign scholars have already realized that food safety has multiple supervision subject, Chinese scholars also recognize that it is not enough for food safety supervision to rely on a single government, so they are also keen on studying other non-governmental entities in food safety supervision.

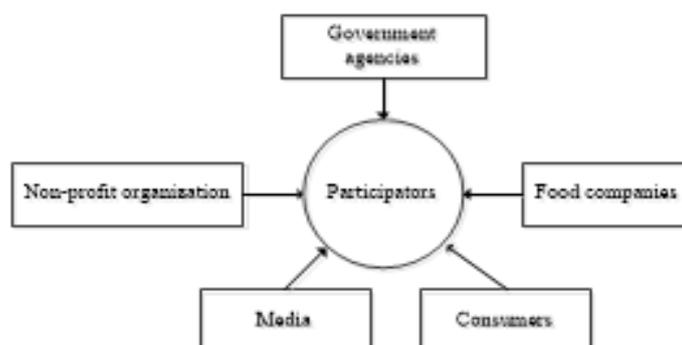

Figure 1 The Participator of Food Safety Supervision

In addition to government, enterprise, Wang Yafeng (2015) proposed that the subject of food safety supervision involves non-profit organizations and news media and other social forces. Chen Shihua (2011) believes that the regulation should pay attention to the participation of various mobile media. Zhu Dian take the consumer as the main participator, to explore the role of consumers in food safety supervision (Zhang Fang, 2013). This paper analyzes the participators that proposed by scholars, participation can be summed up as government agencies, food companies, consumers, the media, and non-profit organization, as shown in Figure 1.

3) Compared with developed countries, China's food safety supervision is not mature, in order to solve the food safety problem caused by information asymmetry, some scholars actively explore solutions that match with China's national conditions.

Information disclosure is an effective way to improve food safety, but it needs the help of other social forces (Gong Qiang, 2013). But the participators of food safety supervision lack effective

integration, lost their role, so that they misjudged their responsibilities (Ding Mingjie, 2009). Therefore, some scholars believe that strict traceability system should be established, which not only allow consumers to have intuitive understanding of food, but also can define the roles and responsibilities of participators, and help to improve the overall level of quality and safety of food industry (Shan Lijie, 2013). But this traceability system depends on the information system, therefore, Wang Hongchang advocated the combination of information technology and institutional arrangements to solve the problem of asymmetric information (Wang Hongchang, 2013). Say concretely: we can solve the problem of information distribution through institutional arrangements, use food safety information through information technology.

All in all, information asymmetry and the problem of food safety are closely related, and food safety information disclosure and related information technology support and system support are the key to solve the problem. However, the use of information technology depends on the system arrangement, while domestic system lacks of systematic research on food safety supervision, cannot integrate various social resources and realize dynamic supervision on food safety. And, it should be noted that the food safety regulatory requires the support of law system. So it is necessary to construct a new pattern of food safety supervision with the combination of information technology and system arrangement.

3 The Basic Framework of Food Safety Supervision Mode

Food safety supervision involves multiple participators which is a source of food information. The construction of the government system is the key to the distribution of information resources. Information technology is the guarantee of the normal operation of all parties. Therefore, this paper puts forward the basic framework of food safety supervision mode, such as 2.

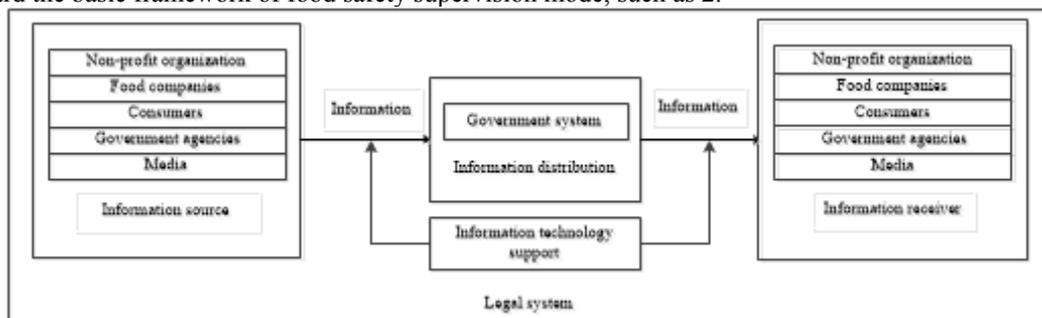

Figure 2 The Basic Framework of Food Safety Supervision Mode

1) The participants of food safety supervision are not only the provider of food information, but also the recipient of food information. The problem of food safety is due to the information asymmetry, so let the food information share between the participants, can avoid the opportunism behavior and adverse selection behavior.

2) Government system is key to the distribution of food information between participants. It can control the flow of food information, achieve maximum information sharing, so the reform of the government system plays a vital role.

3) Information technology support is the tool guarantee of food safety supervision. The characteristics of information technology makes the information flow fast and timely, so it can achieve dynamic supervision of food safety.

4) The legal system is the legal guarantee of food safety supervision. To establish a strict legal system of food safety, can implement the responsibility and role of participants. And appropriate penalties can increase the illegal costs of them.

4 Conclusions

Through the above analysis, we recognize that the government system reform, information technology, legal system plays important role in food safety supervision. On the basis of this, we put forward the following suggestions about system reform, application of information technology and construction of legal system.

1) The reform of the government system. We must adhere the leading role of government, and introduce other social subjects. In the process of regulation, government needs to make appropriate regulation and intervention, but this regulation and intervention has to listen to the voice of other

participants, to play the advantages and positive role of them. In this way, we can not only transfer the limited administrative capacity of the government from a large number of inefficient supervision to more meaningful services and management, but also improve the efficiency and social welfare of the food market.

2) The application of information technology. The government needs to ensure that the food safety information can be shared in time according to the relevant rules. So we need to build China's food safety information cloud computing platform, define standardized data structure and data interface, and achieve convenient data entry, storage and sharing.

3) The construction of legal system. Through legislation, we need to clear all participants of food supply chain and their legal responsibility of information collection, disclosure and sharing. At the same time, in order to ensure the authenticity of food safety information, the audit and inspection operation of food safety information should be standardized. Moreover, it should be clear that the corresponding punishment regulations is essential, which can increase the illegal cost.

Owner-Managers and Risk Perception: Empirical Evidence from Cameroonian Small and Medium Enterprises

Mbiki Mamai, Du Lijing

School of Management, Wuhan University of Technology, Wuhan, P.R. China, 430070

(E-mail: mbikimamai@yahoo.fr, 349666905@qq.com)

Abstract: The aim of this study is to determine to which extent the characteristics of managers in SMEs influences the perception of risk of Cameroonian SME. A quantitative study was carried out by giving out a questionnaire to 86 managers of Cameroonian SMEs with a range of 50 and 500 employees. Based on our results, we found that the education level of owner-manager has a significant impact on the perception of risk and also the ownership structure of SMEs in the Cameroonian context has a correlation with the perception of risk of managers.

Key Words: Risk management; Owner-managers; Risk perception; Characteristics of managers; SMEs

1 Introduction

In the current economic context, a company is more obliged to take risks to dissociate from its competitors, and therefore adopting new strategies. It could either be a question of innovation or of entry into new markets. According to Barthélémy (2002), with the various risks which the company must face, managers are now obliged to integrate risk management in their corporate management. Moreover in doing so, they increase their competitiveness. Alquier and Lagasse (2006) proposed that risk management should be a concern for all companies especially SMEs which are particularly vulnerable to a plethora of business risks and competition. Risk management has as goal to create a reference framework for companies to effectively face risks and uncertainties. The risks are present in almost all economic and financial activities of companies. Thus, whatever the nature of a business project, the greater the degree of innovation that will be large compared to skills and experience of the company, the more they will be impressed of uncertainties. According to Schuyler (2001), the uncertain, which is the result of the unknown and the variability of the states of nature of materials and the human systems, is at the origin of several risks faced by the company. SMEs have an advantage over the larger companies because of the proximity of managers and their collaborators which do not imply a complex organization to control or direct very diverse or remote teams. This implies that the study of the profile of principal managers of SMEs and how their perception of risk has a strong impact on the strategic management of their company.

The purpose of this article to gain the understanding of the perception of owner-managers toward risks and to include or understand how the owner-managers face the situations that they consider being risky. This article attempts to identify the factors which influence the risk perception of the owner-managers of SMEs. We will focus first on the key actor of SMEs: the manager. We will try to determinate to which extent the entrepreneurial profile of the manager influences his perception of risk. Furthermore, we will test the links between various structural and contextual control variables (size and age of the company, ownership structure, perceived uncertainty of the environment and sector of activity) and risk perception. We will try in this article to answer the following question: Which criteria influence the risk perception of SMEs managers?

2 Definition of Small and Medium Enterprises

The definition of SME varies from one country to another and also according to organizations. In a general way, we can refer to the definition of Julien (1988) for which the small and medium-sized company is before a whole company's jurisdiction, if not financially independent, operating in primary sectors, manufacturing or servicing, and whose duties and responsibilities are incumbent often of a person usually sole owner of the capital. In America, it is a function of the number of employees. Thus, are considered as small businesses, the companies using 5 to 50 employees, whereas the Medium-sized companies are those who's maximum size is 500 employees (American business review, 2001). In the European Union, Small and medium-sized enterprise are defined like companies employing less than 250 people, with a sales turnover which does not exceed 50 million Euros, or which the total of the annual balance sheet does not exceed 43 million Euros (EC, 2003/361/EC, 2003).

In Cameroun, the definition of SME has known changes. Until a certain period, the most usual

definitions are that of FOGAPE (Fund for assistance and guarantee to SMEs), is deemed as a Cameroonian SMEs any individual or collective enterprise, whatever its legal form of which 51 % at least of the capital and the managers are Cameroonian; with sales turnover less than or equal to 1 billion Francs CFA (Article of the decree n° 84/510 of 13 June 1984 on the creation and organization of FOGAPE). In our work, a definition including several criteria will be retained. For our analysis, "Cameroonian SME is a company using completely or partly the Cameroonian capital, employing between 50 and 500 people, and having a share capital of fewer than one billion francs CFA". Those employing less than 10 people will be regarded as "very small company" according to National Institute of Statistics (2009) and will consider on a maximum workforce of 500 people as the ceiling to define SME (November, 2001).

3 The Typologies of the Owner-Managers

Since the work of Smith, his studies show a distinction of two main types i.e. craftsmen and opportunists (Getz and Petersen, 2005; Smith and Miner, 1983). Others will name the conservatives and entrepreneurs (Kotey and Meredith, 1997; Saddler-Smith et al, 2003). One of the most outstanding typologies in the world of SMEs is that of Julien and Marchesnay (1996) that distinguish the "PIG" and "GAP" owner-managers:

PIG (perenniality, independence, growth)

It seeks stability and independence of its capital, the growth is secondary to him. Julien and Marchesnay (1996) qualify it "*risk averse*",

GAP (growth, autonomy, perenniality)

The GAP research in priority growth; Independence is relegated to the second plan; it is a "*risk taker*". It is these typologies that explain and describe how SMEs are distinguished in their forms and their intensity in innovation, risk taking and search for opportunities, these various elements being the means used to put in action entrepreneurial profile in a strongly focus on growth and prosperity Sadler-Smith et al., (2003).

Despite the many limitations arising from the typological approaches Cadieux (2010), they still allow us to highlight various factors that may have an impact on how owner-managers of SMEs consider the growth, the risk, and even the performance of their company. Many typologies of managers were therefore established in the literature of management science Filion (2004).

4 Owner-Managers and Risk

Generally, in Small and Medium Enterprise (SME) the owner-managers are involved with the managerial tasks of the company and by this fact are sensitive to the consequences of decision-making. This, in turn, can reduce their capacity of risk taking. When risk aversion of managers is not any more to show; Fiegenbaum and Thomas (2004) reported that the managers are not always inclined to risk aversion and that they can be taking risks in certain contexts. This comes to show that the attitude towards the risk can change according to the context of the decision-making.

It should also be noted that the attitude towards risk and the capacity to identify it are conditioned by the global perception of risk. According to Siovic (2000), social, political and cultural factors play a significant role in the development of risk perception of an individual. For his part, Holton (2004) affirms that the perception of risk depends not only on personal characteristics but also of situational and contextual factors of each decision.

There is multiple evidence that the individual characteristics of SMEs owner-managers and SMEs ownership structure have a significant impact on the business direction of an organization as well as on risk management practices (Watson and Newby, 2005; Acar and Gök, 2011; Brustbauer, 2014; Gao et al., 2013; Georgousopoulou et al., 2014; Kim and Vonortas, 2014). The perception of risk and risk management in a small company cannot be separated from the personality of its owner-managers who is the key actor of SMEs. This allows us to formulate the following hypothesis:

H1: The entrepreneurial profile of SMEs managers is positively associated with risk perception;

The study by Acar and Gök (2011) proved that the risk perception is negatively associated with the risk appetite in health and finance, whereas the risk is positively linked with organizational size. Owner managers of SMEs in this study tend to have a higher perception of risks Acar and Gök (2011). From the study of Gilmore et al; (2004), the perception of running a larger company involves greater risk. Increasing the number of employees, for example, was linked with higher overheads. According to the finding of Gilmore et al., (2004), they showed that because their financial constraints, SME focus on the

marketing strategies which have lower risks rather than on the growth-oriented business strategies. Acar and Gök (2011) also showed that the characteristics of the industry are very important because unstable demand or rapid technological change can influence the individual risk perception. From all the above, we can formulate the following hypothesis:

H2: Perception of risk is positively associated with the characteristics of SMEs;

5 Research Methodology

A quantitative research design has been put into place to test the relationship between the profile of managers and their perception of risk and a data regression model was used to estimate the empirical relationship. To conduct our research process, we solicited 182 SMEs selected by random draw from a population and obtained 86 answers, that to say a rate of response is equal to 45 %.

The purpose of this study is to highlight the existence of a potential link between the factors of contingencies selected and risk perception within SMEs. To achieve this goal, we carried out a multivariate analysis. This analysis allows us to judge the effect different variables taken together. Take from the same model all contingency variables give a clear and more realistic vision between the factors taken into account and the attitude towards risk of owner-managers.

Since, the objective is to distinguish the variables which influence the attitude towards risk of the owner-managers, the variable to be explained is dichotomous: we use the method of binary logic. The qualitative dependent variable Y takes the value of 1 if the owner-managers of the company has a higher risk perception ($Y_i=1$) and value 0 otherwise ($Y_i=0$). The independent variables related to our study are defined by:

- Firm Size is measured by the number of employees;
- Previous experience is measured by the years of professional experience of managers;
- Level of Education, the educational attainment of the managers and measured by 5 items
- Ownership Structure is defined by two items family business and non-family business
- Perception of the environment is defined by the level of risk perceived and measured by 6 items (Likert 5-point scale)

6 Results of Analysis

6.1 Characteristics of SMEs in Cameroon

It arises from the descriptive statistical analysis that more than 68.6 % of companies have a staff of fewer than 100 employees. Only 10.5% have more than 250 employees. We also note that 64 % of the companies have more or less than 20 years old. This mean that following the economic crisis in the 80s, many companies were closed and it was after this crisis, that we were witnessing the reconstruction of the economy.

A reading of the ANOVA table provided by SPSS shows that the two most discriminating variables in the establishment of the proposed typology are the age of manager ($F = 72.357$; $p=0,000$) and education level ($F = 49.750$, $p=0,000$) of the manager. Then come the variables firm size and risk aversion, the previous experience of manager appears as having not any influence on the constitution of the classes. It is isolated from the descriptive of the identified profiles of managers. The classification of the profile manager in Cameroun realized by K-means cluster analysis gives us three types of the managers respectively containing 31, 41 and 14 managers.

The first group represents 36 % of the managers and is constituted for the majority of the young people whose age is less than 45 years with a higher training level and have a higher risk perception.

The second group consists of 48% of the managers thus the age varies between 45 to 65 years, this group has an education level not exceeding bachelor degree and having also a higher risk perception.

The third group represents 16% of the managers thus the age is more than 65 years, with a training level not exceeding the secondary and having a lower risk perception.

6.2 The entrepreneurial profile of SMEs managers with risk perception

The statistical model to process requires the independence of the behavioral variables between them. To verify this is the case, we initially tested the correlation between the variables taken two by two with a chi-square test. This test shows that only the variable "Education Level" must be considered in the binary logic.

Binary logistic regression analysis in which we crossed the risk perception of managers and level of education (as shown on table1), gives 0.619 the value of R-square Nagelkerke which means that the education level of managers in SMEs in Cameroon explains 61.9 % of the variance in the perception of

risk managers. The model seems compelling; the statistics (overall percentage) in the classification table indicate it is 79.1 %, which means that the model is true in 79.1 % of cases.

Table 1 Model Summary

Step	-2 Log likelihood	Cox & Snell R Square	Nagelkerke R Square
1	53.537(a)	.430	.619

The odds ratios show in the same direction the probability that the perception of risk by the manager increases by $\text{Exp}(B) = 35.402$ each time the level of education increases by a slice. (Table2). In short, the relationship between the two involved variables in the presence is positive and significant with the threshold of 5%. In support of this, Alrashidi (2016) suggest that Managers’ possessing higher levels of education adopted innovative management approaches and have a significant influence on the risk perception associated with exporting decision. However, our result does not confirm Petrakis (2005) study that better educated individuals are associated with a lower perception of risk.

Table 2 Variables in the Equation

	B	S.E.	Wald	Df	Sig.	Exp(B)	
Step 1(a)	V2.edu.level	3.567	1.019	12.242	1	.000	35.402
	Constant	-7.068	2.124	11.071	1	.001	.001

6.3 The characteristics of SMEs with perception of risk

To verify the independence between structural variables, we initially tested the correlation between variables taken two by two with a chi-square test. This test shows that only the variable "sector of activity" should be excluded from the binary logistic.

Then, we checked the absence of a multi-collinear relationship between variables by calculating the VIF coefficient (variance inflation factor). High values of VIF indicate the presence of multi-collinear relationship. Bressoux (2008) indicate that we can speak of a multi-collinear relationship when FIV exceeds 5. The results presented in the table3 show that no multi-collinear relationship existing between the variables retained in our study because their VIF is close to 1.

Table 3 Collinearity Statistics

Variables	Tolerance	VIF
Coefficients	0.928	1.078
Size of company	0.970	1.031
Main sector of activity	0.962	1.040
Ownership Structure	0.963	1.038
Perception of the environment	0.980	1.020

The logistic regression analysis by Forward Stepwise (Conditional) allows to test one by one the explanatory variables and to retain only in the equation the most significant variables. The result of our analysis gives us a Cox & Snell R Square 58 % and Nagelkerke R Square 83.6 % which means that the characteristics of SMEs explain 83.6 % the variance of risk perception of managers.

Table 4 Model Summary

Step	-2 Log likelihood	Cox & Snell R Square	Nagelkerke R Square
1	47.420(a)	.469	.676
2	34.177(a)	.545	.785
3	27.149(b)	.580	.836

As shown in table 5 there is a strong correlation between the company size $B = 2.124$ and perception of risk of managers. Even the value of $\text{Wald} = 5.214$ confirms this hypothesis. This is explained by the fact that managers have a risk aversion and so, the main goal is the growth of their enterprise. This also confirms the study carry out by Acar and Gök (2011) which show that risk perception is positively linked with organizational size.

Likewise, there is a strong negative correlation between the structure of ownership $B = -2.776$ and risk perception of managers, this is explained by the fact that the majority of the ownership structure of our samples is constituted of 67.4% of the family business. We know that the owner’s family managers

prefer to avoid risk, this is why business family grows faster than non-family companies.

Besides, the uncertainty perceived of the environment also shows a strong correlation with $B=1.907$ and encourages managers of SMEs to take the less risky situation for the survival of their companies. The result of that analysis lets us validate more or less our second hypothesis.

Table 5 Variables in the Equation

		B	S.E.	Wald	df	Sig.	Exp(B)
Step	V6.Employees	2.124	.930	5.214	1	.022	8.361
	V8.ownership	-2.776	1.133	6.003	1	.014	.062
	V9.Environment	1.907	.609	9.815	1	.002	6.735
	Constant	-4.231	2.350	3.241	1	.072	.015

7 Implications of the Study

The findings of this study, which present the relationship between the characteristics of owner-managers and risk perception contribute to the literature of risk management by a covering various set of small firms which although still relatively young. These characteristics of owner-managers play a significant role in risk management. Even, it is not yet clear from the literature how these characteristics affect risk perception of SMEs owner-managers. It is also expected to be beneficial for managers as well as to understand whether they are risk-taker or risk-averse managers in different domains. We hope that our study encourages SME manager to new experiences and increase the chance for their survival business, and consequently the economies of the nations.

Therefore, this topic needs to be investigated further in the future taking into account more characteristic of SMEs. And another research could also examine risk perception of SMEs owner-managers in different industries.

8 Conclusions

In this paper, we have investigated the relationship between the profile of SMEs manager and perception of risk. Although the research is limited by the small number of companies, our study suggests the following findings:

There is a positive and significant relation between the education level of managers and his perception of risk. The resulting model explained 61.9 % of the variance in the perception of risk by managers. It means that the education level of managers influences his perception of risk.

There is a strong correlation between the size of company characterized by the number of employees and perception of risk of managers.

The Ownership structure of companies is negatively associated with the perception of risk of managers and positively associated with the uncertainty perceived of the environment

In order to confirm the results found in this study, we suggest enlarging the number of companies in our sample and to include more variables in the model, so that we can have clear details of the links between the various factors which influence perception of risk managers in SMEs.

Abstract: Through reading the references, this article finds out that as a new form of logistics, modern logistics is a high risk industry that need to strengthen risk management and constantly improve the risk prevention capability of modern logistics. In this regard, based on modern logistics risk, this article discusses and analyzes the current situation of modern logistics risk prevention. Puts forward some innovative risk precaution measures to strengthen the logistics risk prevention and management of effective risk aversion.

Key words: Risk prevention; Modern logistics; Innovation research

1 Introduction

With the rapid development of social economy, the modern logistics is gradually rising, and develop into an independent industry, which has a great advantage in the market and profit. However, modern logistics, as a new type of integrated logistics, compared with the traditional logistics, its responsibility and risk is more obvious, and there is a whole process of logistics production, is a high risk of the industry. Modern logistics for customers to provide the most convenient, the most suitable, the most easy, the best logistics services, because too many aspects of the service, virtually increased risk of logistics. How to effectively identify the risk of each link and strengthen risk prevention is the key issue of logistics enterprises, it should strengthen the innovation of logistics risk identification in order to better prepare the risk prevention measures.

Practice shows that the logistics industry is a highly risky industry. In recent years, the research of logistics risk becomes an important topic of academic and industrial circles.

Foreign some scholars for the chilled food logistics in the presence of risk were studied put forward effective measures to decrease the chilled food logistics risk, some scholars studied waste stream of risk factors, to risk and waste materials recovery and treatment guiding policies were assessed, including dangerous goods transport, recycling and processing three aspects. Some foreign scholars have studied the political risk in the development of airport logistics center. The political risk factors were identified, and the risk was evaluated by using the analytic hierarchy process. And scholars have studied the problem of investment risk in chemical production logistics.

Domestic scholars in the logistics industry risk studies are rare, according to the relevant literature research, and the relevant research are: (1) the research on the industrial risk. Some scholars take the risk of high-tech industry as the research object, and study the risk factors, risk benefit mechanism and risk evaluation model of high and new technology industry. Some scholars have studied the real estate industry risk, Liu Ping (2006) based on the regional real estate development's own characteristic, has studied the regional real estate industry risk analysis and the prevention countermeasure. Some scholars based on the reasons for the growth of China's coal industry performance analysis, proposed the development of the coal industry, how to avoid risks. Soochow University Chao Chuan Yu professor (2012) in the research project, "Taiwan manufacturing industry risk index establish feasibility study" to need the requirements of practice and policy guidance, index establishment of feasibility analysis, established a set of industry risk measurement index and evaluation method, is intended to assess the risk of China's industry of the different industries, and confirm the important elements of the preparation of industrial risk index. (2) Research on the risk of logistics enterprises. Mainly concentrated in the following five aspects: Research on the risk of logistics process; the research of logistics enterprise risk management; the research of logistics enterprise business risk; research on logistics enterprise exchange rate or tax related risks; financial risks of enterprise logistics research. (3) Research on risk prevention. Wang Chuanxu (2003) put forward the third party logistics enterprise operation engineering in the existence of many uncertainties of risk factors, and put forward the risk prevention measures. Zhong Jing (2006) based on the characteristics of exchange rate risk, the system studies the risk prevention of foreign logistics enterprises.

2 The Current Situation of Modern Logistics Risk Prevention

Modern logistics risk diversification, and there is a risk of some yet to be discovered, resulting in modern logistics enterprises take greater risks, for their production and operation pose a threat, affecting the normal operation and management activities in an orderly way. In this regard, modern logistics enterprises should increase the risk recognition and take corresponding risk prevention measures, and to adequate professional staff management and control, as much as possible to reduce the risks to the minimum and ensure normal modern logistics service and guarantees the sustainable and stable development of the modern logistics enterprises. But at present, many modern logistics enterprise risk prevention awareness is not high and has not yet established scientific risk prevention idea, did not develop a risk monitoring mechanism etc., coupled with the lack of effective risk prevention means, resulting in modern logistics risk prevention work effect is not ideal. In this regard, we should strengthen the innovation of risk prevention of modern logistics, improve the ability of modern enterprise risk prevention.

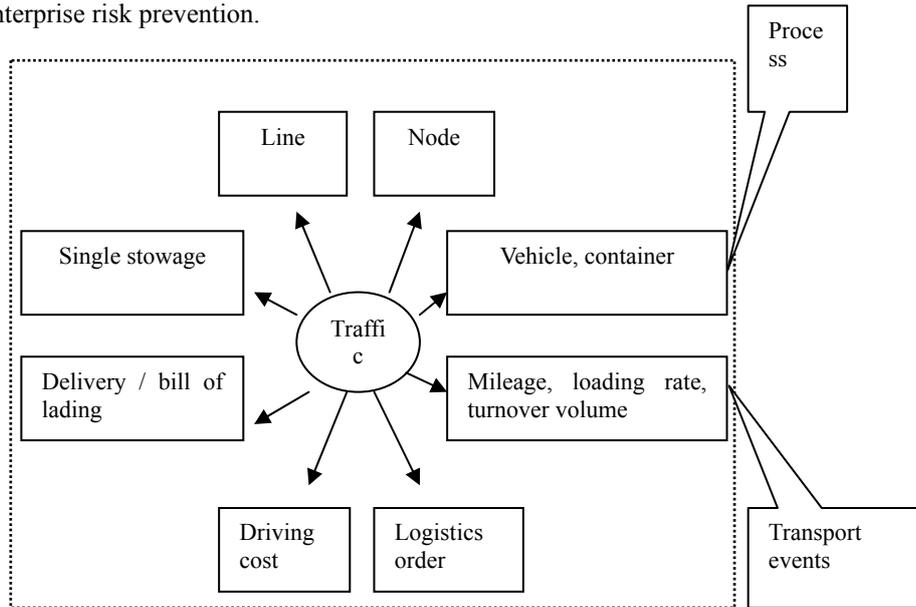

Figure 1 Simple Schematic Diagram of Enterprise Logistics

3 Research on the Innovation of Modern Logistics Risk Prevention

3.1 Risk prevention idea

For the modern logistics enterprises, opportunities and risks coexist, to the fierce market competition to win a certain advantage must pay attention to risk prevention, establish a correct concept of risk prevention to effectively carry out modern logistics risk prevention work (Liu Yongsheng, Yuan Wentao, 2013).

Establish a comprehensive concept. Part of the modern logistics enterprises in the business of blindly pursuing economic profits, is often the first business, will have a management program and the corresponding control methods, even in the presence of the risk before the development of risk management procedures, making each process of logistics services in more or less there are risks, unable to carry out effective risk pre control. In this regard, we should establish the overall concept, mainly includes two aspects: first, to ensure that the risk prevention cover all risks of modern logistics, including each kind of risk of the whole process, all kinds of risk has a special department, full-time staff responsible for; second, to ensure that risk prevention is able to effectively identify the logistics enterprises are facing all the risks (Wang Yanqiu, 2012). In order to achieve the above two points, the modern logistics enterprises must form a "risk first" concept, the modern logistics development in the former to develop risk management and control methods, and all risks which include, in order to realize effective control of all risk. Furthermore, it should establish risk identification information management system, establish an information management system by using advanced information technology, computer technology and so on, to modern logistics service project to conduct a comprehensive risk and understand the existing and potential risks and effectively identify the risk and

take the preventive measures to avoid risks.

Establish the systematic idea. Modern logistics by the production, transportation, packaging, warehousing, loading and unloading, distribution and other aspects of the composition, is a complex system engineering, which determines the risk prevention system. Effective risk management cannot be achieved through a single model, the model should include different subsystems, such as the production risk subsystem, transport risk subsystem, etc., by the subsystems constitute an organic system. So modern logistics enterprises to prevent the risk whether can achieve the desired effect, the key is to see the operation risk management system of each subsystem, which any one subsystem appear operational problems, may lead to the failure of the whole risk management system. Modern logistics enterprises shall establish a system of risk management philosophy, the establishment of a sound system of risk management system, and ensure the integrity of each subsystem and operation, in order to achieve good risk prevention effect.

Set up the idea of centralization and decentralization. In order to improve the effectiveness of modern logistics risk prevention, different types of risk should be responsible for different departments, and set up full-time personnel management, that is, decentralized management. At the same time, all departments should be responsible to the enterprise manager, that is, centralized management. The centralization and decentralization of risk management philosophy, the modern logistics enterprises are facing the risk of spread to various departments, each department can concentrate to control all kinds of risk, so it is convenient to control the risk, eliminate the risk and its adverse effects.

3.2 Innovation of risk prevention measures

Risk is different, the risk prevention measures should be different. Modern logistics enterprises in effective recognition on the basis of risk, the risk for different types of the corresponding risk control measures(Ouyang Fei,2013), to achieve the effective control of risk, for modern logistics enterprise to create a good business environment. Modern logistics enterprises in the risk prevention measures on the innovation, as follows:

3.2.1 The prevention measures of innovation contract responsibility

Logistics enterprises should make clear the strategic partnership between the sub-contractors and the information system providers, and establish a good relationship with them, so that it can help to prevent the risk of contract responsibility. In contract responsibility risk prevention can be used these measures: first, to establish a win-win concept, clear responsibilities of the parties, strengthen the degree of trust in the process of cooperation between the two sides; second, to establish a set of perfect open exchange mechanism, as far as possible to improve the information sharing degree, smooth exchange of information to avoid the information distortion phenomenon, so as to reduce risk; third, the establishment of cooperation mechanism. Based on mutual trust, the logistics enterprises and the sub-contractors and the information system providers establish a formal cooperation mechanism. In the process of cooperation, the two parties share the risk and share the benefits (Wang Wenjuan, 2009); fourth, strengthen the contract management. Logistics enterprises need to establish a set of analysis and evaluation system for the contract, accurately analyze the contract risk, and establish the corresponding warning mechanism and prevention system (Liu Li, Zhang Dong, 2011); fifth, establish credit evaluation mechanism. In the choice of cooperation objects, logistics enterprises should have a set of scientific and effective credit evaluation mechanism, and cooperation with the credit situation of enterprises. In order to ensure the accuracy of credit assessment results, validity, timeliness, logistics enterprises can in the internal organization set up a full-time departments or set up a full-time job, responsible for the collection, statistics, analysis the credit information of enterprises cooperation intention, to the evaluation of the object of service level, operation level etc. dynamic tracking and monitoring, in order to provide the basis for the credit evaluation.

3.2.2 The risk of innovation in the implementation process of preventive measures

The risk in the implementation process of modern logistics is inevitable, can only try to reduce the risk, avoid suffer huge economic losses. For such risks, modern logistics enterprises can set up the whole process of risk prevention and control system with to improve risk monitoring mechanism; dynamic tracking and monitoring throughout the implementation process control every aspect of the risk factors, to realize the effective control of risk. At the same time, the corresponding risk control measures for the implementation of various aspects of logistics risk control. For example, the risk of loading and unloading process, the main responsibility for the main body of the loading and unloading, to determine the loading and unloading of each loading and unloading personnel loading and unloading risks, once the risk and accountability of the responsible person.

3.2.3 The prevention measures of innovation and settlement risk

For modern logistics enterprises, the settlement risk not only affects the normal logistics services, but also endanger their own development, so we must attach great importance to the settlement risk prevention (Huang Shiquan, 2012). First, accounts receivable established beforehand, in the matter, after the risk control measures will be the extension of settlement risk prior to, not in credit conditions and to control the risk of, to the event, the risk control; second, reasonable preparation of capital plan, strengthen the management of cash flow and budgeting, eliminate the financial risk in the bud stage; third, build customer data files, carries on the appraisal according to the contents of the file of customer credit determined customer credit rating. The high credit rating of customers, and normal operation, have the ability to repay customers allows for greater credit amount. On the other hand, to control the amount of credit, in order to avoid large credit receivables, accounts receivable caused by poor management. For other risks, the modern logistics enterprises can be covered by comprehensive liability insurance, through the logistics insurance to minimize the loss of their own. China needs to further improve the laws and regulations related to logistics and insurance, so that the logistics insurance gradually standardized, legal system, improve the authority of the logistics insurance, more logistics companies are willing to insure logistics insurance.

4 Conclusions

To sum up, the whole process of modern logistics service exist all kinds of risks, such as contract liability risk, production risk, the risk of transportation service, handling risks and financial risks, and there are still many unknown risks, so logistics enterprises face a great risk of the industry. However, in the environment of market economy, every industry is facing opportunities and risks, the key depends on how to avoid risks and seize the opportunity. Therefore, the modern logistics enterprises should effectively identify the risk of every link in the process of modern production logistics and continue to increase and innovation risk management, improve the risk prevention capacity, defuse the crisis, seize the opportunities to develop, create good conditions and environment for its development.

The Logical Evolution from Management to Governance of Public Security in China

Chen Rui

School of Marxism, Wuhan University of Technology, Wuhan, P.R.China, 430070

(E-mail: chenr_1314@163.com)

Abstract: Public safety is a hot topic for a long time, from the sense of danger in peace time, to establish the concept of safe development and related theory of one after another, highlights the important status of public safety in our country. With the economic transition and social structure differentiation, the situation of our country's public security is becoming more and more complex, the risk is also more and more severe, urges the government to change from the management mode of "unit" to "multiple", in order to improve the ability and efficiency of the main body to prevent and respond to public security crisis. Through the history review of public safety management and the reality of the rise of governance, concluded that the system plays an important role in the management of the government model, which provides a theoretical basis for the institutional construction of public safety management in China.

Key words: Management; Government; Transformation; System

1 Introduction

As a subject of science, public security management is both a theoretical and practical question. The international recognition of it is the whole process about the maintenance of people's normal life and the industry state of order, the countermeasures taken when something that disorganizes the order happening, the elimination of the consequences and the recovery of the state of order. The essence of public security management is that the government take measures to maintain, protect and recover public security.

The concept of "governance" is derived from the west, United Nations Commission on economic and social affairs consider that good governance should include 8 main features, they are participation, consensus, responsibility, transparency, response, effective and efficient, rule by law, and does not exclude any groups and individuals¹.

Participation	Consensus	Responsibility
Transparency	Main Features of Good Governance	Response
Effective and Efficient	Rule by Law	Fair and not Exclude

Figure 1 Eight Main Features of Good Governance

Compared with the "society-centered" governance system of western developed countries, which mainly regard social self-government and community collaboration as the characteristics. The trace of management in our long-standing experience of subjective experiential, conceptual "government-centered" governance model is too obvious. "Governance" is a stable repeated measures and process of a country in response to its territory, people and various affairs in the different areas faced on both the challenges and crisis (Zhou Xueguang, 2014). The changes of The Times prompted the public security manager acting as the main body of the government will change the idea to reconstruct the relationship between the market and society, on the basis of actively draw on the successful management experience of western and combined with China's national conditions, forming a "public affairs public governance" mode: the government has the division of labor and cooperation with the society, Shared responsibility and Shared work, and public security stakeholders "public management of common governance" government model (Yan Jirong, 2012).

The forms of our country, and the resulting properties and the regime "the minority is subordinated

¹ Economic and Social Commission, United Nation. What is Good Governance[R]. <http://unesap.org/pdd/prs/ProjectActivities/ongoing/gg/governance.asp,23/10/2010>

to the majority, the individual subordinated to the collective, the whole party subordinated to the central” are the principles of the public that lay the rationality in the process of safety management in the power of the government. With the development of economy and the deepening of the reform, market and social environment is becoming increasingly complex, based on the need of reality, government has joined the social variable while continuing to improve the management mode of public safety. In the process of exploring and solving the defects of management, gradually transition to the logical context of governance, formed a reasonable management system for the management of the replacement model, and finally establish the government and social equality, cooperation, sharing of public safety management relations. Under the logic of the environment, it is necessary for us to do a simple comb of the history and the emerging managerial elements of public security management which is helpful to explore the inner mechanism of the transition of management to administration.

2 The Historical Logic of the Management of Public Security in China

With the deepening of globalization, countries around the world has increasingly frequent exchanges in such aspects as politics, economy, culture and so on, public safety has become the focus all over the world, especially the periodic cycle of the economic crisis and the frequent occurrence of terrorism, has encouraged countries to invest a lot of manpower and material resources to study and prevent the crisis of public security, trying to capture and master the commanding heights and discourse power in the field of public security research.

America is the first country which has measures on public security management. In the New Hampshire Fire Accident in 1803, American government offered aids for fire-stricken area, which started the first example to deal with public security crisis. Compared with America, public security management began later. Although in Criminal Law, there are detailed provision about public security, but systemic/normative and particular law is lack. When government deals with security crisis, they use more subjective will, experience and their own judgment. The typical example of this is that in the late of 1980s, our country mainly used “strike hard” or “control” movement to deal with it, lacking in systemic form and the concept of legality. With the development of reform and open up and the concept of managing state affairs according to law, public security management in China gradually walks on the way of institutionalization, diversity and standardization. From the perceptive of historical logic, the development of public security management can be divided into three periods.

2.1 Construction of traditional public safety management

Traditional public safety including natural disasters, social security incidents, disasters, accidents, public health events and so on, focus on the management of post-disaster and emergency and handle various events, such as the aforementioned “strike hard”, “rectification” belong to this phase. The Party and the government played a decisive role in the traditional public safety management. Both in support and reconstruction of natural disasters and accidents, the safety or the protection of society, the public health event or investigation and prevention, the government has played an important role, as the Chinese sage Mencius said: “Mental laborers dominate others, manual laborers are dominated by others. Ruled feed others, rulers rely on others to feed.” Although the position of division of labor is different, but as “Mental laborers” government is born to play a manager role, therefore, it is difficult to imagine that without participation of the government, public safety can be effectively managed. On the other hand, social security as traditional public administration objects to accept government administration, but also face the problem of self-reflection and survival. Since the government at this stage is the main way of thinking afterwards emergency management, advance warning is not enough awareness, lack of resources leads to social investment in the face of the public security crisis loss is too large, the high cost of relief, especially in the government lack the social security crisis under effective communication and understanding of the situation, and their experience will be top-down administration and often in sports management phase auxiliary to the crisis, “Diagnosis”, will inevitably result in the abuse of administrative power and low management efficiency, its “Diagnosis and treatment” of natural results unsatisfactory. The social organizations and individuals are too dependent on the government in crisis, lacking of its own means and methods in crisis, but it’s also an important reason that is difficult to improve for China's public security management.

2.2 Construction of public security management system

It mainly takes those caused by the large public safety emergency events and public security crisis as an opportunity to enact a series of laws, policies and regulations, promote the public safety management transferring the motion, dispersion, intermittent types of management trend to institutional

change. In the work of fighting against SARS in 2003, exposed a lot of related issues, such as poor information, information inaccuracy, emergency preparedness etc. For this purpose, the State Council formulated the Regulations on Preparedness for and Response to Emergent Public Health Hazards, it provides the powerful legal weapon to deal with the same type of emergency, and also establishes a unified, efficient, authoritative emergency disposal mechanism. After the Wenchuan earthquake in 2008, the National People's Congress had revised the Law of the People's Republic of China on Protecting Against and Mitigating Earthquake Disasters, gave a detailed description and arrangements for the earthquake prevention, rescue, reconstruction, supervision and responsibility, provided a clear legal basis for the scientific earthquake prevention and disaster reduction. What's more, in order to cope with the growing food safety crisis, especially the outbreak of the tainted milk powder incident in 2008 prompted our country in the start of the second years had passed the Food Safety Law of the People's Republic of China, in expected to solve the problem of food safety from the system. And in response to deal with large-scale social security incidents such as the frequent occurrence of mass incidents, our country also makes the corresponding formulation and revision of the "Law of the PRC on Public Security Administration", "The Fire Protection Law of the People's Republic of China", "Material Law of the People's Republic of China and "National Security Law of the People's Republic of China" and other relevant laws. The publishing of these laws and regulations, from the system level is very good to make up for the government in dealing with the public security crisis emergency mode and management methods, to standardize the behavior of the government improper administrative in effective at the same time and also provides the society its own means of crisis management, government and society can be legal, systematic and public safety management become more efficient.

2.3 Construction of the modern public security management

There are two aspects to reflect the modernity of modern public security management, on the one hand, securities of network and national sovereignty become a new social concern. On the other hand, with the differentiation of social structure and the development of Internet technology, social network independents of reality gradually, it almost becomes an entity which has the nature of the extensive social. Its independence has shown that occurrence and development of network security events is different from security incidents in traditional society. The characteristics of network, such as opening, interaction and penetration etc. make network of public security crisis broader, spread faster, transform events more complex, response emergency more difficult compared with social public security crisis. Therefore, government should deal with network security crisis using modern point of view, the government should also learn network knowledge actively, focus on the network dynamic and strengthen the network of supervision. Dealing with public opinion on the Internet and network security crisis, according to request of Xi Jinping by using "Six of timeliness". Besides, although the development of economic globalization becomes in-depth, national boundaries get fuzzy at the meantime. Developed countries with the strengths in economic and culture intervene the political and social culture of the developing countries, this makes outbreaks of sovereignty crisis in developing countries and it has a strong impact on public security and social stability. In the process of dealing with national sovereignty security crisis, the party and government should increase crisis warning to a strategic height. To divide the security boundary in form of law, remodeling ideology of country actively, efforting in improving the management level of the government and optimizing the abilities for country to deal with national sovereignty security crisis on the basis of referencing foreign advanced management techniques; The second is to make full use of institutional strengths and to turn the power of institution to the force of improving the present situation of the state and public security on the basis of establishing and perfecting relevant laws, which is the premise to establish modern management of public safety. During this process, the origin and the nature of state authority and derivative government's leadership and compulsive in the field of public safety which is not only the power basis of building government system, but also is the power source of system functions' role playing. As a result, the legitimacy and rationality of the government authority in relation to the rationality and legitimacy of related system is the key to the formation of the public security management environment.

3 The Reality Logic of the Rise of China's Public Security Governance

Management theory is the basis of public security governance. In recent years, the concept of "governance" frequently appear in academia, public security and policy areas and even in the discussion of practical departments, and make it a very hot topic in the theoretical significance. The third plenary session of the eighteenth "several major issue decisions of the Central of the Communist Party of China"

comprehensively deepen reform. Put forward the concept of “governance” at the national level for the first time and risen “National governance” to “the overall goal of comprehensively deepen reform” in the strategic height, highlight the practical significance of governance theory (Zhu Xiongwu,2010). Public security governance emphasizes the cooperation and negotiation between the public security and society. In general, governance is a process in which state and citizens through cooperation, negotiation, partnerships, to realize the interactive of public affairs management. Society changed from the consumers of public security products into producers and providers of public security products, together with the government to decide the type of public security product supply, the scope and the quantity of supply, improve the efficiency of the government public safety management to the greatest extent at the same time to increase the proportion of society in providing public security products. The rise of China's public security governance stems mainly from the following four aspects:

3.1 The gradual consummating of the market mechanism

As has pointed out at the Third Plenary Session of the 18th Central Committee of the CPC: “We should make the market play in allocating resources, thus playing a decisive role and better to the role of Government.” “A decisive role” in which signifies the Government's determination to withdraw from the market, allowing markets to self-development and compete orderly, which also gives full play to market forces in allocating resources efficiently. Therefore, the Government has led the market competition mechanism in the supply of public security products, which greatly enriched the variety of the products while developing the quality of public security products, which increased room for Governments to choose the best public safety products, and created the conditions for the Government to reduce spending on public security. On the other hand, the gradual improvement of the market mechanism has promoted further restructuring and development of the economic, which has laid a good foundation for public security governance.

3.2 The gradual maturity of civil society

The rising of Western management theory derived from the development and maturity of civil society. Unlike that in West, the development of civil society in our country originated more from the cultivation and shaping that from the Party and the Government. Thus, the growth of our country's civil society mainly depends on the attitude of the Government. With the focus of the Government shifts to economic construction, the Government needs social organizations to share the task of developing economic, optimizing economic development environment and resolving social conflicts, which can accelerate the development of social organizations. The vigorous development of social organizations has provided a platform for which people can express their standardized, diversified demand intensively and orderly. This is not only advantageous to the communication and coordination between Social organizations and the Government on public security issues, which provide basis for reasonable decision-making of the Government, but also beneficial for public organizations to share some of the functions of public security from the Government, which can express the Government's pressure of public security. With the gradual maturity of the civil society, social organizations are capable of providing public security products different from those provided by the government. As for the product type, the government focuses on such macro aspects of public security events as prevention, rescue, supervision and responsibility, but social organizations can proceed with such micro aspects as disease prevention and control, psychological counseling and safety education and provide differentiated public security products, which is not only a powerful supplement to public security products of the government but also an inherent requirement of the promotion of fine public security governance and the construction of a public security government pattern featured with joint construction and sharing.

3.3 Significant improvement in public security awareness

Maslow, a famous American social psychologist, put forward the famous theory of hierarchy of needs in the book of Human Motivation Theory, which holds that people's demand from low to high is five levels (Lin Fang, 1987).

As the figure shows, human safety needs only after physiological needs, is one of the most basic, the most priority needs. In simple terms, apart from hunger, shelter, sex and other physical needs, nothing is more important than its own security. People will only seek after the three higher levels of need after meeting the physiological needs and safety requirements. Therefore, security requirement is the premise and foundation of all human needs, people can get Free and comprehensive development only in a safe environment. The rapid development of economy basically meets the physiological needs of the majority of the population, the problem of survival is not the topic that people care most about. People began to seek a higher level of need, they concerned much more with their own interests closely related to public safety. With the enhancement of independent consciousness and right consciousness,

People express their concern for public safety through various ways.

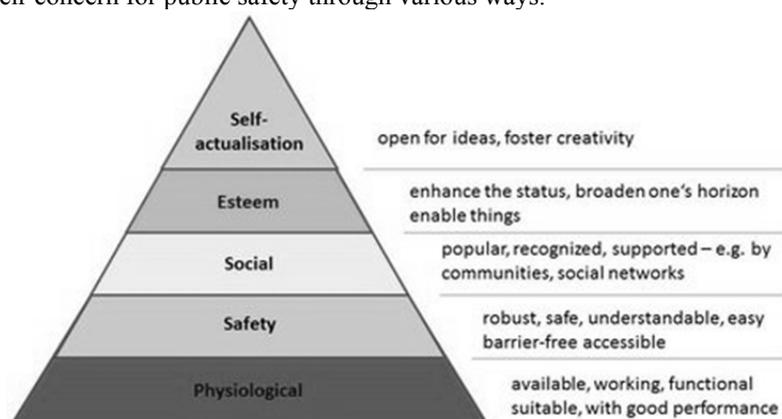

Figure 2 People's Five Levels Demand from Low to High from Maslow

Especially in the internet field, people discuss public security issues through interactions over the internet and gradually form online public opinions which further influence government behaviors. The government is also vigorously cultivating the public security awareness of the people while continuously enhancing its public security management level. To achieve these objectives, the government has been optimizing the public security education system, popularizing public security knowledge among the people and strengthening the efforts in promoting public security, etc. A rational public security governance network is also under active construction, to reduce the costs of public security products of the government.

3.4 The increasingly of social management problems

Our country is in the key period of economic transition and social structure transformation, social differentiation is intensifying, social contradictions presents the complexity, variability, diffusivity, violence and other characteristics, it has obviously increased the difficulty of social public security management. When facing the social contradictions and problems, government, the main body of social public security management, cannot protect the social public security with hysteretic management style and incomplete management system, the frequency of mass disturbance and emergencies has seriously affected the national security and social stability. On the other hand, economic development has extended the scope of public sphere, and then many new departments and fields has appeared. There are have more and more objects of social management, large and large control limit, and required higher standards about professionalization, normalize and refinement of management entity, and if government rely on superincumbent homocentric management mode, it will difficult to meet the requirement of social public security. Therefore, the government is pressing needs to introducing social entities to help governing public security together, and enhance their initiative, encourage them to provide refined and various public security's productions for society, eventually make a multi-governance public security management system.

In early 2015, Politburo of the CPC Central Committee approved “ the outline of national security strategy”, highlighting the significance of public safety management for our country's national security strategy, while the coming of the risk society goes beyond the traditional governance category and the concept of crisis management, prompting the shift from traditional “management” model to modern governance model based on the efficient coordination between government and society(Cao Huimin,2015). In the new era, we should treat the new model" in the whole point of view, giving full play to the characteristics of “governance” coordination and high efficiency actively constructing and improving the management network system with the joint participation of multiple subjects. Timely and reasonably response to the crisis of public security.

4 Results and Discussion

According to the experience of the western, in the process of transforming from the public security management to public safety management, the system has played a decisive role. Compared with the government “rigid” management model, the right way to resolve the crisis is to bring the crisis of public security into to the framework of system. System is a sign of mature public security governance at the

same time, according to the theory of institutionalism, a system is a set of rules of social interaction in some way. as a result, the mature system of governance will change the new management innovation to the prevailing rule of the social interaction in the form of institution (Yan Jirong,2010). With the growing importance in the social interaction, public safety system has become the logical starting point of the change from safety management to governance. Form this concept, we can find the following governance “conversion” path.

4.1 The needs of internal reform

Viewing history of China’s reform practice, in public security field, system of design, and produced and change, which implements organizational goal of the government on public safety management, demand on efficiency and order, are oriented toward Government. Therefore, system structure looks “rigid” more and “elastic” insufficient, especially as people lined with public security risk front line of public was not involved actively in constitution process, related legal, and regulations place more restriction rather than support on social, public identity degrees is not high, and legitimacy basis is absent. Therefore, Government has an urgent need to change the system-built process in response to growing public safety crisis. One important way is to combine Government’s “political needs” for managing public safety with citizen’s “social demand” on their own living conditions. in full respect for the basic needs of community, the government and people should achieve a high degree of agreement, making the public security law or regulations exist and continue. Society is not only to participant in the system design, production process, but also acts as system monitor who supervises the process, feedbacks its effectiveness and change outdated system. It is due to full participation that Government’s “innovation” in management changes system into general roles of social interaction, and then, public safety transformation from management to governance becomes a possible thing.

4.2 The choice of external reality

There exists a matter of “heavy application, light management” in public security of our country (Wang Yingying, 2010). The scale of “management” main tends to the approach after public safety crisis and lacks prior warning ability. In addition, the development of economic and differentiation of social structure increase the depth and breadth of the government management, although some advantages for public security in data collection are brought, professional management technology are not supplemented. Therefore, government has limited public security data analysis and judgment ability, and cannot effectively deal with public security crisis. Overall social organization not only can use professional knowledge and scientific method of public security crisis to provide early warning and forecast, but also can provide opinions and suggestions for the government management from the perspective of professional, because of its professional staffing, professional technical ability and the advantages of the stable structure make, to make social organizations becomes the most ideal partner in the field of public security. To arouse the enthusiasm of social organizations involved in public safety management and carry out the principle of “public affairs in public management”, the government should give some space for social organizations, release the affairs which government cannot or should not interfere to social organization, but only monitor their behavior with laws, regulations and other forms of social organization behavior regulation, and timely introduction of market competition mechanism, to further improve the efficiency of social organization and management, to promote the transition from the traditional public safety management to the government “at the helm” society “paddle” of the modern public security management.

On the other sides, professional division of labor lead to disadvantages like fragmentation of government departments, refined classification of labor division, department overstaffed and so on. Department barriers exist, the heavy lack of cooperative consciousness cause in each department's over concern about power and weaker responsibility consciousness. When public security crisis occurs between departments, shuffling and wrangling happens frequently which will seriously affect the efficiency of the government public safety emergency management. Social organizations can effectively reduce division of labor based on specialization, contribute the coordination of functions of related parties, turn the ideas of departments, eliminate the discrimination of areas, and attribute to common consciousness of departments by instituting public secure platform. Moreover, they govern public security together based on the target of fairness and effectiveness. What is more, compared with governance, the interaction between social organizations and people was more frequent and deeper and social organizations can provide public with differential, fine-tuning, individualized public secure products, increasing the options for public as well as contributing to the improvement and completeness of products by the governance. It can also large the kinds and enhance the quality of products.

Therefore, both positions in characteristics of society and the social organizational functions in

supply and demand in security management cannot be lack of the establish and fixation of relationship between government and the society, contributing to the regulations becoming the beginning of changes in common security from management to governance.

5 Conclusions

The change from management to governance was a history process. The revolution of concepts of government, establishment and completeness of regulations, the improvements of involvement concept are the indispensable factors. Public security management inevitable commons the motivation and capacity of turning to public security governance due to its public attribute. Therefore, we should build public security regulations from the point of government, regulations and society, improving national precaution and effectiveness of dealing with public security crisis. We also need to accomplish the empathize in 18 the fifth plenary session that “firmly building the concept of secure development, persistence in giving priority to public interest, completeness the public secure system”. It can ensure national security and social stability, defending the security of lives and properties.

Abstract: This paper discusses the institutional innovation of engineering ethics risk control by the method of engineering ethics. The research argues that the government should innovate the decision institution of the project, the project supervision institution and the project evaluation institution from the dimension of ethics concern, and construct the institution of engineering ethics risk control. Finally, we conclude that the institutional innovation can control the engineering ethics risk to a certain extent, and reduce the negative impact of the project, so that the construction of the project will benefit the human being.

Key words: Government; Engineering ethics; Engineering risk; Institutional innovation

1 Introduction

With the development of science and technology, modern engineering construction has become more and more important in the society and environment. The modern engineering, which has a great engineering risk, bring an unexpected negative impact as well as it brings the great benefits to the people. Engineering risk refers to the sum of the factors which cannot be entirely eliminated by all human beings, while it may bring the loss and lead to the expected effect of the project cannot be achieved. The key problem that people pay close attention to is how to control engineering risk. People not only expect the "good project" which the quality of construction techniques can reach the standard, but also hope that the construction can be the "good project" guarantee human safety, health and well-being, which involve the risk control problem of engineering ethics.

As an important part of project management, risk management is the focus of domestic and foreign scholars. However, only a few scholars have studied engineering risk management from the perspective of ethics. For example, Pan Jianhong and Duan Jiwei discussed the role and function of engineers in controlling engineering ethics risk, and put forward the action strategy to carry out the ethical responsibility of engineers (Pan Jianhong, Duan Jiwei,2015). It has great significance for studying the role and countermeasures of the engineering community members in the control of engineering ethics risk. But there is no research on the role and countermeasure of the government in controlling engineering ethics risk as an important member of the engineering community.

The government, one of the members of the engineering community can reduce the risk of engineering ethics through the system innovation. China is a socialist country, and the investment, building and management of the national large-scale project are directly participated by the government. For instance, manned space engineering, large water conservancy projects and the building of large railway and highway are directly led by the government due to the large investment and the higher coefficient of technical difficulty. Although some of the smaller projects are not dominated by the government, it still needs to accept the government's supervision and assessment. If the decision-making, supervision and management of the project are lack of ethical concern, the harm to mankind may be immeasurable. Chinese government should reduce the risk of engineering by institutional innovation to make a better service for human being.

2 Improvement of the Engineering Decision-Making System

As engineering technology is becoming more and more complex, the scope of its influence is growing. Facing a mass of stakeholders and different kinds of interest requirements even including opposite aspects, we should make an important decision on how to make reasonable and efficient engineering decisions into consideration, meanwhile "Habermas's discourse ethics theory" (Song Xiren,2000) has an important reference function for innovating engineering decision-making system.

It can be divided into two main aspects: "internal negotiation" and "external negotiation", by which the discourse ethics theory is used to carry out the project decision-making. The "internal negotiations" means equal negotiation within the company before make the engineering decision, the participants

include engineering managers, engineers, technical experts and workers. A consensus can be reached by fully listening to their opinions of engineering decision-making and interest requirements.

The "external negotiation" refers to the social dimension of project decision-making which should take into account the views and interests of the community, and promote the participation of the social public. In order to achieve the accuracy and efficiency of the external negotiations, of course, there is unnecessary for all the public to participate in. In fact, that part of the public, as a stakeholder in the interests of engineering technology, is the one who should be involved in solving the problem.

The "external negotiation" of engineering decision-making needs to follow "Principle of Informed Consent". In 1964, "Principle of Informed Consent" was put forward for the first time in "Declaration of Helsinki" issued by World Medical Association, and originally used in medical ethics and bioethics. In medical ethics and bioethics, "Principle of Informed Consent" requires that "medical staffs or medical researchers, in the process of clinical diagnosis and treatment or involving in human medical experiments, need to inform patients or subjects related information for them to make decisions by their own" (Liu Yueshu,2013). The objective of "Principle of Informed Consent" is to protect the legitimate rights and interests of patients and subjects from more harm. In engineering ethics, similarly, we can take "Principle of Informed Consent" for reference to protect the stakeholders who may be damaged by the project risk.

Firstly, project stakeholders should be protected to have the right to know the engineering risk in abiding by "Principle of Informed Consent" in the engineering practice. Due to the sociality of the engineering risk, it is necessary to assure that everyone who is undergoing the engineering risk has the right to know. For the engineering stakeholders, the right should include two aspects: one is that the risk information is fully informed, and the other is that the one need to be willing to take the engineering risk rather than achieve the goal by means of deception or external force.

Secondly, some experts believe that "technical matters need knowledge about engineering, or belong to engineering ethics in particular for engineers to protect the public health and safety of the scope of ethics, the decision shall be made by the engineer or from the perspective of engineering"(Li Shixin ,2007)it should promote the public participation and improve public scientific literacy to make sure the scientificity and rationality of risk perception in public. The public cannot professionally and rationally internalize risk like an engineer because they did not receive professional training. In reality, there are usually some cases that the public prevent engineering implementation in a tough way due to the risk acceptability of the incomprehension. In order to avoid the engineering risk, the public in China should enhance the comprehension of scientific knowledge and engineering risk and actively participated in the engineering activities, and solve problems arising in engineering activities through the reasonable negotiation rather than the mob.

3 Improvement of the Engineering Supervision System

Engineering is for human service, and any project must be examined from the ethical perspective. Engineering ethics risk assessment is to assess the hazards that may be brought to human health, safety and well-being. Project risk is objective and universal. In the past, people paid more attention to the engineering technology risk assessment and prevention, which is essential. Because the ethical evaluation of the project and the ethical precautions have the characteristics of anticipation and overall situation, it has become the focus of attention by relevant scholars and engineering practice activities in recent years.

At present, China has basically established a supervision system concerning "Administrative department under the State Council is built to implement unified supervision and management of the engineering quality of the whole country" (Zhang Shisheng, Wu Xinhua, 2011). However, the government will encounter many difficulties on the supervision and management of these projects in the concrete engineering, however, because some large complex engineering projects, such as social public construction project, water conservancy project and railway engineering which involve many different main units of project, are closely related to the interests of the public.

In the engineering activities, the government's object of supervision and management is the members of engineering community which include the decision maker, organizer, designer, implementer of the engineering. Specifically speaking, the government, company and engineer are the members of engineering community. The supervision of the government in the engineering activities mainly refers to the self-disciplined activity that the government develops for its own project management system, supervision system and supervisors, and which can further improve the government supervision system

of the engineering, regulate the behavior of government supervision and achieve the effectiveness and efficiency of government engineering supervision.

Nowadays, Chinese government has strengthened the engineering supervision by the internal inspection of monitoring unit, the reform of supervision and regulation system and the construction of innovative professional supervision institution, but there are still some shortages in Chinese government's internal regulation. For one thing, there still exists the problem such as the position ambiguity of subject role and the decentralization of management function in the process of Chinese government's supervision. At present, different functional departments have their own agenda and low management efficiency within some regional governments in China, however, when such a supervision mechanism don't run sluggish, it is pretty easy to result in the power dispersion and the lack of authority and leadership ability of the government in the process of engineering supervision, and even the frequent occurrence of corruption. "In 2008, for example, duty crime cases that investigated and dealt with by the national procuratorial organs in the field of engineering construction was more than 60 %"(Qiu Dingnan, 2012). For another, it needs to be improved on the information disclosure of the engineering supervision for the government. The public who is also the stakeholder of the engineering has the right to know the project which is closely related to the people's lives, to some extent, while there has been so far existed lack of transparency on the investment and decision-making project by Chinese government. This phenomenon will cause the problems the public and society cannot supervise the government in the round, which has some effects to promote the government for a better supervision to a certain degree. In view of the above two aspects, Chinese government still needs to strengthen the internal supervision of the engineering, while it should ascertain the subject of government supervision though the further promotion of the reform of government supervision system, and realize the rapid transmission of information through strengthening the construction of electronic government affairs.

The supervision of the other community members of the engineering by the government mainly refers to audit and supervise these members: engineering contractors, suppliers of raw materials, engineering survey and design team, construction team, engineering management team and etc. So, it can effectively control the ethical risk and achieve the value in the project construction all over the country.

At present, Chinese government still has some problems in supervising the members of the engineering community as following. Firstly, lack of the effective engineering supervision system. Since the complexity and variety of engineering projects, the existing supervision system has the case of supervision invalidation frequently, and in reality, people's safety and health are seriously endangered by the usual occurrence of the misprision and tin pot projects. Secondly, Chinese engineering supervisors lack the professional and ethical quality. Nowadays, in the projects of China, "beat-head decision" of the government officials occurs frequently, while they depend on experience or without any meditation to make decisions which cause a huge waste of human and financial resources at last. Lastly, the accountability system of engineering decision supervision of Chinese government is not so perfect that the supervision function of the government will be greatly reduced if the responsible person can't be found quickly and accurately as the engineering decision goes the wrong way. For these problems, Chinese government should quickly perfect its engineering supervision system, establish the social supervision mechanism of engineering, encourage the public to participate in it, and implement the accountability system of engineering, so that the government supervision is more effective in the project.

4 Improvement of the Engineering Evaluation System

If you want to build the engineering evaluation system that works for ethical evaluation, it is essential to establish ethical principles of the engineering risk assessment. Engineering ethical code can guide people to correctly evaluate engineering risks, and take timely remedial measures to effectively avoid engineering risk.

Martin, American engineering ethicists, once proposed: "Project is social experiment"(Mike W Martin, 2005). With the development of science and technology and the improvement of human dependence to science and technology and engineering, such as the "social experiment", if it is successful will effectively promote the development of human society, but if it fails, it will often result in casualties and death threats, even a serious threat to the public's welfare, health and safety.

In modern society, it is fundamental principle for each country to develop laws and policies to ensure the legitimate rights and interests of citizens from abusing. Moreover, "Supreme Principle of

Life" and "Humanitarian Principles" are also the important principles that human beings in practice should follow, while it is the core of the social responsibility and engineering ethics of the engineering community to safeguard the human safety and the sustainable development of the nature.

Currently, there have been many professional associations of engineers listed the principle of protecting the public in the first place in developing the ethical code in the world. For example, "The engineers should put the public's safety, health and welfare in the first place in performing their duties" was listed in the first position of many terms in the basic principles and employment rules of Canons of Ethics for Engineers in American National Association of Professional Engineers. "Accept the responsibility for making engineering decisions consistent with the public's safety, health and welfare and timely reveal the factors that may endanger the public or the environment." was put in the first ethical code of Institute of Electrical and Electronics Engineers (IEEE). American Institute of Chemical Engineers also put "The public safety, health and welfare is the most important in performing their professional responsibilities, and protect the environment." in the first place of its ethical code. Thus, "Safeguard the public's health, safety and welfare", as the primary ethical principle of the engineering safety assessment and the work of engineers and engineering community, has been worldwide recognized by the most association of engineers.

Reviewing China, however, "Chinese Engineer Creed" has been revised for the fourth time Chinese Institute of Engineers in Taipei in 1996, and place the social responsibility of engineers on the top of the creed, among which provides that engineers should "Abide by the laws and regulations, protect the public safety, promote the public welfare". Currently, the other continental engineers in China have not built the specialized professional ethical code of engineers, the sense of ethical responsibility of engineers is still relatively scarce. the professional ethical awareness of engineers is still in the stage of "Do the engineering better" rather than "Do the better engineering", Therefore, it is considerably necessary to establish the independent code of engineer's professional ethics and determine "Safeguard the public's health, safety and welfare" as the primary principle in China.

5 Conclusions

According to the ethical principles of engineering evaluation, the government, in addition to the quality evaluation system of engineering, should also develop an evaluation system to assess the social impact of engineering. The assessment of the social impact of engineering should include three aspects: economic impact assessment, ecological impact assessment and safety impact assessment. Economic impact assessment is whether the input-output ratio is high and whether the corresponding economic benefit can be brought about. Ecological impact assessment is used to evaluate the possible ecological damage caused by the engineering and ensure the sustainable development of ecosystems. Try to avoid the damage of the ecosystem by engineering activities and the engineering activities caused by ecological crisis. For example, because the Egypt government had not fully ecological impact assessment on the project Aswan High Dam, it brought the great damage of the local natural environment. Thus, we cannot ignore its impact on the ecological environment in a specific engineering activity, and should maintain the ecological balance to achieve harmonious development between man and nature. Safety in production is the top priority, although the impact factors caused by safety impact assessment and successful engineering construction are numerous. In order to successfully implement the project, it is necessary for man to make a safety assessment of the engineering. The safety assessment of the engineering must be carried out by the invited third independent sector, in case the formalism appears to lose the meaning of the safety assessment.

Mitigating Real Estate Development Risk from Real Option Angle

Cai Qianfen, Wang Junwu

School of Civil Engineering and Architecture, Wuhan University of Technology, Wuhan, P.R. China,
430070

(E-mail: caiqianfen@163.com, junwuwang@163.com)

Abstract: This paper illustrates the real options that exist in real estate development projects. Real options analysis (ROA) is an important topic in real estate due to the nature of the development environment. Though developers currently make their decision using intuition and judgment, they actually mitigating real estate development risk from real option angle. Traditional options are introduced, along with key definitions, qualitative and quantitative analysis proposed. Real options analysis provides a framework for analyzing flexibility in development projects by taking into account a manager's ability to react to risk. It is a powerful tool for real options analysis in the field of real estate developing risk management.

Key words: Real estate; Real options analysis (ROA); Investment; Risk

1 Introduction

The uncertainty exists over the course of a property project. Uncertainty around a project's financial return (Per Geltner and Miller, 2007), Most real estate developer showed interest in real options tool, but they drag their feet due to the newness and complexity. However, real option analysis has become considerably popular among both practitioners and scholars (Krychowski and Quelin, 2010). There is plenty of literature using real options analysis to analyze the equilibrium behavior of property prices (Grenadier, 1996; Guthrie, 2009a). Various studies have applied traditional option pricing models to empirical data such as land transactions (Quigg, 1993), as well as general property transactions (Sing and Patel, 2001). Developers are aware of the many risks and uncertainties in real estate, and the various tools they have to mitigate them. They are also aware that traditional discount cash flow analysis does not directly account for the value of flexibility. When a developer initially conceives of a project, they actually accounts for the uncertainty in real estate development projects in the real options principal. He or she has a base set of assumptions upon which an expected financial return for that project is calculated. However, reality is sure to deviate from these assumptions, flexibility allows a developer to control risk. Each source of flexibility is, in technical terms, a "real option". An option is defined as the right, but not the obligation, to take some course of action in the future. They exist whenever two conditions are met: new information will arrive in the future; and the news will affect decisions when it arrives.

Real options are markedly different from financial options in that their value is based on a physical asset rather than a security such as a stock. Given the roots of real options in the financial theory, the most popular methods for real option analysis are derived from the case of financial options (Krychowski and Quelin, 2010). Real options and financial options share some terminology here:

1) A call option is the right but not the obligation to purchase an underlying asset for a predetermined price (the "strike" price).

2) A put option is the right but not the obligation to sell an underlying asset for a predetermined strike price.

3) An American option can be exercised on or before its maturity date.

4) A European option can only be exercised on its maturity date.

5) A compound option is an option on an option.

6) A rainbow option is any option that is exposed to more than one source of uncertainty.

Real option analysis method is superb valuation method, suitable for higher-risk assets. It explicitly evaluates the flexibility, options, and choices inherent in an asset and account for risk and uncertainty in ways that conventional appraisal method do not (Pomykacz, 2013). Based on the analysis, the projects with negative NPV of expected cash flows may be accepted, or delay investment until an expanded NPV under uncertainty (Trigeorgis, 2005).

2 An Example

A familiar example in real estate is a land option. A land option is a type of call option that is

commonly used in real estate. Though it can be structured in numerous ways, the basic land option provides a buyer with the right but not the obligation to purchase a piece of land at a given price (the strike price). The strike price is normally equal to the residual land value calculated for the proposed project. If the value of the land is equal to or greater than the strike price, the option is “in the money” and the developer will purchase the land. If not, the option is “out of the money” and the developer can walk away. The main value of the option is that it reduces the risk of the investment by providing the developer with time to gain more knowledge, thereby reducing uncertainty. The value of the option is positively correlated with the length of the option and the amount of uncertainty associated with the project.

When one looks closely at real estate development, it becomes evident that numerous real options exist. Following is a different scenario to real estate: The option to defer or expand a project (a call). Common examples are scaling a residential building down in size in order to save costs (often by switching from concrete or steel construction to a wood frame building). The option to abandon a project or scale the project back by selling a fraction of it (a put). An option to extend the life of a project (a call). An option to phase a project (a compound call). An option to switch between different modes of operation. For instance, consider an office building that can be converted to residential. Here the underlying asset is the value of the proposed residential project with the value of the office building (plus the construction or conversion cost) as the strike price. During the development, decision makers align their understanding of future opportunities, risks and objectives, so that they can coordinate their efforts and activities more easily (Amer et al., 2013).

3 Data and Methodology

Two methodologies are utilized in developer’s attitude analyzing. One is quantitative analysis, the other is qualitative analysis.

3.1 Quantitative analysis

According to the National Bureau of Statistics, property prices in China's 70 major cities grew and down from different year, Data between 2010 to 2015 are collected.

The table bellow is National real estate market in China.

Table 1 National Real Estate Market in China

Year	National real estate development investment (100 million yuan)	Real estate construction area (10000 sq.m.)	Residential real estate new construction area (10000 sq.m.)	Development enterprises land acquisition (10000 sq.m.)	Residential property sales (10000 sq.m.)	GDP growth rate (%)
	①	②	③	④	⑤	⑥
2015	95979	735693	154454	22811	128495	6.9
2014	95036	726482	179592	33383	120649	7.4
2013	86013	665572	201208	38814	130551	7.67
2012	71804	573418	177334	35667	111304	7.65
2011	61740	508000	190100	41000	109900	9.3
2010	48267	405500	163800	41000	104300	10.45

Data source: National Bureau of Statistics of China

From data above, we calculate two ratios compared to the GDP growth rate. Residential real estate new construction area/Real estate construction area, and Development enterprises land acquisition /Residential property sales. The two ratios could roughly indicate the property developer’s investment willingness. They will acquisition more parcels of land and more new properties were constructed when economy booming.

Table 2 Developer Investment Willingness and GDP

Year	Residential real estate new construction area/Real estate construction area (%)	Development enterprises land acquisition /Residential property sales (%)	GDP growth rate (%)
	③/②	④/⑤	⑥
2015	21	18	6.9
2014	25	28	7.4
2013	30	30	7.67
2012	31	32	7.65
2011	37	37	9.3
2010	40	39	10.45

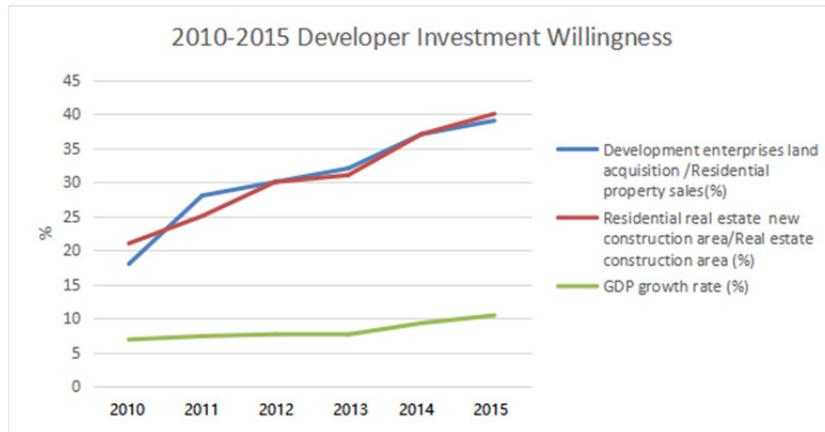

Figure 1 2010-2015 Developer Investment Willingness

3.2 Qualitative analysis

The fluctuations of real estate price affect the real economy at the complex market environment in China. Developers use different means to protect their own interests. By observed, three main developer’s behaviors were generalized from news websites. The developers cope with risk though means below:

1) Developers "land" for long times without the development of idle land. Land is a vital social resource, the developers acquiring land for residential development. Lured by the rising land prices, they waiting instead of immediately constructing. There embedded a call option that developer can expand the project several years later, the call option could bring more profits.

2) A project to be phased development. Generally understood by the seasoned practitioner that development profit is always acquired from the rising property prices. When a large project is pushed to the market, the price is often guaranteed price, with the program was popular and successful, and price also started soaring. The next phrase’s price to the market is generally higher than the previous phrase. So phrase development is a significant way to maximize the developer’s benefit. There embedded a compound option that developer can action accurately on the basis of the former phrase sales results.

For the outskirts real estate project, due to the immature traffic facilities and surrounding environment, there is plenty of risk to developer. To ensure success,the developer phased the project. Then they generally gamble accordingly: transfer land, cooperate with other enterprises. This is a good way for some developers to mitigate developing risk.

3) Property hoarding. Newly built residential flats deliberately held back from the market may push prices high. Most buyers seek property for investment, self-use or retirement purposes. Despite recent fluctuations, most buyers believe that property prices will go up in the long run and real estate is still an ideal investment. On the other hand, the developer insists on a conservative way in selling a property, in order to get more profit. Developers hoarding properties to limit the housing supply in the market. Then property prices will gradually go up as the imbalance between supply and demand improves. Some popular projects increased their sale price by a considerable growth rate, as demand largely exceeds supply. For developers, there embedded a call option to sell higher price real estate.

Table 3 Customer Satisfaction

Scenarios	Next action	Option
“land” without development	drive prices up	call
be phased development	transfer land/cooperate with others	compound
property hoarding	Sell properties more expensive	call

4 Results and Discuss

By summarizing developer invest behavior, we hope to overcome the barriers that currently exist in applying real options analysis (ROA) to real estate development, and help developers better understand the real options investment method. The real options actually exist in real estate development projects from the above analysis. Developers widely used real options analysis (ROA) with no conscious. They use different real options to avoid probably loss, mitigate risk, and gain more profits. Developer choose

their behavior on different economic environment. They use a call option to expand the project some period of time later, use a compound option to transfer investment decision and so on.

We didn't cover the issue that how to value the option. The two most common methods of valuing financial options are the Black-Scholes model and the binomial option pricing model.

5 Conclusions

We learned that a developer's job is to assess and mitigate risk. We also learned that developers implicitly value real options via intuition and judgment by adjusting the hurdle rates or return requirements for any given project. The thesis facilitated the real estate industry's adoption of real options analysis by providing a simple and transparent phenomenon and data that not only serves as a proof of concept for real options analysis, but values the relative risks and returns associated with the real options that developers commonly face in practice. By providing an easy-to-use principal of options in a project, developers will assess the risks and returns better. The frame work should not be used as a prototype due to the simplifications we made. However, it does serve as a proof of concept for the use of real options analysis for real estate development projects.

Abstract: Food security, as a basic livelihood issues, is an important indicator of people's lives to measure the quality of a country. In this paper, the perspective of research focusing on food chain, we present that the interests of the game and information asymmetry are the major trigger factor to the formation of risk, and build the relation diagram of "subject risk" for food security. Then we analyze the formation mechanism of food safety risk based on the production-supply-distribution, government, social supervision and consumption. Therefore, we regard that the government should coordinate and interact with other subjects as the main food safety regulator, and reduce information asymmetry and interests of the game between the constituent subjects through the development of relevant mechanisms and public policy, thus effectively reducing food safety risks.

Key words: Food safety; Food chain; Interests of the game; Subject risk

1 Introduction

Food security, as a basic livelihood issues, is an important indicator of people's lives to measure the quality of a country. In recent years, melamine, clenbuterol, plasticizing agent, and other unsafe factor for food has occurred frequently, which is a serious threat to the health and safety of people. The broad social impact not only damage reputation of the food enterprises, but also is a fatal blow to the entire food industry, and meanwhile the country's image will be also severely affected.

At present, there are still some food safety problems to be solved in China, involving food safety supervision mechanism, laws, regulations, policies, standards, and monitoring and evaluation, inspection and other aspects. These problems mainly display in that the level of industrialization and integration is not high in food industry, the scale is not large and the foundation is weak, the responsibility of business entity is insufficient, the investment of quality and safety control is low, management is not strong and moral integrity and system construction industry lags behind. The FSO (food safety objective) articulates the joint target of a food chain, including all relevant links in that chain, and is common to all other food chains relevant to a pathogen/commodity combination (G.M. Gorris, 2005). Governments can do a better job on the food safety management by revealing the quality and safety information, reducing information asymmetry and providing behavioral incentives (Zhou and Yang, 2002). Zhou and Geng (2002) recommended that traceability systems could be used to control and manage food safety issues. There was growing interest in co-regulation of food safety with public and private sectors working hand-in-hand to deliver safer food at lower (regulatory) cost (Martinez et al., 2006). There is a need for early identification of emerging food safety issues in order to prevent them from developing into health risks. Marvin et al. (2008) proposed a four-step procedure for the early identification of emerging issues. A conceptual framework of enforcement of food safety regulation was developed to assess the degree of shift toward co-regulation from traditional approaches (Rouvière and Caswell, 2012). Jia and Jukes (2013) studied five components of Chinese food safety control system and they thought what need to be improved were as follows: legal requirements, food control management, punishment, and access to information. There are some other scholars also believe that it is needed to build a food regulatory model contains multiple supervision bodies (Tan Defan 2011; Li Jing, Chen Yongjie, 2013).

In this paper, we focus on the formation mechanism of food safety risks. Based on analyzing the food factors (Section 2), we discuss the formation mechanism from production-supply-distribution,

¹ Corresponding author: Lv Wei, weil@whut.edu.cn

government, social supervision, consumption and non-subjective risk triggering in Section 3. Finally, the paper will be summarized in Section 4.

2 Game Subjects in Food Chain

“The People’s Republic of China Food Safety Law” defines food safety as “non-toxic, harmless food, conform to proper nutritive requirements of human health, cause no acute, subacute or chronic hazards.” Food security does not only have a connection with food science technical level, the formulation of laws and regulations related to food, but is more influenced by food employees’ ethical, the level of consumer awareness about food safety and the capacity of government regulation on food supply chain. In this paper, food safety risk is defined as “food safety factors leading to the possibility of loss of public health and sustainable development of the industry, government credibility, the country’s image.” Among them, the risk caused by the interests of the game and information asymmetry which triggered by the relevant subjects (enterprises, government, social forces, consumer) is called “subject risk”, and risk of non-human factors is called “non-subjective risk.”

“Food from farm to table” experiences the production, testing, transportation, marketing and other aspects. Related subjects of all aspects including food production, food supply food logistics and other related food companies, forming a complete food supply chain, added to the ultimate consumer, these constitute a food production, supply and consumption network systems. In addition, in the circulation of food, the government and public oversight power also play an important role. Formation of food safety risk is the result of its various circulation factors working together, which has complex and comprehensive features. Under the interaction of interests of the game among parties, information asymmetry and other factors, the subject take wrong behavior in some aspects, it is possible to produce food safety risk, these related subjects will be the main factors of food safety risks.

From food production and processing, food transportation and sales to government regulators, social supervision forces, and ultimately to consumers, relevant subjects play different roles in ensuring food safety. However, with the environment that the law is not perfect and a serious lack of ethics, some roles are prone to problems and triggered by factors, such as the interests of the game and information asymmetry in some external factors, which will form a “food safety subject risk”. (Fig.1)

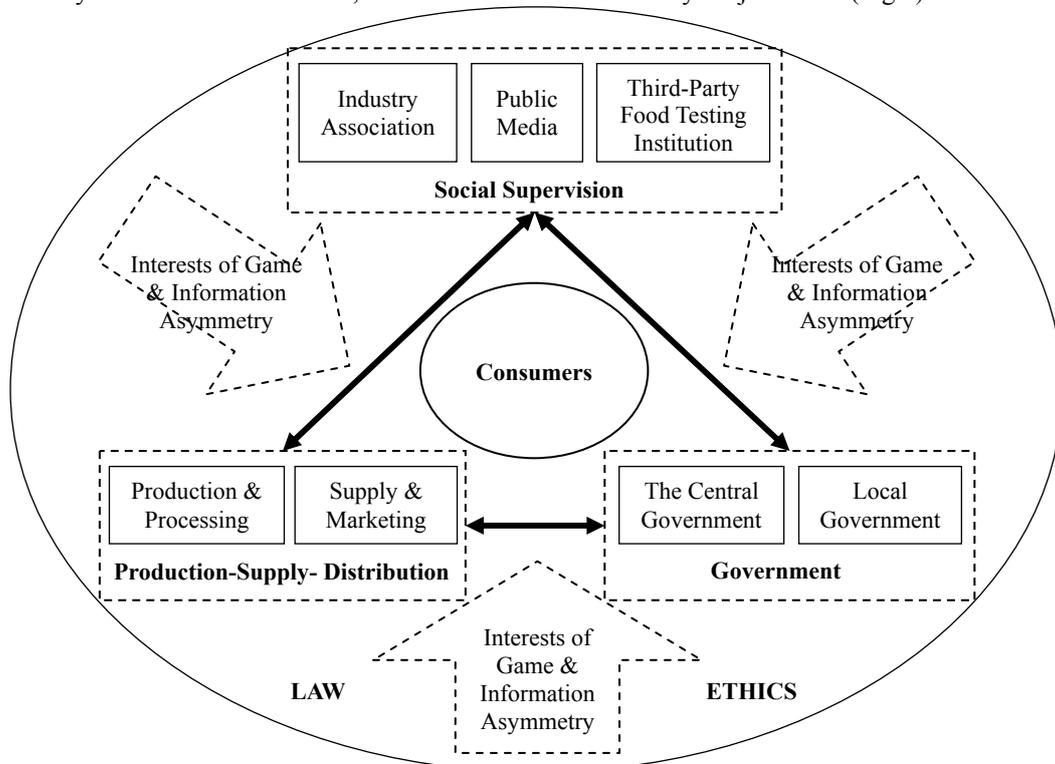

Figure 1 The Relation Diagram of “Subject Risk” for Food Security

3 The Formation Mechanism of Food Safety Risks

3.1 Production-supply-distribution

In the circulation of increasingly complex situation, a perfect internal control system is directly related to whether food enterprises can effectively avoid food safety risk or not. Internal control includes the environmental control, risk assessment, enterprise activities control, information dissemination and communication, monitoring and feedback, running any module loophole could trigger food safety risks. Any modules fail could cause the food safety risk. (Fig.2)

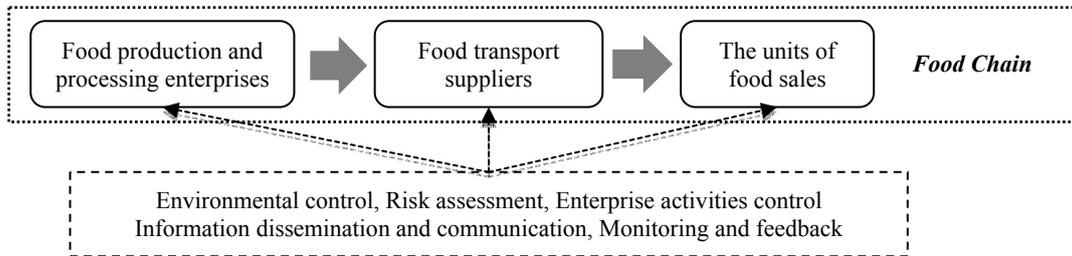

Figure 2 Sources of Risk Within the Food Enterprises

Food production and processing. In reality, farmers tend to invest more pesticides and fertilizers to pursue production and achieve maximum benefit. Agricultural planting and breeding are influenced by pesticides, chemical fertilizers, waste gas, waste water and solid waste. And when people eat these contaminated products, it will produce not only direct health hazards, but also cause an increase in food-borne illness. Thus, at the source of the food supply chain, the extensive uses of chemicals and biological agents bring great risks to food safety. This kind of chemical and biological food contamination often has experienced long-term accumulation in the food chain, and its harm to the health of people tend to be found in a long time after that, and it brings challenges to food safety evaluation. In addition, enterprises tend to extend the shelf life of food, even illegally use food additives in order to meet market needs in food processing. To some extent, these lead to the food safety risk. At the same time, employee's self-awareness and knowledge of risk prevention is weak, which often lead to illegal operations, resulting in food safety risks.

Food transportation and sales. Food is also at risk in the process of transportation and sales. During the food transport, food secondary pollution may occur, due to the packaging, storage, transportation and other facilities are backward and poor management. In addition, in the area where operation order is substandard and regulatory exists loopholes, selling inferior products is very common, resulting in risks in marketing chain. Currently, there is no perfect food market credit mechanism in China. Driven by the profit maximization, food companies would provide information to their advantage by using their information advantages. On the other hand, the cost for consumers getting food quality information is high, and consumers are always at a disadvantage on the right to know and option. It is difficult to judge the food safety for consumers, which easily trigger food safety risks.

3.2 Government

The government has played a single regulatory role for a long time in food safety management in China. The government is the "monopoly" in food safety supervision system. Excessive government intervention in food safety supervision, ignoring the market's own regulatory regulation. (Fig.3)

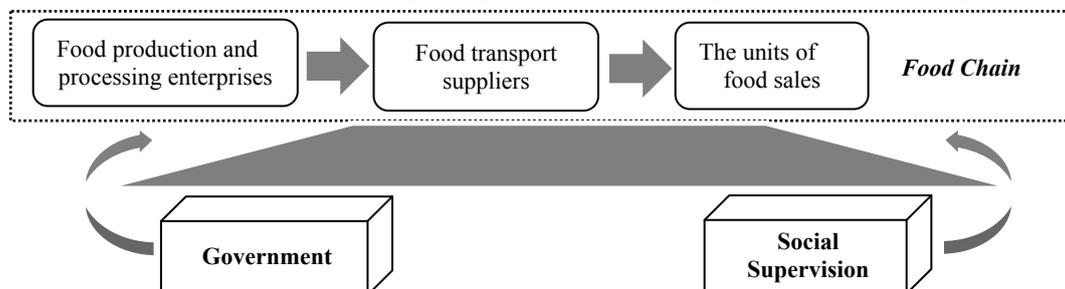

Figure 3 The Model of Food Safety Risks Formation Mechanism in Food Chain Perspective

Government lack of approaches of effective messaging and collaboration with enterprises, social forces and consumers. Regulatory focus is not prominent, resulting in regulatory power cannot function

effectively and induce food safety risks. In a single regulatory system, local government's regulation is often based on local interests, so that the government perform their duties negatively in the regulatory process, and even appear the phenomenon of business-government collusion.

In addition, Chinese government's division of regulatory are based on food chain, and there often will be regulatory gaps at the junction of the food chain. Food safety incidents often occur at this stage. government regulatory department for food safety take sub-management, and there are a number of chain of custody, resulting in multiple management, it is difficult to achieve management integration; the status quo of unclear functions and responsibilities between different departments, causes scattered power regulation; At the same time, the lack of information-sharing mechanism between departments with serious phenomenon of hitchhiking, slacking and prevarication, severely reduce the efficiency of supervision. Existing regulations do not establish a sound food safety information disclosure mechanism. In the collaborative linkage of government, enterprises, social forces and consumers, different actors unable to achieve two-way transmission of information. The government is in the "islands of information", which is likely to induce the regulatory risks.

3.3 Social supervision

Food safety social supervision system is a system which use social force independent from government and the relevant functional departments to supervise food safety , including its main food industry associations, the media, the third-party food testing agencies and so on. (Fig.3)

The legislation of China industry association construction is not mature enough, the relevant policy and documents define no delimitation for law enforcement and industry self-regulation, leading industry associations have no laws when coordinate with the government and enterprises, the imperfect associations internal control mechanism cause that association management systems will not play a substantial role. Consumers get food safety information mainly from the media, but the lack of some of the media's role and the absence of expertise, resulting in distortion of report content, non-effective supervision of enterprises and wrong guidance to consumers. Under the new media environment, press releases and changes are random, easily forming wrong public opinion. In addition, wrong reports easily lead to the proliferation of misleading guidance of public opinion; the effect of new media may increase difficulty of government regulation. China third-party food testing organizations have following problems. First, the company's "credit bundling" lower its credibility and led to oversight effect "greatly reduced"; secondly, to detect poorly equipped to detect the depth and breadth can't meet practical needs. Among food enterprises, government and consumers, there are serious information asymmetry. If social force can provide accurate information for the government, consumers will be able to reduce the degree of information asymmetry, reducing food safety risks. Conversely, if it cannot effectively reflect the information available to the government and consumers, it will trigger food safety risks. In addition, if the consumer associations, the media, third-party food testing institutions related practitioners in the interests of drivers, to act against ethics behavior, do not perform oversight obligations will trigger food safety risks.

3.4 Consumption

Food companies and consumers are in a position of supply and demand in the market, they're a pair of contradiction with the inevitability of conflict of interest exists between the two interests of the game. Furthermore, there is information asymmetry between businesses and consumers, enterprises in order to seek to maximize their own interests, the implementation may take advantage of the information asymmetry opportunistic behavior, harm the interests of consumers. We did a survey of food safety by asking more than 500 customers from Hubei, Jiangsu, Beijing and other provinces and cities in China, the results show a general lack of consumer knowledge related to food safety, customs are not concerned about the quality of food or hygiene; they have low risk perception, lack of self-awareness, to buy food without realizing the problem, these result in food safety risks. While consumer awareness of rights is very weak, which will condone wrongdoing business to a certain extent, accelerate the formation of a food safety risk.

3.5 Non-subjective risk triggering

Some potential risks of force majeure also lead to food safety issues.

1) Environmental Pollution. Our water, soil and others have varying degrees of pollution, in this environment a variety of harmful substances get into the food chain transfer, leading to a variety of food safety issues;

2) Natural Disasters and Climate Change. Global warming, natural disasters, to a certain extent, weakened the resilience of agricultural ecosystems, leading to greatly reduce the yield and quality, food safety problems;

3) New Technology Risks. Technological advances, more and more technologies (such as nanotechnology, gene technology), are applied to plants and animals, and ultimately be consumed by the body, the unknown nature of new technologies may bring uncertainty to the human body harm;

4) Radioactive Waste Radiation. To the human body, some radioactive substances may be acute and chronic toxicity, genetic mutation, carcinogenic, teratogenicity and other long-term effects.

4 Conclusions

Food safety issues occur frequently in modern Chinese society, largely because the interests of the game and information asymmetry under the unstuck food safety regulations. Relying solely on government is difficult to cover everything, and it is needed to establish a food safety supervision mode of which requires governments to collaborate with food producers and consumers, and the three agencies could interact (Wang Shuling and Xie Shouxiang, 2014). In this paper, we analysis the relevant subjects of the formation mechanism of food safety risks from the perspective of the food chain, and find that there are conflicts of interest and information asymmetry among the related subjects, thereby generating the phenomenon about interests of game among production-supply-distribution, government, social supervision. In the production-supply-distribution, raw material producers seek to maximize the benefits available by providing food processors inferior material and deliberately concealed this message; food processors take down the production process and other means to produce substandard products in order to reduce their production costs; local governments use outdated equipment in order to reduce regulatory costs, or do not report the relevant information to their superiors timely for their own performance, and so on. In the food distribution process, the relevant subjects will produce the relevant interests of the game caused by the economic and political interests and other factors, the issue of food security information deliberately concealed make information asymmetry between each other, triggering food safety risks.

At this stage, as the main food safety regulator, Chinese government must unite all the main coordination linkage, through the development of mechanisms and policies to reduce the information asymmetry and interests of the game between the constituent subjects, thus improving radically Chinese food Safety.

Abstract: Highway emergency support capability is a prerequisite and important guarantee for successfully implementing the transportation of emergency supplies, the deployment of emergency response teams and other emergency reopening actions. This paper firstly establishes an evaluation system of highway emergency support capability based on a document content analysis, then optimizes the index system using the Delphi method and finally develops an evaluation index system with 5 first-level indexes and 23 second-level indexes. Subsequently, on the basis of this evaluation system, it uses the analytic hierarchy process to determine the weights of each index, establishes a fuzzy comprehensive evaluation model and carries out empirical research on a specific city utilizing field survey data. This paper therefore attempts to provide a theoretical reference for improving highway emergency support capabilities.

Key words: Highway emergency support capability; Fuzzy comprehensive evaluation; Delphi method; Analytic hierarchy process

1 Introduction

There is a particular city located in the southeast area of Hubei province, which is an important transportation hub. It is located in an area where the Yangtze River waterway and the east-west 318 state road are vital passageways through Midwest China, and the south-north 209 state road is one of the important roads connecting southern and northern China. Additionally, the area surrounding this city has a high incidence of natural disasters. Therefore it is extremely important to evaluate the city's emergency support capability and propose optimization strategies in order to enhance the development of the highway support capability in Hubei province.

In the case of a disaster related emergency, a highway emergency support capability is a prerequisite and important guarantee of the successful implementation of the transportation of emergency supplies, the deployment of emergency response teams and other emergency reopening actions (Joseph Yu, 2014). Existing research on the evaluation of a highway emergency support capability mainly focuses on evaluation methods. These include the fuzzy evaluation method, analytic hierarchy process, factor analysis method, neural network method, and grey theory method. For example: Yin used the analytic hierarchy process to construct an evaluation system for a highway emergency support capability (Yin, 2012, Ju Y, 2012); Some researchers proposed the minimum deviation combined weights based evaluation model in an attempt to resolve the "polarization" effect in group decision making with diverse subjective and objective evaluation methods (Liu et al, 2014, Peng Han, 2014); and Yang and Peng indicated that it should be possible to synthesize the subjective G1 method and the objective entropy method to provide a weight for each index (Yang, 2011). These examples demonstrate that the existing research which has evaluated highway emergency support capabilities has mainly enhanced the scientificness and objectivity of evaluation outcomes through innovative evaluation methods, but has not effectively improved index systems.

This paper makes a comprehensive evaluation of the city's emergency support capability by developing an evaluation system from the perspective of fuzzy mathematics, thereby attempting to achieve objective and accurate evaluation outcomes. This paper therefore develops a relatively scientific index system for emergency support capability evaluation and applies the Delphi method to obtain a more objective evaluation. On this basis, this paper establishes a fuzzy comprehensive evaluation model and conducts empirical research using the field survey data of the city to obtain an evaluation outcome. This will hopefully offer a reference for the further enhancement of highway emergency support capabilities.

2 Research on the Index System for Highway Emergency Support Capability Evaluation

2.1 Principles of constructing an index system

The choice of the evaluation indexes is the key point of a comprehensive highway emergency support capability evaluation. Merely relying on one or several indexes with a low correlation for evaluation is undoubtedly subjective and unilateral; conversely, adopting a large number of complex indexes will inevitably result in a huge amount of data, which not only makes the process difficult to control, but also leads to the “a miss is as good as a mile” phenomenon in the outcome deviation, leading to difficulties in achieving the expected results. Therefore, this paper follows the following principles in constructing the index system: the systematic principle, scientific principle and comparable principle.

2.2 A Preliminary determination of the index system

Having considered development principles, domestic and foreign evaluation systems and both academic and practitioner research results with regard to developing a highway emergency support capability index system, this paper conducts an in-depth investigation and systematic analysis and considers industry experts' opinions to develop the index system comprehensively. At the same time, it reflects the current situation of highway emergency support from its content and constituent elements on the basis of the following government documents: Highway Traffic Emergency Plans, Public Emergency Plans in Hubei Province, Highway Traffic Public Emergency Plans in Hubei Province and Highway Traffic Emergency Support Plans in Hubei Province. The proposed index system incorporates the 7 evaluation levels as first-level indexes and further refines them into 26 second-level indexes, as shown in Table 1.

Table 1 The Index System for Highway Emergency Support Capability Evaluation

First-level index	Second-level index
emergency response team support (B ₁)	size of leading group (C ₁₁)
	status of emergency reopening teams (C ₁₂)
	status of logistics security teams (C ₁₃)
	status of expert advisory teams (C ₁₄)
	rescue capability of emergency teams (C ₁₅)
	status of emergency capacity equipment (C ₂₁)
	communication equipment of emergency command (C ₂₂)
emergency equipment support (B ₂)	status of large mechanical equipment items (C ₂₃)
	responding speed of emergency equipment (C ₂₄)
	status of emergency supply reserve (C ₃₁)
	status of emergency supply management (C ₃₂)
emergency supplies support (B ₃)	status of emergency supply repository (C ₃₃)
	responding speed of emergency supply (C ₃₄)
	status of emergency plan development (C ₄₁)
	status of emergency plan management (C ₄₂)
	frequency of emergency plan drills (C ₄₃)
emergency plan support (B ₄)	frequency of emergency plan revision (C ₄₄)
	situation of emergency plan start-up (C ₄₅)
	source of emergency fund (C ₅₁)
	status of emergency fund utilization (C ₅₂)
emergency fund support (B ₅)	evaluation of emergency fund utilization (C ₅₃)
	category of emergency fund utilization (C ₅₄)
	iteration frequency of emergency technologies (C ₆₁)
emergency technology support (B ₆)	status of emergency technologies application (C ₆₂)
	feedback speed of emergency information (C ₇₁)
	status of regional emergency information sharing (C ₇₂)
emergency information support (B ₇)	status of emergency information evaluation (C ₇₃)
	status of emergency information institutions (C ₇₄)

2.3 Revisions of the index system

When using the Delphi method, organizers analyze questionnaires and how they contribute to the research questions and consult with specified panel members to come to a consensus. Panel members have no horizontal communication, and only connect with the organizers unilaterally. After several rounds of consultation and feedback, opinions become increasingly unanimous and thus a statistically

significant and collective judgment of experts can be obtained.

For the purpose of this revision, there were two rounds of consultations after which the experts' opinions tended to be unanimous; therefore the revised results were derived after integrating these opinions. The experts consulted included senior personnel from the highway safety emergency management department, people who work in the area and academics. Thus, the advice provided was professional and representative.

2.3.1 The revision of the first-level evaluation index

The aforementioned Delphi method was utilized for the revision of the first-level evaluation index.

The active coefficient of expert refers to the collection rate of expert consultation tables, which indicates the degree of experts' interest in the research and willingness to cooperate. 9 questionnaires were distributed and collected, i.e., 100% active coefficient, for the first round of expert advice, which implies that the degree of cooperation from the experts is relatively high and the research results are of a high credibility.

The ratio of full score refers to the ratio of the number of significant experts and the total number of experts. In this round of investigation, which is the basis of determining the importance of indexes, a less than 50% ratio of full score implies that the experts believe that the significant contribution of the corresponding index in the index system is relatively low. In the second-level index system that was developed, the only index with a less than 50% ratio of full score was "emergency technology support".

The sum of grade is the aggregated score of all experts for an index. The average assignment is obtained by dividing the sum of grade by the number of experts. In the first round investigation, the evaluation opinions of "not important", "ordinarily important" and "extremely important" were assigned with 0, 1 and 2, respectively. The only indexes with a sum of grade less than 9 (the expert average assignment less than 1) were "emergency technology support" and "emergency information support".

The coordination of experts reflects the degree to which experts' evaluations fluctuate regarding the relative importance of an index. The coordination of experts is selected as the basis for judging whether there are significant differences between the experts regarding the evaluation of an index. More specifically, when the coordination of experts is larger than 0.5, there should be a relatively large difference regarding the evaluation on the corresponding index. In the first round of investigation, the only indexes with a coordination of experts larger than 0.5 were "emergency technology support" and "emergency information support".

Therefore, according to these results, the "emergency technology support" and "emergency information support" indexes should be deleted.

Table 2 The Statistics of Experts' Consultation Results in the First Round

name of first-level index	ratio of full score	sum of grade	average assignment	coordination of experts
emergency equipment support	1	14	1.555555556	0.18
emergency supplies support	1	14	1.555555556	0.22
emergency technology support	0.44	4	0.444444444	0.55
emergency fund support	0.90	12	1.333333333	0.25
emergency response team support	1	17	1.888888889	0.18
emergency plan support	1	16	1.777777778	0.18
emergency information support	0.67	8	0.888888889	0.52

2.3.2 The ranking of the significance of the first-level indexes

In the second round of investigation, 9 questionnaires were distributed and collected, i.e., 100% active coefficient. The ratios of full score of all indexes were over 90%. The evaluation opinions of "not important", "not too important", "ordinarily important", "relatively important" and "extremely important" were assigned with 1, 2, 3, 4 and 5, respectively. If each sum of grade is larger than 27, then each index is at least "ordinarily important". A coordination of experts of less than 0.25 implies that the coordination degree of experts is high and the credibility of the results is relatively high. The significance degrees of all indexes were ranked according to the weighted averages and the corresponding results are shown in Table 3.

Table 3 The Statistics of Experts' Consultation Results in the Second Round

name of second-level index	ratio of full score	sum of grade	coordination of experts	weighted average	rank
emergency equipment support	1	39	0.18	6.82	2
emergency supplies support	1	34	0.20	5.11	3
emergency fund support	0.90	30	0.25	3.96	5
emergency response team support	1	48	0.13	7.11	1
emergency plan support	1	33	0.16	4.73	4

After two rounds of experts' questionnaires and data analyses, the index system was revised: subsequently 5 refined first-level indexes as well as 23 second-level indexes constituted the index system of highway emergency support capacity evaluation.

3 A Fuzzy Comprehensive Evaluation of the Highway Emergency Support Capacity

3.1 The determination of the index set in the evaluation

After the preliminary determination and two rounds of revisions of the index system of highway emergency support capacity evaluation, an index system was obtained consisting of 5 first-level indexes and 23 second-level indexes $U=\{B_1, B_2, B_3, B_4, B_5\}$. $B_i=\{C_{i1}, C_{i2}, L, C_{ij}\}$ ($i=1, 2, L, 6$; $j=1, 2, L$)

Table 4 Index Set in the Evaluation

first-level index	second-level index
emergency response team support (B_1)	size of leading group (C_{11}) status of emergency reopening teams (C_{12}) status of logistics security teams (C_{13}) status of expert advisory teams (C_{14}) rescue capability of emergency teams (C_{15})
emergency equipment support (B_2)	status of emergency capacity equipment (C_{21}) communication equipment of emergency command (C_{22}) status of large mechanical equipment items (C_{23}) responding speed of emergency equipment (C_{24})
emergency supplies support (B_3)	status of emergency supply reserve (C_{31}) status of emergency supply management (C_{32}) status of emergency supply repository (C_{33}) responding speed of emergency supply (C_{34})
emergency plan support (B_4)	status of emergency plan development (C_{41}) status of emergency plan management (C_{42}) frequency of emergency plan drills (C_{43}) frequency of emergency plan revision (C_{44}) situation of emergency plan start-up (C_{45})
emergency fund support (B_5)	source of emergency fund (C_{51}) status of emergency fund utilization (C_{52}) evaluation of emergency fund utilization (C_{53}) category of emergency fund utilization (C_{54})

3.2 The comment set of the evaluation object

The evaluation criteria set is that which consists of all the possible evaluation results from the reviewers of the evaluation index. For the ease of experts' evaluations and grading and in accordance with the purpose of an emergency support evaluation system, the evaluation criteria set was constructed as $Y=\{Y1, Y2, Y3, Y4, Y5\}=\{\text{Excellent, Preferable, Fair, Poor, Bad}\}$, as shown in Table 5.

Table 5 The Comment Set of the Evaluation Object

level	grade range	median	level illustration
Excellent Y_1	90~100	95	completely meets the emergency support demands
Preferable Y_2	70~90	80	adequately meets the emergency support demands
Fair Y_3	60~70	65	basically meets the emergency support demands
Poor Y_4	40~60	50	less able to meet the emergency support demands
Bad Y_5	0~40	20	cannot meet the emergency support demands at all

3.3 The determination of evaluation indexes' weights

The determination of evaluation indexes' weights is one of the most critical aspects when conducting a comprehensive evaluation, as the relevance of these weights directly affects the final evaluation results. There are multiple methods for determining the weight set, and some common methods in practice are the Delphi method, group comprehensive weight, expert investigation method, and analytic hierarchy process.

This paper applies the analytic hierarchy process to obtain the comprehensive weights for indexes in each level. To this end, the relative importance of indexes in the same hierarchy has to be compared to comprehensively compute the indexes' weights on the basis of an ordered and hierarchical index system. In the analytic hierarchy process, the weight assignment of each hierarchy will affect the final result, directly or indirectly. The analytic hierarchy process combines qualitative and quantitative methods, and as a result, a complex system can be decomposed into clear and explicit factors and the accuracy of the analyzing results can be improved.

3.3.1 Establishing a judgment matrix

The analytic hierarchy process (AHP) uses mathematical methods to compute the weights reflecting the relative importance of elements in each hierarchy, computes the relative weights of all elements based on the total ordering of all hierarchies and ranks accordingly. The weight computation of first-level index is used as an example:

Table 6 The Assignment Standard of Elements in the Judgment Matrix

scale	definition
1	Indexes B_i and B_j are equally important
3	B_i is slightly more important than B_j
5	B_i is more important than B_j
7	B_i is somewhat more important than B_j
9	B_i is significantly more important than B_j
2,4,6,8	The importance degrees of the two indexes are between the odd-numbered scales
reciprocal	$B_{ij}=1/B_{ji}$, the opposite of the abovementioned results

Table 7 The Judgment Matrix of Some Experts

First-level index	team B_1	equipment B_2	supply B_3	plan B_4	fund B_5
team B_1	1	3	5	1/5	1/5
equipment B_2	1/3	1	3	1/7	1/9
supply B_3	1/5	1/3	1	1/7	1/9
plan B_4	5	7	9	1	1/3
fund B_5	5	7	9	3	1

3.3.2 An index weight and consistency check

When a person evaluates complex things, there are often some deviations: thus in order to judge whether the evaluation results have a high degree of consistency, it is necessary to conduct a consistency check. By geometrically averaging and normalizing each row vector in the judgement matrix A, it is

possible to obtain the weight vector W. Let the maximum characteristic root of A be λ_{max} , and then $AW=W\lambda_{max}$.

- 1) compute the product in each row of the judgment matrix

$$M_i = \prod_{j=1}^n b_{ij}, i = 1, 2, \dots, n \tag{1}$$

- 2) compute the geometric mean of M_i

$$\bar{W}_i = \sqrt[n]{M_i} \tag{2}$$

- 3) normalize W

$$W_i = \bar{W}_i / \sum_{i=1}^n \bar{W}_i \tag{3}$$

Table 8 The First-Level Comprehensive Weights of a Highway Emergency Support Capability

First-level index	index weight
team B_1	0.27
equipment B_2	0.13
supply B_3	0.07
plan B_4	0.18
fund B_5	0.34

- 4) compute the maximum characteristic root λ_{max} of the matrix

$$\lambda_{max} = \frac{1}{n} \sum_{i=1}^n \frac{(UW)_i}{W_i} = 5.380616403 \tag{4}$$

- 5) conduct a consistency check

The construction of a judgment matrix can reduce the interference from other factors and objectively reflect the influence of the difference between a pair of factors. However, such a matrix inevitably contains some degree of inconsistency when synthesizing all the comparison results. Hence, it is necessary to conduct a consistency check on the decision maker's judgment matrix using the following steps:

- ① compute the consistency index CI (Consistency Index)

$$CI = \frac{\lambda_{max} - n}{n - 1} = 0.0951541007 \tag{5}$$

- ② look up the corresponding mean random consistency index RI (Random Index)

In order to measure whether the judgment matrixes with different orders have a satisfactory consistence, the RI judging the mean random consistency is introduced, as shown in Table 9.

Table 9 The Mean Random Consistency Index RI

index	value								
matrix orders	1	2	3	4	5	6	7	8	9
RI	0	0	0.52	0.89	1.12	1.26	1.39	1.41	1.46

- ③ compute the consistency rate CR (Consistency Ratio)

When the order is larger than 2 and the consistency rate is $CR=CI/RI<0.10$, the judgment matrix is deemed to have a satisfactory consistency; otherwise, the judgment matrix has to be adjusted to achieve a satisfactory consistency.

$$CR = CI/RI = 0.0951541007/1.12 < 0.10 \tag{1}$$

So we think that judgment matrix has a satisfactory consistency.

Similarly, the weights for the second-level indexes could be determined, as shown in Table 10.

Table 10 The Membership Matrixes and Weights Used in Highway Emergency Support Capability Evaluation

first-level index	weight	second-level index	weight
emergency response team support (B ₁)	0.27	number of people in leading group (C ₁₁)	0.11
		number of people in emergency reopening team (C ₁₂)	0.20
		number of people in logistics security team (C ₁₃)	0.24
		status of meeting job demands (C ₁₄)	0.17
		reopening speed of emergency reopening team (C ₁₅)	0.29
emergency equipment support (B ₂)	0.13	number of emergency capacity equipment items (C ₂₁)	0.03
		status of emergency capacity equipment (C ₂₂)	0.07
		number of large mechanical equipment items (C ₂₃)	0.13
		status of large mechanical equipment items (C ₂₄)	0.27
		responding speed of emergency equipment (C ₂₅)	0.50
emergency supplies support (B ₃)	0.07	mode of emergency supply reserve (C ₃₁)	0.05
		status of emergency supply reserve and management (C ₃₂)	0.09
		number of emergency supply reserves (C ₃₃)	0.15
		radiation range of emergency supply repository (C ₃₄)	0.28
		responding speed of emergency supply (C ₃₅)	0.43
emergency plan support (B ₄)	0.18	category of emergency plan (C ₄₁)	0.16
		frequency of emergency plan drills (C ₄₃)	0.16
		frequency of emergency plan revision (C ₄₄)	0.30
		status of reopening according to emergency plan (C ₄₅)	0.38
emergency fund support (B ₅)	0.34	source of emergency fund (C ₅₁)	0.07
		category of emergency fund utilization (C ₅₂)	0.10
		status of meeting reopening demands (C ₅₃)	0.45
		evaluation of emergency fund utilization (C ₅₄)	0.38

3.4 Constructing the model of fuzzy comprehensive evaluation

3.4.1 Establishing the membership matrix

It is necessary to transform the indexes' value into the eigenvalues of judgment matrixes by using the membership function. The comment set of highway emergency support capability evaluation in Hubei province is Y={Excellent, Preferable, Fair, Poor, Bad} and the affiliation is obtained by statistics. For each index i, there is an evaluation membership matrix R_i.

$$R_i = \begin{bmatrix} r_{11} & r_{12} & L & r_{15} \\ r_{21} & r_{22} & L & r_{25} \\ L & L & L & L \\ r_{m1} & r_{m2} & L & r_{m5} \end{bmatrix} \tag{1}$$

(m is the number of second-level indexes in the i-th first-level index, i=1, 2, 3...5.)

3.4.2 Establishing the evaluation model

In summary, by conducting the fuzzy operation and normalizing the fuzzy evaluation matrix and the weight vectors of factors, the set of fuzzy comprehensive evaluation results will be obtained. As a result, U - the set of evaluation indexes, Y - the set of evaluation standards, W - the set of comprehensive weights and R - the set of evaluation membership matrixes constitute the comprehensive hierarchy evaluation model E of the highway emergency support system in Hubei province.

$$E = W * R = \{W_1, W_2, \dots, W_n\} \begin{bmatrix} r_{11} & r_{12} & L & r_{15} \\ r_{21} & r_{22} & L & r_{25} \\ L & L & L & L \\ r_{m1} & r_{m2} & L & r_{m5} \end{bmatrix} = (b_1, b_2, L, b_5) \quad (2)$$

4 Results

To validate both the rationality of the proposed index system of highway emergency support capability evaluation, and the operability and applicability of the fuzzy comprehensive evaluation model, the field survey data of a particular city are selected so that mathematical calculations can be performed. The detailed data are shown in Table 11.

Table 11 The Index System Data Sheet of the Highway Emergency Support Capability

first-level index	weight	second-level index	weight	evaluation of a particular city				
				Excellent	Preferable	Fair	Poor	Bad
emergency response team support	0.31	number of people in leading group (C ₁₁)	0.11	0.176	0.118	0.353	0.118	0.235
		number of people in emergency reopening team (C ₁₂)	0.20	0.059	0.118	0.294	0.412	0.118

		category of emergency fund utilization (C ₅₂)	0.10	0.824	0.059	0.000	0.000	0.118
		status of meeting reopening demands (C ₅₃)	0.45	0.000	0.000	0.235	0.588	0.176
		evaluation of emergency fund utilization (C ₅₄)	0.38	0.176	0.294	0.412	0.000	0.118

4.1 The fuzzy comprehensive evaluation in the first stage

Based on the data in Table 10, the data were processed using the membership function to obtain the eigenvalues of the evaluation matrix. The membership judging matrix of the first-level index B_1 is:

$$R_1 = \begin{Bmatrix} 0.176 & 0.118 & 0.353 & 0.118 & 0.235 \\ 0.059 & 0.118 & 0.294 & 0.412 & 0.176 \\ 0.059 & 0.353 & 0.412 & 0.118 & 0.059 \\ 0.059 & 0.118 & 0.471 & 0.235 & 0.059 \\ 0.059 & 0.176 & 0.706 & 0.059 & 0.000 \end{Bmatrix} \quad (1)$$

The membership vector of the first-level index B_1 (emergency response team) is:

$$E_1 = W_1 * R_1 = \{0.017 \quad 0.174 \quad 0.480 \quad 0.202 \quad 0.073\} \quad (2)$$

The final score in the fuzzy comprehensive evaluation of the city's highway emergency support capability is 63.46419044 and the rating is "Fair".

Similarly, the membership vectors of B_2 (emergency equipment support), B_3 (emergency supplies support), B_4 (emergency plan support) and B_5 (emergency fund support) are respectively:

$$E_2 = W_2 * R_2 = \{0.063 \quad 0.192 \quad 0.595 \quad 0.108 \quad 0.042\} \quad (3)$$

The comprehensive evaluation is 66.26692127, the rating is "Fair".

$$E_3 = W_3 * R_3 = \{0.308 \quad 0.260 \quad 0.381 \quad 0.000 \quad 0.050\} \quad (4)$$

The comprehensive evaluation is 75.88301479, the rating is "Preferable".

$$E_4 = W_4 * R_4 = \{0.325 \quad 0.177 \quad 0.158 \quad 0.067 \quad 0.273\} \quad (5)$$

The comprehensive evaluation is 64.13038411, the rating is "Fair".

$$E_5 = W_5 * R_5 = \{0.311 \quad 0.164 \quad 0.164 \quad 0.082 \quad 0.280\} \quad (6)$$

The comprehensive evaluation is 62.98425485, the rating is "Fair".

4.2 The fuzzy comprehensive evaluation in the second stage

By applying the derived weight vectors of the first-level indexes, it is possible to calculate the evaluation results of the city's highway emergency support system as:

$$E = W * R = \{0.199 \quad 0.182 \quad 0.324 \quad 0.113 \quad 0.156\} \quad (1)$$

The results show that the percentages of the city's highway emergency support system evaluated as "Excellent", "Preferable", "Fair", "Poor" and "Bad" are 19.9%, 18.2%, 32.4%, 11.3% and 15.6%, respectively. According to the group median of each evaluation rank, the comprehensive evaluation score is 63.34240456, which means that the capacity of this city's highway emergency support system is rated as fair.

Based on the computations of the fuzzy comprehensive evaluation model above, the comprehensive evaluation score of this city's highway emergency support capability is 63.34240456, in other words, it is fair according to the evaluation criteria. The detailed scores and ranks of the indexes are presented in Table 12.

From the results it can be seen that there are 3 indexes that are evaluated as "Preferable", including the responding speed of emergency supply, the category of emergency fund utilization and the number of emergency supply repositories. 8 indexes are evaluated as "Fair" including the evaluation of emergency fund utilization, the reopening speed of the emergency reopening team, and the status of meeting job demands. The 7 indexes with a score of less than 60 are the number of people in the leading group, the number of people in the emergency reopening team, the status of large mechanical equipment items, the number of emergency capacity equipment items, the frequency of emergency plan revision, the frequency of emergency plan drills and the status of meeting reopening demands; moreover the scores of the number of emergency capacity equipment items and the frequency of emergency plan drills are especially low.

We can see from the weights calculated by the analytic hierarchy process that the emergency response team support and the emergency fund support account for a large proportion of the first-level index, while the status of meeting reopening demands, the responding speed of emergency supply, the status of reopening according to the emergency plan, the evaluation of emergency fund utilization and others, account for a large proportion of the second-level index. Therefore, these indexes should be regarded as the key development targets; however, the development of other indexes should not be ignored.

Table 12 The Evaluation Results of the Second-Level Index

second-level index	weight	evaluation results	serial number
responding speed of emergency supply (C ₃₅)	0.43	87.941	1
category of emergency fund utilization (C ₅₂)	0.1	85.294	2
number of emergency supply repositories (C ₃₃)	0.15	80	3
category of emergency plan (C ₄₁)	0.16	79.118	4
status of emergency supply reserve and management (C ₃₂)	0.09	77.353	5
number of large mechanical equipment items (C ₂₃)	0.13	75.588	6
status of reopening according to emergency plan (C ₄₅)	0.38	73.824	7
responding speed of emergency equipment (C ₂₅)	0.5	70.294	8
evaluation of emergency fund utilization (C ₅₄)	0.38	69.412	9
reopening speed of emergency reopening team (C ₁₅)	0.29	68.529	10
status of meeting job demands (C ₁₃)	0.17	67.647	11
mode of emergency supply reserve (C ₃₁)	0.05	65	12
radiation range of emergency supply repository (C ₃₄)	0.28	65	13
number of people in logistics security team (C ₁₄)	0.24	61.471	14
status of emergency capacity equipment (C ₂₂)	0.07	60.588	15
source of emergency fund (C ₅₁)	0.07	60.588	16
number of people in leading group (C ₁₁)	0.11	59.706	17
status of large mechanical equipment items (C ₂₄)	0.27	58.824	18
number of people in emergency reopening team (C ₁₂)	0.2	57.059	19
frequency of emergency plan revision (C ₄₄)	0.3	57.059	20
status of meeting reopening demands (C ₅₃)	0.45	48.235	21
number of emergency capacity equipment items (C ₂₁)	0.03	40.294	22
frequency of emergency plan drills (C ₄₃)	0.16	39.412	23

5 Conclusions

For the indexes with a low score in the city's highway emergency support capability, this paper proposes the following optimizing strategies:

1) In order to develop the support capability of the city's emergency responding team, it will be necessary to increase the number of leaders in the emergency leading group, improve the emergency command system and enhance the emergency command capability. Moreover, the grass-rooted emergency reopening team needs to be enhanced by the inclusion of a combination of professionals and part-time workers as well as volunteers. On the one hand, the professional emergency reopening teams need to be strengthened, but on the other hand, their strengths should be utilized and emergency responding work needs to be carried out in an orderly manner under the supervision of emergency management institutions.

2) In order to enhance the capability of the city's emergency equipment support, it will be

necessary to increase the number of emergency capacity equipment items and large mechanical equipment items. Specifically, on the one hand, increase the amount of investment and certain emergency equipment items according to the total number of highway miles in each city and county; and on the other hand, sign agreements with local large-scale machinery equipment leasing manufacturers, in order that emergency equipment can meet the demand in emergency situations by being augmented by leased equipment.

3) Finally it will be necessary to increase the frequency of pre-disaster drills as outlined in emergency plans, and evaluate and resolve the problems revealed by the drills in a timely manner. On this basis, the emergency plan should be revised and a dynamically optimized emergency planning system established.

Construction of the Personnel Management Informatization at the Era of “Internet+”

Feng Chengjin

Human Resource Department, Wuhan University of Technology, Wuhan, P.R. China, 430070
(E-mail: 147487387@qq.com)

Abstract: Under the background of comprehensive reform of universities and the personnel system, how to integrate the Internet technology and traditional personnel management will undoubtedly become the opportunities and challenges for university personnel department. This article deeply analysis the importance and urgency of information technology by comparative analysis and extensive research, and describes in detail from demand analysis, structure design, function module design, system database and so on. The system is tested by the samples and the results of the experiment show that: The system can realize the basic multi-level personnel management operation function, has friendly man-machine interaction interface and good expansibility, can guarantee the real-time and accuracy of the database information, which improve the efficiency of personnel management and promote the university management work.

Key words: Internet +; Personnel management; Information technology; Platform construction

1 Introduction

With the new generation of information technology and innovation 2.0 interactions and development, people's lifestyles, work, organization, social forms are undergoing profound changes. "Internet +" is a new forms, new formats, which is the integration of Internet and traditional industries under innovative 2.0. And it is the new normal of economic and social development, that Morphological evolution of the Internet and the birth of ,driven by the innovation of the knowledge society 2.01 .

Under this new normal social development, personnel management information on personnel management in the universities is particularly important. As an important part of university information technology, personnel management information is conducive to promoting the process of modernization of personnel management; improve the level of Personnel Management. Current College Personnel Management Information has been realized, to personnel management work to bring a qualitative leap, greatly improving the efficiency of personnel management. But we should also see that the current situation of personnel management, information technology is not optimistic, there are still slow to update data, insufficient information processing capability, information management system is not perfect and other issues.

In terms of colleges and universities, The practical significance of 'Internet +' lies in the Internet innovation deeply integrated into the teaching reform of colleges and universities, Fusion in the personnel management of colleges and universities, promotes personnel management information construction of colleges and universities, actively builds the big data, big platform and application of colleges and universities. Promote the efficiency and service quality of college personnel information management, form new form of personnel management and service supported by "Internet +".

2 Thoughts of Personnel Management Informatization Construction

With the continuous development of Internet technology and the needs of expanding the personnel management function, personnel management information construction in colleges and universities should constantly change work idea, innovative work style, gradually construct a multi-level, multi-dimensional informatization development organic system, promote data resources integration between teaching, scientific research and relevant departments, to realize information resources sharing, In favor of the information management system of unified planning and unified coordination, finally realizing the wisdom campus of big data, platform, and application(Deliger,2010).

2.1 Personnel must reduce the decentralization, practice the concept from management to service

Along with the arrival of information age, personnel management of university are also in the ongoing reform, but a lot of universities is not still get rid of the management mode under the planned economic system, management system and management idea obsolete. Universities often spread that

¹ "Internet plus" activated more information energy. Guangming Wang, 2015.07.01

“The personnel department do not do what they should do” and “The personnel department is not the people can do” (Jun Zhao, 2015). The former highlights the phenomenon that current personnel lack service consciousness, the latter from the side reflects the complexity of the personnel work. In order to promote the reform of higher education and the personnel system reform better, the personnel department of universities must innovative work ideas, take the concept of "people-oriented" through the whole process of the personnel management work, try to reduce the decentralization, overall arrangement, coordination and cooperation, actively carry out the management consciousness to the service work. Personnel management information is not in order to control better, or just in order to improve the efficiency of management, but in order to provide better public services for the majority of teachers and students staff, finally realizes the important change of that the service is management.

2.2 Personnel management must optimize business processes, adopt the mode of the combination of offline and online.

Personnel Affairs clue more information cumbersome, and is closely linked with the interests of the faculty. In order to complete the work faster and better, the personnel department must continually review and refine the work content, optimize the business process, actively push forward the "five one" working mode which means post management as the basis, salary welfare as the gripper, talent work as the key, information sharing for the protection, data reporting as the carrier, actively adopt the mode of the combination of offline and online job. Pushing forward the construction of the informatization cannot move the works on the line from offline simply, working online can't completely replace work offline. From offline to online is the developing trend of The Times, it is an effective way to optimize allocation of manpower and resources, online operation can online as far as possible to deal with, This requires a combination ensures unimpeded communication channels, things which can't be online operation is still in use offline. The transformation from offline to online is a process of constantly to improve college personnel management informationization, and this is a gradual process that need to work in the personnel department in the constant practice and exploration (Zhan Wang, 2008).

2.3 Personnel management must promote information management system, improve the work efficiency and service quality.

The personnel management work of universities are very complicated work, they are random city, dynamic, and strong repeatability. Information construction must promote the combination of the existing Internet technology with traditional personnel management work effectively and establish the personnel management information system that satisfies the daily work. The construction of personnel management information system, firstly, we should regard personnel file information as breakthrough, Organize a large number of personnel basic information and programmed information resources well, in order to ensure the information collected timeliness and accuracy from the source; Secondly, we should formulate strict specification information work, form a unified data storage, transmission and application of the standard, as far as possible to avoid data redundancy, to ensure the consistency of data in the process of using information; Thirdly, information management system need to focus on the integration of multidisciplinary, especially introduced scientific statistical theory and methods, to facilitate the existing information processing to reflect the dynamic changes of the personnel information data timely, objective and accurate. So as to implement the data information of application and the function of regeneration; finally, information management system should combine digital campus network and web portal, By means of advanced information technology and media to realize information resources sharing, realize the link of the information seamless between the personnel department, the educational administration department, research department and other related functional organizations to Improve the utilization rate of information to a great extent(Shaofeng Zheng, Pingping Wang,2009).

3 The Information Platform Construction of Personnel Management

Under the general background that the information technology changes rapidly and the school's comprehensive reform as well as personnel system reform advance totally, the reform of the personnel management system need more rapid advance. Personnel information, job information and salary information relating to the personnel department of many colleges and universities are usually managed by Excel or FoxPro and other office software. Some colleges and universities also build the software system of LAN environment to assist the daily management work. So to say, all these lay a good material foundation for the construction of information platform. Personnel management information platform should start from the actual situation of colleges and universities ensure the construction of a unified planning and centralized management, avoid redundant construction. Not only need it to include

all basic business of personnel department, but also to realize the correlation between the various functional departments. The whole platform mainly consists of four parts: core business module, the object module, collaborative module as well as supporting module. As shown in figure 4-1(Haijun Zeng, Ruiqiu Sun, 2015).

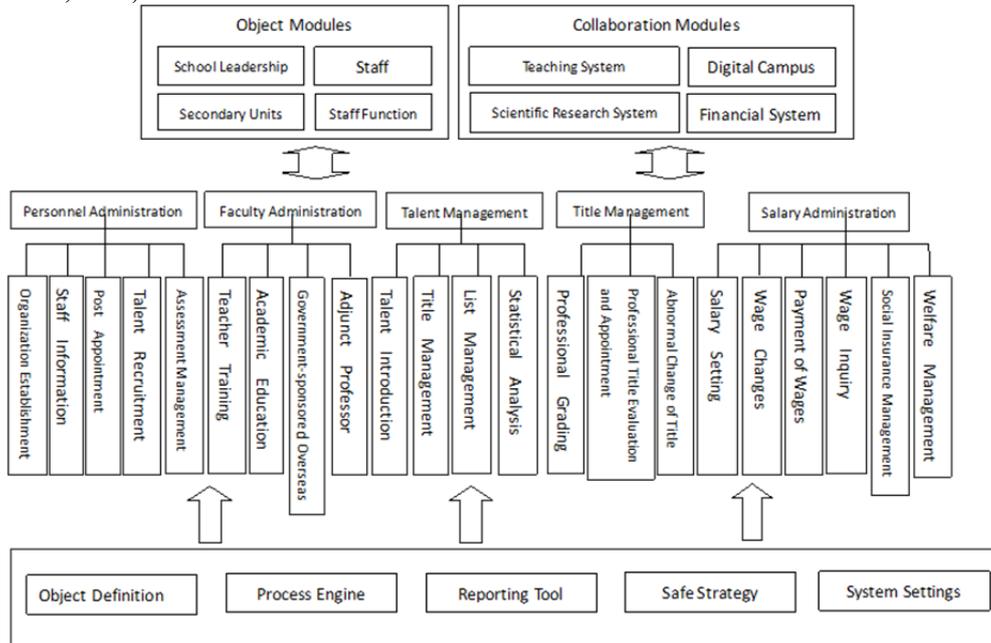

Figure 1 The System Block Diagram of the Personnel Management Information Platform

3.1 The core business module

The core business module including all daily works of the personnel department, mainly adopt the mode that all information are managed systematically according to the duty, combined with the specialist maintenance of each department to entrust. It is divided into five modules, including the personnel management, teacher management, talent management, job management and salary management. This core business module manages the school staffs’ whole relevant information from taking work to personnel changes or retirement. Specific classification is shown in table 4-1. System will divide sections into different working groups and authorize each department different authority according to the specific responsibilities, so that each group only has operating rights for their own management of data information, but for the rest of the data they just has access only to browse and query.

Table 1 Core Business Module Classification

Sub Modules	Specific Items	Function Declarations
Personnel Management	Organization Establishment	Establishment and revocation of an organization. The personnel allocation, statistics and monitoring.
	Staff Information	Basic information management of teaching and administrative staff, information inquiry, statistics and analysis of staff.
	Post Appointment	Post release, declaration, review and evaluation.
	Talent Recruitment	Recruitment website creation, maintenance, management and recruitment of professional and technical personnel.
	Assessment Management	The staff annual appraisal and engagement examination.
Faculty Management	Teacher Training	Training plan management. Teacher training statistics and analysis.
	Academic Education	Application and review of academic qualifications. Statistics and analysis of academic record.
	Government-sponsored Overseas	Application and review of Government-sponsored Overseas. Statistics and analysis of going abroad record.
	Adjunct Professor	Appointment, reappointment and dismissal of adjunct professor.

Talent Management	Talent Introduction	Formulation and implementation of the high level talent introduction plan.
	Title Management	Maintenance of high level talent title or talent project information.
	List Management	Get talent title or talent project staff list maintenance.
	Statistical Analysis	Associated with personnel and unit information, do Statistical analysis of high level talents.
Title Management	Professional Grading	Principles and objectives of professional and technical post classification.
	Professional Title Evaluation and Appointment	Declaration, evaluation and appointment of professional titles.
	Abnormal Change of Title	The change of title information associated with the personnel information.
Salary Management	Salary Setting	The definition of the standard of salary payment, the condition setting, the formula setting.
	Wage Changes	The wage change notification, confirmation for handling and feedback.
	Payment of Wages	Automatically generate monthly payroll data and changes in the form of statements of data.
	Wage Inquiry	Payroll information, changes in the situation of inquiries, export, print.
	Social Insurance Management	Types of insurance, base, set and adjust the formula, and wage information related.
	Welfare Management	Pension and disability allowance, difficulties subsidies and other application, examination, registration, payment.

3.2 The object module

According to the service object and the different types of business, object module including four parts, consists of school leaders, teachers, secondary units and functional organization. Object module's designs are based on the concept of "people-oriented", by the information management and service of the faculty as the main line, open to all kinds of faculty and secondary units, as well as service for decision-making of leadership of the school. Similar to the core business module, the system will set different user permissions according to different objects, in order to ensure the timeliness, accuracy and security of data. For example, when faculty come into the college, the system will assigns the user name (usually the No.) for the worker, by which the user can register and login the system, and they can input their own information, query, can online title appraisal, annual examination and approval of the business, also can print all kinds of reports required for business; But when the information occurs error or change, staff must submit an application for change, after that the related personnel department will review and modify.

3.3 The collaboration module

The structure of the collaboration module is on the basis of a good platform with digital campus network, mainly relating to the financial system, the scientific research system and teaching system. The purpose is to establish a unified data exchange platform between information systems in relevant secondary units in school or department, thus we can integrate the information of staffs within a unified information system, meanwhile provide standards, norms, safety and rich data resources to each other, promote the personnel, finance, scientific research and teaching departments to better serve the school's overall strategic planning and each work of the school carried smoothly, cooperation and exchange, so as to realize seamless link of information between departments, realize the benign interaction of information support, improve, the information service (Haijun Zeng, Ruiqiu Sun, 2015).

3.4 The supporting module

In order to ensure the flexible configuration of the whole system and stable operation, convenient to integrate multiple information system, and provide information searching, statistics, data analysis and other functions to each user, design is required for a platform to build the perfect support module. Support module is mainly used for the definition of business object, interface settings, workflow monitoring of production, output and print, all kinds of statements and the design of the security policy.

4 Conclusions

The construction of information platform of college personnel management, can not only improve the resource utilization rate and the work efficiency, ensure the personnel information timely, accurate, security to the greatest extent and simplifying the process, reduce the information redundancy and information asymmetry caused by human factors, but also conducive to promote the construction of college office style of work. Colleges and universities should follow the rule of development of information technology, continue to strengthen organization and leadership, and gradually improve the quality of information and personnel workers, continue to improve and optimize the management information level in practice, so as to promote faster and better development of university information.

A Research on Risk Management of Agent Construction System of Engineering Project

Li Gang

Capital Construction Department, Wuhan University of Technology, Wuhan, P.R. China, 430070
(E-mail: 540405111@qq.com)

Abstract: As a new model of engineering management, the agent construction system not only improve the level of the engineering project management, but also enhance the efficiency of project management. But actually, there are still many risks in the process of project construction. Focusing on the risk of agent construction system in engineering project, this paper analyzes the origin of the risk. The study applies the means of risk control and risk transfer, and establishes comprehensive risk index system through case study. The system can be applied to scientifically evaluate level of risk and standardize management risk.

Key words: Engineering projects; Agent construction system; Construction agency; Risk management

1 Introduction

Project agent construction system derived from America's construction manager system (CM system). CM system means the owner of a project entrusted the construction manager to be responsible for the management of the entire project. The manager has to manage things including feasibility study, design, procurement, construction, commissioning, etc. The project cost is not included. Project agent construction system can take different mode of agent construction according to the characteristics of the project. General project agent construction may apply Project Management model (PM) or Project Management Contract model (PMC). Agent construction system that takes design as its leading task includes Enterprise Project Management mode (EPM) and engineering general contracting mode (EPC). In July 2004, the government issued "the decision of the State Council on the reform of investment system", clearly put forward that the non-operating government investment projects must accelerate the implementation of agent construction system. Compared to other project construction management systems, agent construction system has six advantages, followed by decision-making of the project gets more scientific and thorough; project management level and work efficiency is greatly improved; real implementation of project contra; give full play to the role of competition mechanism; it's conducive to curb corruption; Government regulation of the project gets enhanced.

There are DBB, DB, BT, BOT, EPC and other models in the overseas. Ann V.A (1993) shows that the principal project in order to obtain greater benefits, choose a smaller cost delegate, delegate to obtain greater benefits. It is important to build relations on behalf of the establishment; David Baccarini (1999) through the use of the logical framework approach, the project goal into cost target, output targets, expected earnings target, in order to achieve successful project management; M. Bertolini (2006) that the non-profit government investment projects due to quality and schedule constraints, the tender price given appropriate discounts can increase the likelihood of where the subject should therefore Analytic Hierarchy Process (AHP) the risk of the project shall be evaluated to provide decision-making basis for the contract project.

Domestic scholars mainly analyze the project risk factors acting system. Ding yijun(2013) analyzed the construction units in construction contract, project preparatory stage and the implementation of risk exists, and puts forward some corresponding preventive measures; Gao junfang(2013)describes the system mode forms of agent construction project, and he thought the risks mainly from the project environmental system, project subject, the process of project management and the project objectives; Lijia.and Tengjin (2014) from occurring and types of agent risk management model of risk analysis, think that there is job risk, policy risk, system risk and risk behavior subject such as four major categories.

However, it has to be clearly recognized that, agent construction project has a lot of uncertain factors, since it goes through a entire process from the project initiated, financing, transfer to operation, involving many of the subject such as project owners, construction agency, supervision units and contractors. Generally speaking, there is risk from four stages in project agent construction system, which is decision-making, design, construction and completion. Through recognition of the above four stage risk, studying into a specific case as the research object, this paper constructs project risk evaluation index system to carry out a comprehensive and in-depth research.

2 The Advantage of Agent Construction System

The advantage of agent construction system is mainly manifested in the following six o'clock.

Firstly, decision-making of the project gets more scientific and thorough. Since the feasibility study not only needs to meet the requirements of the government, but also has to satisfy the needs of the follow-up work of the project. Implementing agent construction system, the owner of the project entrusts construction agency to do the preparatory work. The agency may seek for professional consulting agency to do the work, so that the owner needn't to do the decision by themselves.

Secondly, project management level and work efficiency is greatly improved. Under the agent construction system, since the agency is selected by bidding, it is often a consulting organization that is specialized in project investment and construction management and is familiar with the whole process of construction. They own a large number of professionals and have rich experience and knowledge in project construction management.

Thirdly, real implementation of project control. The implementation of agent construction system introduces legality construction mechanism, which takes strict contract management as core, to government investment projects. In the premise of meeting the function of the project, the investment, schedule and quality requirements of the project once confirmed in the commission contract between clients and construct agency, shall not be altered arbitrarily.

Fourth, give full play to the role of competition mechanism. Since agent construction system uses multi-channel bidding procurement, the whole process is fully competitive. The construction agency, pre bid consulting agency, construction units or supplier of equipment and materials will do its utmost to provide the optimal technology solutions, services and products with reasonable price. It not only helps to reduce the total cost of the project, but also to optimize the project.

Fifth, it's conducive to curb corruption. The implementation of agent construction system will break the pattern of "investment, construction, management and use" in the current government investment system, which makes all sectors separated from each other and restricting each other.

Sixth, Government regulation of the project gets enhanced. Through the division of responsibilities, the project construction parties supervise each other's work. The sense of responsibility of the parties has been strengthened.

3 Risk Evaluation

3.1 Establish evaluation index system

1) Determine the risk list

First of all, use flow chart analysis to analyze the process of the whole project. The whole process can be divided into four stages: planning, design, construction, completion, as shown in table 1:

Table 1 Potential Risk List for Each Stage of the Project

Agent construction contract risk	Design management risk	Construction progress risk	Project settlement risk
Engineering feasibility study risk	Demolition risk	risk	Contract Close-out risk
Financing risk	Design bidding risk	Safety risk around construction site	Stakeholder risk
Bidding risk	Organizational coordination risk	Quality risk	moral hazard
Approval procedures risk	Excessive authority risk	Risk of contract risk cost control
.....	Technology risk	Management risk	
	Regulatory risk	
		
Decision-making stage	Design stage	Construction stage	Completion stage

Secondly, using expert investigation method, we invite 20 experts to rate probability (P) and the loss degree (L) of each risk factor in the risk list according to the existing conditions of the project. The rate has five grades from low to high according to the standard of 1-5 Points Scoring. Calculate the score of each risk factor according to the following formula.

$$R_i = \frac{1}{n} \sum_{t=1}^n P_{it} \times L_{it} \quad (1)$$

R_i is the comprehensive score of risk factor i; P_{it} is the score that expert t rates the probability of risk factors i at; L_{it} is the score that expert t rates the loss degree of risk factors i at.

Finally, calculate risk value according to the expert scoring, as shown in table 2:

Table 2 Experts' rates at Risk Factors

Project stage	Risk factor	Risk value
Decision-making stage	Agent construction contract risk	8
	Engineering feasibility study risk	12
	Financing risk	15
	Bidding risk	3
	Approval procedures risk	3
Design stage	Design management risk	12
	Demolition risk	14
	Design bidding risk	9
	Organizational coordination risk	10
	Excessive authority risk	6
Construction stage	Construction progress risk	20
	Safety risk around construction site	9
	Quality risk	10
	Risk of contract risk cost control	24
	Management risk	6
	Regulatory risk	8
	moral hazard	5
Completion stage	Project settlement risk	14
	Contract Close-out risk	12
	Stakeholder risk	10
	moral hazard	2

2) Determine the risk evaluation index system

According to the expert evaluation results above, combined with the project's actual condition and operation, the factors of low risk level are removed. The project risk index system includes 4 first-level index and 17 second level index, as shown in Table 3:

Table 3 The Project Risk index System

Object level	First-level index	Second level index
Total object X	Decision-making stage X ₁	Agent construction contract risk X ₁₁
		Engineering feasibility study risk X ₁₂
		Financing risk X ₁₃
	Design stage X ₂	Design management risk X ₂₁
		Demolition risk X ₂₂
		Design bidding risk X ₂₃
		Organizational coordination risk X ₂₄
		Excessive authority risk X ₂₅
	Construction stage X ₃	Construction progress risk X ₃₁
		Safety risk around construction site X ₃₂
		Quality risk X ₃₃
		Risk of contract risk cost control X ₃₄
		Management risk X ₃₅
		Regulatory risk X ₃₆
	Completion stage X ₄	Project settlement risk X ₄₁
		Contract Close-out risk X ₄₂
		Stakeholder risk X ₄₃

3.2 Calculation of risk evaluation value

1) Establish the index set X for risk evaluation

$$X = \{x_1, x_2, x_3, x_4\} \tag{2}$$

The sub index sets are:

$$X_1 = \{x_{11}, x_{12}, x_{13}\} \tag{3}$$

$$X_2 = \{x_{21}, x_{22}, x_{23}, x_{24}, x_{25}\} \tag{4}$$

$$X_3 = \{x_{31}, x_{32}, x_{33}, x_{34}, x_{35}, x_{36}\} \tag{5}$$

$$X_4 = \{x_{41}, x_{42}, x_{43}\} \tag{6}$$

2) Determine the weight of each index

According to the results of the expert investigation method, the weight of each index is determined by using analytic hierarchy process.

We get the weight set of the index as follow:

$$W = \{0.20, 0.33, 0.30, 0.17\} \tag{7}$$

$$w_1 = \{0.23, 0.33, 0.44\} \tag{8}$$

$$w_2 = \{0.26, 0.30, 0.15, 0.17, 0.12\} \tag{9}$$

$$w_3 = \{0.22, 0.16, 0.18, 0.26, 0.08, 0.10\} \tag{10}$$

$$w_4 = \{0.42, 0.32, 0.26\} \tag{11}$$

3) Determine the evaluation set

There is 5 risk assessment level from low to high score, corresponding to a score of 1,2,3,4,5. The evaluation set is:

$$V = \{1,2,3,4,5\} \tag{12}$$

4) Constructing fuzzy relation matrix

The research invites 20 experts in related fields to score all the risk factors. The result of the scoring is shown in table 3:

Table 4 Risk Factors Evaluation Level Summary Table

Object level	first-level index	Second level index	evaluation grade				
			Low	Relatively low	Middle	Relatively high	High
X	X ₁	X ₁₁	0	5	14	1	0
		X ₁₂	0	2	5	11	2
		X ₁₃	0	0	4	14	2
	X ₂	X ₂₁	0	1	7	10	2
		X ₂₂	0	2	6	12	0
		X ₂₃	3	4	12	1	0
		X ₂₄	1	5	10	4	0
		X ₂₅	3	12	5	0	0
	X ₃	X ₃₁	0	0	2	10	8
		X ₃₂	2	5	9	4	0
		X ₃₃	0	2	15	3	0
		X ₃₄	0	0	3	5	12
		X ₃₅	4	12	4	0	0
		X ₃₆	4	14	2	0	0
	X ₄	X ₄₁	0	0	3	14	3
		X ₄₂	0	0	6	12	2
		X ₄₃	0	1	14	5	0

We get the membership matrix of comment set as follow:

$$R_1 = \begin{pmatrix} 0 & 0.25 & 0.7 & 0.05 & 0 \\ 0 & 0.1 & 0.25 & 0.55 & 0.1 \\ 0 & 0 & 0.2 & 0.7 & 0.1 \end{pmatrix} \tag{13}$$

$$R_2 = \begin{pmatrix} 0 & 0.05 & 0.35 & 0.5 & 0.1 \\ 0 & 0.1 & 0.3 & 0.6 & 0 \\ 0.15 & 0.2 & 0.6 & 0.05 & 0 \\ 0.05 & 0.25 & 0.5 & 0.2 & 0 \\ 0.15 & 0.6 & 0.25 & 0 & 0 \end{pmatrix} \quad (14)$$

$$R_3 = \begin{pmatrix} 0 & 0 & 0.1 & 0.5 & 0.4 \\ 0.1 & 0.25 & 0.45 & 0.2 & 0 \\ 0 & 0.1 & 0.75 & 0.15 & 0 \\ 0 & 0 & 0.15 & 0.25 & 0.6 \\ 0.2 & 0.6 & 0.2 & 0 & 0 \\ 0.2 & 0.7 & 0.1 & 0 & 0 \end{pmatrix} \quad (15)$$

$$R_4 = \begin{pmatrix} 0 & 0 & 0.15 & 0.7 & 0.15 \\ 0 & 0 & 0.3 & 0.6 & 0.1 \\ 0 & 0.05 & 0.7 & 0.25 & 0 \end{pmatrix} \quad (16)$$

5) Calculate the fuzzy comprehensive evaluation set

We get the fuzzy comprehensive evaluation set as follow:

$$S_1 = w_1 \times R_1 = (0 \quad 0.0905 \quad 0.3315 \quad 0.501 \quad 0.077) \quad (17)$$

$$S_2 = w_2 \times R_2 = (0.049 \quad 0.1875 \quad 0.386 \quad 0.3515 \quad 0.026) \quad (18)$$

$$S_3 = w_3 \times R_3 = (0.052 \quad 0.176 \quad 0.294 \quad 0.234 \quad 0.244) \quad (19)$$

$$S_4 = w_4 \times R_4 = (0 \quad 0.013 \quad 0.341 \quad 0.551 \quad 0.095) \quad (20)$$

The membership matrix R of the real estate project investment risk object level index X on the evaluation set V is shown as follow:

$$R = \begin{pmatrix} 0 & 0.0905 & 0.3315 & 0.501 & 0.077 \\ 0.049 & 0.1875 & 0.386 & 0.3515 & 0.026 \\ 0.052 & 0.176 & 0.294 & 0.234 & 0.244 \\ 0 & 0.013 & 0.341 & 0.551 & 0.095 \end{pmatrix} \quad (21)$$

Finally, we get the fuzzy comprehensive evaluation set S of the project as follow:

$$S = W \times R = (0.03177 \quad 0.14489 \quad 0.36295 \quad 0.38007 \quad 0.11333) \quad (22)$$

6) The comparison result

The corresponding score of evaluation set is set as: $V_1 = 1, V_2 = 2, V_3 = 3, V_4 = 4, V_5 = 5$.

The investment risk comprehensive evaluation value of the real estate project:

$$N = S \times V^t = (0.03177 \quad 0.14489 \quad 0.36295 \quad 0.38007 \quad 0.11333) \times (1 \quad 2 \quad 3 \quad 4 \quad 5)^t = 3.4973 \quad (23)$$

The evaluation value of the investment risk index of the real estate project is shown as follow:

$$N_1 = S_1 \times V^t = (0 \quad 0.0905 \quad 0.3315 \quad 0.501 \quad 0.077) \times (1 \quad 2 \quad 3 \quad 4 \quad 5)^t = 4.01 \quad (24)$$

$$N_2 = S_2 \times V^t = (0.049 \quad 0.1875 \quad 0.386 \quad 0.3515 \quad 0.026) \times (1 \quad 2 \quad 3 \quad 4 \quad 5)^t = 3.118 \quad (25)$$

$$N_3 = S_3 \times V^t = (0.052 \quad 0.176 \quad 0.294 \quad 0.234 \quad 0.244) \times (1 \quad 2 \quad 3 \quad 4 \quad 5)^t = 3.442 \quad (26)$$

$$N_4 = S_4 \times V^t = (0 \quad 0.013 \quad 0.341 \quad 0.551 \quad 0.095) \times (1 \quad 2 \quad 3 \quad 4 \quad 5)^t = 3.728 \quad (27)$$

In summary, the investment risk comprehensive evaluation value of the project is 3.5, which indicates a relatively high risk level of the project. The risk comprehensive evaluation value during the decision-making stage is 4.01, which is relatively high. The risk evaluation value during the design stage is 3.118, which indicates a middle risk level. The risk value during the construction stage is 3.442, which is relatively high. The risk evaluation value during the completion stage is 3.728, which indicates a relatively high risk level. Overall, this engineering project faced a serious risk of loss. Therefore, it is significant that manager should enhance identification and prevention of risk, assess risk level regularly and adjust risk management strategy.

4 Risk Analysis

4.1 Analysis of risk in planning stage

In this case, the project is mainly faced with the risk of financing, agent construction contract and feasibility study during the planning stage. And risk level of the three risk factors is much higher than other factors. Therefore, the project managers must attach great importance to risk during this stage.

1) Manager should grasp the progress of the work and check the relevant information frequently. Identify potential risk and associated incentives so that they can timely adjust management decisions before risk arising to avoid the occurrence of it.

2) The risk of agent construction contract may influence the later engineering investment, quality, progress and cost. So the collection of related information should be done before the signing of the contract. Analyze the upper limit of investment, cost and process so that we can sign contract within the range of ability. In addition, the relevant professional and legal personnel should be invited to review the

contract ensuring that the content and conditions of the contract are complete and clear.

3) Choose professional personnel in the field to carry out the project feasibility analysis, and take the environment, policies, funds and their capacity into consideration.

4) Financing is a big problem that many projects will encounter. During this process, we should choose investors who have a good reputation and sufficient capital to avoid a series of risk in later stage due to funds appropriation problems.

4.2 Analysis of risk in design stage

Design risk and coordination risk is the main risk in the design phase. The level of other risk is relatively high, but is still within control. For example, the demolition risk, the risk is so small for this project that can be ignored.

1) When the design agency develops design drawings, they should do works based on the needs of investors and users to avoid the risk of rework. In addition, choose design personnel that are of good reputation and investigate their past works to find out whether they meet the requirements.

2) The project management agency reaches a cooperative relationship with other main units during this stage. Therefore, it is important to choose suitable contact person in order to ensure the smooth cooperation between the various subjects.

4.3 Analysis of risk in construction stage

The construction environment of the project is very special. The project is carried out in the streets that have lots of vehicles and pedestrians. Therefore, the main risk of the project is safety risk around construction site, construction progress risk, cost control risk and quality risk.

1) For the problems of safety around construction site, the project managers can choose protection tools of good quality and inspect the problems of safety around construction site regularly, and arrange safety education for on-site construction personnel.

2) Regularly check the progress of the project to prevent the project duration. But due to the outdoor work, the construction progress is mainly influenced by the weather. Therefore, prepare good rain proof engineering to ensure the project carried out smoothly in case of rain work rush if weather may have a great influence on the project.

3) For cost control, regularly review the cost of the project. Choose suppliers that are cost-effective to save cost for the investors. If the cost is expected to exceed the initial investment amount, make sure you communicate with the investors as soon as possible.

4) Maintain good communication with supervision agencies to get information of the quality of the project timely. Take remedial measures immediately once the project is found out to be unqualified.

4.4 Analysis of risk in completion stage

The main risk during the stage is the project settlement risk and contract management risk. To avoid the risk, the project manager should take good communication with investors and timely finish the project settlement. Classify all funds from the beginning of the project in case that there is need to provide proofs when there is a dispute.

5 Conclusions

This article builds the project agent construction risk management system from the risk identification, evaluation and prevention. Research of risk identification is already very mature. Methods of risk identification are so comprehensive that can meet the needs of risk manager. Compared with former research, this study identifies risk from different point of view. This paper identifies the risk project construction agencies are facing from the point of view combining the level of risk and the stage of risk. Research on risk assessment is difficult. We use fuzzy measure methods to assess risk since risk is unable to measure accurately. Therefore, the risk assessment method has the need to be further developed. This paper chooses risk assessment methods that are of good operability and reliability. This paper discusses risk prevention from two aspects, one is risk level and another is stage of risk, hoping we could develop more thinking about the direction of risk management from different views.

Study on Social Media Coverage and Management Mechanism in Emergency Events: Case Study of Weibo Coverage on the Wuhan July 6th Torrential Rainfall

Yang Mengxi

International Office, Wuhan University of Technology Wuhan, P.R. China, 430070
(E-mail: mxyangamazing@foxmail.com)

Abstract: The social media here refers to the internet-based platforms, on which the internet users generated content and relationship can be exchanged interactively, including blogs, podcast, WeChat, Weibo, etc. In nowadays information age, social media has been playing an influential role in every aspect of people's daily work and life, historically changing the way they receive or publish information. Especially in coverage of emergency events, social media has become one of the main channels for information generation and dissemination due to its unique propagation characteristics and extensive power. This journal is aimed to explore the reporting characteristics of social media and management mechanisms in emergency events, by studying the case of Weibo coverage on Wuhan July 6th torrential rain.

Key words: Social media; Emergency events; Wuhan July 6th torrential rainfall; Management mechanism

1 Introduction

Between July 5th to 6th 2016, another round of heavy rain poured down in Wuhan, following the attacks of continuous heavy rainfall the week earlier and it became the last straw that had completely paralyzed the entire city transport system. At 7:00 am on July 6th, the heavy rain had caused traffic gridlock in most areas of the city of Wuhan, leading to the emergency shutdown at a number of major roads and subway stations, with more than 180 roads impassable in the city due to the consequent waterlogging. According to the official data issued on CCTV, this disastrous continuing heavy rainfall is the most severe one since the year of 1998, and it had been reported as “a fifty years rare one”, for the highest rainfall in city area is claimed to be over 330 mm. Immediate attention from all over the world had been drawn to Wuhan, as well as that from the general public in the city.

At the same time, a plurality of correlation Weibo accounts in a timely manner set on line at the first moment, by publishing inner-city traffic conditions, cancellation or delay of airline flight numbers and train trips, residential areas with water and power lines affected in urgent need of assistance and other real-time transfer of personnel message, all these had effectively complemented the reporting absence of traditional media, by acting as one of the main information channels during the torrential rain.

According to Cohen (2009), social is a short-form news platform that provides audiences with news, links and witnessing of events by various first-hand accounts. On this networked platform that both individuals and organizations participate by publishing and reposting micro-blogs, according to their interest or their judgments of the news value contains in a message.

As the dominant micro-blogging website in China, Weibo provides users with a online platform that delivering no more than 140-character messages, following, commenting, reposting, clicking thumbs-up, etc., and all the facilities of the website has been re-constructed with a series of unique features according to the Chinese tastes (Li, 2011). According to Li, Weibo has made it much easier for anyone to participate in online reporting whether they are directly involved, or just reposting the news, or critically engaging with it.

Although many scholars have been looking into social media and the coverage of news events on Weibo in recent years, the gap that left to be discovered, however, is the coverage of emergency events on Weibo, the analysis of its reporting characteristics and the management mechanism. Therefore, this is the subject that will be specifically look into as following.

2 Reporting Characteristics of Social Media

Faced with this unexpected natural disaster, social media has been given full play to its reporting characteristics, which has mainly been shown in the following three aspects: immediacy, three-dimensional, and interactivity.

1) Immediacy

Social media published reports at the first moment as the event occurred, and continued to follow up on it in real time.

As the most widely used micro-blog site in China, Weibo inherited the fast, convenient and consistent propagation characteristics of social media with on-time and up-to-date information, including residential area wall collapse evacuation, emergency shutdown of subway stations due to intrusion, certain regional traffic warning, different regions proposing different ways to go through, etc., hence to alert the public to travel safety and maintain personal security (Pu, 2013). Especially during the rush hour period, some of the major Weibo accounts updated in quite an intensive frequency of every three minutes, providing information of water sections and bypass solutions for the citizens.

Because of its immediacy, Weibo could therefore respond flexibly to the public in the face of various influences caused by torrential rainfall in Wuhan, and therefore they could handle the situation properly.

2) Three-dimensional

The three-dimensional nature of social media is mainly presented in the form of reports, whereas the information is presented sensibly in a perspective way.

As it can integrate a variety of media forms of communication social media, Weibo is capable of collecting text, pictures, audio and video in one, and by adding a hyperlink in publishing and streaming content, relevant information resources for effective restructuring, breadth of coverage and to extend the validity of depth, so as to achieve a more comprehensive dissemination of results, according to Li (2012). You can see, Weibo on this storm reports, regional and rain close-up of the situation at the scene, pictures and videos had occupied considerable space, with picture, sound and influence of intuitive feelings brought to the public whereas the traditional media cannot match.

100 original Weibo messages posted by verified users between 8a.m. to 11a.m. on July 6th 2016 has been randomly selected and categorized according to the multimedia content contained. The research result is shown in Figure 1.

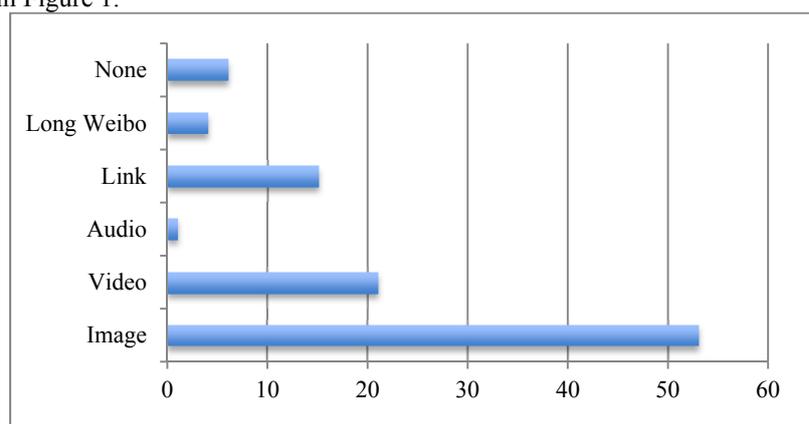

Figure 1 Multimedia Contained in Coverage

Based on the three-dimensional nature of social media, the three-dimensional perception built up by the public facing the extent of the impact of heavy rainfall had further strengthened the dissemination of results.

3) Interactivity

The interactivity of social media works especially in building up an online exchange, real-time interactive network platform between government departments and the public.

As social media has supported information publishers and readers with instant online communication capabilities, in addition to communicating accurate and timely information to the public outside, as Dencik (2012) mentioned, Weibo also plays as an exchange bridge between the government departments and social conditions and public opinion, and guides online public opinion direction. Weibo official information released by means of forwarding and receiving the informed user comments and other features, also provides feedback and additional information to help people in need to build a convenient communication platform (Li, 2012). This mode of transmission, on the one hand, is conducive to the cross complementary practice of social media and traditional media reports, it is also largely conducive to the transmission of information to achieve the integration; on the other hand, Weibo provides a reasonable channel by achieving the effective two-way communication for public utterance

on the storm events.

The selected 100 original Weibo messages have been categorized according to the interactions in coverage. The research result is shown in Figure 2.

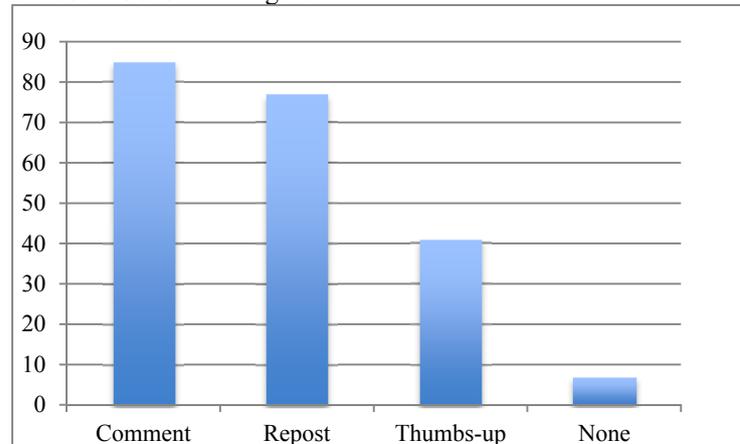

Figure 2 Interactions in Coverage

Interactive social media in the coverage of the incidents was particularly fully expressed, and the public could communicate on relevant topics of torrential rain, express their feelings and offer advice on taking timely countermeasures.

3 Management Mechanism of Social Media in Emergency Report

1) In today's society, social media in emergency management mechanism report fully reflected in the government and the media is interdependent and indivisible. According to Pu (2013), in all types of emergencies, governments at various level need the media to inform the public of the relevant information, and correctly guide public opinion, the media relies on official government channels to get news resources to meet the public demand for information. Thus, management is the essence of social media with regard to its supervision and regulation, and the guidance and control of its report content, report mode, transmission range.

The rapid development of social media, can be called as the network public opinion barometer, but in emergencies reports, the government is still the most authoritative and reliable source of information. As Guo (2010) pointed, due to the fact that certain range of social impact often brought forth by unexpected events' conflicting, abnormal and special nature, therefore, the necessity for the government's role in both guiding social media coverage and public opinion and controlling the boot, cannot be ignored.

2) The management mechanism of social media enables its full coverage feature, including immediacy, three-dimensional and interactivity, etc., and fill the gap of traditional media coverage, hence increasingly becoming an important part of unexpected incidents reporting (Li, 2011). Unlike the traditional media that needs to get first-hand source of information from government departments or professional bodies, social media allows users to customize individual message spreading before being untreated or confirmed. In addition, the impact of treatment processes and other content to convey to the public, the government also relies on social media to gather feedback feelings of public opinion, brought together the people, in order to better perform government functions (Liu, 2013). It could be seen that social media is an unexpected event in the release of information, coordination and supervision of various departments handling, and network output port of public opinion in the speed of information dissemination, breadth, reliability aspects have occupied an important position.

3) The management mechanism of social media is reflected by means of information technology platform to fulfill the functions of supervision and management with strict control and filtering false information. As Liu and Bian (2013) mentioned, media life lies in authenticity and objectivity, but also in the proper meaning of the social media community property itself. In cases of emergency, the public mostly shows panic and herd mentality, more likely to be swayed by false information and rumors. Meanwhile, the lack of public information about the ability to filter filtering performed, will lead the blind proliferation of false information and rumors, spread negative effect on the government emergency department for treatment process and impede social security and public order (Pu, 2013). In this case,

social media should shoulder the responsibilities of the network's constant pressure of public opinion, building public-trust, correctly guide public opinion, in the special period to help stabilize the people.

Therefore, in the emergency report to the strict supervision of social media, it should report the content, form and dissemination of reports and other aspects of the scope of supervision and management, to achieve effective transfer of real information. Specific regulatory measures can start from three aspects: Firstly, the pre-checks before the information reaches a certain propagation effects, truthfulness and objectivity strict consideration; secondly, the medium-term control, handling of false information be deleted, information publishers a serious warning; and thirdly is the late regulation to clarify the rumors, correct guidance, to eliminate negative impact on false new or rumors.

4 Conclusions

In the face of July 6th Wuhan torrential rain, this unexpected natural disaster, social media had performed as a significant part in emergency reportage, and stick to the implementation of strict implementation of relevant management mechanism. Being given full play to its own reporting characteristics, social media respond to the society with immediate, three-dimensional and interactive information that largely contribute to the emergency events reportage. Furthermore, due to the management mechanism of social media, messages published and disseminated on site have been largely guaranteed to function well.

As a consequence, though facing this “fifty years rare” rain, people in Wuhan could still be able to remain calm and handle their routine daily life well. There were no major public safety incidents during the basic maintenance and resumption of the normal production and life, and all this ensured the smooth and stable social order. Through this social media network communication platform, Wuhan people have not only overcome the difficulties caused by the weather, but also have shown the virtue of mutual help, encouraging each other and working together over the crisis.

It is worth mentioning that in following the week after the rain, a section on South Lake hardest hit video on Weibo spread, a record of this piece of land after rain gradual recovery, but also inspired people living here: “Natural disasters cannot be resisted, but time will erase it. Everything will be restored as ever, and the city is still just beautiful as before. ”

Abstract: We have conducted case studies on upgrading a system of making rules and technical standards in advanced medical area including new pharmaceuticals, medical devices, regenerative medicine and treatment, regenerative medicine tools, personalized medicine, personalized diagnosis and personalized medicine tools. Though the observation, we found four focal factors to be shaped for upgrading. (1) awareness of the important role of regulations and technical standards (2) needs of double structure in designing regulatory system (3) a system for finding targeted rules (4) continuity of activity in organizations. This paper will explain the character of four factors and will suggest an optimal design to overcome these disadvantages along with policy value chain.

Key words: Innovation; Regulation; Medical technology; Regulatory science

1 Introduction

PMDA (Pharmaceuticals and Medical Device Agency) has been in charge of approval in pharmaceutical products and the medical equipment in terms of safety and efficacy in Japan. In 2007, MHLW (Ministry of Health Labour and Welfare) in “five year strategic plan for innovative drug and medical device” declared to reduce the drug lag to the US by 2.5 years by 2011, and after the lag has been reduced, there are 1 year drug lag to the US in 2016¹. However, in global market, medical related companies, even Japanese companies, tended to apply approval to European first, then American regulatory authorization, then Japanese one. As Japanese has several innovative technologies in medical field and relatively large market in medical product, upgrading rule making system is urgent need to contribute to society’s health and quality of life.

2 Precedence research and methods

2.1 Objectives

In innovative medical technology field, even if a basic study of emerging technology is completed, it sometimes does not lead to a medical product with practical use because the rule or guidance which is need for the new technology has not been created. Therefore, we have analyzed rule making policy and system comparing the US, EU and Japan in order to solve the problem. Our research conducted the case studies on emerging technologies in the field of medical devices, regenerative medicine, regenerative medicine tools and personalized medicine. Through the case studies, we extracted four problems to challenge in order to upgrade the system of rule composition in emerging medical technology. Finally, we will propose policy options for the rule composition system to solve the four problems.

2.2 Analytical methods

Through the case study of rulemaking in emerging medical technology, we used a boundary organization (BO) framework and regulatory policy value chain. BO is situated between different communities and mediates them (Guston, H. David, 1999). BO is formed when a boundary object which is a new demand, new concept, new specialty or new recognition, appears. The related stakeholders gather around the boundary object and try to mediate or bridge different communities as a working group or a consortium (T. Hellström and M. Jacob, 2003). In this case, we analyzed BO between innovators (scientists and engineers) and regulators (regulatory agency). There are information asymmetries in both sides. There are four important functions, networking, agenda/strategy setting, securing resources and organizing operating body, the BO should have when it mediates two communities smoothly (Y. Hayashi and S. Kano, 2013). Our research showed the BO itself and the role of BO changed each phase of the regulatory policy value chain (Y. Hayashi and K. Shingo, 2015; Y.

¹ Pharmaceuticals and Medical Device Agency, “Test Calculation of Drug Lag.” [Online]. Available: <http://www.pmda.go.jp/review-services/drug-reviews/about-reviews/p-drugs/0013.html>.

Hayashi and S. Kano ,2014).

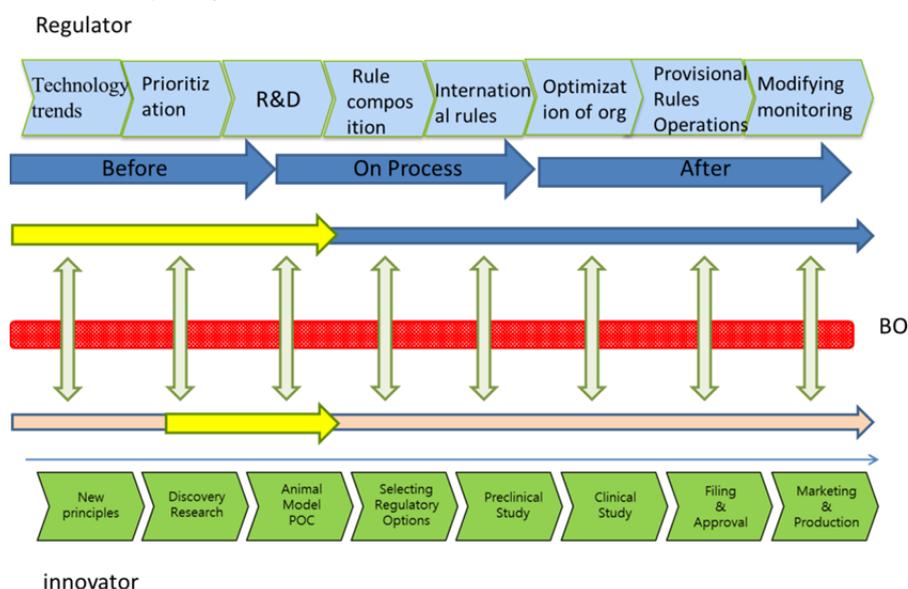

Figure 1 Policy Value Chain and Boundary Organization

3 Analysis and Results

Our case study shows that four remarkable features are disadvantages in Japanese rule making system. We will suggest policy options in light of four functions, Strategy/Agenda settings, networking, resource and operating body, of BO.

3.1 Awareness of the important role of regulations and technical standards

First focal element is “awareness of the important role of regulations and technical standards.”

History of regulatory science was short and it was officially defined in the fourth Science and Technology Basic Plan which was approved by Cabinet in 2011 as “in adapting the achievements of technology to social and human needs in the most optimal way, by making precise prediction, evaluation and judgment based on evidence.” Article 13, paragraph 2 of the Act to Promote Healthcare and Medical Strategy in 2014 declares importance of regulatory science. PMDA, regulatory authority in Japan, had a well-organized approval system and approval period was shorten in these days as a result of setting target review times and providing basic consideration for reviewers in websites in order to clarify the standards for review¹.

Through the case study observation, Japan’s taking initiative in rulemaking of medical fields is still on the way. In ICH case, in the beginning of 21st century, Japan hesitated to take an initiative to make world rule of S7b/E40 and hesitated to incorporate the world rule to Japan. PMDA was a specialist for approval procedure, however, it was passive to rule making in an emerging technology and a new drug tends to be in approval process earlier in EU and the US than Japan. In addition, Japanese pharmaceutical market is big enough so that PMDA resource is not enough for paying much attention outside of Japan (Y. Hayashi and K. Shingo ,2015).

Making world technical standards trough ISO is just beginning and in 2013, in biochip in biotechnology field, the performance evaluation method from Japan was admitted as a new standard for the first time in ISO (Y. Hayashi and S. Kano,2014).

Regulation is as much important as innovation because regulation sometimes accelerates innovation and sometimes disturb innovation. As harmonization of the world progresses, making rules and standards become important elements of a platform of producing medical products.

Policy options are as follows;

- Related to strategy and agenda setting, it is important to continue to insist the importance of RS in government and penetrate the concept into organization and society, as RS play an important role to

¹ “Regulatory Science/The Science Board/Standard Development | Pharmaceuticals and Medical Devices Agency.” [Online]. Available: <http://www.pmda.go.jp/english/rs-sb-std/rs/index.html>.

make products' practical use possible on the basis of science or statistical based analysis in society.

- Related to networking and resource, RS education in university is essential. Specialists who can work in ICH, ISO and IMDRF should be nurtured to network Japan and abroad.

- As an operating body, in addition to government organization, strategy planning organization which articulate government RS policy is needed to bridge innovator and regulator.

3.2 Needs of double structure in designing regulatory system

The second character is that designing regulatory process needs double structure. A difference between regulator's science and innovator's science is less recognized. A regulatory process needs double structure of evaluation which are evaluation of evaluation and guidance of guidance. Innovator's science means "verification of the validity of the evaluation technology" and "verification of the validity of the criteria on the basis of the evaluation technology." When regulators evaluate an emerging medical technology, their evaluating index should be evaluated whether it works or not. When a technology or product is not new, there already is the evaluating index or you can adapt secondhand index from countries abroad which has approved it beforehand. However, in case of an emerging technology, there is no evaluating index. Therefore, innovator and regulator are interacting in this double structure.

In the US, through the Microarray Quality Control(MAQC) project, the US Food and Drug Administration (FDA), working with related companies and researchers, collected the evaluating data and developed the way of evaluation to make and revise evaluating index and a guidance. In Japan, in the beginning, Japan's Ministry of Health, Labor and Welfare (MHLW) and Ministry of Economy, Trade and Industry (METI) formed a working group to make a guidance for development and evaluation incorporated the US and EU guidelines for microarrays, however, there was no organization to produce evaluating data. In the meantime, National Institute of Advanced Industrial Science and Technology (AIST) joined and Biochip consortium was formed by related companies in order to strengthen Japanese companies' specified technology like accuracy. Through Biochip consortiums, data was corrected and contributed to revise a guideline for development and evaluation.

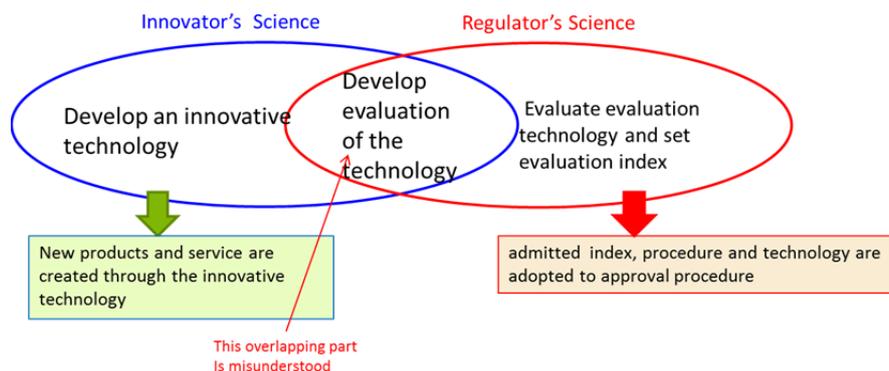

Figure 2 Double Structure in Designing Regulatory System

Policy options are as follows;

- Related to networking, collaboration between RS and IS to develop validation technology is needed.

- Related to Resource, Regulatory side needs its' own RS institute, so called Research Engine to collect data and make a database.

- At present, Japan Agency for Medical Research and Development (AMED) is providing both RS's and IS's funds together. Sorting RS's Funding from IS's Funding, and Reviewing function of AMED should be done.

3.3 A system for finding targeted rules

As Japanese government's science policy have targeted technology, targeted rules should be need in accordance with target technology in medical fields. Though Japanese government has spent large amount of budget to develop iPS cells technology, in the beginning of the research, little attention was paid to a rule making, so that it is hard to make them use as products.

MAQC projects were designated to make targeted rules for microarrays and sequencers to be marketed with safety and efficacy.

Policy options are as follows;

- Related to strategy and agenda setting, horizon scanning system should be incorporated. From an

open innovation point of view, various technology including AI and simulation model from outside should be searched.

- Related to networking and resource, innovators of companies, academia and hospital and regulators should work closely to identify problems and procedures in an agile way. One of the idea is that FDA and academic cooperation centers called Centers of Excellence in Regulatory Science and Innovation (CERSI).

- As an operating body, “Regulatory Science Center” will be established within 3years.

To have operating body, feedback and problem finding could be used for next strategy planning.

3.4 Continuity of activity

The continuity of activity related rule making is very important. Even emerging medical technologies are different each other, some boundary organizations cover several area and accomplish multitasks as HESI did. The case study in S7B/E40 indicated that “HESI could join from the very beginning “before” stage through “after” stage and could help strategic decision making. Continuity cultivated network and reliability among stake holders including regulators and enabled to make securing of research resources and organizing of operating body easier.” An organization through Regulatory Value Chain has big advantage to manage each stage. In addition to the continuity of organization, continuity of personnel is also important especially in complicated medical new technology field. To communicate and take initiatives in global scene like ICH or ISO, nurturing specialists is very important.

Policy options are as follows;

- Related to all function, strategy, agenda setting, networking, resource and operating body continuous activity has a possibility to strengthen functions as case study showed.

Table 3 Summary of Policy Options

	Strategy/ Agenda setting	Networking	Resource	Operating body
awareness of the important role of regulations and technical standards	Continue to insist the concept in government policy	Specialists in ICH,ISO, IMDRF	Global specialists RS education in Univ	Strategy planning organization
needs of double structure in designing regulatory system		Collaboration between RS and IS to develop validation technology	Regulatory Research Engine Sorting RS's Funding and IS's Funding (Reviewing function of AMED)	
system for finding targeted rules	Horizon Scanning System	Innovator(company, hospital, Research institute) Regulator	CERSI	Regulatory Science Center, CERSI Feedback and problem finding
continuity of activity in organizations	Continuity of BO strengthen each function			Sorting function of NIHS/PMDA/MHLW

4 Conclusions and Implications

Although Regulatory science situates opposite side of the blue sky science and it is not spectacular or gorgeous science, it is very important in terms of “adapting the achievements of technology to social and human needs with evaluation based on evidence” with safety, efficacy, speedy and continuously. Among four focal points “(1) awareness of the important role of regulations and technical standards” indicates the concept and importance of RS should be penetrated in society. “(2) needs of double structure in designing regulatory system” indicates that difference of role between innovator’s science and regulator’s science should be recognized. The third point, “(3) a system for finding targeted rules” needs speed, horizontal scanning and front runner’s mind in specific rulemaking in addition to the conventional safety and efficacy. The last one “(4) continuity of activity in organizations” means that

organizations should utilize accumulated knowledge and resources at present and in the future.

Toward the establishment of “Regulatory Science Center” and upgrading total regulatory process, more detail of design should be explored.

Abstract: This paper presents an important discussion in the food and nutrition security area in China. This is a multidimensional, multilevel and an evolving concept, having a wide variety of influencing factors. At the international level, this subject has been managed by different approaches through history. Initially more concerned on supplying enough quantity, this international movement was gradually absorbing other needs in a new set of dimensions in order to combat food insecurity. This context represents a fertile field for the approach and comprehension of the policy-making process towards the complexity science, which has been contributing to the public policy field. In this framework, 'for-benefit' civil society organizations (CSO) have an important role in reaching the desirable ends, also known as the common-good, which here is considered as food and nutrition security. The paper use case study methodology with literature review and statistical analysis, with data from international organizations and indexes. The conclusion appoints that by making good use of the evolving CSOs' voluntary willingness to cooperate for food and nutrition security, the Chinese policy-makers have the opportunity to innovate, to gain scale and to improve quality, by structuring mechanisms for enhancing the involvement of the 'for-benefit' civil society organizations into this public policy, in a regulated and participative manner.

Key words: Food and nutrition security; Public policy; Complexity science; China

1 Introduction

The ideas concerning food and nutrition security (FNS) have been changing in each context along history. After the Second World War along with the creation of the United Nations (UN), this matter was brought to the international level and involved an unprecedented number of actors. During this period, the international arena suffered strong influence from the Cold War bipolarity and had the theme of FNS managerial roles focused in food quantity and food aid, under a bargaining approach in alignment, for instance, with the United States policies.

The outcome of such articulations along with the 'world oil crisis' in the decade of 70's seemed to result in certain instability in the international system, leading to the so-called 'world food crisis' during the same decade due in particular to a growing population demand. This crisis gradually stimulated the participation of the civil society in the UN conferences, held by different agencies on distinct topics, with high incidence and audience in the 1990's. All these movements were relevant for the enlargement of the discussion of the FNS theme, and the increase of the actors' diversity in this area; thus, new ways to deal with a new set of dimensions in order to combat food insecurity were developed.

Regarding China, the main focus of this paper, the history of FNS governance is commonly divided into three moments: the first period refers to the old regime of command and control, between 1949 and 1977. The second one refers to an intermediate regime of mixed instruments, between 1978 and 1992, and the last one, it refers to a new regime of regulatory governance, between 1993 until the present days.

Nowadays, with over 240 million farmers, 1 million processors, and other millions of distributors, China has been promoting several changes in the public policies for FNS. In the last decade, major changes in the public policies were done according to the Food Safety Law (FSL), approved in 2009, as well as an institutional reform that ended in 2015 which shows the dynamism and emergence of the needs for improving the FNS in the country.

Despite this there has been a growing curve of concerns about food security, there is also a strong feeling by the society that the present conditions may improve in the next five years. According to a recent survey performed by the Pew Research Center (2015), 43% of people believe in this positive trend, making the level of confidence being only surpassed by the corruption combat policies, with 63%.

One of the factors for this optimism is related with unprecedented levels of investments to support the agro-food sector. However, the challenge to manage scale persists, considering the complexity to develop a common regulatory framework that effectively integrates numerous actors across multiple

levels of governance with highly heterogeneous circumstances (Yasuda, 2015).

Many achievements were made towards food production and hunger combat, making the country comply with international commitments. However, China faces a paradox: while food quantity has been provided closely to sustainable levels, the country remains with the biggest global undernourished population and at the same time, it has to face problems about overweight and obesity among children, which almost doubled in a decade (X. Zhang, van der Lans, & Dagevos, 2012; Y. X. Zhang, Wang, Zhao, & Chu, 2016).

This paradoxical relation, once again, elucidates the complex environment to improve the FNS policy, which has been highly affected by food hygiene, unsafe food, and poisonous food scandals, usually generating a widespread panic at the society, influencing in a decrease of social trust, and the feeling that the risk for food insecurity is omnipresent. Recent mass media coverage on such scandals has been both informing and alarming the population, making the food safety topic more common in the ordinary conversations in daily life.

The evolving characteristic of the FNS concept and the macro-environment trends in China also demands long-term planning, mainly related to the growing rural-to-urban migrations and the progressive loss of rural workforce, besides the more demanding consumer behavior, which tends to gradually value more certified and green products.

Aiming to keep high levels of self-sufficiency in food supply, the government has been providing investments in the development of agriculture projects and research, placing the country as the world's largest and decentralized research and development (R&D) public system over the matter (ASTI, 2012). While food production is being enhanced through technological developments, the country has also been establishing partnerships in Africa and Latin America for leasing or buying arable lands.

There are difficulties everywhere. In the rural areas, difficulties in the public policy's operational roles have been indirectly stimulating the formation of 'self-governing social organizations' to fulfill these gaps. 'Self-governing social organization' or simply 'civil society organizations' are self-organized groups characterized by voluntary participation, relative autonomy from family, market and state; and capacity for collective action to advance common interests" (Anheir, 2013).

As the number of this kind of civil society organization (CSO) in China has been increasing since last decade, the present paper analyzed that this actor has been able already to bring positive effects to the public policy, even not having their roles clearly defined in the public policy yet. One example of this cohesion is the fact that family farming co-operatives, rather than isolated peasants, has been promoting a healthier and more sustainable food production, using fewer levels of highly toxic pesticides, and delivering a better quality product to the stakeholders.

In the urban areas, the risks at the processing and consumption levels have direct relation with the food poisoning occurrences. The small family businesses still represent a great share of the food shops, and while they have difficulties to converge with the sanitary demands, they have in these ventures the base of the household income. Another risk emerging at the urban centers is regarding overweight and obesity, which has been steadily growing since last decades, reaching levels that give evidences that public policies have failed on predicting the phenomenon and acting preventively.

While China has been evaluating the results of the latest version of the food safety reform, and has been working in enhancing the public policy to face the evolutionary pressures of this matter, more investments have been done for supporting this process. The challenge to enhance effectiveness in the management processes of those policies represents an opportunity to innovate and to generate a civil society enrollment with the propensity of establishing voluntary actions.

This would represent an adjustment of strategies and innovation in the Chinese public policies in the issue of FNS, which seems to demand detailed planning and experimentation, despite giving a constructive answer to the emerging self-governing social organizations about their roles, in particular in the rural areas.

2 Literature Review

Two key concepts are relevant to structure the methodology of the present paper: the definition of food and nutrition security by Gross, Schoeneberger, Pfeifer, and Preuss (2000), and the complex framework for public policy, by Colander and Kupers (2014). This combination elucidates the complexity and the evolving characteristic of the FNS and call for the enrollment of the civil society for the success of public policies.

For FNS, Gross et al. (2000) divided the concept into four dimensions: food availability, access to

food, utilization of food and nutrients, and stability, which is a transverse dimension to the other three, as can be seen below:

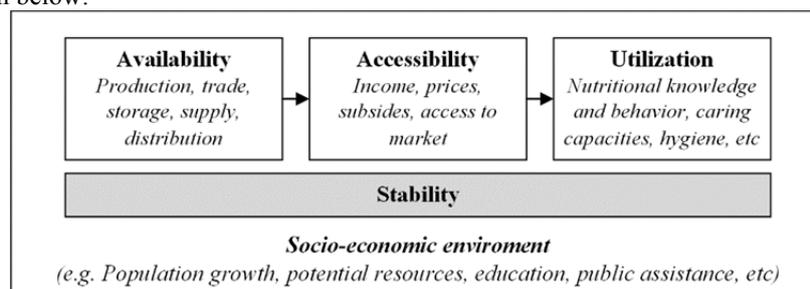

Figure 1 Four Dimensions of Food and Nutrition Security

Source: Based on Gross et al. (2000)

First of all, it is necessary to ensure the availability of enough food for the whole population, including food production, national and international trade, besides food supply and distribution. The access, therefore, is only accomplished when everyone is able to reach food physically and economically, in an acceptable social way, which includes, buying, exchange or hunt.

The utilization of food and nutrients has two different perspectives: the biological and the social aspects. According to Gross et al. (2000), the biological dimension refers to “the ability of the human body to ingest and metabolize food. Nutritious and safe diets, an adequate biological and social environment, a proper health care to avoid diseases ensure adequate utilization of food” and the social perspective cover the nutritional knowledge, choices and eating habits, and the social role of food in the family and community.

At last, stability refers to the time element of the three conditions mentioned above. Problems in the availability, accessibility and utilization of food can be chronic, seasonal or transitory, which has important considerations for the definition of actions, both relevant to the strategies adopted by households or for the public policy.

Furthermore, according to Gross et al. (2000), to comprehend the determinants and consequences of the FNS and its conceptual guide framework for management of public policies, a broad range of social organization levels must be considered. They argued that these levels come from the individual and the household (micro level) to the global levels (macro level).

The wide, evolving, multilevel, and multidimensional characteristic of the FNS concept converges with the complexity framework for public policy, from Colander and Kupers (2014). This frame is inserted in the so-called ‘complexity science’, which emerged in the fields of physics, mathematics, and biology, but was largely propagated with the computer revolution, during the 1970’s and 1980’s. Some of these fields were important at this initial phase to include the evolutionist character to the science, because they address the continuous change in social systems. Fewer theories in the social sciences, however, are evolutionary. For a theory to transcend the level of general system change to discuss the level of the exact workings of change, it should focus on the dynamic and temporal dimensions of change; emphasize the selection variables; focus on adaptive processes; and recognize change as a process that is both contingent and path-dependent (Kerr, 2002).

Instead of modelling the public policy as a set of equations as standard science does, complexity science models a system of the general issues the standard science has been lacking a proper model because the matter is simply too complex, too intertwined, to be captured by a set of solvable equations. This does not mean that informal models cannot be used, instead there are many that are consistent with the complexity vision, especially with genetics, evolution, and biology.

The same tendency can be related to the complexity science on the public policy, as the areas may present higher or less degree of complexity. The economics has already developed indexes in the complexity science, such as the ‘Economic Complexity Index’ (Hausmann et al., 2014), promoting diversified tools for analysis. The complexity economics converges more with strategy, and archetypal constructions, like the artificial stock market, for example.

While the complexity economics has already a vast literature, the complexity frames still relatively new in public policy. However, from the late 1950’s, authors like Lindblom (1959) were already criticizing the ‘rational comprehensive method’ of policy-making: “no one can practice the rational comprehensive method for really complex problems, and every administrator faced with a sufficiently complex problem must find ways drastically to simplify”. In this sense, the development of public

policy is a very complex process without beginning or end and whose boundaries remain very uncertain, especially in the case of FNS, as its concept is complex by having the multi-actor, multi-level and evolving characteristics. This diversity assumes that the matter is inserted in a system that cannot be controlled. In this perspective, the government role is not isolated in a top-down approach, but focusing on counting on the civil society to evolve the policies themselves (Colander & Kupers, 2014).

In this sense, the governmental policies are best thought as operating in an ecostructure space where institutions are designed to stimulate creativity and bottom-up initiatives with formal goals and objectives. These goals are not to focus on any specific ecostructure, but to let the ecostructure to emerge, adapt, and to evolve, including governmental changes.

In this framework, the discoveries of the small tweaks in the government operational systems would help them to be more feasible, reducing potential failings (Colander & Kupers, 2014). The cyclical diagram below illustrates the ideal model of this ecostructure under the complexity framework for public policy:

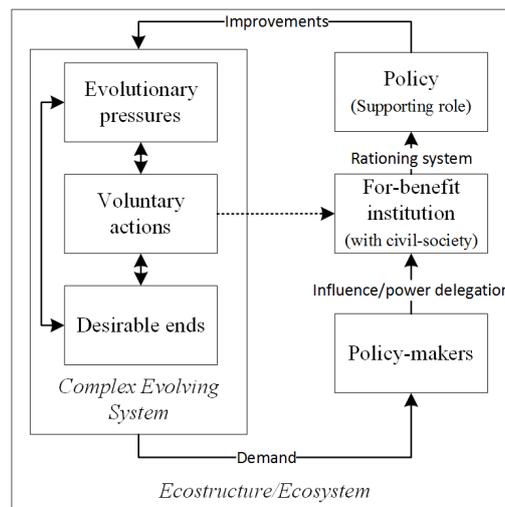

Figure 2 The Complexity Framework for Public Policy
Source: Based on Colander and Kupers (2014)

The complexity framework introduces the realization of policy's goals, which emerge from bottom up and is not imposed. The complexity of these policies is a continuous exploitation of emerging goals and means, all together to achieve their objectives; thus, the complexity framework engaging widely is not only logical but also essential. For this reason, interactions between policy makers and other stakeholders are equally crucial. Community engagement, stakeholder management, and consultation are complementary to the policy making strategies.

In this context, Colander and Kupers (2014) argued that in the policy part, the debate is not either government or market, but the main role of the government to structure the ecosystem. The authors continuing arguing that the ecosystem involves a combination of both bottom-up dynamics, and top-down influence, besides the central issue of the social policies, namely how they can influence themselves.

The policy-makers, then, need to enhance the government's moral strength, in order to continually work on managing these evolutionary pressures, aiming to guide them towards a desirable end. Thus, the signs of an ecostructure able to maintain equilibrium in this perspective seem to be a result of voluntary actions, meaning less influence or control of the government and more influence of the society. In this sense, this complex evolving system shall generate a demand to the policy-makers, who can influence the general ecostructure by only capturing this voluntary willingness to cooperate based on the social goals that have not been met yet.

In order to make good use of this willingness, the government, by delegating many of its coordination roles to other collective institutions shall reach a rationing system for improving public policies. As it was done in the past, the encouragement of corporations, nonprofits, and other institutions come to fulfill collective choice problems. However, the ideal structure under this scheme seems to be the 'for-benefit' institutions, which are legal structures that complement the current dichotomy of for-profit or for-charity structures, and catalyze an ecosystem that is more conducive to people

developing their social nature, rather than just their materialistic nature. ‘For-benefit’ institutions are those which are invariably composed spontaneously and structured by the civil society, composed of emergent associations, organizations and movements directly attuned to societal problems and able to connect and amplify to the public sphere (Habermas, 1996).

Reaching this rationing system with the CSOs, the delegated for-benefit institution shall work to be budget-efficient, maximizing as much as possible the social return, generating a supporting role to the public policy in this evolving ecostructure – not designed to control the system.

The cycle reaches the end or the new beginning with improvements in the public policies, which have diversity among their characteristics. This diversity drives novelty and innovation and in an appropriately diverse system, improvements shall emerge without being imposed or planned by anyone. These changes in public policies that affect the ecostructure are called by Colander and Kupers (2014) as ‘metapolicies’, which consider that individuals can solve social problems from the bottom up with far less direct government involvement.

In general, policy theories based on a multi-actor approach are necessarily more complex than theories in situations dominated by one actor or by a tight group of actors. This multiplicity brakes the linear theory on the causal relationships in the policy field, and evolve a diverse set of networks with stakeholder organizations, which relate to the different possible intervention variables in order to be taken into account.

At last, the complexity framework for public policy offers some significant low-cost measures, but demands experimentation, assuming that historically there are success and failures over these attempts and the complex interconnections between activism and laissez-faire seems to be pro-market, pro-social and pro-environment at the same time. To deal with these interactions, the present supervision and management system for FNS in China was restructured between 2003 and 2015, reaching the following:

Figure 3 Food Safety Supervision and Management System in China
 Source: Chen, Wang, & Song (2015, p. 2208)

The system illustrated above shows the responsibilities distribution on the national level, but one of the biggest difficulties remain to promote a coherent scale management strategy. According to Yasuda (2015, p. 747), “the country’s food safety regulatory system has evolved largely in reaction to crisis”. The author adds that the four dominant strategies of scale management currently employed are failing: “the use of coordination bodies, locally directed model production bases, food safety campaigns, and regulatory segmentation”. For him, “each policy encounters different challenges: for coordination bodies, the problem is local integration; for model production bases, the challenge is national integration; for campaigns, the shortcoming is poor institutionalization; and, for regulatory segmentation, the problem is policy diffusion”.

The chain effect on the communication management and the frequency of the changes on the public policy, including the regulation, affect directly the stability dimension on the FNS concept. It demands time and resources to train the personnel in its thematic varieties and at all levels that the policy presupposes. According to Yasuda (2015, p. 749), this multi-level harmonization process is affected by “the sheer size of China’s bureaucracy results in weak monitoring practices that, in turn, give rise to corruption and other pathologies of governance”. These side effects tend to be felt in a higher degree where there is greater distance from the driving force of the public policy, raising awareness for the main inspection services at the county level.

While the FSL brought definitions on the responsibility of related governments, and enhanced the communication and cooperation within them, the influence of the old segmented supervision system still obfuscates certain responsibilities, especially in small food workshops and vendors. The mechanisms for sharing information between departments often fail. Therefore, the resource allocation is often not appropriate and results in wastage of facilities and a shortage of professional inspectors is detected. In this sense, the relationship between central governments and local governments requires further clarification in order to become more clearly defined. Besides that, media, consumers and third parties do not play an important role in supervising the management authorities if compared to systems from other countries (Jia & Jukes, 2013).

The civil society participation into the FNS public policy may not be important so far, but it is possible to observe successful experiences. In 2011, for example, “the Ministry of Health¹ announced 21 new food standards, including maximum mycotoxin levels, pesticide residue limits, and blends with the food additives. The food safety standards also solicited and took opinions from food producers, traders and consumers before enacting” (MOH, 2011a,b apud Jia & Jukes, 2013, p. 239).

Another evidence of the contribution from social organizations comes from the investigation conducted by Zhou & Jin (2013). They surveyed 507 vegetable farmers in Zhejiang province to analyze the use of highly toxic pesticides. Among the findings, “vegetable farmers who received less training and selected handlers as their marketing channel had a tendency to apply highly toxic pesticides and cooperative members were less likely to be highly toxic pesticide users”. This suggests that the public policy must go beyond the improvements of detecting systems to quality control, but also involve the farmers in educational and training programs to enhance the knowledge of safe vegetables and highly toxic pesticides.

The civil society enrollment through supported organizations can also support the scale reach for the agricultural production bases (*shifan nongye jidi*, hereafter APB), which has been working with 24,600 hazard-free production bases, 593 central-level demonstration zones, 100 demonstration counties, and 3,500 provincial-level demonstrations zone (China, 2007). According to Yasuda (2015), decentralizing regulatory control using the locally directed model of APBs addresses the scale problem in the way that “regulators do not need to develop a complex national law and instead can delegate regulatory authority to local governments. As a matter of governance, decentralization encourages local innovation and intergovernmental learning. Inspectors benefit from local knowledge and are able to identify non-compliers”.

The author later details how each APB unit can enhance FNS and the management of scale by appointing that “the solution to the scale problem via decentralization foregoes an integrative approach from the top-down, and instead builds effective governance from the bottom-up. [...] Aggregating farmers in a base enables regulators to conduct inspections regularly, whereas regulators typically must spend over a week to reach farms scattered around a single village” (Yasuda, 2015, pp. 755-756 emphasis added).

The Chinese Government recognizes the challenges on FNS, which are reflected in the last 5-year plan on national food safety control systems (China, 2012). In the document, ten key areas are identified for further improvements: laws, regulations, and standards; surveillance and assessment; inspection and testing; processing control; export and import food safety control; emergency management; comprehensive coordination; scientific support; food safety integrity; education and training.

3 Methodology

The present paper is inserted in a broader research comparing the case studies of China and Brazil regarding the historic evolution of the public policy for food and nutrition security. This specific paper brings relevant findings focused on the Chinese case study, analyzed in light of the complexity science regarding its logical and conceptual structure. The methodology was based on literature review from books, articles, and reports; besides statistical analysis with data from international organizations and indexes.

Firstly, the literature review started from the definition of FNS, by Gross et al (2000), and the historic approach for the matter in the international level, inside United Nations system, mainly through the detailed work of Shaw (2007). The literature review for the case study of Brazil, despite of not being detailed in the present paper, was relevant to have an additional reference for establishing comparisons,

¹ The Ministry of Health (MOH) was dissolved and become part of the National Health and Family Planning Commission (NHFP) in March, 2013.

allowing a deeper comprehension of the Chinese system peculiarities.

Secondly, the literature related to the complexity science was absorbed from areas such as economics, and public administration, until reach the field of the public policy with Colander & Kupers (2014). This demanded more literature review related to the CSOs roles in the public policy, made with UN agencies reports and contents from Anheier (2013), who also indicated the possibility of using statistical analysis for measuring the civil society enrollment in the public policy¹.

Thirdly, the case of China was studied through books, articles and reports since 1949, but the last decade was focused for the present paper. In this sense, the main contributions came from Zhou & Jin (2013), Wu & Zhu (2014), Yasuda (2015), Chen, Wang, & Song (2015), P. Liu (2010), and Yan (2012), despite Pesqué-Cela, Tao, Liu, & Sun (2009) with the specific outlook on the CSOs in the country.

Finally, international indexes related to the CSOs enrollment in the public policy, such as the Civil Society Index (CSI), and the Bertelsmann Stiftung's Transformation Index (BTI) were studied. The CSI would be the ideal index for establishing statistical analysis, but it does not offer comparative or a time-series measures, mainly by considering qualitative aspects that are not easily reached in a high frequency. To overcome this limitation, the present paper has analyzed such index and found that the BTI is part of the CSI in more than one dimension, and can also be used to measure the civil society enrollment in the public policy. The BTI was disassembled and 27 of the total 52 indicators were regrouped into three big dimensions: political transformation, economic transformation and management transformation², reaching a new index, called here as 'CSOs enrollment in public policy', which was correlated with food and nutrition security data from FAO. The results of this last step were significant to confirm the last 10-year evolution of this relation, as already identified through literature review.

4 Findings

In China, it was identified a relative low degree of civil society enrollment in this public policy, but with an on-growing movement, as some experiments has been held recently with positive results, such as the recently extinct Ministry of Health planning new food standards with food producers, traders and consumers in 2011 (Jia & Jukes, 2013). The finding that rural co-operative members are less likely to use highly toxic pesticide rather than other users (Zhou & Jin, 2013) also shows that collective social or communitarian organizations are willing to contribute more to FNS.

The detailed study by Pesqué-Cela, Tao, Liu, & Sun (2009) is another evidence in this sense. The authors called the attention for the emergence of 'self-organizing social organizations' as one of "the most significant yet unexplored developments in rural China". The authors define 'self-governing social organization' as meeting each of the following criteria: Firstly, they are not initiated and sequentially controlled by any of the local Party-state agents. Secondly, local Party and government officials do not participate in the decision-making processes of these organizations. Thirdly, their heads are not appointed by the government and do not concurrently hold a post in the local Party-state apparatus. For this paper, this type of organization is approached to the CSOs for parameterization of the concepts and contents.

Pesqué-Cela, et al (2009) found out that these organizations have been "playing an important role in the provision of local public goods and services". This recent phenomenon was motivated by a high level of distrust with local government officials, "largely for their unwillingness or inability to provide

¹ Although the complexity framework for public policy (Colander & Kupers, 2014) is relatively new and the dimensions of complexity are not easily subjected to formulas and statistics, some authors have been working on a contrary perspective, pointing out that building local capacity for analyzing civil society is a key to its future strength. One of the references in this perspective is Anheier (2013), who developed the conceptual and methodological framework for an 'index system' to measure the civil society development based on the so-called 'Civil Society Diamond' (CSD). This has been an on-going process that started in 1999 with the initiative from the 'World Alliance for Citizen Participation', also known as CIVICUS, which maintains the 'Civil Society Index' (CSI) until nowadays.

² In **Political transformation**: Basic administration; Effective power to govern; Association/assembly rights; Freedom of expression; Separation of powers; Civil rights; Party system; Interest groups; and Social capital. In **Economic transformation**: Socioeconomic barriers; Banking system; Anti-inflation/forex policy; Macro-stability; Social safety nets; Equal opportunity; Output strength; Environmental policy; and Education policy/R&D. In **Transformation management**: Structural constraints; Civil society traditions; Conflict intensity; Policy learning; Policy coordination; Anti-corruption policy; Consensus on goals; Cleavage/conflict management; and Civil society participation.

public goods and services”. The villagers might attempt to participate in this CSOs as an alternative to “serve their own and community’s interests, independently from the local Party-state”.

The authors (Pesqué-Cela et al., 2009) adds that presently there are unprecedented opportunities for citizens to associate and play an active role in community affairs outside the government or Party in China. The aim for these CSOs is not to challenge, nor to complement the local state, but to autonomously assume some of the functions and tasks that the local state does not perform as required or expected. “The main points in this direction are the excessive tax burdens, widespread official corruption, land expropriation without proper compensation, and the deterioration of the environment”. It is also found that “lineage structure, inter-lineage rivalry, intra-lineage cohesion, and labor out-migration” have statistically significant effects in villagers’ participation in such CSOs in the village level.

The data compilation resulted in the following chart. The result for China counts on an increase of 5.6% between 2005 and 2014, and for 2015-2016 remained the same from the previous biennium. This shows that the CSOs has been gradually achieving more roles in the Chinese public policy. Another relevant aspect is that between 2014 and 2016, China is the only BRICS member-state that has not decreased the CSOs enrollment in the public policy, remaining stable. All the other states have reached results in the biennium 2015-2016 that are inferior if compared to the level verified a decade before, in the biennium 2005-2006, what puts China in a very special position, as are not following the international tendency inside this particular political bloc.

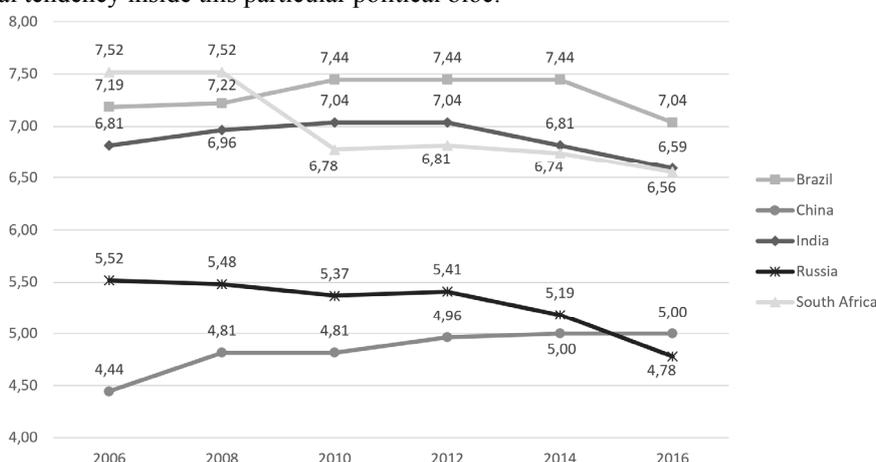

Figure 4 CSOs Enrollment in Public Policy in China and Other BRICS Member States (BTI Selected Indicators – 2005-2016)
Source: (BTI, 2016)

Having the results structured, a correlation using IBM® SPSS® (Statistical Package for the Social Sciences) version 22 was tested with one FNS indicator available at the FAO statistical database (FAOSTAT, 2016), namely ‘average dietary supply adequacy’. The results confirmed the positive correlation in high or strong level, with $r = 0.888$, $n = 6$, $p = 0.018$, as it can be seen in the table below:

Table 1 Correlation Between CSOs Enrollment in Public Policy and Average Dietary Supply Adequacy (%) in China (2005-2016)

		CSOs enrollment in public policy	Average dietary supply adequacy (%)
CSOs enrollment in public policy	Pearson Correlation	1	.888*
	Sig. (2-tailed)		.018
	N	6	6
Average dietary supply adequacy (%)	Pearson Correlation	.888*	1
	Sig. (2-tailed)	.018	
	N	6	6

*. Correlation is significant at the 0.05 level (2-tailed).

Source: Made by the authors with data from BTI (2016) and FAOSTAT (2016).

The trend for China is to keep experimenting and enhancing the connection with the CSOs in the

near future, resulting in progresses in scale management and follow-up processes, showing an openness for the bottom-up approach on the Chinese FNS public policy, besides giving a response to the emerging 'self-organizing social organizations', as suggested by Pesqué-Cela, Tao, Liu, & Sun (2009).

5 Conclusions

The complexity framework for public policy adapted to the Chinese political-institutional reality has enormous potential to contribute to the FNS public policies in the country in the short term, mainly on the need for improving quality and scale management. The movement of CSOs enrollment in the FNS public policy is more present at the rural level, but it can spread to urban centers, with its own logic, counting on different segments of the civil society to generate specific demands and voluntary actions to reach this desirable common good. In this movement, including medical doctors and research institutes is highly strategic, as their levels of confidence as social communication channels are considered 'highly honest' and 'highly concerned about the citizen's health' (R. Liu, Pieniak, & Verbeke, 2014). This process demands detailed study and planning, besides experimentations, gradually implementing changes, observing the results and impacts at each step.

For the initial experiments, enhancing public consultations is a relevant source for a cost-benefit analysis, evaluating the results in the sense that good consultations translate into budget allocation, and the lack of consultations or ineffective consultations exponentially increase the risks and therefore the costs of an operation. For creating these risk versus benefit analysis, establishing the use of 'consultation plans' is recommended, as it includes the information gathering based on answering questions of guiding principles and best practices, considering also applicable legal frameworks, and special regulations. Both guiding principles and best practices are the result of processing and gathering practical provisions stated in the legal frameworks, which lay down positive regulations on public consultations, besides experiences and lessons learnt in the field.

Another source for empowering the CSOs is promoting a more efficient division of labor between foundations and grassroots organizations. Considering that the philanthropic sector in China has been increasing steadily, a reform in this sector in this direction could be helpful to build capacity, as this interconnection with the CSOs supports the management of scale in a more responsive approach.

The support for the interconnection between different-targeted CSOs is another aspect to be considered, as it can enhance potential to spread guidance towards a better quality and more sustainable production and consumption. This guidance should be managed through the FNS public policy programs of technical assistance, access to markets – including reward for organic production in public purchases – microcredit, and making food surveillance, which has limitations on the present punitive approach, to work in a more educative perspective in order to enhance nutritional knowledge and behavior.

Improving quality and enhance the scale management will remain affected by the massive production system, the geographic size, and unwieldy bureaucracy, as the regulators attempt to build an integrated national regulatory regime. However, by making good use of the evolving CSOs' voluntary willingness to cooperate for the common good, namely FNS, the Chinese policy-makers have the opportunity to gain scale and improve quality, by simply enhancing the enrollment of this actor into the public policy, in a regulated and participative manner.

Research on Evaluation of Innovative Business Incubator Service Ability Based on BSC and AHP

Wu Shuxin, Bai Yu

School of Management, Wuhan University of Technology, Wuhan, P.R. China, 430070

(E-mail: wsx8929@163.com, baiyu_whut@163.com)

Abstract: In recent years, innovative business incubators are regarded as the cradles of start-ups' innovation. This paper proposes an evaluation hierarchy of five service ability dimensions of innovative business incubator via adapting to BSC theory, and then makes out the importance weights of their indexes by AHP methodology. Finally, the analysis finds out that the fundamental service ability weights the highest among five dimensions, and several indexes, like the transformation rate of science and technology innovation achievement and the ratio of entrepreneurship tutors with advanced titles play the vital roles in evaluating the business incubator's development and innovation service ability.

Key words: Evaluation hierarchy; BSC; Innovative business incubator Service ability; AHP

1 Introduction

In this special time driving by the development of Technology and Innovation, the Massive Entrepreneurship and Innovation by All trend has been the vital national strategy, promoting Chinese economic troika and advancing the whole competency of the country. The innovative business incubators, represented by the Massive Spaces in China, have sprung up and keep developing and innovating.

At present, many innovative incubators have not yet get rid of the traditional service mode, and the basic services and low ability can neither utilize the government-funds effectively, nor satisfy the increasingly need by start-ups. As a result, innovation on service mode of business incubator and the re-evaluation of service ability become an inevitable choice. We use BSC and AHP to conduct an evaluation hierarchy via five dimensions and several indexes of service ability for innovative business incubator, in order to make the innovative business incubator a stable, healthy and long-run operation.

2 Literature Review

2.1 Definition and Innovation of business incubator

The definition of "Business Incubator" in researches is similar with both its physical term and utility function. Business incubator" is a professional physical space where an organized, rich-resources environment and support services were offered, and can accelerate the development of the enterprises (A & Gaynor, 2000). Business incubator can be an innovational system that helps new enterprises to grow up (Raymond, 1987). With the practices for decades, the service quality of business incubator has changed with keeping pace with the market innovation, the mechanism of incubator has changed, and a new networked mechanism can support the innovation effectively (Bollingtoff & Ulhoi, 2005). Also, studies emphasis that the operational mode development of business incubator is key to the innovation and evolution of industry, and should change the traditional mode to a "incubating chain" mode (Haapasalo & Ekholm, 2004; Zuo Li et al., 2015).

2.2 The evaluation system of innovative business incubator service ability

It is a remarkable advantage for innovative incubator to provide strong professional and relevant services for the incubated enterprises. Research on evaluating service ability of innovative business incubator has never stop. Allen & Richard (1990) put forward three categories: shared services, services in management and net-worked services. Yu Qingdong et al. (2008) designs seven indexes for incubating achievements, including the total income and total industrial output of incubated enterprises, the number of personnel and the number of patent invention. Li Jingrong et al. (2011) resolves the service ability into the operational service ability, the development service ability and networked service ability. In summary, the evaluation of innovative business incubator service ability generally consists of physical facility, management support, financial support and network-resource support.

2.3 The application of BSC theory in innovative business incubator evaluation system

BSC (Balanced Score Card) theory, proposed by American Scholar Professor Robert S Kaplan, is a management system in core of enterprise development strategy and it is widely applied in presenting the performance of enterprises linked with perspectives of financial, customer, internal operation,

innovation and learning (Brander & McDonnell, 1995).

According to the perspectives of BSC theory, the innovative business incubators, especially the service provision should develop in a strategic visual. This paper makes the service strategy off four levels, consisting of the level of financial and benefit, the level of business service, the level of innovational service and the level of customer satisfaction (Figure 1).

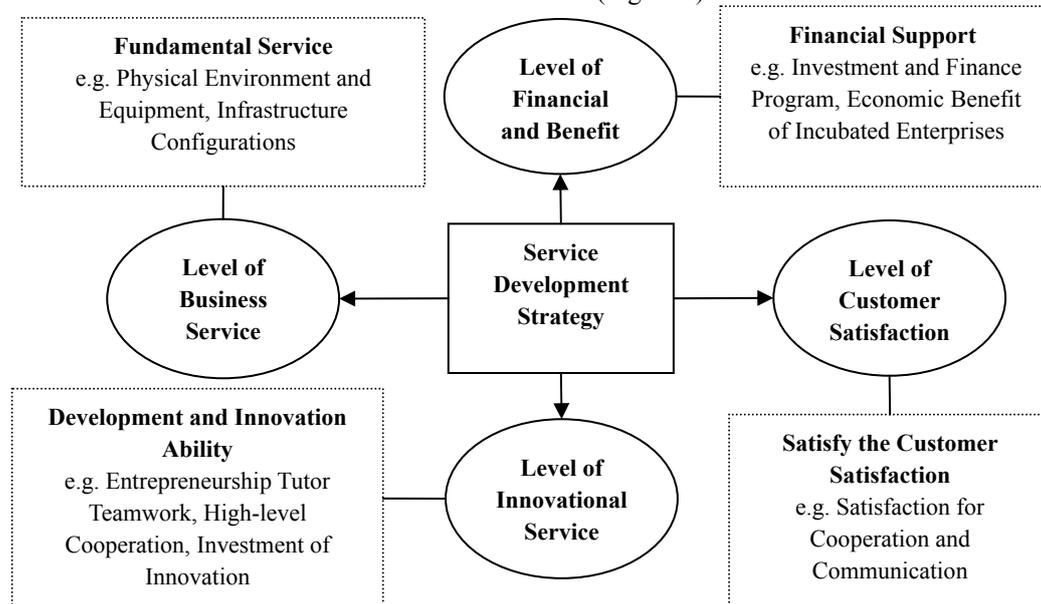

Figure 1 The Application of BSC in Service Development Strategy of Innovative Business Incubator

3 Evaluation Hierarchy of the Innovative Business Incubator Service Ability

3.1 The principles to establishment of evaluation hierarchy

In this evaluation hierarchy, five principles, consisting of objectiveness, hierarchy, comprehensiveness, measurability and sustainability, are taken into considerations, that is, first, the five dimensions we design are accordance with the objective facts, and are consulted by the authoritative experts. Next, we should take a comprehensive and sustainable visual to design the service ability dimensions, which cover from fundamental element to the long-run development elements. Also, the related indexes in the next levels should correspond to the distinct dimensions, and can be qualitatively measured.

3.2 The dimensions and indexes of service ability in the evaluation hierarchy

Based on BSC theory introduced above, as well as referring to some references, we established an evaluation hierarchy of the business incubator service ability with five dimension levels and several related index levels (Table 1).

Fundamental service ability indicates the basic service functions of innovative incubators, which meet the normal operation of incubated enterprises. Although the fundamentals have different focuses for the differences of incubators' scales of operation and resource acquisition, yet most novel incubators share the same basic services, like the physical site, infrastructure figurations and information consults.

Capital operation ability refers to the supportive service ability of investment and finance programs for incubated enterprises offered by incubators. Because most incubated enterprises need sufficient funds in the initial and growth periods, the efficiency of incubator in acquisition, investment and withdrawal of capital chain can effectively evaluate its service ability in investment and finance.

Development service ability, compared on fundamental ones, explains an ability to series of value added services for entrepreneurship, such as senior training lectures, professional service team guidance, entrepreneurship mentor assistance, in further cultivating starting-up enterprise from nursery to acceleration in incubation process.

Innovative service ability mainly aims at high technology and innovative incubated enterprises. Through investing in research and development, introducing and updating technology, certifying and promoting technology, the incubator helps the incubated enterprises to promote the generation, implementation and marketing of their new programs.

Table 1 Evaluation Hierarchy of Innovative Business Incubator Service Ability

Evaluation hierarchy of innovative business incubator service ability (S)	Dimension Level (S _i)	Index Level (S _{ij})
	Fundamental service ability S ₁	
		construction cost of infrastructure configurations S ₁₂
		times of general business service S ₁₃
		times of information flow S ₁₄
Capital operation ability S ₂		the ratio of the number of incubated enterprises in acquisition of finance service S ₂₁
		the ratio of the number of incubated enterprises in acquisition of risk investment service S ₂₂
		the average ROE of incubated enterprises S ₂₃
		the average ROIs of incubated enterprises S ₂₄
Development service ability S ₃		the growth rate of incubated enterprises S ₃₁
		times of training lectures about entrepreneur and innovation S ₃₂
		the ratio of employees with bachelor degree or above in the total service employees S ₃₃
		the ratio of entrepreneurship tutors with advanced titles in the total members of talent teams S ₃₄
		times in promoting the cooperation of leading enterprises in key domains S ₃₅
Innovative service ability S ₄		the ratio of R&D investment in total investment S ₄₁
		the number of invention patents S ₄₂
		the number of approved patents S ₄₃
		transformation rate of science and technology innovation achievement S ₄₄
		construction and maintain cost of invested innovative platform S ₄₅
Degree of service satisfaction S ₅		incubated enterprises' satisfaction about the cooperation process S ₅₁
		incubated enterprises' satisfaction about the information communication S ₅₂
		incubated enterprises' satisfaction about the managerial process S ₅₃
		the complaint rate of incubated enterprises S ₅₄

Degree of service satisfaction refers to the evaluation on the feedbacks from incubated enterprises to the operation states of all service programs of incubator in their cooperation process. These feedbacks are evaluated by not only the satisfaction of communication and management, but also the complaints from the incubators.

4 Data Analysis by AHP

AHP (Analytic Hierarchy Process) is a practical and ideal solution for multi-objective decision, as well as an extensive use in solving kinds of risk prediction or performance evaluation. This paper wields AHP to measure the weight of each index via conducting the comparative matrixes, and ensure the relative importance between the two indexes. The marks of each matrix are judged by both qualitative and quantitative methods. Interview and expert scoring are used to screen the dimensions and indexes in the evaluation hierarchy, so that the judgment of the importance weights is relatively credible.

4.1 Judgment matrix of dimension level and conformance test

Let the objective level of evaluation hierarchy as "S", the dimension level as S_i (i= 1, 2, 3, 4, 5), the relative importance weights between the former index and the later one are graded as "1-9" points, as well as its reciprocals. Thus, the matrix of dimension level can be as follow:

$$S = \begin{bmatrix} 1 & 2 & 2 & 2 & 4 \\ 1/2 & 1 & 2 & 2 & 3 \\ 1/2 & 1/2 & 1 & 2 & 2 \\ 1/2 & 1/2 & 1/2 & 1 & 3 \\ 1/4 & 1/3 & 1/2 & 1/3 & 1 \end{bmatrix}$$

The feature vector $W(S_i) = (0.3486, 0.2517, 0.1784, 0.1470, 0.0743)^T$; To this five order, $\lambda_{\max} = 5.1636$, $RI = 1.12$, $CR = 0.0364 < 0.10$, meet conformance.

4.2 Judgment matrix of index level and conformance test

Let the index level as S_{ij} ($i, j = 1, 2, 3, 4, 5$), Thus, the index matrix of S_1 can be as follow:

$$S_1 = \begin{bmatrix} 1 & 1 & 3 & 2 \\ 1 & 1 & 3 & 2 \\ 1/3 & 1/3 & 1 & 1/2 \\ 1/2 & 1/2 & 2 & 1 \end{bmatrix}$$

The feature vector $W(S_1) = (0.3509, 0.3509, 0.1091, 0.891)^T$, $\lambda_{\max} = 4.0104$, $RI = 0.90$, $CR = 0.0039 < 0.10$, meet conformance.

the index matrix of S_2 can be as follow:

$$S_2 = \begin{bmatrix} 1 & 1 & 1/2 & 1/3 \\ 1 & 1 & 1/2 & 1/3 \\ 2 & 2 & 1 & 2 \\ 3 & 3 & 1/2 & 1 \end{bmatrix}$$

The feature vector $W(S_2) = (0.1411, 0.1411, 0.3880, 0.3298)^T$, $\lambda_{\max} = 4.1545$, $RI = 0.90$, $CR = 0.0579 < 0.10$, meet conformance.

the index matrix of S_5 can be as follow:

$$S_5 = \begin{bmatrix} 1 & 2 & 1/2 & 1/4 \\ 1/2 & 1 & 1/2 & 1/4 \\ 2 & 2 & 1 & 1/6 \\ 4 & 4 & 6 & 1 \end{bmatrix}$$

The feature vector $W(S_5) = (0.1321, 0.0941, 0.1719, 0.6020)^T$, $\lambda_{\max} = 4.2153$, $RI = 0.90$, $CR = 0.0806 < 0.10$, meet conformance.

the index matrix of S_3 can be as follow:

$$S_3 = \begin{bmatrix} 1 & 2 & 2 & 2 & 1/3 \\ 1/2 & 1 & 1/2 & 1/3 & 1/5 \\ 1/2 & 2 & 1 & 1/3 & 1/4 \\ 1/2 & 3 & 3 & 1 & 1/3 \\ 3 & 3 & 4 & 3 & 1 \end{bmatrix}$$

The feature vector $W(S_3) = (0.2258, 0.0702, 0.0965, 0.1665, 0.4410)^T$, $\lambda_{\max} = 5.3406$, $RI = 1.12$, $CR = 0.0760 < 0.10$, meet conformance.

the index matrix of S_4 can be as follow:

$$S_4 = \begin{bmatrix} 1 & 5 & 3 & 1/5 & 1 \\ 1/5 & 1 & 1/3 & 1/6 & 1/3 \\ 1/3 & 3 & 1 & 1/3 & 1/2 \\ 5 & 6 & 3 & 1 & 4 \\ 1 & 3 & 2 & 1/4 & 1 \end{bmatrix}$$

The feature vector $W(S_4) = (0.1885, 0.0483, 0.1051, 0.5029, 0.1552)^T$, $\lambda_{\max} = 5.3114$, $RI = 1.12$, $CR = 0.0695 < 0.10$, meet conformance.

4.3 Analysis on indexes of innovative business incubator service ability

From the calculation of the matrixes above, the weights of service ability indexes are as follow:

Table 2 The Weight Distribution of Innovative Business Incubator Service Ability Indexes

$S_i \backslash S_{ij}$	S_1	S_2	S_3	S_4	S_5
S_{11}	0.1223	0.0335	0.0403	0.0277	0.0098
S_{12}	0.1223	0.0335	0.0125	0.0071	0.007
S_{13}	0.038	0.0977	0.0172	0.0154	0.0128
S_{14}	0.0659	0.083	0.0297	0.0739	0.0447
S_{15}	-	-	0.0787	0.0228	-

From the Table 2, abscissa suggests the five dimensions of service ability, while ordinate presents the index levels ($j=1,2,3,4,5$). A horizontal comparison shows that the abilities of fundamental service and capital operation are the most competitive ones among the five dimensions. The service ability of development and innovation are also the crucial dimensions in evaluation of innovative business incubator service ability. Also, figure 2 indicates the rank of top-ten weights among the indexes. Compared horizontally, these indexes are the most importance ones according to our study.

A vertical comparison reveals that each ability dimension has relatively important indexes, such as the construction cost of infrastructure configurations, the average ROE of incubated enterprises, the growth of incubated enterprises, and the ratio of R&D investment, transformation rate of science and technology innovation achievement.

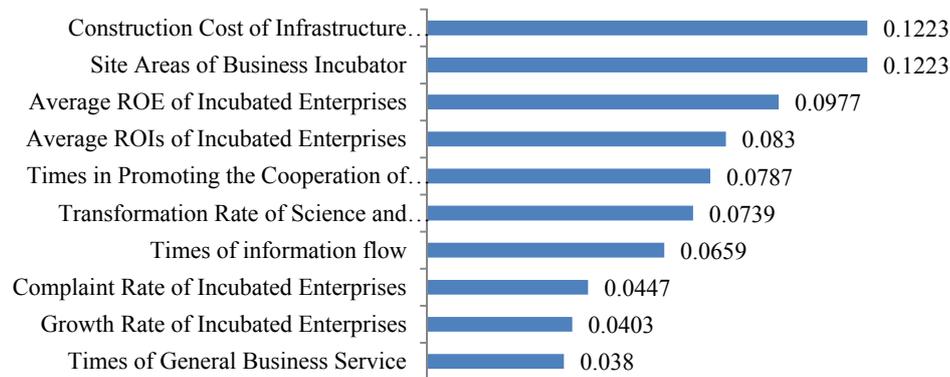

Figure 2 The Ranks on Top-Ten Index of Innovative Business Incubator Service Ability

5 Conclusions

This paper explores the evaluation on service ability of innovative business incubator, and builds an evaluation hierarchy, which contains five dimension levels and several relevant indexes, combing through Balanced Score-Card theory. From each weight of indexes calculated through AHP methodology, the fundamental service ability is weighted the highest among the whole dimensions. However, the indexes, like the average ROE and ROI of incubated enterprises, transformation rate of science and technology innovation achievement, the ratio of entrepreneurship tutors with advanced titles etc., play a vital role in evaluating the service ability of innovative business incubator's development and innovation.

As objective and credible as possible, the limitations of this study cannot be ignored. Firstly, as diverse as the actual innovative business incubators are, the indexes in this article still have an incompletely face, and more comprehensive indexes remains to be explored. Secondly, the scales of some start-ups are limited and they can hardly provide the high-level services, so the dimensions of service ability must be according to fact. Thus, our subsequent research will consider different innovative fields of enterprises, and be focused on the more detailed and appropriate indexes, as well as other service ability dimensions to improve the evaluation hierarchy in the future.

Research on Resource Sharing of Science and Technology Public Service Platform Based on Multi-Agent Game Theory

Zhang Nan, Wang Xiuting

School of Management, Wuhan University of Technology, Wuhan, P.R. China, 430070

(E-mail: zhangnan9212@126.com, wxt660@126.com)

Abstract: This paper analyzes the impact mechanism of three subjects on the public service platform of science and technology. According to evolutionary game theory, two group evolutionary game models are established to explore the evolutionary processes and stable strategies of both players in the game. The experimental results show that the resource sharing is related to the government's supervision, the willingness to participate in the enterprises, the power of the resources invested by universities and research institutes. The resource sharing problem can be solved effectively when the game system is developing towards a good evolutionary trend.

Key words: Government; Enterprises; Universities and research institutes; Science and technology public service platform; Resource sharing

1 Introduction

Platform construction has experienced the first ten year period(Zhang Guihong,2015).The domestic scholars defined it as high-quality and effective basic system provided by scientific instruments and equipment, technology resources, information network resources of resources sharing, industry monitoring and other public technology service(Zhang LiHua etc,2007;Wang Rui min etc,2010).The United States, Japan, Britain and other developed countries pay great attention to the government's leading role(Dai Guoqiang,2013).Therefore, it discussed refers to the resource sharing platform which can provide the knowledge intensive service.

Platform of resources sharing participation generally refers to the sharing activities of the undertaker.Enterprises as the main body of innovation,resource sharing system is the most important subjects of interest;universities and research institutions are the resource providers;government resources are unique(Xie Yun,2007);intermediary organizations plays a bridge role.At present, the research is mainly based on the evolutionary game theory of the two main body,such as the sharing mechanism evolution game analysis of technology infrastructure conditions without external supervision(Chen Keke, 2011);the evolutionary game of innovation oriented enterprises and government public service platform (Hou Yumei, Xue Wenhong, 2015); A study on the evolution of service platform and the demand side of technology service in the two sided market operation mode(Gu GuiFang,2015).Therefore, this paper focuses on the three main body,based on the evolution game theory to construct government and enterprises, enterprises and universities and research institutes of evolutionary game model,analysis influence of technology resources sharing factors, respectively to explore the game behavior evolution stable strategy and sensitivity analysis.

2 Evolutionary Game Model of Resource Sharing in Public Service Platform

2.1 The mechanism of resource sharing in the public service platform

According to the theory of resource view, the organization is a collection of heterogeneous resources(PETERAF M A,1993; WERNERFELT B,1984). Dai Guoqiang (2013) believes that platform has become an important carrier for the government to manage the allocation of resources,to effectively overcome the fragmentation of research resources and isolated island phenomenon.The American government set up a special technology center; the Japanese government ensure the efficiency by formulating relevant regulations; the EU“6th Framework (fr6) plan” to implement the network management is the world largest regional synthetic plan.But now, the lack of effective laws and regulations to protect the sharing of scientific resources.Universities and research institutes have innovation resources to share,such as talent, information,scientific research,infrastructure.Enterprises are the main innovation main body.As can be seen from the above analysis, the role of the three resources share mechanism as shown in figure 1.

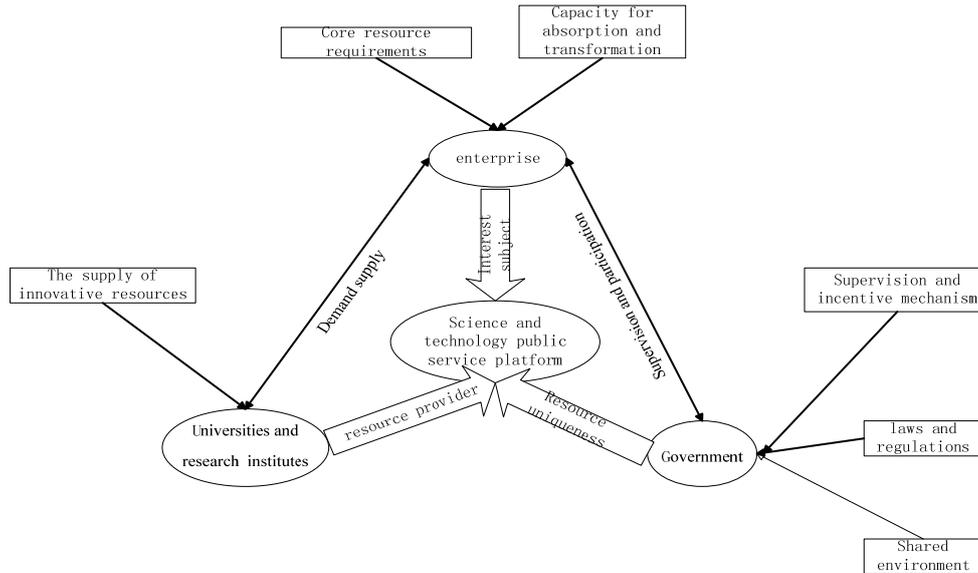

Figure 1 Mechanism of Resource Sharing in Science and Technology Public Service Platform

2.2 Basic assumptions and the establishment of the model

It can be built by the government and enterprises, enterprises and universities and research institutes of the evolutionary game model analysis of resource sharing. make the following assumptions:

Table 1 Related Parameters and Meaning

Parameter symbol	Meaning
R1	Gains from the government's implementation of regulatory strategies
C1	Costs required by the government to implement the regulatory strategy
R2	The gains obtained by the participation of enterprises
C2	Sharing cost, knowledge conversion cost and knowledge conversion cost involved in the implementation of the strategy
R3	The income of the enterprises to implement the strategy of not participating
M1	Due to the implementation of the government regulatory strategy, the enterprises does not participate in the strategy of potential losses
R4	Due to the implementation of the government regulatory strategy for participating enterprises to bring additional revenue
M2	Because the government does not supervise the implementation of the strategy, in order to participate in the additional losses caused by the enterprises
R5	Income from investment strategy chosen by universities and research institutes
C3	The cost of investment strategy required by universities and research institutes
R	The dynamic degree of the resources invested by universities and research institutes
R6	To participate in the enterprises as a result of the additional income that the university, scientific research institute invests the resources to obtain
M3	Participate in the enterprises as a result of the additional loss of resources brought by the university and research institutes
R7	Gains from the government's implementation of non regulatory strategies
M4	The potential loss of the investment strategy in universities and research institutes is not involved in the enterprises.
R8	The income from the implementation of the strategy of non - investment in universities and research institutes
M5	The utility loss of the government supervision without the participation of enterprises
M6	Utility loss of University and research institutes without enterprises participation

1) China's platform construction is from top to bottom, so the government plays a leading role in the construction and operation of the platform. That is, its strategic space for P1 {Supervise, not

supervise}. Universities and research institutes are the most important providers of resource sharing because of their rich innovation resources, its strategic space for the P2 {Input, No input}. Enterprise is the core of service platform, to speed up the transfer of core technology to the enterprise is an important measure, its strategy space P3 (Participate, Not participate). Because service platform has limited rationality, they will continue to learn to adjust the strategy to achieve interests.

2) It needs to set the relevant parameters and their meaning of the note as shown in Table 1.

3) Assuming that in the initial state, the choice of government regulation strategy is the proportion x ; selection of enterprises "participate" strategy on the ratio is y ; universities and research institutes selected "Input" the proportion of strategy is z , $0 \leq x \leq 1, 0 \leq y \leq 1, 0 \leq z \leq 1$. This paper builds the evolutionary game model with the game benefit matrix, as shown in Table 2, Table 3.

Table 2 The Payoff Matrix Between Enterprises and Government

government	enterprises	
	Participate	Not participate
Supervise	$R1-C1, R2-C2+R4$	$-M5, R3-M1$
Not supervise	$R7, R2-C2-M2$	$0, R3$

Table 3 The Payoff Matrix Between the Universities, Research Institutes and Enterprises

universities, research institutes	enterprises	
	Participate	Not participate
Input	$R5-C3, rR6+R2-C2$	$-M6, R3-M4$
Not input	$R8, R2-C2-M3$	$0, R3$

4) The following are the establishment of the dynamic equation of the copy:

a. During the game model between the enterprises and the government, enterprises to implement the "Participate" and "Not participate" strategy of the expected income benefits were $W11, W12$, the average expected return of $W1$, there are:

$$W11=y(R2-C2+R4)+(1-y)(R2-C2-M2); W12=y(R3-M1)+(1-y)R3; W1=xW11+(1-x)W12$$

In the same way, the expected return of the government to implement the strategy of "Supervise" and "Not supervise" is $W21, W22$, the average expectation is $W2$, then there are:

$$W21=x(R1-C1)+(1-x)(-M5); W22=xR7; W2=yW21+(1-y)W22$$

So the dynamic equation of the enterprises and the government's strategy is:

$$F1(x)=dx/dt=x(W11-W1)=x(1-x)(W11-W12)=x(1-x)[y(R4+M2+M1)+R2-R3-M2-C2]$$

$$F1(y)=dy/dt=y(W21-W2)=y(1-y)(W21-W22)=y(1-y)[x(R1-C1+M5-R7)-M5]$$

b. Universities, research institutes and enterprises in the game model of enterprises in the implementation of "Participate" and "Not participate" strategy, the expected benefits were $V11, V12$, the average expected return of $V1$, there are:

$$V11=z(rR6+R2-C2)+(1-z)(R2-C2-M3); V12=z(R3-M4)+(1-z)R3; V1=xV11+(1-x)V12$$

Similarly, colleges and universities, the implementation of the "Input" and "Not input" strategy, the expected benefits were $V21, V22$, the average expected to be $V2$, there are:

$$V21=x(R5-C3)+(1-x)(-M6); V22=xR8; V2=zV21+(1-z)V22$$

Therefore, the dynamic equation of the reproduction of the strategy of enterprises and universities and research institutes is:

$$F2(x)=dx/dt=x(V11-V1)=x(1-x)(V11-V12)=x(1-x)[z(rR6+M4)+(R2-R3-C2-M3)]$$

$$F2(z)=dz/dt=z(V21-V2)=z(1-z)(V21-V22)=y(1-y)[x(R5-C3+M6-R8)-M6]$$

According to the dynamic equation $F1(x)$ and $F1(y)$, there are 5 local equilibrium points in the evolutionary game of the enterprises and the government, that is, $D1(0,0), D2(0,1), D3(1,0), D4(1,1), D5$

$(\frac{M5}{R1+M5-C1-R7}, \frac{R3+M2+C2-R2}{R4+M2+M1})$. Similarly, according to the dynamic equation $F2(x)$ and $F2(z)$, there are 5 local equilibrium points in the evolutionary game among the University, the scientific research institutes and the enterprises, that is, $D6(0,0), D7(0,1), D8(1,0), D9(1,1), D10$

$(\frac{M6}{R5+M6-C3-R8}, \frac{R3+C2+M3-R2}{rR6+M4})$. The sharing of resources and the evolutionary stability through the Jacobian matrix local stability analysis as shown in Table 4. Figure 2 and Figure 3 are the dynamic process of interaction.

Table 4 Results of Stability Analysis of Equilibrium Point

Equilibrium point	DetJ	TrJ	result	Equilibrium point	DetJ	TrJ	result
D1	+	-	ESS	D6	+	-	ESS
D2	+	+	Unstable fixed point	D7	+	+	Unstable fixed point
D3	+	+	Unstable fixed point	D8	+	+	Unstable fixed point
D4	+	-	ESS	D9	+	-	ESS
D5	-	0	saddle point	D10	-	0	saddle point

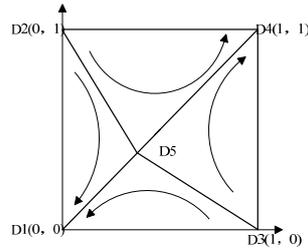

Figure 2 The Dynamic Process of the Interaction Between the Enterprises and Government

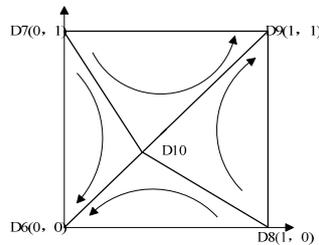

Figure 3 The Dynamic Process of the Interaction Between Universities, Research Institutes and Enterprises

3 Sensitivity Analysis and System Phase Diagram

Through the sensitivity analysis, the effect of the parameter changes to the saddle point D5 and D10, by changing the position of D10 and D5 to make the game system can tend to the state of our hope, that is, ESS equilibrium point D4 (Participate,Supervise), D9 expressed (Participate, Input) state.

1) Parameters R1, R2, R3, R5, R6, R7, R8. As R1 increases, the D5 shift to the left horizontally (Figure 4);as R2 increases, D5 and D10 will be vertically downward (Figure 8); when R3 is reduced, D5 and D10 are vertically downward (Figure 8);as R5 increases,D10 the level of the left (Figure 5);as R6 increases, D10 is vertically downward (Figure 7);when the R7 decreases, D5 will level shift (Figure 9); when reducing the R8, D10 the left shift(Figure 5).

2) Parameters M1, M2, M3, M4, M5, M6. When M1 and M2 increase,D5 is vertically downward (Figure 6);while M3 decreases,M4 increases,D10 will vertically downward (Figure 7);when M5 decreases, the D5 level will shift to the left (Figure 4);when the M6 was reduced, the level of D10 will shift to the left (Figure 5).

3) Parameters C1, C2, C3. when C1 decreases, D5 will left shift (Figure 4); when the C2 decreases, D5, D10 are vertically downward (Figure 8); when C3 decreases, D10 will shift to left (Figure 5). By the above analysis, that is, the government, enterprises, universities and research institutes to reduce costs, the system will be a good evolution of the trajectory of development.

4) Parameter R.when R increases, D10 will vertically downward (Figure 7), the University, research institutes all input resources,which will make the system presents a good evolutionary trajectory.

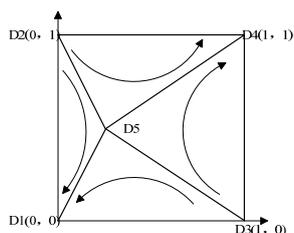

Figure 4 R1, M5 Increase, C1 Decrease

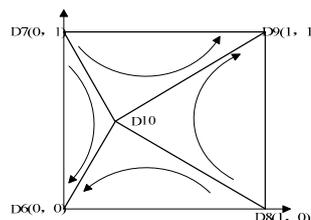

Figure 5 R5 Increase, R8, M6, C3 Decrease

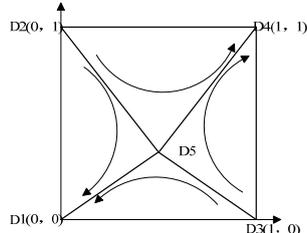

Figure 6 M2, M1 Increase

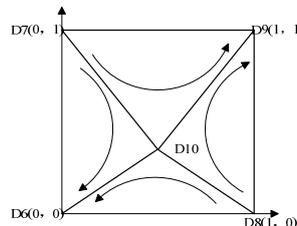

Figure 7 R6, M4, R Increased, M3 Decrease

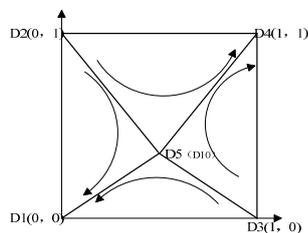

Figure 8 R2 Increase, R3, C2 Decrease

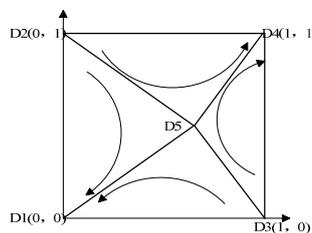

Figure 9 R7 Decrease

4 Conclusions

Analysis results indicate that the resources of science and technology in public service platform and the resources of government supervision, enterprise's willingness to participate and institutions of higher learning and scientific research institutions are shared. Therefore, the breadth and depth of the sharing resources of science and technology public service platform depends on the changes of government, enterprises, universities and scientific research institutions. When the three form a good interactive relationship, it can further promote the effective sharing of scientific and technological public service platform.

Research on the Industrial Contribution and Influence Factors of Sci-Tech Small and Micro Enterprises in Wuhan

Li Qiong¹, Cheng Yanxia²

1 School of Economic Management, Wuhan Huaxia University of Technology, Wuhan, P.R. China, 430223

2 School of Management, Wuhan University of Technology, Wuhan, P.R. China, 430070
(E-mail: liqiong913@163.com, chengyanxia221@126.com)

Abstract: This paper selects current fast-growing sci-tech small and micro enterprises as research object. Though defining the concept for sci-tech small and micro enterprises, it clarifies the distinctions between small micro enterprises and sci-tech small and micro enterprises. In addition, this paper teases out the major seven industry types based on the current development situation of small and micro enterprises in Wuhan. It also analyzes the contribution of sci-tech small and micro enterprises in Wuhan to the development of regional economy by using output value contribution. On the basis of this, this paper concludes the scale economies, government, trade demand, human resources and information network are current leading power affecting industrial contribution by using multiple linear regression model.

Key words: Small and micro enterprises; Sci-tech small and micro enterprises; Industrial contribution

1 Introduction

Hubei province is located in the center of economy and geography in our country, which is facing the good opportunity from national industrial structure adjustment of and industrial upgrading. The rapid development of strategic emerging industry has become the important guarantee to implement the strategic objective of innovation and wisdom, and sci-tech small and micro enterprise is one of the important support for rapid development of strategic emerging industry in Hubei province.

At present, there is no description regarding sci-tech small and micro enterprises abroad, but only small and micro enterprises or small-enterprises, which mainly focus on its development constraints due to financing problems. Visser M Anne (2005) explains the impact of human resources to the financing of small and micro enterprises by using econometric model; Martin, Ludus (2010) analyzes hindering effect of financing problems during the development of small and micro enterprises through the establishment of data model. In addition, Chinese scholars research the interaction between sci-tech small and micro enterprises and economic development in the past two years. Chen Huinv and Ding Li Yang (2013) analyze and found it is very important to the development of economy that sci-tech small and micro enterprises by increasing the growth rate of the total factor of society and driving structural adjustment of social factors; Lin Zhouyu (2013) believes that the government functions, efficiency, and market environment play an important role in the healthy development of sci-tech small and micro enterprises; Yao Qi etc. (2014) propose that it is necessary for science and technology departments of government, scientific research institutes of University, the science and technology intermediary organizations etc. to renew ideas, establish mechanism and build platform, as well as accelerate the development of science and technology small and micro enterprises.

Wuhan is one of the important bases of national trade and logistics, which is also one of the areas with most active business activities of small micro enterprise in China. Now, there are more than 17 small micro enterprise cluster industrial parks, such as Wuhan small micro enterprise (technology) pioneering park, have been built in Wuhan, which could be regarded as the epitome of the development of technology-based small micro enterprises in China, and it has representative. Therefore, it is very meaningful to take Wuhan as the basic point to make the research on the regional contribution and influence factors of sci-tech small and micro enterprises, which is of great theoretical and practical significance.

2 Sci-Tech Small and Micro Businesses Definition

Considering the definition and connotation of technology-based small and micro businesses, the article for the definition of technology-based small and micro enterprises as follows: We believe that products and services of technology-based small and micro businesses are higher scientific and technological. The enterprises are relatively small in scale and the intellectual intensive enterprise,

engaged in high-tech research and development, production and operation of high-tech products, and independent accounting or relatively independent accounting. Their staff are mainly scientific and technical personnel, R & D personnel ratio is not less than 10%, and the R & D intensity is not less than 6%. they are in possession of development of no less than 10% and research and development strength of less than 16%. These enterprises own some intellectual property rights, advanced technology and knowledge, providing products and services by innovation, mainly concentrated in the areas of electronic information, biological engineering, new material, Internet of things, new energy, research and development of science and technology, service and consulting.

3 The Current Development Situation of Wuhan Science and Technology Small Micro Enterprise

Statistics departments at various levels of Wuhan and Hubei province have comprehensive and systematic basic information concerning scale, production, research and development personnel quantity and level of technology-based small micro enterprise. According to the specified industry from technological small and medium-sized enterprise service net, clear Wuhan technology-based small and micro enterprises are mainly distributed in strategic emerging industries and related industries of high technology, including seven industry(biological medicine, electronic information, new materials, light mechanical and electrical integration, resources and environment, new energy and high efficiency saving energy, and high technology services).After 10 years of development, Wuhan photoelectron information industry accounted for 25% of the world market, 60% of the Chinese market, optical communication components accounted for 70% of the domestic market. The development of Bio pharmaceutical industry is well in Hubei, especially in Wuhan. In June 2007, the national development and Reform Commission formally approved to build Wuhan National biological industry base (Optics Valley of biological city). This is the second national industrial of Wuhan East Lake High Tech Development Zone since the national photoelectron information industry base.

4 The Evaluation for Contribution of Sci-Tech Small and Micro Enterprises to The Regional Economy in Wuhan

We choose output value contribution degree to judge and measure the contribution degree of technology-based small micro enterprises to regional economy in Wuhan. Its computation formula as follow:

$$Y = \frac{\Delta C}{\Delta D} = \frac{C2 - C1}{D2 - D1}$$

ΔC standing forthe growth of production value of sci-tech small and micro enterprises in Wuhan.

ΔD standing forthe growth of Wuhan GDP. According to related data from the statistical yearbook, the relevant government departments and small and micro enterprise park, we select nearly 10 years of relevant data and get the calculation result:

Table 1 The Evaluation for Contribution of Sci-tech Small and Micro Enterprises to the Regional Economy in Wuhan

	2006	2007	2008	2009	2010	2011	2012	2013	2014	2015
Contrib-ution degree	0.0125	0.0356	0.0415	0.0757	0.0824	0.105	0.1241	0.1556	0.1741	0.1852

From the results, we can see the situation of the contribution of sci-tech small and micro enterprises to regional economic in Wuhan is getting better and better. With the stronger support of Wuhan for small and micro enterprises, especially sci-tech small and micro enterprises, the number and size of sci-tech small and micro enterprises in Wuhan is growing, and they are become more and more important for the development of the regional economy in Wuhan.

5 Analysis on the Main Factors Affecting the Contribution Degree of Sci-Tech Small and Micro Enterprises to Regional Economy.

5.1 Model

According to the relevant theoretical analysis of regional economy and small and micro enterprises, the paper chooses some probable influencing factors for contribution to the regional economy of technology-based small and micro enterprises in Wuhan. The independent variables include six types of human resources, scale economy, trade demand, infrastructure, government management, information

network (Poon.J,2003).

Establish multiple regression model as follow:

$$Y = b_0 + b_1R + b_2M + b_3TR + b_4JC + b_5GV + b_6X$$

Considering the comparability of historical data, the data using relative indicators:

Y standing for the contribution of technology-based small and micro enterprises to the regional economy.

R standing for human resources, to investigate the contribution of human resources to the growth of technology-based small and micro enterprises of in Wuhan. Specific indicators are the number of employees, in sci-tech small and micro enterprises, accounted for the proportion of total employment in Wuhan.

M standing for the scale economy, an important source of increasing returns, constitute the important determinants of industrial agglomeration. We use industry growth from technology-based small and micro enterprises in Wuhan accounts for the proportion of Wuhan GDP as a measure of the scale economy.

TR standing for trade demand factors, we choose total trade of sci-tech small and micro enterprises in Wuhan accounted for the proportion of total trade in Wuhan GDP.

JC on behalf of the infrastructure, convenient developed and facilities perfect urban infrastructure construction can effectively reduce the cost, and attract sci-tech small and micro enterprises. We use the construction industry output value related to technology-based small and micro enterprises accounted for the proportion of Wuhan GDP as an index.

GV index on behalf of the government management. Political policy stability and good regulatory environment are the important reference information for location selection of technology-based small micro enterprise, and also the influence factors of agglomeration development. The government is specifically set for financial expenditure of related projects of sci-tech small and micro enterprise in Wuhan accounted for the proportion of Wuhan GDP as a share of GDP to measure the government function.

X represents the information network. On the one hand, the huge “information externalities” will generate information arbitrage activities, so that small and micro enterprises of science and technology can be gathered in the amount of information to gain the benefit. On the other hand, as information for technology-based small and micro enterprises in Wuhan can create a greater spatial effect. We choose post and telecommunications business volume accounted for the ratio of GDP as the developed degree of the local information.

B0 is constant, and b1, b2...B6 is the coefficient of each index variable.

The range of sample selection is 10 years of data, which is from 2006 to 2015.

5.2 The empirical results

Make the data type into the Eviews software, and use the least squares (OLS) regression, get the following the final regression analysis result by the correlation test.

Table 1 Analysis Result By the Correlation Test

The independent variables.	T value	Prob.	The coefficient
The human resources R	1.166503	0.0188	0.665608474
Economies of scale M	6.301033	0.0004	3.028875281
Trade demand TR	2.331795	0.0417	1.258127993
Infrastructure JC	1.162454	0.3291	0.114928972
The government management Gv	3.176235	0.0140	1.957556002
Information network X	1.783434	0.0245	0.411069588
R value: 0.919726		F statistic: 826. 919	
R ² value: 0.929179			

We can see that the values of R and R² are very close to 1, showing that regression model regression effect is remarkable.

By analyzing the P value and the t value, we can conclude the economies of scale M t value is maximum in the indicators, which influence the contribution of sci-tech small and micro enterprise in Wuhan for regional economic. It shows that the scale economy formed by the group effect of sci-tech small and micro enterprise in Wuhan has the most significant impact on the regional economic contribution rate, and the influence coefficient is 3.03; Second, followed by the impact of government

factors, the impact coefficient close to 2; Trade demand on the regional economic contribution rate are more important, influence coefficient is also more than 1; The T value of human resources and information network is more than 1, which indicates that the agglomeration of high tech service talent has a strong correlation with the regional economic contribution of sci-tech small and micro enterprises in Wuhan. The indicators of infrastructure have the lowest correlation with the regional economic contribution of sci-tech small and micro enterprises in Wuhan, which indicates the impact of the infrastructure and information network on the regional economic contribution is limited.

6 Conclusions

The development of sci-tech small and micro enterprises in Wuhan has become an important force to support the regional economic development and industrial innovation in Wuhan. In recent years, there are a variety of different sci-tech small and micro enterprise industrial parks as the characteristics through policy guidance, industrial cooperation, and other ways. By means of the value of the contribution rate and multiple linear regression model, the paper concludes that the situation of the contribution of sci-tech small and micro enterprises to regional economic in Wuhan is getting better and better, which first thanks to the government and the trade needs, and secondly owing to human resources and information network. With the gradual improvement of relevant data, we can carry out industrial differentiation research aiming at sci-tech small and micro enterprises in the future, to clarify the contribution and impact of different industry types of sci-tech small and micro enterprises on the regional economy.

Abstract: The interrelation between Intellectual Capital (IC) and economic development is analyzed theoretically, and the main conclusion is that regional economic differences can result from the uneven development of Regional Intellectual Capital (RIC). We construct the evaluation system of RIC to appraise the stock and increment of the eastern, central, and western regions of Shandong Province from 2004 to 2012. The results indicate that the overall stock of RIC shows a growing trend with significant regional differences: East high and West low. Findings also demonstrate that the amplitude of RIC increment is large, and the Central is even more unstable.

Key words: Regional intellectual capital; Regional economic differences; Shandong province

1 Introduction

Intellectual Capital, which has attracted a wide common attention of domestic and foreign scholars, enterprises, research institutions and international organizations, is pushed to the forefront in the era of knowledge economy. The contribution of traditional production factors to economic development decreases more obviously than ever, under the law of diminishing marginal utility, and the optimistic role of intellectual elements has become increasingly prominent.

Since the implementation of reform and open policy, Shandong's economy developed rapidly, as a regional characteristic manifests apparently: a greater economic development gap broadens between east and west. Accelerating the economic development of less developed areas in West to reduce the widening gap, and acquiring a relatively balanced development to achieve the dual goals of economic prosperity and social stability, are major policy issues. After a long term exploration and implementation of series of policies and development strategies that government did, there is no indication that this gap would be eliminated fundamentally. In addition, the interactions between the four elements of IC bring a spiral upward trend to RIC, which is the driving force for economic growth. Thus, analyzing the reasons of regional differences in economic development, from the perspective of RIC, has a certain reference value for narrowing the gap economic developments caused.

2 Literature Reviews

Intellectual Capital theory, as a strategic management theory, not only is of great significance at the enterprise level, but also has a guiding role in the national and regional economic level. In 1996, Swedish government and Stockholm University applied modified Skandia Navigator to the national level, in order to quantify the development of national intellectual capital. In 2004, Nick Bontis argued that RIC has hidden values owned by individual, enterprise, research institutions, communities and regions, which was a kind of source for enterprises to create wealth in current and future. He raised the National Intellectual Capital Index Theory creatively and introduced structural equation model to measure IC- which include human capital, process capital, market capital and reproduce capital- of the Arab countries. Since then, the concept of RIC has begun to attract widespread attention (Andriessen and Stam, 2005; Bounfour, 2005; Hervas-Oliver and Dalmau-Porta, 2007; Stähle and Bounfour, 2008; Lin and Edvinsson, 2011; Kapyla, 2012; Stähle and Stähle, 2012; Yeh-Yun et al., 2013).

On the basis of foreign researches, domestic scholars began the studies of RIC, combined with Chinese conditions. They tend to divide it into human capital, structural capital and relational capital and innovation capital, in the aspect of measuring RIC (X. Pan, 2003; Y.F. Chen, 2006; X.J. Wang, 2008; W. Chen, 2010; Z.Q. Ding, 2011; J. Lu, 2013); construct evaluation index system suitable for China (Y.F. Chen, 2006; Wang X.J. Wang, 2008; X.B. Wang, 2009; B.R. Dong, 2010); based on different perspectives, research the function mechanism of RIC to regional development and the role it plays in the transformation of economic growth mode (A.P. Xu, 2008; Q.C. Zhang, 2010; Z.Q. Ding, 2011, X.G. Tang, 2012; M.H. Wang, 2013); build metrics system and confirmed that RIC has a positive impact on economic growth, considering the provinces (W. Chen, 2010; B.R. Dong, 2010; H.Y. Pu, 2010; X.P.

Zhang, 2011). All the research results have shown that RIC plays a promoting role in regional economic development.

3 Data and Methodology

3.1 Metrics system

Considering domestic and foreign scholars' classification on intellectual capital, we divide regional intellectual capital into human capital, structural capital, relational capital and innovation capital in this paper. According to the research of some scholars, such as Chen Yufen (2006), Wang Xiaobin (2009), considering the data readily available, this paper selects specific indicators system to evaluate RIC shown in Table 1.

Table 1 The Metrics System of RIC

Primary Indicators	Secondary Indicators	Tertiary Indicators	
Human Capital (H)	Education level (H ₁)	Education budget expenditure to GDP ratio (H ₁₁)	
		High school students in the school to total number ratio (H ₁₂)	
	Medical level (H ₂)	Number of doctors per capita (H ₂₁)	
		Number of beds per capita in medical institutions (H ₂₂)	
	Social security (H ₃)	Population participating in pension insurance to total population ratio at the end of the year (H ₃₁)	
		Population participating in unemployment insurance to total population ratio at the end of the year (H ₃₂)	
		Population participating in basic medical insurance to total population ratio at the end of the year (H ₃₃)	
	Structural Capital (S)	Industrial Structure (S ₁)	Percentage of primary industry (S ₁₁)
			Percentage of secondary industry (S ₁₂)
Percentage of tertiary industry (S ₁₃)			
Government efficiency level (S ₂)		Public finance budget revenues to GDP ratio (S ₂₁)	
		Public finance budget expenditure to GDP ratio (S ₂₂)	
Social circulation and information communication mechanism (S ₃)		Per capita total passenger (S ₃₁)	
		Per capita total freight (S ₃₂)	
		Per capita total postal and telecommunication services (S ₃₃)	
		Per capita number of library (S ₃₄)	
Relational Capital (R)	International trade (R ₁)	Total investment from foreign to GDP ratio (R ₁₁)	
		Total import and export to GDP ratio (R ₁₂)	
		Total capital FDI contracts used to GDP ratio (R ₁₃)	
	Domestic trade (R ₂)	Total retail sales of social consumer goods to GDP ratio (R ₂₁)	
		Total deposits from financial institutions to GDP ratio (R ₂₂)	
		Total loans from financial institutions to GDP ratio (R ₂₃)	
	Personnel exchanges (R ₃)	The proportion of foreign tourists (R ₃₁)	
		International tourism receipts to GDP ratio (R ₃₂)	
	Innovation Capital (I)	Innovation investment (I ₁)	The expenditure of R&D to GDP ratio (I ₁₁)
Local Financial Allocation to Local fiscal expenditure ratio (I ₁₂)			
Innovation output (I ₂)		The proportion of patent applications (I ₂₁)	
		The proportion of utility model applications (I ₂₂)	
		The proportion of appearance design applications (I ₂₃)	
Innovators (I ₃)		The proportion of R & D personnel in Industrial enterprises above designated size (I ₃₁)	

3.2 Data sources

With reference to F.H. Mu (2006), we divide Shandong into eastern, central and western regions according to their developed degree, shown in Table 2. In empirical analysis, 30 indicators of 17 cities are from the 2004-2012 years of "Shandong Statistical Yearbook" and "Shandong Science and Technology Yearbook".

Table 2 The Economic Regions of Shandong Province

Region	Cities
Eastern region	Qingdao, Yantai, Weihai, Rizhao, Weifang, Dongying
Central region	Jinan, Taian, Zibo, Laiwu, Linyi
Western region	Dezhou, Liaocheng, Binzhou, Hezi, Zaozhuang, Jining

3.3 Evaluation of the four elements of RIC

In this paper, we use factor analysis to evaluate RIC. The details are as follows. Due to the inconsistent dimensions of indicators, we use the data after pretreatment for indicators' calculation: standardize, using the difference between an indicator and its expected value to divide its standard deviation. we use statistical software, SPSS 17.0, to analyze all the indicators of these four elements. The calculation process is as follows:

Expressions of human capital are

$$F_{H1} = -0.239H_{11} - 0.024H_{12} + 0.263H_{21} + 0.145H_{22} + 0.233H_{31} + 0.332H_{32} + 0.078H_{33} \quad (1)$$

$$F_{H2} = 0.613H_{11} - 0.291H_{12} - 0.105H_{21} + 0.129H_{22} - 0.037H_{31} - 0.275H_{32} + 0.226H_{33} \quad (2)$$

$$F_H = \frac{74.28\%F_{H1} + 19.26\%F_{H2}}{93.54\%} \quad (3)$$

Expressions of structural capital are

$$F_{S1} = -0.269S_{11} + 0.173S_{13} + 0.043S_{21} - 0.195S_{22} + 0.230S_{31} - 0.050S_{32} + 0.186S_{33} + 0.299S_{34} \quad (4)$$

$$F_{S2} = 0.058S_{11} + 0.071S_{13} + 0.279S_{21} + 0.463S_{22} + 0.021S_{31} + 0.348S_{32} - 0.070S_{33} - 0.170S_{34} \quad (5)$$

$$F_S = \frac{57.71\%F_{S1} + 22.32\%F_{S2}}{80.03\%} \quad (6)$$

Expressions of relational capital are

$$F_{R1} = -0.207R_{11} + 0.336R_{12} - 0.068R_{13} - 0.065R_{21} + 0.032R_{22} - 0.022R_{23} + 0.359R_{31} + 0.379R_{32} \quad (7)$$

$$F_{R2} = 0.093R_{11} + 0.059R_{12} + 0.041R_{13} + 0.241R_{21} + 0.417R_{22} + 0.426R_{23} - 0.055R_{31} + 0.002R_{32} \quad (8)$$

$$F_{R3} = 0.587R_{11} - 0.080R_{12} + 0.459R_{13} - 0.164R_{21} + 0.040R_{22} + 0.103R_{23} - 0.117R_{31} - 0.15 \quad (9)$$

$$F_R = \frac{50.79\%F_{R1} + 30.35\%F_{R2} + 14.74\%F_{R3}}{95.87\%} \quad (10)$$

Expressions of innovation capital are

$$F_I = 0.154I_{11} + 0.176I_{12} + 0.196I_{21} + 0.189I_{22} + 0.201I_{23} + 0.196I_{31} \quad (11)$$

Finally, put the indicators standardized into the above expressions, and calculate the scores of the four elements, shown in Table 3.

Table 3 Scores of four Elements of RIC of Shandong Province

Region	Years	H	S	R	I
Eastern Region	2004	-0.1189	-0.3383	0.6670	0.8748
	2005	-0.0945	-0.2248	0.6373	0.4554
	2006	0.0413	0.0573	0.6337	0.9297
	2007	0.1941	0.3926	0.6191	0.8948

	2006	-0.3418	-0.0838	0.1207	0.0613
	2007	-0.2213	0.0977	-0.0306	0.3747
	2008	0.0255	0.3745	0.0013	0.5281
	2009	0.3261	0.4936	0.2620	0.5667
	2010	0.6966	0.7017	0.3187	0.5821
	2011	0.8267	0.6037	0.3720	0.3689
	2012	0.9384	0.8452	0.2190	0.4252

Western Region	2004	-1.2682	-1.6271	-0.8464	-1.6749
	2005	-1.2159	-1.5556	-0.8613	-1.6364
	2006	-1.1198	-1.2816	-0.9022	-1.4695
	2007	-1.0950	-1.0718	-0.9559	-1.2473
	2008	-0.9406	-0.8004	-0.9741	-1.2648
	2009	-0.6963	-0.4065	-0.7737	-1.2150
	2010	-0.4186	-0.1983	-0.6935	-1.1102
	2011	-0.3165	-0.1958	-0.7110	-1.0394
	2012	-0.1201	-0.0047	-0.6702	-0.9050

3.4 Evaluation of RIC

Pearson correlation test is done to test the interrelationship between the four elements. There are significant linear correlations between H, S, R and I, with confidence level of 0.01. Thus, we need to apply the factor analysis for dimensionality reduction to calculate the composite score of RIC.

Before the factor analysis, KMO test and Bartlett's test go first to the sample data, with the KMO value, 0.687, Approx Chi-Square, 162.502, and the significant probability of the chi-square statistic, 0.000. All these say that this data is suitable for factor analysis. According to the elements' scores, principal component analysis selects only the first principal component (the contribution is 90.497%). So, RIC can be expressed as:

$$F = 0.263F_H + 0.261F_S + 0.259F_R + 0.267F_I \quad (12)$$

The scores of RIC are shown in Table 4.

Table 4 Scores of RIC of Shandong Province

Years	Eastern Region	Central Region	Western Region
2004	0.2872	-0.1371	-1.4262
2005	0.2034	-0.1573	-1.3873
2006	0.4388	-0.0641	-1.2564
2007	0.5535	0.0596	-1.1496
2008	0.6604	0.2461	-1.0474
2009	0.8502	0.4343	-0.8149
2010	1.0628	0.6049	-0.6386
2011	1.1609	0.5704	-0.5967
2012	1.3538	0.6382	-0.4486

4 Comparative analysis of RIC

Analysis of RIC stock

We can get a line chart of the stock of RIC, shown in Figure 1, according to Table 5. From Figure 1, we can see clearly that there are huge differences in RIC stocks. For example, in 2004, the RIC score of eastern region is 0.2872, while in the west the score is -1.4262; in 2008, this gap is almost unchanged; until 2012, western region's score still cannot catch up with eastern region's in 2004. And from figure 1, the scores are steady upward, especially the western region. To some extent, this ensures that the future economic developments have enough intellectual support. And though the western region lags behind, there is a chance to close the gap still. In addition, we can visually find the curves are almost parallel, with a weak narrowing trend. To put it in other word, from the perspective of IC, bridging the economic differences between the three areas remains a daunting task.

Through Johansen co-integration test, Chen Wu (2010) found co-integration relationship exists between RIC and economic development, that in the short term, RIC and the level of economic growth may deviate from equilibrium, but in the long run, maintain balance. In other words, economic development lags behind the development of IC. According to the descriptive analysis, we try to explore the reasons for the existing differences between RIC.

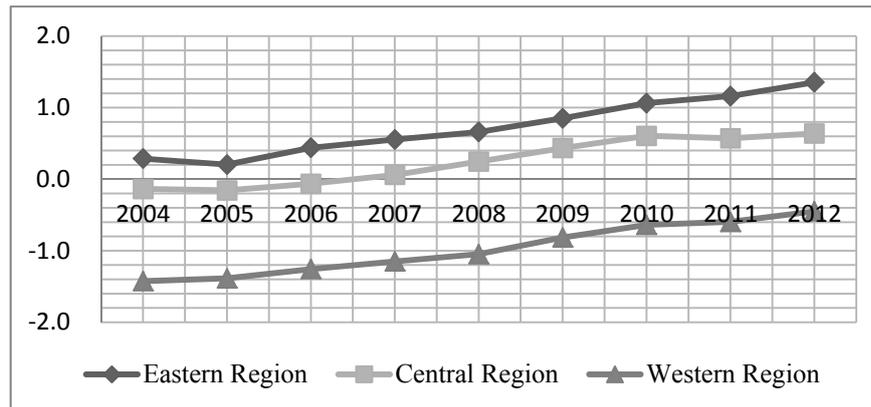

Figure 1 The Line Chart of the Stock of RIC of Shandong Province

1) Human capital

In 2004, the expenditure of education budget in Shandong was 18.07 billion RMB. With the growth year after year, it had reached 114.1 billion by 2012. And in 2010, Shandong implemented Social Security reform and Medicare reform, so the level of social security has been greatly improved. With the investment Shandong Provincial Financial Department put on a yearly basis, human capital acquires a more secure guarantee. In addition, in recent years, the west tried to increase the education spending as much as possible, but it fails to change the condition in the short term for the low starting point. And the east, with excellent geographical location and natural conditions, and a high level of medical and social security, attracts a large number of high quality talents. All of these result in the differences in human capital.

2) Structural capital

In the east and center, the primary industry continues to decline, the service industry quickly became the second largest industry that is able to compete with traditional industries and the tourism and logistics in the tertiary industry experience a rapid rise. Thus, the industrial structure of this region becomes more rational, and the increasing of social interaction accelerates the speed of information dissemination, as well. Located on Jiaodong peninsula, the east owns convenient marine traffic, but due to geographical restrictions, land transports are relatively backward. Thus, the central region with all the geographical advantages becomes the largest regional traffic center. Located in the central of the continent, rail transportation is convenient in the west, and its cargo traffic is also greater than the peninsula.

3) Relational capital

In the last few years, economy is driven by foreign investment in Shandong. This makes industries gathering rapidly in a short term, with wealth created. But it also becomes one of the reasons for the widening gap between rich and poor. Foreign direct investment enriches the investment areas through technology spillover effect, so the more investment eastern and central regions are put into, the wider the gap will be. And in recent years the tendency to rely on foreign investment, has eased, especially in the east. In addition, that South Korea, North Korea and Japan is across the sea with the east, and that the Jiaodong Peninsula is a summer resort with a pleasant climate and beautiful scenery, accelerate the development of tourism to some extent. The foreign tourists' number, tourism revenues, and import and export of goods and labor are more than other regions', and on a yearly basis. In contrast, the disadvantages of the central and western appear.

4) Innovation capital

Shandong provincial government has emphasized on innovation for a long time. In the 12th five-year period, Shandong Province proposes to complete an enterprises-bodied, market-oriented, and production-combined technological innovation system continuously, and built an innovation-oriented province first in domestic. Jiaodong Peninsula is a gathering place of knowledge-based talents. Moreover, compared to traditional domestic firms, foreign enterprises pay more attention to product and technological innovation, and the entrance of Foreign-funded enterprises provides a template of organizational innovation for the traditional private enterprises. In the eastern region, the stocks of other capitals are higher. With the interaction of capitals, business innovation can evolve into regional innovation capital better.

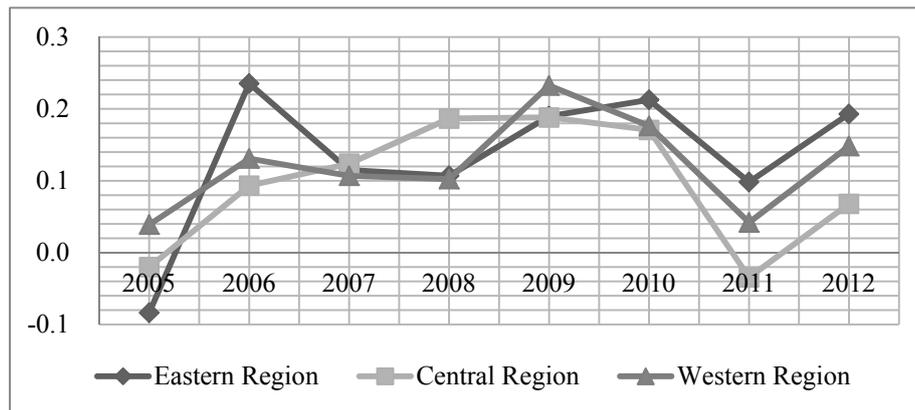

Figure 2 The Line Chart of the Increment of RIC of Shandong Province

5 Analysis of Incremental RIC

We calculate the RIC scores from 2004 to 2012, and get a line graph of increment from 2005 to 2012, shown in Figure 2. As can be seen from Figure 2, despite the large incremental floating, the basis trends are consistent and stable. The increment of 2009 and 2010 is rather, the highest point in history since 2004, but later in 2011, the increment declines overall. In addition, the central region experiences a long period of steady, while there was a significant decline, even negative growth, in 2011. Additional investment in RIC can make it to get some growth, but even without any investments, the existing RIC stock can also produce a certain increment with the interaction of the four elements, which is called endogenous. However, the absence of external inputs will affect the future sustainable development. That is to say the increment of IC lags behind investment.

On one hand, in 2010, with the insignificant increases of other three capitals, the growth in health care and social security level supported the continued strengthening of human capital. So we have to acknowledge that the increase of external inputs does play an important role in the current stock of IC. On the other hand, over the years, the west invested more than the other regions in both educational expenditure and public budget. Yet, because the western population is growing faster and its innate RIC stock is less, such investment brings minimal increments. With the role of both, the incremental IC of 2010 is nearly the same of 2009's.

After 2010, RIC increment happens to a significant decline, and its causes are mainly reflected in the following aspects: (1) A surge in 2010 made the increment in 2011 insignificant. In 2010, the participating proportion of health insurance surged, with little change in the total population. So the decline in 2011 is reasonable. (2) Comprehensive upgrading of communication technology has changed the traditional means of communication. The development of mobile phones and the Internet makes the Posts and Telecommunications in 2011 plummeted from 197.3 billion to 77.1 billion. And since 2010, flights in Shandong increased unprecedentedly, resulting in a weak growth in highway and rail traffic. (3) European debt crisis resulted in import and export and foreign investment projects flagging. The further escalation of the European debt crisis brings a slow economic recovery, a continued decline of foreign investment, a sharp decrease in import and export demand, a continued downturn in shipping market, and weak market demands of container trade. And all these led to a substantial fall in the import and export trade.

In 2011, the increment of innovation output that affected 58.63% of innovation capital in central region, dropped 9.95%, compared with 2010, and the number of innovators is down by 0.8 percentage points. With the insignificant increase of other capitals and a serious recession of innovation capital, the RIC of central region expresses a negative growth in 2011. Moreover, through the analysis above, the overall decline of RIC in 2011 is a normal phenomenon in the rapidly developing. No need to worry too much, but it is necessary for the central region to add the innovation capital investment.

6 Conclusions

Numerous theoretical arguments and empirical analysis done by domestic and foreign scholars have both affirmed the contribution RIC makes to and its decisive role in regional economic development. Therefore, a balanced development of RIC becomes the driving force to coordinate regional economic development. In this study, we use factor analysis to measure RIC of eastern, central

and western regions in Shandong Province, by re-constructing the metrics system of RIC. And the results show that RIC stock of the overall is upward trend, but regional development is highly uneven, showing East high and West low; and that IC increment remained stable, with a large amplitude. This result is consistent with the economic development of Shandong. According to the results, we analyze the impact of RIC elements on the coordinated economic development in turn. But when referred to the reaction the economic development makes to RIC, the study only shows the analysis from a theoretical point of view, not an empirical test. Moreover, when researching the relationship between RIC and economic development, the previous studies, including this one, only focus on measuring RIC and ignore the need to measure economic development. All in all, RIC has gradually become the driving force of economic development of national and regions, and despite improving the RIC of backward area, regional economic disparities can be reduced to some extent, but there still need amounts of scientific work to study how to coordinate the development of regional economies.

Abstract: University Innovation Teams are tightly organized creative research groups who have the features of complementary advantages, solidarity and cooperation. They regard leading figures in discipline as the core, backbones of scientific research as the main body, professionals and assistants as the supporting. They are steadily engaged in basic research, applied research, high-tech research, tackling key technical problems, integration and extension of technology, and so on. At present, Hubei Province is vigorously promoting the construction of "Innovation Hubei". Among this process, making the best of the supports of all kinds of university innovation teams should be an important aspect. This study has adopted the traditional questionnaire method, and has analyzed the current development situation of innovation teams through sending out questionnaires to them, and has performed an analysis of the current problems of university innovation teams from the survey results.

Key words: University innovation teams; Leading figures; Team development

1 Introduction

University innovation teams, as intensively innovative research teams in university's innovation group, enjoy the advantages of the knowledge-intensive and intelligence-intensive resources, and offer theoretical support for major theoretical problems and significant scientific task project. In addition, university innovation teams achieve their value of serving locally social and economic development through intensely combining the scientific research problems with social needs as well as turning scientific achievements into a productivity force. What's more, by cooperating with universities and research institutes in other regions, university innovation teams stimulate the driving force brought by scientific innovation, and gradually introduce, assimilate, innovate foreign technology and turn the scientific achievements into productivity so as to serve the social and economic development in Hubei province.

2 Literature Review

Because of the lateness in getting start to construct innovation team, unsystematic related theory and rare experience, there are series of problems and dilemmas urgently requiring being solved and perfected during the construction and development of university innovation teams. The researches of Zhao Hengping, Huang Xueman (2008); Pan Yong, Helmet (2004); Lu Wenming, Zhao Minxiang, Jiang Lai (2006) indicate the major problems which exist in university innovation teams. First, the aim of construction of the team is unclear, the internally interdisciplinary cooperation is insufficient, and management system is unreasonable; the leading figures of the team are scarce, and cultural construction in the team is frequently ignored; second, influenced by traditional thoughts, team members tend to have misgivings toward others through cooperating process, especially with different researchers who are from other disciplines, which leads to massive inefficiency in the cooperation of interdisciplinary and inter-college research teams; third, team resources were wasted. In September, 2012, Hubei government officially initiated The Plan of Promoting Innovation Ability of Universities in Hubei Province (Huang Jian, 2013). Zhao Pengfei, Xiao Juntao (2013) hold the views that the interactive development between local university in Hubei and regional economy is not only the embodiment of social serving function of the university, but also is realization of the harmony in local economy and society. The interactive development between university and local economy at least involves government, entrepreneur, and university; the core of the interaction at least includes scientific research, cultivation of talents, formulation of policy, scientificity of decision-making, and other perspectives; the measure of interaction comprises the cooperative innovation, long-term mechanism, supporting policy, Safeguarding system. Henceforth, the interactive development between local university and regional economy is a long-term systematic project which needs constant exploration and

accumulation.

3 Research Method

This research adopts traditional questionnaire method. By distributing questionnaires to university innovation teams in Hubei, this research analyzes the situation of innovation teams and finds out problems which exist in the innovation teams from the investigation results. During this research, 220 questionnaires are distributed and 200 feedbacks are received, covering various university innovation teams. 192 questionnaires are valid among those feedbacks, through which the team analyzes the reliability and validity of the results. Reliability analysis is completed mainly by split-half reliability method and α reliability analysis method. α is calculated to be 0.82, which has high reliability because of corresponding to the requiring scale of 0.8 to 0.9. Validity analysis is completed under SPSS method. α is measured to be 0.62, variance contribution rate is 38%, and correlation coefficient is 0.6 after analyzing content, externality, and structure with factor analysis method, which are up to the standard of effective questionnaire, proving the high credibility of the investigation.

4 The Current Circumstance of Hubei University Innovation Teams

4.1 Basic condition of Hubei's university innovation teams

By the end of September, 2015, Hubei province had already set up 18 state-level key laboratories in universities, which are all led by leading figures in certain related academy, were constructed for scientific innovation team and cooperated with different disciplines and entrepreneurs to research the innovation of industry, university, and institute. Except for state-level key experiment, the number of state-level and local innovation teams that were formed by different universities reaches 50. These teams engage in subjects including Hylology science, Economy Management Science, Biology, Geological Information and Survey, Agriculture, Shipping, Electronic Machine, Vehicle Engineering, Culture, Medicine, and other fields. According to incomplete data, up until 31th December, 2015, university innovation teams in Hubei province had altogether won 23 international prizes, 306 nation-level prizes, 289 province-level prizes, 7 local prizes, and 9 industrial prizes. They had published altogether more than 10000 high-level academic papers and 392 writings, applied for more than 1000 patents, acquired 253 copyrights of software, established cooperative relationships with 32 universities which include world first-class universities, Harvard, for example, and had more than 60 cooperative enterprises, including regional organization like EU, Wuhan Government, Traffic Management Bureau of Shenzhen, Zhongguancun Software Park and transitional entrepreneur like Intel, HP, Alibaba, Tencent. With the help of industry-university-research platform, innovation achievements have successfully turned into more than 2 billion RMB outposts.

Statistics above show that current university innovation teams are in well function, and have successfully established the transitional process of research-achievement-outpost, which has produced significant effects. However, after the investigation, there are still some problems in management, construction and evaluation which exist in university innovation teams.

4.2 Status of the construction of Hubei's university innovation teams

Through the investigation about more than 50 innovation teams, some common characters existing in these teams are found. Firstly, high-level leading figures are included; secondly, certain scientific capability and organized staff are equipped; thirdly, nation-level key projects or advanced national key scientific problems are the aiming researches; fourthly, nation or local government offer major funds for the teams.

By investigating 11 nation-level key laboratories practically, it is found that the structure of innovation team in key laboratory is generally formed by 4 units which is organization model, cooperation model, management model and effect model, as shown in Figure 1.

As the construction of innovation teams in China develops rapidly and deeply, it is bound to happen that more and more outstanding innovation teams will emerge in universities that have independent research capability. Therefore, after the parallel comparison between university innovation teams in Hubei and other provinces as well as many foreign countries, it is not hard to find the shortcomings of new university innovation teams, which will be elaborated in the following context.

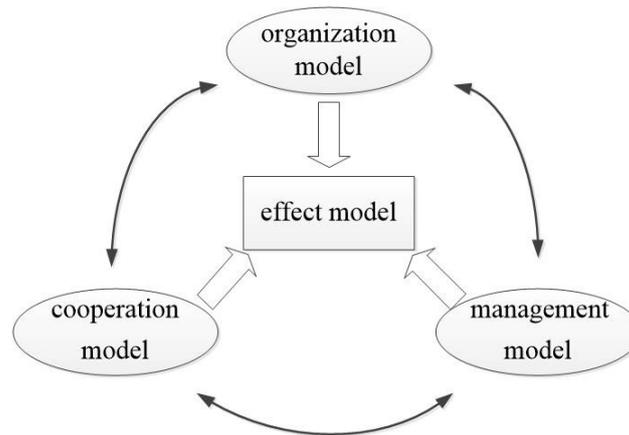

Figure 1 Structure Model of University Innovation Team in Hubei

4.2.1 Master-apprentice relationship is common

According to research paper, currently, most of university innovation teams in Hubei consist of graduate tutor and graduates who they teach, while students who are led by different tutors will find it hard to have access to the team. In these teams, master-apprentice relationship is very common, which causes limitation of the team scale, severe homogenization of academic background, and lack of diverse theory and scientific experience. 90% of university innovation teams in Hubei province are of this type. They tend to adopt comparatively similar research method and technology and scientific aim, which results in the lack of innovation motives. At the same time, scientific achievements are frequently utilized as the capital for the promotion in the work, instead of the further and deep research. Henceforth, influential achievements are seldom produced in these teams.

4.2.2 Structural barrier hinders exchange of different subjects

University Innovation teams are mainly set up on the basis of several colleges, faculties or teaching groups. However, internal system in university was a comparatively stable and independent long-term unit that meets professional teaching requirements. This system tends to be conservative and builds many barriers for reorganization of different subjects in innovation team, hindering the construction of cross-subject and cross-college innovation teams. Besides, in the current cross-subject team, since different academic members generally belong to different colleges, members often lack communication and cooperation with each other, on the contrary, carrying on research individually, which obstructs the genuine cross-subject cooperation.

4.2.3 Piecing-together team is common

Many teams were set up for applying new projects in hurry situations, therefore professional members were urgently introduced to meet research needs. This kind of innovation teams have materialistic aim, lack scientific evaluation, and are simply combined into a structurally imperfect team urgently, which are not as advanced as it appears. Original scientific achievements are hardly achieved because of the lack of cohesiveness, long-term aim, stable status, and deep research. These piecing-together teams have the tendency of being disordered, which put much financial burden on team management and bring both human resource and material resource wastes.

4.2.4 Lacking effective team management

When innovation teams were set up, some universities didn't build appropriate supporting system in time and lack team rules as well as specific managing responsibility. Team managers are often troubled by daily management, which obstructs the research process. Or in other situations, the manager may overemphasize external support. They spend much time finding financial support and resources, but neglect the relationships of internal members, the discrepancy of subjects, pace of research, profit distribution, and other management problems.

4.2.5 Unreasonable evaluation system.

The system of test and evaluation has a strong guidance for research activity, and concerns about whether it can fully stimulate the incentives of members and promote team's harmonious operation. At the present time, there are some major problems existing in the Test and Evaluation. For instance, the first writer was overemphasized in the policy of personnel appointment, promotion and assessment of scientific achievements. This heavily discourages the enthusiasm of other team members who are not the first writer, making them not willing work with others. Besides, the evaluation systems in most

universities are too inflexible and specific, and generally have short evaluating time, and are not conform to the rules of innovation teams. Therefore, it narrows the space for innovation teams to build up systematic research and suppress their willingness to take on researches that are long-term, important and basic, which results in rare influential scientific achievements.

4.2.6 The construction of team culture was ignored

Team culture is the soil for scientific team to exist and develop, and only if there was fair team culture, can team have foundation to inherit and develop. The construction of team culture is to establish people-oriented thoughts, and to create a harmonious, friendly, cooperative, stimulating atmosphere for members. However, current university innovation teams in Hubei rarely put emphasis on the construction of team culture. Abandoning team culture is harmful for forming team cohesiveness and the full realization of the potential of teammates, and finally will influence team's scientific innovation.

4.3 Status of management of university innovation teams in Hubei province

One basic concept in the construction of university innovation team is that by innovating system and management, the team can break the self-barriers existing between colleges, groups, members, and optimize the distribution of innovative resources on a high level so that innovation capability of the team can be improved. This investigation starts from two perspectives---academic exchange and encouraging system. Considering about strengthening the construction of innovation capability under free conditions, optimizing the distribution of resources in premise of exchanging academic information, encouraging engagement under fair situation, selecting the superior ones at the basic of competition, and performing encouraging system under effective evaluation, this investigation designs a scientific management model, as shown in Figure 2.

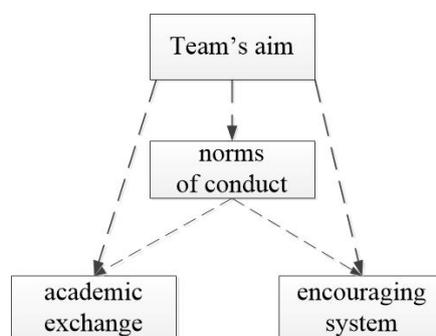

Figure 2 The University Innovation Team Management Model

Based on this model, the status of university innovation team management is analyzed, and some problems are found as shown in the following context.

4.3.1 Management model is antiquated: administrative management model strays from internal norms of scientific research

In recent years, de-administration has become a hot social issue. National Medium and Long-term Educational Reform and Development Program (2010-2020) specifically stated that "proper management system that fits character of university should try to be discovered and established, and the actual existing administrative rank and administrative management system should be cancelled." De-administration finally became nation-level educative policy, but it is still not an easy task. Pan-administration is widely spreading in universities in Hubei province. Pan-administration, on the perspective of the management of innovation teams, is managing team with administrative orders and lacking the innovative talent management system which is on the basis of leading figures that are in related academy. For example, when organizing the application for projects, team is often formed under the administrative order oriented situation, which influences the innovative level and achievements. Scientific research is different from administrative management. Science requires constant attempts and innovation, but administrative management sticks to the rule in order to avoid mistakes. The scientific breakthrough was founded on the basis of many failures. If scientific management was instructed by administrative management, scientific research may balk at making mistakes, which avoids risk but the possibility of success as well.

4.3.2 Unreasonable distribution of interests: sharpening internal conflicts and influencing cohesiveness of research team

University innovation teams have the same target which bonds members with the team. Only if team member shared the same teaching or scientific aim, can they recognize each other's advantage,

pardon others' shortcomings, and stimulate cohesiveness. However, internal conflicts are pretty common among university innovation teams in Hubei, especially conflicts between individual and team. It mainly shows as following perspectives: individual aims and collective aim; individual achievement and collective achievements; individual personality and role in the team; individual willingness and collective decision; individual competitive mentality and collective harmonious need, and so on. In the light of the reason, there are mainly three perspectives causing internal conflicts in team: Firstly, the member's dependence towards each other. For the innovation team, division of labour in the innovative project requires that each member must cooperate with others, keep information exchanged and adjust research activity. However, when these requirements are not met, conflicts become possible. Secondly, difference exists between each other. Informative difference, recognitive difference, individually demanding difference, and characteristic difference are sure to bring some definite discrepancies which lead to conflicts. Thirdly, internally imperfect system contributes to the emergency of conflicts. The scarcity of innovative resources, rough flow of scientific information, unreasonable rewarding system, the lack of reasonable competitive system, and great change of external circumstances can easily cause internal conflicts.

5 Conclusions

Theoretical achievements are remarkable, but frontier achievement shows discrepancy. To a deep extent, theoretical achievement promotes the development of related subjects and the overlap of different subjects and they build solid foundation for promotion of nation's innovative capability. As investigation shows, university innovation teams make great achievements in theoretical innovation. They have published more than 10000 high-level papers until now, and gained great reputation from academy field. However, one of the problems is that advanced theoretical achievements are rare, lagging behind advanced theory. One recognizable result is that research achievements from nation-level key laboratories are in nationally leading position, such as national-level key silicate laboratory in Wuhan University of Technology which is in the lead internationally in silicate field and related applications. It held an international meeting in 2015, and made an academic report to international leading figures in silicate field and had won many national and international prizes. But except for nation-level laboratories, other innovation teams seem to be incapable and delayed in accomplishing innovative achievement.

Industry-university-institute comes into effect, technological IO has obvious achievement, but proportion of technological IO was low. In the industry production, electronic technology, aerospace, motor industry, and many other fields, our country has to rely on foreign technological monopoly, which causes severe dependence on foreign technology and puts much financial burden on China, hindering the development of society. Therefore, innovation teams must focus on these fields and constantly overcome technological difficulties so that China can hold more intellectual property rights. And then, combining the technology with practical needs and turn them into commercial technology to accomplish the transition of research to outpost. University innovation teams in Hubei province have great amount of technological outposts, but actual outposts are seldom to be seen. According to investigation, it is a very low proportion that only 20 technology copyrights can be put into production in every 100 technology copyrights. The projects that are put into production practically make ten million-level profits for corporation averagely every year, and some even have hundreds of millions of economical values, which proves that these IO innovative breakthroughs achieve remarkable success.

Research on the Function and Practical Path of the Enterprise Association for Science and Technology to Promote Scientific and Technological Innovation

Pan Jianhong, Gao Huimin

School of Politics, Wuhan University of Technology, Wuhan, P.R. China, 430063

(E-mail: pan177@163.com, April_ril@163.com)

Abstract: As the important force in the enterprise scientific and technological innovation, the Enterprise Association for Science and Technology of China plays a positive role in the development of society and the modern enterprise, which has features such as non-profit, professional and scientific, etc. This thesis takes these following five aspects as the breakthrough points of the missions of the Enterprise Association for Science and Technology to achieve the aggregation of enterprise innovation talent, meanwhile promoting collaborative innovation, integrating social resources, getting the government support, as well as promoting the formation of enterprise innovation environment, analyzing the specific functions of the Enterprise Association for Science and Technology to promote enterprise scientific and technological innovation, so as to come up with the paths of the Enterprise Association for Science and Technology to promote scientific and technological innovation.

Key words: Enterprise association for science and technology; Scientific and technological innovation; Function; Practical path

1 Introduction

As a kind of non-profit social organization in China, association of science and technology is based on researching, playing an important role in promoting the progress of science and technology and the innovation of nation's science and technology, as well as providing support to guide the decision-making of the government and technology innovation of enterprises. The Enterprise Association for Science and Technology as a subordinate to the branch of science and technology association, becoming an important force to promote enterprise technology innovation, enterprise scientific and technological innovations are in urgent need of more participation of the Enterprise Association for Science and Technology. But at present, the study of the Enterprise Association for Science and Technology is relatively rare. If attention, academic circles mostly stay on the academic ability of the Enterprise Association for Science and Technology, about the study of its ability of promoting enterprise innovation and its role in practice, it is absent. From the point of the research in China, some scholars mostly focus on the overall research of the science and technology association, for example, Xi yongqin and Chen xinfeng (2009) think that the science and technology association plays an important role of circulation in the national innovation system of science and technology, Zeng guoping and other scholars(2015) also think that the work of the Enterprise Association for Science and Technology is of great significance to build an innovation-oriented country, innovation not only needs the support of "hard resources", also needs "soft resources" to support, the science and technology association innovation should focus on the construction of soft environment. Chen yuxuan (2012) comes up with that the Enterprise Association for Science and Technology would like to be a good linkage between the Party and the government should conclude the bridge of technical workers in a large number of new economic organizations, and is supposed to be with practice, develops the work of the Enterprise Association for Science and Technology creatively. These studies take more consideration to put science and technology organizations or the Enterprise Association for Science and Technology in the whole background of the development of enterprises, and put less attention on the promotion of enterprise technology innovation ability. Foreign scholars also have some research of this aspect, through the research of the relationships between south Asian governments and social organizations, Batley Rich, Rose Pauline (2010) and other scholars conclude that social organizations are able to integrate resources. This paper mainly analyses the present missions of the Enterprise Association for Science and Technology and its functions and paths to promote the enterprise scientific and technological innovation.

2 The Missions of the Enterprise Association for Science and Technology in the Development of the Modern Enterprise

As the dominant force in the enterprise scientific and technological innovation, the Enterprise Association for Science and Technology of China plays a positive role in the development of society and

the modern enterprise. The Enterprise Association for Science and Technology is the mass organization for the enterprise of science and technology workers, the bridges and links for the enterprise management policy makers contacting enterprise technical workers (Wu gang, 2014), and the important force to promote enterprises in scientific and technological progress as well as technological innovations. However, with the deepening of the reform, many problems have emerged in association of science and technology, which were not adapted to the current situation and function failure (Wang yuming, Liu xiangyun, 2011). At the same time, China has shifted from the period of social management to social governance, the Enterprise Association for Science and Technology especially needs to grasp their own roles and missions in this transformation period.

2.1 To achieve the aggregation of enterprise innovation talent

In the work of contemporary science and technology innovation, talent reserve is a cutting-edge strength and the core of the effective realization of scientific and technological innovation. But at present, the development condition of the Enterprise Association for Science and Technology in China faces the challenge of small scale and insufficient full-time staff, the existing full-time staff quality is not good enough and lacking professional and technical knowledge, most employees have not received professional training. These directly lead to the shortage of the Enterprise Association for Science and Technology's talent resources. Both self-sufficiency rate of original technology and conversion rate of scientific and technological achievements are not so high which restrict scientific and technological innovation. Therefore, there is no deny that the Enterprise Association for Science and Technology is significant in training outstanding innovative talents for the enterprise technological innovation. The Enterprise Association for Science and Technology needs to unite outstanding scientific and technological personnel, constantly serve for science and technology innovation and provide adequate reserve forces to the science and technology innovation of enterprises. The Enterprise Association for Science and Technology still needs to accelerate the improvement of the outstanding scientific and technological innovation talent cultivation system, extensively carry out scientific research achievement selection of scientific and technical workers and other activities, establish incentive mechanism, implement enterprise special reward system for scientific and technical workers who have outstanding contribution in enterprise technology innovation. Reserving the enterprise technology innovation talents for enterprise innovations is the major mission of the Enterprise Association Science and Technology, and the fundamental support to promote enterprise technology innovation.

2.2 To promote collaborative innovation

There are obstacles and restrictions of partial developmental defect in enterprise technology innovation at the present stage. As for the Enterprise Association for Science and Technology dimension, the Enterprise Association for Science and Technology and the technology innovation ideas of science and technology innovation talents lack of government and social support activities. There is a certain degree of role absence and fragility, and nowhere to display technology innovation ideas. And for the modern enterprise dimension, the modern enterprise lacks the sense of urgency and crisis consciousness in scientific and technological innovation, the original innovation and integrated innovation ability is weak, the concept of enterprise technological innovation is exhausted. The enterprise is the main body of technological innovation, promoting scientific and technological innovation ability including three dimensions: The Enterprise Association for Science and Technology, scientific and technological innovation personnel and modern enterprise, coordinating the force of this three main body. Therefore, the effective docking of Enterprises Association for Science and Technology with the modern enterprise is beneficial to their own shortage. At the same time, bringing science and technology innovation personnel's advantages into full play, promoting the transformation of high-tech achievements, establishing an effective mechanism of production-study-research cooperation, overcoming the key technical problems of enterprise, and enhancing the independent innovation capability of enterprises.

2.3 To integrate social resources

China is in the primary stage of socialism; the development of market economy system is not perfect. Lacking of technological innovation and the absence of development financing lead to the poor performance of the Enterprise Association for Science and Technology in the field of economy and culture, etc. In this case, the Enterprise Association for Science and Technology must be based on enhancing their own strength to support scientific and technological innovation of the enterprises, closely circling around the central task of the enterprises, giving full play to the advantages, focusing on the social resources, for their own use. The Enterprise Association for Science and Technology shall put their sights of development to the society, integrate the available social forces, exert the advantages of discipline and specialty, cohere and integrate the resources of technology and human, include popular

science resources, publicity resources, etc., and establish a distinctive image of the Enterprise Association for Science and Technology. At the same time, the Enterprise Association for Science and Technology should focus on the science and technology innovation resources, and promote the improvement of science and technology innovation ability.

2.4 To get the government support

The Enterprise Association for Science and Technology is supposed to actively seek further support from the government when it maintains its own independence and autonomy, as well as the reasonable tension with the government. According to its own professional fields and disciplines, the Enterprise Association for Science and Technology is undertaking different functions of the government, solving the problems of the government mechanism, and promoting the effective development of government work. The Enterprise Association for Science and Technology attracts more attention of the government, so as to drive the government roundly grasping the adverse development of the Enterprise Association for Science and Technology in China, increasing the financial support of the government, taking financial support actively, tax incentives and other positive actions so as to support them better development. The government shall transfer its functions to the Enterprise Association for Science and Technology in a certain extent, commission them to carry out scientific activities and technical training services, conduct public recognition and award, and so on. Such initiatives are not only conducive to the government’s work carries out effectively, but also the catalyst which expand the Enterprise Association for Science and Technology and develop modern enterprise innovation.

2.5 To promote the formation of enterprise innovation environment

The enterprise science and technology innovation is an important component in practicing innovation driven development strategy effectively, and building up a good enterprise innovation environment is the key to vigorously promoting the modern enterprise science and technology innovation. In China, the modern enterprise is facing the realistic problem of low technology innovation ability, lacking of independent innovation, etc., the independent innovation consciousness of enterprise is weak, lacking of innovative atmosphere. Therefore, striving to enhance the ability of science and technology innovation and creating the enterprise innovation environment, are the inevitable path to promote the scientific and technological innovation of enterprises in China. To greatly improve the ability and level of service in enterprise's scientific and technological innovation and enterprise construction, and create a good corporate innovation atmosphere need the Enterprise Association for Science and Technology to carry out innovative exchange activities deeply and widely, understand business needs, promote the effective connection between business needs and related intellectual resources, and serve for enterprise transformation and technological innovation. At the same time, the Enterprise Association for Science and Technology is supposed to further optimize the allocation of scientific and technological resources, sound scientific and technological innovation integrated service system, optimize the environment of enterprises innovation and competition, actualize the construction of enterprise innovation environment.

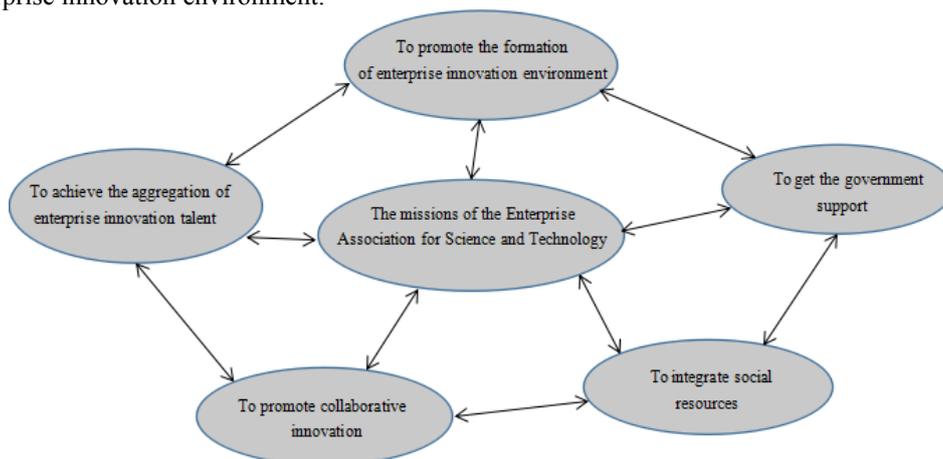

Figure 1 The missions of the Enterprise Association for Science and Technology

3 The Specific Functions of the Enterprise Association for Science and Technology to Promote Enterprise Scientific and Technological Innovation

The Enterprise Association for Science and Technology is the mass organization of the enterprise scientific and technological workers, the bond of contacting enterprise scientific and technological workers, business leaders and employees, as well as the solid bridge of enterprises communicating with societies, scientific research institutions and universities (Zhang licheng, 2011). The Enterprise Association for Science and Technology plays a main role in promoting modern enterprise independent innovations of science and technology, the followings are the specific functions of promoting enterprise innovation of science and technology.

3.1 To provide the scientific and technological support and information service for enterprise innovations of science and technology

3.1.1 To provide the support of the innovative technology and encourage original innovations

After the reform and opening up, with the planned economy turned to the market economy gradually, Chinese science and technology organizations get rid of the rigid thoughts formed by the planned economy, but new ideas and consciousness hasn't been established indeed (Zhang heng, 2013). Therefore, the enterprise innovations of science and technology badly need the innovative technology support of the Enterprise Association for Science and Technology. Through the research of the relationships between south Asian governments and social organizations, Batley Rich, Rose Pauline (2010) and other scholars conclude that social organizations are able to integrate resources. To promote the improvement of enterprise original technology, the Enterprise Association for Science and Technology integrates human resources and social resources which benefit enterprise innovations, promotes the popularization of resources by providing technological innovations and encourage enterprises to innovate independently on the basis of this. The progress of ability of science and technology innovation is the most direct power source for enterprise technology innovations. The concept of strength innovation is the only way for an enterprise which wants to get great developments. The Enterprise Association for Science and Technology also needs to provide the support of technological innovation for the enterprise, encourage original innovations and integrated innovations, and provide more possibilities for enterprise innovations and developments.

3.1.2 To build the platform of circulation of science and technology information and serve enterprise technology innovations

The Enterprise Association for Science and Technology is the builder of the information platform of science and technology—build the circulation channels of the Enterprise Association for Science and Technology transferring science and technology information to the enterprise and the innovative personnel. The Enterprise Association for Science and Technology plays a key role in timely and fast circulation of technology information, and are able to transmit national policies about science and innovation, update information about technological innovations timely and promote scientific information to flow step by step. Enterprise technology innovations must be guided by innovative ideas, driven by innovative technology and linked by innovation achievement. By making innovative ideas scientific, professional, comprehensive and real-time, the new system of science and technology innovation can be improved. The construction of the technology information platform provides a two-way communication platform of experience in technical innovations and decision-making reference tools for enterprises and enterprise innovative talents.

3.2 To do a good job of intermediary services for the enterprise science and technology innovations

Enterprise's developments cannot leave the innovation activities of science and technology. Science and technology innovation activities provide the support of path and the guarantee of theory for developments of enterprises. Therefore, for the Enterprise Association for Science and Technology, combining scientific workers in society and enterprise technology innovation activities is another function: intermediary services. The Enterprise Association for Science and Technology plays a role of a "middleman" between scientific workers and enterprises, and the identity of "middleman" cannot be replaced. But due to the previous government influenced by the thoughts of administrative totalitarianism, functions such as intermediary services of science and technology which belong to science and technology communities are interfered and monopolized too much by the government. How to combine scientific and technical workers with enterprises effectively and how to become a good "middlemen" of the Enterprise Association for Science and Technology are problems with which intermediary services are faced.

In intermediary services of the Enterprise Association for Science and Technology, innovating the contents and modes of service continuously should be payed attention to instead of conformism and routinism. The Enterprise Association for Science and Technology plays an important role in circulation

and undertaking between the enterprise and the scientific innovation personnel. The work of intermediary service transforms scientific and technological achievements, builds Bridges between science and business to drive the transformation and application of scientific innovation achievements, brings scientific innovation personnel's outstanding scientific achievements on innovations of enterprise activities and promotes enterprise developments forward. The Enterprise Association for Science and Technology plays the role of the "middleman" effectively, combines scientific workers in society with enterprise technology innovation activities organically and translates the enterprise technological innovations into practice, develops preferentially. Meanwhile, the Enterprise Association for Science and Technology should raise the service quality for the government, enterprises and scientific innovation personnel, play the role of bridge actively and strive for common support of multilateral force.

3.3 To provide services of decision-making consultation for enterprise science and technology innovations

Science and technology innovations have become an increasingly important role in the economic and social developments, and have certain influence on the formulation and modification of government policies. Science and technology evaluation and consultation has become one of the important functions of the Enterprise Association for Science and Technology. The Enterprise Association for Science and Technology also provides advice of scientific policies and service of decision-making consultation for the government. As an institution which collects masses of science and technology workers, associations of science and technology have taken on more and more policy advisory work of science and technology (Liu shujun, 2010). The Enterprise Association for Science and Technology establishes and perfects the expert consulting and evaluation system, providing science protection and the support of path for policy advisory of enterprise technology innovations.

The Enterprise Association for Science and Technology serves enterprise technology innovations, through consulting the Enterprise Association for Science and Technology, enterprises can make their decisions more scientific and reasonable. The Enterprise Association for Science and Technology can provide consulting services including reflecting the views and requirements, providing industry research, assisting the propaganda of policies, carrying out the qualification and project demonstration, etc. Business decisions rely on the support of professional consultancy and the professionalism of enterprise innovation decisions can be powerfully guaranteed.

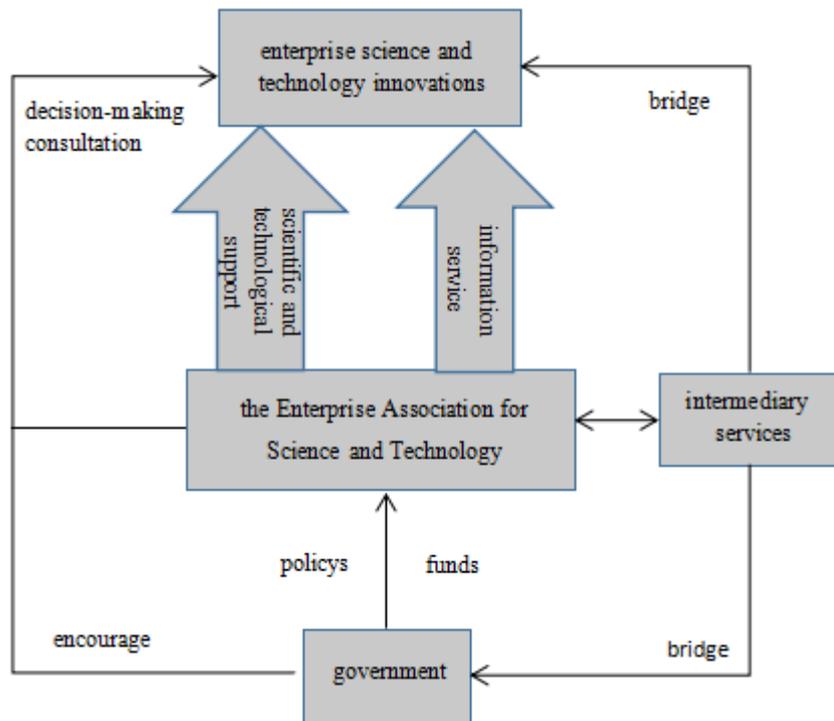

Figure 2 The Functions of the Enterprise Association for Science and Technology

4 The Paths of the Enterprise Association for Science and Technology to Promote Scientific and Technological Innovation

4.1 To build high quality innovation communication platform and innovate science and technology communication means.

The Enterprise Association for Science and Technology is an important organization in the development of science and technology innovations and it is the carrier of scientific and technological innovation in the communication. The scientific and technological innovation of the Enterprise Association for Science and Technology is based on the communication of science and technology workers, and the construction of the innovative communication platform needs to be high quality and pragmatic. The Enterprise Association for Science and Technology carries out high level of national and comprehensive innovation communication meetings, circles around the Enterprise Association for Science and Technology to enhance the independent innovation capacity, provides technical advice and technical diagnosis for the production of technical problems arisen in innovation, encourages the construction of the Enterprise Association for Science and Technology's capabilities and disciplines; at the same time, provides a public platform to communicate freely for entrepreneurs, business practitioners and investors who are committed to build up a new brand. The Enterprise Association for Science and Technology also needs to be carried out high frequency communications for the benefit of science and technology workers, make full use of human resources, promote innovation ability, and provide some guidance for ideas in the association's science and technology innovation.

The innovation of science and technology communication means requires a wide range of measures. If the Enterprise Association for Science and Technology only assembles technology workers on science and technology communication activities, the attraction will weaken or even disappear. It is necessary to give priority to create high quality and pragmatic communication platform of science and technology, and supplement it with science and technology lectures, BBS and so on, so that build up a new pattern for comprehensive and continuous communication of innovation. Firstly, giving lectures on science and technology can improve the quality of scientific and technical workers, update their knowledge, and encourage science and technology information forming a timely, rapid, and comprehensive circulation, effectively promote scientific and technological innovation. Secondly, as for the activities of science and technology BBS, they can push a wider range of enterprise talents' exchanges of ideas, extend the breadth of innovative communication and expand the influence of enterprise technology innovation education. The build of high-level innovative communication platform and the innovation of science and technology are important for creating a good academic ecological environment as well as enhancing the social foundation of independent innovation of the Enterprises Association for Science and Technology and it can provide more paths and choices for the innovation of enterprises science and technology. As some scholars say that "the communication between community of science and technology academic should return to the standard" (Yang wenzhi, 2006).

4.2 To improve the quality of routine work and build high-level talent teams

4.2.1 To improve the quality of routine work

Nowadays, due to many reasons, the Enterprise Association for Science and Technology doesn't have a sound organization and a reasonable regulation, cannot effectively carry out all their work. The Association for Science and Technology has much daily work, so improving the quality of their daily work and enhancing the quality of science and technology workers is an important aspect to promote scientific and technological innovation. Firstly, by training the scientific and technological innovation personnel of the Enterprises Association for Science and Technology to improve the quality of the science and technology innovation and cognitive level, the science and technology innovation will be provided with more possibilities. Secondly, the Enterprise Association for Science and Technology shall improve the quality of regular work such as increasing the supervision and guidance for the work of association, improving the standardization and stability of their work, and expanding the service functions. Thirdly, the Enterprise Association for Science and Technology should establish a transparent and widen participation supervision system, supervise all the work of association and establish accountability mechanism to improve their work especially work for scientific and technological innovation and promote enterprise technology innovations carrying out as planned.

4.2.2 To attach importance to the construction of talent teams

Talent team is the important foundation of the Enterprise Association for Science and Technology service supply. It is the core strength of the scientific and technological innovation, providing professional and scientific support for science and technology innovation. The construction of the high

standard and high quality talent team is the essential path of the Enterprise Association for Science and Technology to promote scientific and technological innovation. Firstly, the Enterprise Association for Science and Technology shall build a high-quality scientific and technological personnel working environment, so as to retain talent and seize the outstanding scientific and technological personnel. Secondly, it also needs to establish science and technology reward and encouragement mechanism, stimulate innovation vitality of scientific and technical workers through the social recognition of their innovation achievement, and strengthen their service ability.

4.3 To strengthen the management of members, and enhance the ability to serve members

Members of association are the main part of the Enterprise Association for Science and Technology and are the foundation of the association's existence and development. The Enterprise Association for Science and Technology should take the association member as the focal point to promote innovation. In China, associations of science and technology always take the way of autonomous management, the leaders of the Enterprise Association for Science and Technology are also produced by the selection of members. However, there is some bad phenomenon in the Enterprise Association for Science and Technology, such as members' structural imbalance, the service consciousness and ability of members is weak, etc. Therefore, strengthening the management and service of members is of vital importance. Through the training of daily work and carrying out innovation activities, the Enterprise Association for Science and Technology enhances the quality of association members, deepens the cohesion and the sense of belonging of the association members, so as to serve for the enterprise technology innovation better. The Enterprise Association for Science and Technology also should strengthen its service consciousness for members, pay attention to the membership interests, create the service platform for association members, and lift the service level for members.

Ben b. Akpan (2000) took the research of the science teachers association (STA), and believed that associations of science and technology played an important role in providing professional services for their members. Firstly, the Enterprise Association for Science and Technology provides updated information and data for the convenience of information communication and interaction among the members. Secondly, it should set up reward and recognition for members who are committed to the technological innovation, show the achievements of technology innovators, strengthen the innovation consciousness of association members. Thirdly, the Enterprise Association for Science and Technology should play a good role of bridge and link when mobilize and lead the members to invest in scientific and technological innovation, build perfect service support system. Fourthly, the Enterprise Association for Science and Technology should fully coordinate the relationship between the members and the association, provide convenient channel to members and the association for their communication and cooperation. The Enterprise Association for Science and Technology is in the service of association members, the members also put their ability on the enterprise technology innovation, forming a benign interactive circulating mechanism so as to promote enterprise technology innovation.

5 Conclusions

As the important force in the enterprise scientific and technological innovation, the Enterprise Association for Science and Technology faces a severe test, the Enterprise Association for Science and Technology shall meet the needs of the new situation of society through positioning its own missions correctly. The missions of the Enterprise Association for Science and Technology in the development of the modern enterprise include achieving the aggregation of enterprise innovation talent, promoting collaborative innovation, integrating social resources, getting the government support, as well as promoting the formation of enterprise innovation environment. The specific functions of the Enterprise Association for Science and Technology to promote enterprise scientific and technological innovation include providing the scientific and technological support and information service for enterprise innovations of science and technology, doing a good job of intermediary services for the enterprise science and technology innovations, and providing services of decision-making consultation for enterprise science and technology innovations. The paths of the Enterprise Association for Science and Technology to promote scientific and technological Innovation are building high quality innovation communication platform and innovating science and technology communication means, improving the quality of routine work and building high-level talent teams, as well as strengthening the management of members, and enhancing the ability to serve members.

Science and Technology Policy and Innovation Efficiency

Xie Wenfeng

The Development of Science and Technology Institute, Wuhan University of Technology, Wuhan, P.R. China, 430070

(E-mail: xiewfeng@whut.edu.cn)

Abstract: The Eighteenth National Congress of the CPC proposed innovation-driven development strategy, technological innovation will replace the demographic dividend has become a new source of economic growth. China's "technology economy mismatch" serious current problem, it is difficult to give full play the role of innovation to lead the economic growth, innovation and efficiency of the urgent need to identify constraints factors. In this paper, the efficiency of innovation and technological achievements into output efficiency and conversion efficiency using data envelopment analysis estimated that a two-stage innovation efficiency of 26 manufacturing industries relatively high efficiency two-stage degree of coincidence, analyze the impact of Science and Technology Policy Innovation Efficiency. The empirical results show that the output efficiency of scientific and technological achievements conversion efficiency greater than, science and technology policy orientation can only penetrate into the first stage of technological innovation, scientific and technological output stage and a conversion phase decoupling serious outcomes. The proposed patent ownership empowering individuals to improve the conversion efficiency of scientific research; closely integrated with the market trends, policy recommendations to solve China's manufacturing industry is in long-term low-end global value chains.

Key words: Science and technology policy; Technological achievements outputs; Scientific and technological achievements; Data envelopment analysis

1 Introduction

In the 18th People's Congress, it was proposed that "Technical Innovation is a strategical support to enhance social production force and comprehensive national power, which shall be placed as a core part of the national development"; also, it was highlighted that self-innovation with Chinese characteristics shall be always insisted on and the innovation-driven development strategy shall be implemented. Since then, the public has been greatly encouraged in innovation. From 2012, the number of efficient patents has been increased by over 30%. Even though large amounts of scientific achievements have been made, it is difficult to satisfy the market demand by products supplied by domestic companies. However, in some industries like steel, cement and electrolytic aluminium are witnessing an over capacity, whose market is impossible to be cleared. In the aspect of the whole world, Chinese enterprises have been engaged in low-and-middle products for a long time, whose additional value to the products are low. Besides, there is a gap between the fields with patents and inventions and the actual market demands, which adversely affect the conversion between scientific achievements and economic benefits. Under this background, both domestic and overseas scholars, in order to enhance the efficiency of conversion between scientific achievements and economic benefits, are studying the impact on innovation efficiency by science & technology policy.

Today, the academic world has a new understanding on the range and scope of innovation efficiency. Feng Zhijun and Zhu Jianxin (2011) pointed out that there are two stages from science & technology input to economic output -- first stage is that researchers and funds are invested while patents, inventions and academic theses are output; second stage is the conversion from S&T achievements to economic output. The efficiency of both two stages will determine the innovation efficiency. Therefore, innovation is not only for high quality theses but also for better economic output and development (Hu Weiwu, 2012). Dong Jie (2012), on the basis of stochastic frontier function, analyzed the factors affecting the innovation efficiency in China. By the analysis, it was found that there are several factors like market support, manpower support, fund support and S&T policy support etc, of which S&T support plays a most important role. If S&T policy well blends with market demands, innovation efficiency will be hugely increased. In 1980, DuPont Bill was proposed in America, stating that the researchers have the ownership of the S&T achievements sponsored by the government; in order to maximize the economic output of the patent, researchers will get the patents they have fully satisfy the market demands. By Dupont Bill, a close combination between S&T policy and market demand was pushed forward, which also makes America become the country whose commercialization efficiency of S&T achievements is the highest all over the

world. On the contrary, if S&T policies break away from the market demand, a pattern that “science & technology is independent from economy” will be formed. In China, there are more than 30,000 S&T achievements while only 6%-8% are turned into actual productivity. That is the innovation efficiency in China is much lower than other developed countries (Chai Guorong, 2010). As a result, we can conclude that the relationship between S&T policy and market demand is the key factor affecting innovation efficiency. Currently, the research achievements are mainly about the design and measurement included in evaluation system (regional, provincial and municipal systems) for innovation efficiency, which cannot be directly made use of to optimize the innovation efficiency (Zha Min, 2013; He Defang, 2011). In this thesis, the study on innovation efficiency is not focusing on regions but industries. By comparing the first stage (S&T policies are reflected by relationship between S&T achievements output efficiency and investment on researchers and funds) with the second stage (market demand is reflected by the conversion from S&T achievements into economic output), we find out the industrial overlap ratio between the two stages. Then it will know about the conjunction between S&T policy and market demand. In this way, the impact on S&T innovation efficiency by S&T policy in China will be reflected. Here below is about the structure of the thesis: section 2 is about evaluation method, index selection and data source of the innovation efficiency at different stages. Section 3 is about by combing with specific data, the conversion efficiency between S&T achievements (26 achievements) and economic output is measured and calculated. Section 4 is about by empirical analysis, the conclusion is made and proposals for enhancing innovation efficiency are issued.

2 Evaluation Method, Index Selection and Data Source

2.1 Evaluation method

Normally, there are three methods used to evaluate the efficiency -- IO (input and output), SFA (stochastic frontier analysis) and DEA (data envelopment analysis). Wassily W. Leontief is the founder of IO method, who established the efficiency evaluation system (see Formula (1)). This kind of method is cored on direct consumption coefficient and complete consumption coefficient). In the formula, X_{ij} is an intermediate product invested from industry i to industry j ; X_j is the total output of industry j . A_{ij} is the direct consumption efficient, B is the matrix of complete consumption coefficient. In the matrix, elements are the complete consumption coefficients. By this evaluation method, the conversion efficiency between single investment and single output can be correctly reflected, which is being widely used in trade and environment. However, evaluation system for innovation efficiency is in a mode with multiple inputs and multiple outputs. So this evaluation method is not suitable.

$$A_{ij} = \frac{X_{ij}}{X_j} (i, j = 1, 2, \dots, n) \quad B = (I - A)^{-1} - I \quad (1)$$

Aigner, Lovell, Schmidt (1977), Meeusen and Broeck (1977) once designed the SFAs independently, which were used to calculate the technological efficiency. In 1955, Battese and Coelli, in order to analyze the cause of invalidity, introduced technological non-efficiency function, by which the impact on efficiency by input and output was reflected. In Formula (2), x_{it} is the factor input at the time of t in industry i ; y_{it} is the output at the time of t in industry i ; $v_{it} - \mu_{it}$ is the residual error. TE_{it} (technological efficiency) reflects the ratio between actual output and production frontiers. So we can say that if SFA is to be used to estimate the innovation efficiency, a production factor which is suitable shall be input while the selection of Kebu-Douglas function and CES will directly affect the correctness of the result.

$$y_{it} = \beta x_{it} + v_{it} - \mu_{it} \quad TE_{it} = \frac{E(y_{it}^* | \mu_{it}, x_{it})}{E(y_{it}^* | \mu_{it} = 0, x_{it})} \quad (2)$$

DEA was proposed by A. Charnes and W.W. Cooper in 1978, which is used to solve the issues related to efficiency evaluation for multiple output and input. When evaluating innovation efficiency, DEA, relying on the input and output data, linear optimization will be used to find out a production frontier, which consists of a decision-making unit with the most efficient innovation. That is the further

other decision-making units from the production frontier, the lower the innovation efficiency is. For Formula (3), X_j is the vector quantity of innovation inputs, Y_j is the vector quantity of innovation outputs, which reflects the quantity of inputs and outputs, u and v is the weight vector, which reflect the importance of inputs and outputs; h_j is the innovation efficiency of J^{th} industry. If DEA is used to evaluate the innovation efficiency, the properties of linear programming can be fully made use of, no need to set up equation and function, so that it is rather simple and feasible; when empowerment, there is no need to be scored by experts but output will be obtained according to actual situation. Therefore, the output will not be adversely affected by subjective factor; moreover, the guidance ideology for relative efficiency will get the output result reflect decision-making units whose innovation efficiency is higher in a clear way. In this way, the gap in innovation efficiency of different decision-making units will be presented, which will help to find out how to optimize the non-efficient units. Because of these advantages, DEA is used to measure the innovation efficiency in this thesis.

$$h_j = \frac{u^T Y_j}{v^T X_j}, j = 1, 2, \dots, n \quad \begin{cases} \max h_0 = u^T Y_0 \\ s.t. v^T X_j - u^T Y_j \geq 0, j = 1, 2, \dots, n \\ v^T X_0 = 1 \\ u \geq 0; v \geq 0 \end{cases} \quad (3)$$

2.2 Index selection and data source

Table 1 Evaluation Index System for Multi-Industrial Innovation Efficiency at Two Stages

Variable	Symbol	Unit
R&D staff full-time equivalent	X1	Man-year
R&D fund	X2	Ten Thousand Yuan
Expenditure of new product development	X3	Ten Thousand Yuan
Quantity of efficient patents	Y1	
Quantity of new products	Y2	
Per capita GDP	Z1	Yuan
Sales revenue of new products	Z2	Ten Thousand Yuan

For innovation efficiency evaluation at two different stages, the original input is the investment on R&D innovation. It is known that innovation needs large amounts of funds while R&D fund is an indispensable input. Apart from investing R&D fund, HR, being as an important carrier of knowledge, is also a key factor for innovation input. Therefore, in this thesis, R&D staff full-time equivalent, R&D fund and expenditure of new product development are selected as the indexes to evaluate the innovation efficiency made at the first stage. As for the intermediate products like patents, theses and projects, they are both the input required at first stage but also the input required at the second stage, which plays a transitional role in the evaluation system. In this thesis, it is planned to reflect the S&T policy by S&T achievements made in 26 industries, so it is necessary to collect the quantity of patents, theses and projects related to these industries. At present, the statistical caliber of thesis is that subjects are used as the standard when sorting out theses. Therefore, it is difficult to converse into industry. In this thesis, quantity of efficient patents and quantity of new products are involved into Table 1. In fact, economic output is the final product of S&T innovation. At the same time, in this thesis, the other two factors -- sales revenue (direct economic output) of new products and per capita GDP (indirectly affected by innovation) are taken into account of. Then, under the help of evaluation systems on innovation efficiency made by Griliches (1990), Ahuja (2001) and Liu Shunzhong (2002), the thesis fulfills the establishment of index system.

All indexes are from China Statistical Yearbook and China Statistics Yearbook on High Technology Industry. Since there are several stages from S&T input to economic output, so it takes some time to finish the conversion. In this way, if the innovation efficiency is measured by the past data, it will not true and accurate enough because it is not consistent with the reality. Considering the affect by time lag, this thesis, by using what Shi Xiusong did, uses the data in 2009 in terms of the intermediate products (including patents and inventions) is used when R&D staff and funds are the original inputs. At the same time, final economic output is the data in 2010. For empirical analysis, it studies the impact on innovation efficiency by S&T policy in 2008 and 2009. Lagging process is done to other data.

3 The Effect of Science and Technology Policy Orientation on the Two-phase Innovation Efficiency of China Manufacturers

In this part, we firstly has adopted the deap2.1 software, after inputting relevant data and using C^2R option, we get two-stage science and technology innovation efficiency prediction model of China 26 manufacturing from 2008 to 2012 as shown in Figure 1. Then, we have analyzed the coincidence degree between high-efficiency and low-efficiency industry of the two phases, which indicates the relationship between science and technology policy orientation and economic output. If there is a high coincidence degree, our current science and technology policy orientation is conducive to improving the efficiency of innovation, among which it exists a synergistic relationship. If there is a low coincidence degree between the two data, so the industrial commercial efficiency mainly supporting by science and technology policy is low, which will affect the improvement of the ultimate innovation efficiency.

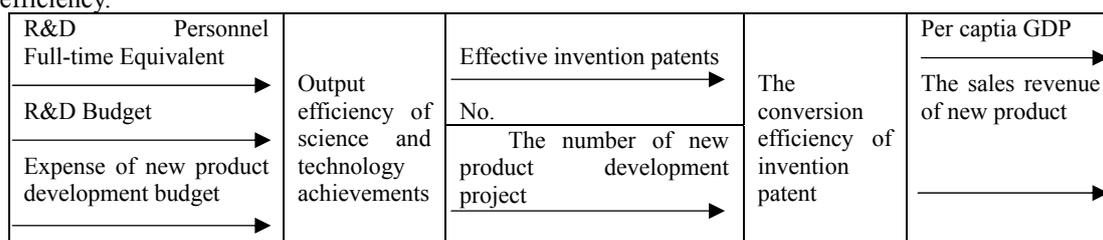

Figure 1 Two-phase technological innovation model of China 26 manufacturing

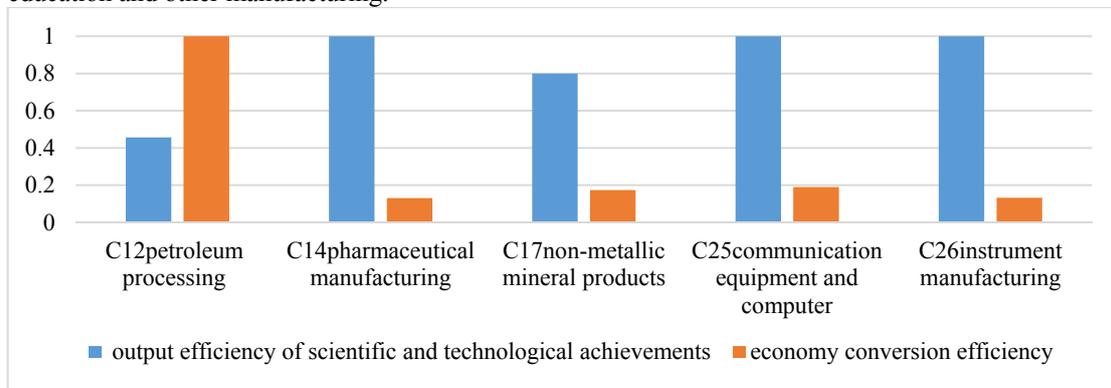

Table 2 The List of the Innovation Efficiency in the Two Phases of China 26 Segments of the Manufacturing Industry from 2008 to 2012

The production efficiency of technological achievements(the first stage)							The conversion efficiency of technological achievements(the second stage)

Data sources: calculating according to the statistical yearbook of China in 2009-2015

As shown in Table 2, the innovation efficiency average value of China's manufacturing industry in the first phase and the second phase show a firstly declining and then rising trend, which is closely related to the economic cycle and the global economy. The outbreak of the financial crisis and deterioration stage is from 2008 to 2010, and the negative impact of economic depression and adverse expectations of investors, the production and conversion efficiency of science and technology all decreased significantly. From 2011 to 2012, the global economy entered the latter two-stage of recovery period, and the scientific and technological achievements and conversion efficiency present a clear rising trend, surpassing the level before the crisis. Under the same change trend, the average size of the innovation efficiency of each industry in the two stages shows a big difference. The efficiency in the first stage was significantly higher than that of the second stage, the scientific and technological achievements is higher, with an average efficiency reaching 0.657; while the transformation efficiency of scientific and technological achievements is lower, only 0.415. This data reflects the main reason for China's science and technology elements into economic output inefficiency lies in the poor science and technology achievements commercialization effect in the second stages.

Note: the industry code represents in order: C1 is for the agricultural and sideline food processing industry. C2 is for the food manufacturing. C3 is for the wine, soft drinks, and refined tea industry. C4 is for the tobacco industry. C5 is for the textile industry. C6 is for the textile and garment. C7 is for the apparel industry, leather, fur, feathers and its products manufacturing industry. C8 is for the wood processing industry. C9 is for the furniture manufacturing industry. C10 is for the paper and paper products industry. C11 is for the printing and reproduction of recorded media industry. C12 is for the petroleum processing, coking and nuclear fuel processing industry. C13 is for the chemical materials and chemical products manufacturing. C14 is for the pharmaceutical manufacturing. C15 is for the chemical fiber manufacturing industry. C16 is for the rubber and plastic products. C17 is for the non-metallic mineral products manufacturing industry. C18 is for the ferrous metal smelting and rolling processing industry. C19 is for the non-ferrous metal smelting and rolling processing industry. C20 is for the metal products industry. C21 is for the general equipment manufacturing industry. C22 is for the special equipment manufacturing industry. C23 is for the transportation equipment manufacturing. C24 is for the electrical machinery and equipment manufacturing industry. C25 is for the communications equipment and computers. C26 is for the instrumentation manufacturing, sports, entertainment, education and other manufacturing.

Data sources: calculating according to the statistical yearbook of China in 2009-2015

Figure 2 The Innovation Efficiency Comparison in Two Stages of Industry with the Most Innovative Efficiency in 2012

The deep reason for the poor commercialization of scientific and technological achievements is that scientific and technological policy orientation and the actual market demand is seriously mismatched. As shown in Figure 2, if the industry with more than 0.8 innovation efficiency is defined as the industry with the most innovative efficiency, the pharmaceutical manufacturing industry (C14), non-metallic mineral products industry (C17), communication equipment, computer (C25), and instrument manufacturing, sports, entertainment, education and other manufacturing (C26) that rank in the forefront of the first stage shall rank in the last five in the second stage of the innovation efficiency. Similarly, as the few industries with a more than 0.8 transformation efficiency of scientific and technological achievements, the petroleum processing, coking and nuclear fuel processing (C12) has a lower innovation efficiency in scientific and technological achievements output stage. If the industry with the

most innovative efficiency in two stages is unable to form a synergistic effect ultimately, it will hinder the efficient conversion of technological elements into economic output. Especially in the shift of scientific and technological achievements output efficiency and technological achievements conversion efficiency, no matter how efficient in the single stage, the input-output efficiency will be greatly reduced finally, the vigor of the innovation-driven development strategy the activity will not be fully released.

The influence of science and technology policy orientation on the innovation efficiency of the two stages are further analyzed combined with the discussion of the industrial nature. In order to reflect the key areas supporting by science and technology policy, we need firstly classify the industry according to a certain standard. The 26 manufacturing industry segments adopted in this paper, some of which are high-tech industries, with a high overall technology level, some of which are the traditional industries, with a low overall technical content. "Statistical yearbook of Chinese high-tech industry -2013", in accordance with the 2011 national industry classification (GB/T), defines all the pharmaceutical industry (all two-digit industry code) and aviation, spacecraft equipment manufacturing, electronic and communication equipment manufacturing industry, medical apparatus and instrument manufacturing industry, part of the information and chemicals manufacturing industry (four-digit industry code) as high-tech industry. In accordance with this standard, the corresponding high-tech industry code in table 2 is in order C13, C14, C23, C24, C26 and C25, and the rest of the industry code are the traditional manufacturing industry. As shown in Figure 3 and figure 4, the R & D personnel and funding input of the 6 high-tech industries in 2012, accounted for more than half of the total amount of 26 industries. In September 2010, the State Council passed the "the resolution of speeding up the cultivation and development of strategic emerging industries", and defined the energy saving and environmental protection, new generation information technology, biotechnology, high-end equipment manufacturing, new energy, new materials and new energy vehicles as the strategic emerging industries. Therefore, after the financial crisis, China's science and technology policy has been focused on supporting the high-tech industry. In this policy, there has appeared a large number of high-tech industry patent invention and academic papers from the Research Institute, Colleges and universities in China. The innovation efficiency of high technology industry in the first stage is significantly higher than that of the traditional manufacturing industry, the top six industries with scientific and technological achievements in half belong to the high technology industry. But the patent invention converting into economic output is limited. The Table 2 shows that science and technology achievements transformation efficiency of high-tech industry in the second stage is not ideal, and the communications equipment, computers, instrumentation, sports, entertainment, education and other manufacturing and pharmaceutical manufacturing industry are those industries in the second stage with the lowest innovation efficiency. It indicates that the promoting effect of science and technology policy orientation on innovation efficiency only takes effect in the first stage, and it is difficult to penetrate into the economic output generation stage, and finally form the mismatch situation between policy orientation and market demand.

4 Conclusions and Enlightenment

We have analyzed through the examples and calculated the two-stage innovation efficiency of China 26 manufacturing industries, and presented the effect of science and technology policy orientation on the two-stage innovation efficiency of China 26 manufacturing industries, we have obtained the following conclusion and enlightenment.

The output efficiency of scientific and technological achievements is greater than the conversion efficiency. After 2008, the average value of the output efficiency of scientific and technological achievements in each industry is significantly greater than the conversion efficiency of innovation in the second stage. The main factor that hinders the improvement of China's innovation efficiency is the slow commercialization process of scientific research results. At present, the innovation in our country still stays in the level of patents and papers, which belongs to the first stage, while as early as 80s in the last century, and the OECD countries began to pay attention to the promotion of the commercialization of patent papers.

By Other's merits, Wise Men Correct Their Own Faults. The DuPont Act in the United States, the patent law in Canada, and the "university industry cooperation plan" in Australia all effectively improved the innovation efficiency in the second stage, the cores of which are that they endow the patent propriety to individual and make full use of the rational person in the pursuit of maximum personal interest to completely release the value of patents in the market. At present, the proportion of individually holding patents in China is far lower than that of the developed countries. The majority of research results are for the country or institutions, which results in the enthusiasm for commercialization of scientific research results is inadequate, so it is necessary for us to learn from foreign experience, and grant the individual ownership of patents, so as to improve the conversion efficiency of scientific research achievements.

Science and technology policy orientation can only penetrate into the first phase of scientific and technological innovation. The Eighteenth National Congress of the CPC has settled the establishment of innovation-driven development strategy, energy saving, and environmental protection. New generation of information technology, biotechnology, high-end equipment manufacturing, new energy, new materials and new energy automobile industry have been established as the strategic emerging industries, and become the main supporting field of China science and technology policy, resulting in a large number of patent papers, while the economic output is rather limited. China has given new energy vehicles and photovoltaic industry a large number of subsidies and support policies, so a large number of such enterprises come into being in a short time. Once the supporting policy is canceled, a large number of enterprises will face difficulties because of the lack of core technology. It indicates that a large number of patent inventions caused by the scientific and technological policy orientation, failed to effectively support the development of high-tech industries, and the scientific and technological innovation is just stuck in the first phase. In order to make the impact of science and technology policy orientation in our country to deeply penetrate to the second stage, we should pay more attention to the quality of scientific and technological innovation, and encourage major innovation and the production of scientific and technological achievements closely related to the actual production. We can take measures

like raising the identification standards of scientific and technological achievements, controlling the blind application of patent invention, and cracking down on maliciously cheating the high technology industry state subsidies and other measures to avoid high technical policy subsidies to repeat inefficient investment, so as to improve the quality of scientific and technological output.

The output stage and the transformation stage of scientific and technological achievements has serious mismatch. In segment industries, the pharmaceutical manufacturing industry and others, which has the highest output efficiency in scientific and technological achievements, have the lowest conversion efficiency scientific and technological achievements; and the industries, whose conversion efficiency of scientific and technological achievements lying in the forefront rank, has a lag-behind industry output efficiency. The innovation activities of two stages cannot form a cohesive force, but mutual constraints, which result in a large number of patent inventions become useless invention, resulting in the innovation efficiency of China's manufacturing industry is overall ordinary, and is difficult to form innovative industry. The output efficiency of scientific and technological achievements and science and technology policy orientation are closely related. A large number of scientific research funds and personnel input are the basis of achieving major technological breakthroughs; the conversion efficiency of scientific and technological achievements and market demand are mutually related, the patent invention, which has nothing to do with the market, is difficult to produce economic benefits. At present, we are carrying out the supply side reform, which is to take the market demand as the principle to carry on the orientated flexible production and avoids the production of excess capacity. As the first productivity, science and technology should also be closely combined with the market trends, to solve the real plight of China's manufacturing industry ever lying in the low end of the global value chain. The local government should also pay more attention to the guiding role of the market in the construction of the incubator, innovation park and other technological innovation intermediary platform, interconnect the information networks between enterprises and scientific research institutes, promote the information sharing among the innovation partners, and create excellent conversion channels for scientific and technological achievements.

We should give full play to the role of policy orientation, and offer strong support to the science and technology innovation activities of industries. On one hand, we must establish and perfect the legal system, modern enterprise system, innovative culture and social security system related with technology innovation to optimize the soft environment of scientific and technological innovation. On the other hand, we need to build with plans, steps and focus the infrastructure construction that is closely related to scientific and technological innovation, improve the hard environment of technological innovation.

An Index Interactive Influence Eliminated Algorithm in Tech-Economy Assessment

Liang Xin, Zhang Zhiyuan

The Department of Equipment Economy & Management, Navy University of Engineering, Wuhan, P.R. China, 430033

(E-mail: whliangxin@163.com, 124427433@qq.com)

Abstract: The index system is the key indicator to influence the result of technology assessment. The establishment index systems are generally asked to obey exclusion principle. Aimed to the problem of dependence ubiquitous in this field, this paper proposes an algorithm to eliminate the index interactive influence through quantitative analysis on two or more indexes, and conducts calculus on a quality evaluation of military-used software, which proves the algorithm effective on eliminating the index interactive influence.

Key words: Tech-economy assessment; Index system; Interactive influence; Weight parameters

1 Introduction

At present, there are many tech-economy assessment methods such as fuzzy evaluation (Yang Lunbiao, Gao Yingyi,1995), analytical hierarchy process (Xu Shubo,1988), and fuzzy comprehensive evaluation, etc. These methods may differ in their characteristics, applying area, but the merits of their assessing result all largely depends on a scientific, reasonable index system. Conventional evaluation index system often takes on tree characters, and the construction relationship is depended on the inner causality and affiliation of assess targets. Thus, the establishment index systems are generally asked to obey exclusion principle (Yang Qing,2000). The assess indicators are required to be absolutely independent in principle. No interference means that the degree of relativity equals 0. But it's impossible to build a non-relevant index system in assess process. Based on quantitative analysis on inner mechanism of index system interactive influence, this paper plans to adjust index weight parameters with elimination algorithm on the basis of preliminary index weight parameters, minimizing the negative effects of interactive influence on assess result and making the assess structure reflecting the evaluation target more accurate and objective.

2 Analysis on Interactive Influence of Two-index

The interactive influence of two-index can be described with a process similar to loop feedback process (Hou Dingpi, Wang Zhanjun,2001), as is shown in fig 1.

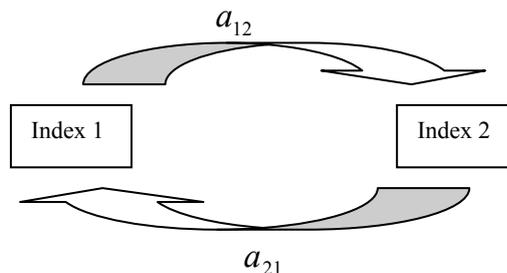

Figure 1 Sketch Map of Two-Index Interactive Influence

To make it easier to analyze, firstly the interactive influence process of infinite circulate is divided into 2n successive phase, assuming that there is only one index to make relevant index change for one time, and that in preliminary stats, the initial value of each index is 1, that is:

$$A_0 = \begin{bmatrix} p_1 \\ p_2 \end{bmatrix} = \begin{bmatrix} 1 & 0 \\ 0 & 1 \end{bmatrix} \tag{1}$$

Where p_1 、 p_2 represent preliminary stats of relevant index of index 1, 2 which influence them to change separately.

After phase 1, the variations of two index as opposed to initial value are:

$$A_1 = \begin{bmatrix} 0 & a_{12} \\ a_{21} & 0 \end{bmatrix} \tag{2}$$

Where $0 < a_{12} < 1$ shows the variation value of index 2 when the variation unit of index 1 is 1; $0 < a_{21} < 1$ shows the variation value of index 1 when the variation unit of index 2 is 1.

After phase 2, the variation value in this variation as opposed to that of phase 1 in equivalent variation is:

$$A_2 = \begin{bmatrix} a_{12} * a_{21} & 0 \\ 0 & a_{21} * a_{12} \end{bmatrix} \tag{3}$$

After phase 2n-1, the variation value in this variation as opposed to that of phase 2n-2 in equivalent variation is:

$$A_{2n-1} = \begin{bmatrix} 0 & a_{12}^n * a_{21}^{n-1} \\ a_{21}^n * a_{12}^{n-1} & 0 \end{bmatrix} \tag{4}$$

After phase 2n, the variation value in this variation as opposed to that of phase 2n-1 in equivalent variation is:

$$A_{2n} = \begin{bmatrix} a_{12}^n * a_{21}^n & 0 \\ 0 & a_{21}^n * a_{12}^n \end{bmatrix} \tag{5}$$

Since the interactive influence is successive, when $n \rightarrow \infty$, which means to divide time to infinity, the result of interactive influence is:

$$A^* = \lim_{n \rightarrow \infty} \sum_{i=1}^n A_i = \begin{bmatrix} (1 - a_{12}a_{21})^{-1} & a_{12}(1 - a_{12}a_{21})^{-1} \\ a_{21}(1 - a_{12}a_{21})^{-1} & (1 - a_{12}a_{21})^{-1} \end{bmatrix} \tag{6}$$

According to the calculation and analysis above, normalize the A^* , we can obtain the final influence coefficient of interactive influence of two-index:

$$A = \begin{bmatrix} 1 & a_{12} \\ a_{21} & 1 \end{bmatrix} \tag{7}$$

The equation above means that the final variation of index 2 when index 1 plays a role of argument and final variation is 1 is a_{12} ; the final variation of index 1 when index 2 plays a role of argument and final variation is 1 is a_{21} (Haines L, 1998).

3 Analysis on Interactive Influence of Multi-Index

When analyzing interactive influence of multi-index, considering the complexity of interactive influence of indexes, simplification it's demanded. Here the method of two-index interactive influence analysis is adopted to conduct the analysis. The interactive influence of each pair of index is shown in Fig 2: index i not only influence index j directly, and through relevant index it will cast indirect influence on index j, and at last it can be simplified that index i influence index j through b_{ij}' .

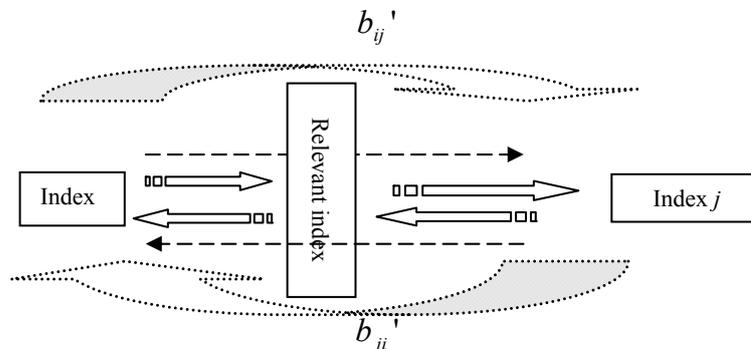

Figure 2 Sketch Map of Each Pair of Indexes' Interactive Influence

Assuming that the factor of each indexes' first interactive influence is:

$$B_1 = \begin{bmatrix} 0 & b_{12} & \cdots & b_{1n} \\ b_{21} & 0 & \cdots & b_{2n} \\ \cdots & \cdots & \cdots & \cdots \\ b_{n1} & b_{n2} & \cdots & 0 \end{bmatrix} \tag{8}$$

The influence factor of index i to index j:

$$b_{ij}' = \sum_{k=1(k \neq i, k \neq j)}^n (b_{ik} * b_{kj}) + b_{ij} \tag{9}$$

The influence factor of index j to index i:

$$b_{ji}' = \sum_{k=1(k \neq i, k \neq j)}^n (b_{jk} * b_{ki}) + b_{ji} \tag{10}$$

According to analysis result of two-index interactive influence, the final influence factor of multi-index interactive influence is:

$$B = (b_{ij}')_{n \times n}, \text{ if } i \neq j, b_{ij}' = \sum_{k=1(k \neq i, k \neq j)}^n (b_{ik} * b_{kj}) + b_{ij}; \text{ if } i=j, b_{ij}' = 1 \tag{11}$$

4 Elimination Algorithm of Index Interactive Influence

Assuming that the index of a certain layer in a certain assess index system is cut out, the son index of which is $D_1, D_2, D_3, \dots, D_n$, as is shown in Fig 3. There exists interactive influence between son indexes. To eliminate the influence, the weight parameter is adjusted through interactive influence factor.

Step 1: According to normal calculating method of index weight parameter, firstly through calculation we can obtain son indexes' weight parameter is: $w=(w_1, w_2, w_3, \dots, w_n)$.

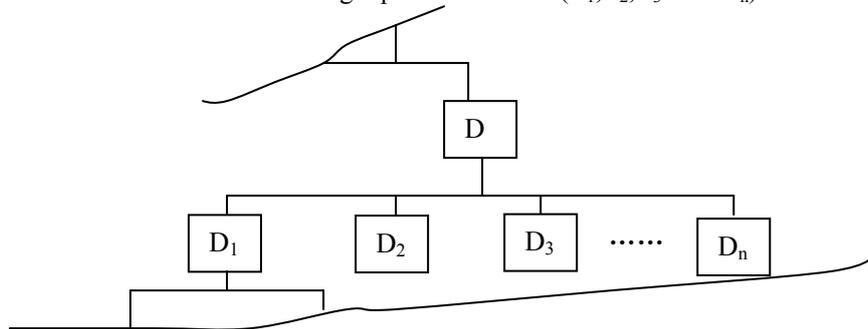

Figure 3 Sketch Map of Locality of a Certain Assess Index System

Step 2: Calculate interactive influence factor.

The factor of son indexes' first interactive influence is:

$$D' = \begin{bmatrix} 0 & d_{12} & \cdots & d_{1n} \\ d_{21} & 0 & \cdots & d_{2n} \\ \cdots & \cdots & \cdots & \cdots \\ d_{n1} & d_{n2} & \cdots & 0 \end{bmatrix} \tag{12}$$

Through analysis on multi-index interactive influence above, final influence factor of n son indexes interactive influence can be calculated:

$$D^{**} = (d_{ij}')_{n \times n}, \text{ if } i \neq j, d_{ij}' = \sum_{k=1(k \neq i, k \neq j)}^n (d_{ik} * d_{kj}) + d_{ij}; \text{ if } i=j, d_{ij}' = 1 \tag{13}$$

Step 3: Adjust weight parameter and eliminate influence.

Adjust the weight parameter of son indexes according to D^{**} :

$$\text{If } D^{***} = \begin{bmatrix} \sum_{j=1}^n d_{1j}' & 0 & \dots & 0 \\ 0 & \sum_{j=1}^n d_{2j}' & \dots & 0 \\ \dots & \dots & \dots & \dots \\ 0 & 0 & 0 & \sum_{j=1}^n d_{nj}' \end{bmatrix} \tag{14}$$

$$w' = w + w \times D^{***} = (w_1', w_2', w_3', \dots, w_n'), \text{ where } w_i' = w_i \sum_{j=1}^n d_{ij}' + w_i \tag{15}$$

Finally, conduct normalization to weight parameter and obtain final index weight parameter with interactive influence eliminated:

$$w'' = w' / \sum_{i=1}^n w_i' \tag{16}$$

For the whole index system, steps above can be adopted and calculation shall be conducted from the lower layer to the upper layer, weight parameter shall be adjusted, then the influence can be eliminated.

5 Calculation Tutorial

Table 1 Preliminary Weight Parameter of Evaluation Index System for a Military-use Software

General target	Son target of first level			Son target of second level		
	target	Preliminary Weight parameter	Adjusted Weight parameter	target	Preliminary Weight parameter	Adjusted Weight parameter
Evaluation of Software quality	functionality	$w_1=0.1$	$w_1^*=0.07$	completeness	$w_{11}=0.3$	$w_{11}^*=0.18$
				interoperability	$w_{12}=0.3$	$w_{12}^*=0.26$
				normality	$w_{13}=0.4$	$w_{13}^*=0.56$
	reliability	$w_2=0.15$	$w_2^*=0.20$	accuracy	$w_{21}=0.3$	$w_{21}^*=0.38$
				robustness	$w_{22}=0.1$	$w_{22}^*=0.08$
				security	$w_{23}=0.3$	$w_{23}^*=0.22$
				Document completeness	$w_{24}=0.3$	$w_{24}^*=0.32$
	usability	$w_3=0.25$	$w_3^*=0.28$	understandability	$w_{31}=0.25$	$w_{31}^*=0.31$
				learnability	$w_{32}=0.25$	$w_{32}^*=0.26$
				operability	$w_{33}=0.5$	$w_{33}^*=0.44$
	efficiency	$w_4=0.2$	$w_4^*=0.18$	Communication efficiency	$w_{41}=0.2$	$w_{41}^*=0.2$
				Execution efficiency	$w_{42}=0.5$	$w_{42}^*=0.5$
				Storage efficiency	$w_{43}=0.3$	$w_{43}^*=0.3$
	maintainability	$w_5=0.2$	$w_5^*=0.22$	compatibility	$w_{51}=0.1$	$w_{51}^*=0.1$
				visibility	$w_{52}=0.3$	$w_{52}^*=0.3$
				modularity	$w_{53}=0.1$	$w_{53}^*=0.1$
				Self-descriptiveness	$w_{54}=0.1$	$w_{54}^*=0.1$
				Document completeness	$w_{55}=0.3$	$w_{55}^*=0.3$
				simplicity	$w_{56}=0.1$	$w_{56}^*=0.1$
	portability	$w_6=0.1$	$w_6^*=0.05$	Hardware system irrelevance	$w_{61}=0.1$	$w_{61}^*=0.12$
				Software system irrelevance	$w_{62}=0.2$	$w_{62}^*=0.18$
				extensibility	$w_{63}=0.2$	$w_{63}^*=0.16$
				Public utility	$w_{64}=0.1$	$w_{64}^*=0.07$
				modularity	$w_{65}=0.3$	$w_{65}^*=0.36$
				Self-descriptiveness	$w_{66}=0.1$	$w_{66}^*=0.11$

Take military use software quality evaluation as an example: According ISO provisions relating to the software quality properties, referring to the definition of McCall model (Li Liangbao, Han Xishuang,2003), combining the experience we obtain in software development evaluation procession, a comprehensive evaluation index system of software quality is built to assess the quality of a certain financial software for military use, as is shown in Chart 1. There exists rather high relevance between first level indexes of functionality and reliability, maintainability and extensibility, etc. in comprehensive assess index system; and as one of first level index, usability owns 3 second level indexes: understandability, which indicates the efforts user spare to understand the logic conception and its' applying area; learnability, which indicates the efforts user spare to learn software application(operational control, input and output for example); operability, which indicates the efforts user spare to operate and control operation (Lin Junxing ,2005), considering these 3 second level index to usability, there also exists rather high relevance among them, and other indexes of same level also face the similar problems: interactive influence among indexes of same level. To eliminate the influence that interactive influence cast on assess result, algorithm proposed above is adopted to adjust the weight parameter.

Firstly, determine preliminary weight parameter through AHP method, the result is shown in Table 1.

Then analyze interactive influence of each son target and adjust weight parameter.

For instance, the preliminary weight parameter of understandability, learnability and operability of first level usability:

$$(w_{31}, w_{32}, w_{33})=(0.25,0.25,0.5) \tag{17}$$

Through Delphi method the factor of 3 son indexes' first interactive influence is:

$$D' = \begin{bmatrix} 0 & 0.6 & 0.5 \\ 0.3 & 0 & 0.4 \\ 0.1 & 0.2 & 0 \end{bmatrix} \tag{18}$$

$$\text{Thus, } D^{**} = \begin{bmatrix} 1 & 0.7 & 0.74 \\ 0.34 & 1 & 0.55 \\ 0.16 & 0.26 & 1 \end{bmatrix} \tag{19}$$

$$\text{And, } D^{***} = \begin{bmatrix} 2.44 & 0 & 0 \\ 0 & 1.89 & 0 \\ 0 & 0 & 1.42 \end{bmatrix} \tag{20}$$

So:

$$(w_{31}^*, w_{32}^*, w_{33}^*)=(0.25,0.25,0.5) \tag{21}$$

According to algorithm above, conducting calculation to son targets of each layer and the adjusted weight parameter can be obtained, as is shown in Chart 1. Finally, a better assessment can be conducted with new weight parameter.

6 Conclusions

Assess index system is the key factor influencing the final result of assessment, and the interactive influence of indexes can determine the objectivity of assessment result. Based on analysis on interactive influence among indexes, this paper takes an attempt to solve this problem through eliminating the interactive influence with weight parameter adjustment, thus promote the authenticity and validity of evaluation result, which is of certain significance to practice in this area. The model is simplified for calculation, which is not in conformity with the actual. And this is the direction of further research.

Research on Online and Offline Promotion Network Coordination to Promote the Transformation of Agricultural Science and Technological Achievements

Li Xue

School of Management, Wuhan University of Technology, Wuhan, P.R. China, 430070
(E-mail: 370637160@qq.com)

Abstract: The transformation of Agricultural science and technological achievements is an important link of agricultural science and technological innovation system. With the rapid development of agricultural informatization and "Internet plus" model, online service in promoting the transformation of agricultural science and technological achievements plays an increasingly important role. This paper analyzes the characteristics of online and offline promotion network for the transformation of agricultural science and technological achievements, and points out existing problems of the two channels in the practice of symbiotic co-existing, and puts forward the model of online and offline collaborative mechanism to promote the transformation of agricultural science and technological achievements.

Key words: Agricultural science and technology achievements transformation; Internet plus; Offline promotion network; Online promotion network; Synergy effect

1 Introduction

Faced with the new requirements of modern agriculture development and new challenges, effective transformation of agricultural scientific and technological achievements is an important way and means to promote agricultural production and increase farmers' income. It is widespread concerned by agricultural community and scientific community (He Jin, 2014). Foreign scholar Scherer using probabilistic model to study the relationship between technology diffusion and market structure, pointed out that market competition can induce high-speed technology diffusion (Scherer, 1980); Thomas Eponou divided the agricultural science and technology achievements transformation process into four interrelated sub subsystem: technology transfer environment, organization and structure of the subsystem, resource subsystem and transformation mechanisms (Thomas Eponou, 1993). Meanwhile, the domestic agricultural scientists carried out extensive research on agricultural science and technology achievements transformation theory and practice. GU Huanzhang and other scholars beginning with the analysis of supply and demand in agricultural science and technology achievements, suggested improve the supply and demand mechanism of agricultural scientific and technological achievements (Gu Huanzhang, Zhang Jingshun, 1997); Pei Cuijuan analyzed the problems of low conversion rate and long conversion cycle of agricultural scientific and technological achievements transformation, discussed and proposed countermeasures to accelerate agricultural scientific and technological achievements transformation (Pei Cuijuan, Dong Zhiqiang et al, 2010).

At present, China's agricultural scientific and technological achievements conversion rate is low, due to geographical space limitations, the "last kilometer" promotion and other issues. Traditional channels under a single line can not meet the demand of modern agriculture, such as feedback on time, advanced science and technology to increase production, agriculture science and technology cannot be effectively transformed. With the rapid development of agricultural informatization and "Internet plus" model, traditional agriculture and the Internet virtual economy achieve "cross-border operation", online service is playing an increasingly important role in the promotion of agriculture scientific and technological achievements transformation.

In view of this, based on the principle of synergy, this paper combines network promotion and traditional production practice, proposes and describes two promotion channels, explores the synergistic mechanism of online and offline promotion network in resource sharing, mutual cooperation and common development, in order to promote efficient transformation of agricultural scientific and technological achievements. Finally, according to the model of double channel and synergistic mechanism, the paper puts forward appropriate suggestions to provide a reference for the development of agriculture and enrich the study results on agriculture scientific and technological achievements transformation.

2 Constraints in Process of Agricultural Science and Technology Achievements

Transformation

Scientific and technological achievements transformation rate is an index to measure the scale of scientific and technological innovations into market-oriented commercial products. Statistics show that every year in China about 6000-7000 agriculture science and technology achievements are available, but the results of the conversion rate was 30% -40%, far below the level of developed countries, like the US, Japan's agricultural scientific and technological achievements conversion rate of 70% -80%, conversion rate in Germany, Britain, France up to 90%(Gu Jun,2013).At the present stage, the overall efficiency of China agricultural science and technology achievements transformation is still at a low level and annual growth trend is weak. According to the different types of agricultural scientific and technological achievements, statistics distribute as shown in Table 1.

Table 1 Different Types of Agricultural Science and Technology Achievements Transformation Distribution

Classification	Type	Conversion Rate	Classification	Type	Conversion Rate
Nationwide	Average	0.289	By Technical Field	Biotechnology and Products	0.276
	Central China	0.284		Livestock	0.277
By Region	Northwest District 2	0.284		Agricultural Equipment	0.279
	Northeast	0.286		Water Industry	0.285
	Northern Region	0.287		Efficient Use of Agricultural Resources	0.285
	Southeast	0.288		Agro-industry	0.287
	South West	0.293		Crop Farming	0.298
	Southern Region	0.294		Forestry	0.303
	Northwest District 1	0.303		Other	0.277
By Transformation Subject	University	0.272		By Technology Type	Collaborative Innovation
	Enterprise	0.288	Innovation		0.291
	Research Institutions	0.299	Imitative Innovation		0.303
	Other	0.281	Other		0.301

Data Sources: Xiao Xian. Agricultural Science and Technology Achievements Transformation Measurement and Analysis. China Science and Technology Forum. 2015.

Low conversion rate of agricultural scientific and technological achievements, the imperfect agricultural extension service mechanism, has been far from meeting the growing needs of agricultural scientific and technological achievements transformation and hindered the pace of modern agriculture development. Constraints to achievements transformation embodies in the following several aspects:

2.1 Singlely traditional offline channel, difficult to meet the needs of agricultural modernization

It is a prerequisite to achieve transformation that agricultural science and technology achievements output to match demands of modern agriculture development. Traditional offline promotion network is limited by geographical factor, different regions and different conversion subjects form a natural barrier. In order to feedback in time, we must break the barrier.

Channels of information transmission is not smooth which caused by two reasons: On the one hand, agricultural research institutions topics, projects are most from internal technology systems, which is lack of considering the specific needs of farmers and agricultural enterprise(Pan Dongmei,2010), thus, outcomes are lack of targeted, operability and usability to solve practical problems; On the other hand, regardless of the field or the industry chain distribution achievements belong to, both side exist structural anomaly. Single offline promotion channel is not conducive to integrate and share information of agricultural scientific and technological achievements, the achievements concentration is imbalance, which led in the case of agricultural science and technology needs are not met, there is still a waste of resources of agricultural industrialization, low levels of R&D reconstruction, agricultural science and technology benefits not high.

2.2 Imperfect online promotion network mechanism, weak support services

The degree of agricultural information determines the speed and efficiency of agricultural science and technology achievements industrialization, the establishment of agricultural science and technology information network is an important guarantee for accelerating agricultural science and technology

achievements transformation (Chen Shouhe,2014). Internet-based online promotion network is an important manifestation of traditional agriculture and the Internet virtual economy "cross-border operation". In terms of the current status of China's agricultural information construction, the basic conditions for online promotion of agricultural information network has been improved than the former, agricultural extension site and management system platform has become an important channel for agricultural science and technology achievements. However, due to the virtuality of internet communication carrier and the practical operability of agricultural reality technology and other issues, online promotion network often difficult to meet "seeing is believing" application intentions of the majority of farmers and agricultural enterprises. And thus lead to online trust crisis, which has disadvantage to the effective transformation of agricultural scientific and technological achievements.

2.3 Imperfect cooperative mechanism of double channels, failed in complementary advantages

Agricultural science and technology achievements transform mainly through two channels: offline and online promotion network, the advantages of the double channels perform different, both have played an important role in accelerating the process of agricultural scientific and technological achievements transformation. But the cooperation mechanisms of online and offline promotion network have not been established effectively, two channels lack of coordinate with each other, can not achieve the complementary advantages and mutual synergistic effect. In particular, the agricultural scientific and technological achievements resources of online and offline lack of effective integration, resulting in achievements into the waste of resources and loss, low levels of R&D reconstruction problems(Bian Quanle,2013); Technical support platform for online and offline failed to combine organically, the distribution of research, management, technology, consultants is uneven, thereby impeding the widespread promotion of agricultural science and technology achievements; Online and offline "double channel" cooperation is not wide enough and deep enough, clear asymmetry between the application risk and application income of achievements, resulting in the relevant transformation service agencies lack of enthusiasm.

3 Synergy Mechanism of Online and Offline Promotion Network

3.1 Offline promotion network

Offline promotion network is the inevitable approach and process for agricultural scientific and technological achievements transformed from potential productivity into real productivity, after the achievements supply-side output, the promote-side mainly experimental research on and entity display agricultural achievements, using agricultural parks as carrier and relying on supports of policy and funds. By providing a full range of achievements experience, achieve a direct contact between the application side and results, provide a realistic basis for agricultural enterprises or farmers to apply the results.

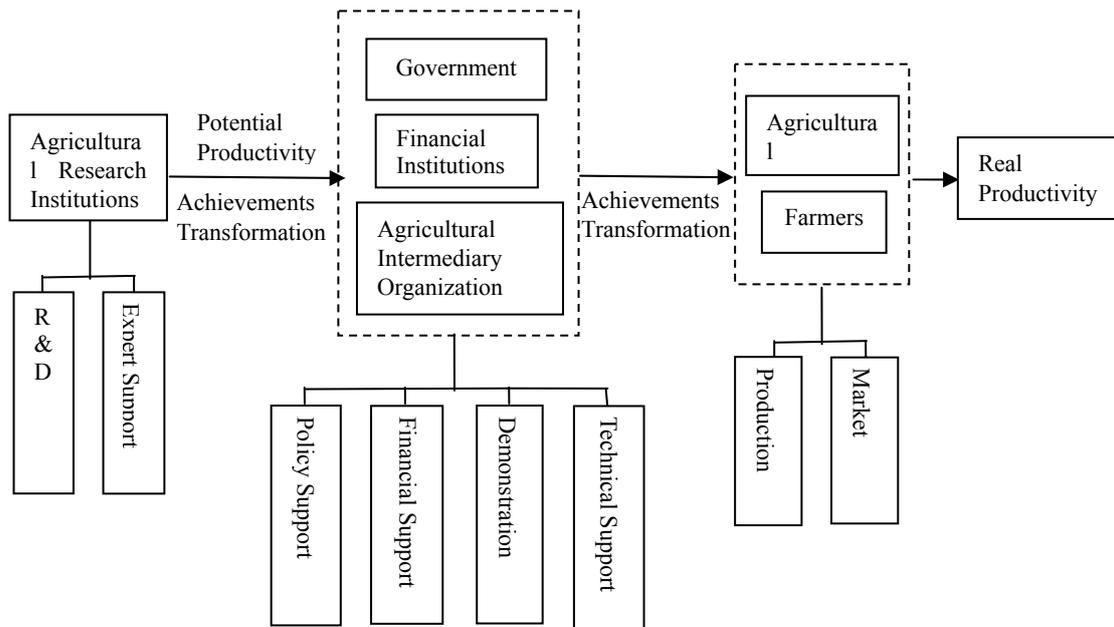

Figure 1 Offline Promotion Network of Agricultural Scientific and Technological Achievements Transformation (Traditional Conversion Channel)

All in all, the offline promotion network namely the traditional conversion channel, its unique advantages in the following three aspects: 1) Realize "face to face contact" between outcomes and the application side, solve the "seeing is believing" problem, win the trust of outcome-user and these are factors for them to make an investment decision; 2) Technical problems can be taught directly, eliminate confusions of outcome-users by consulting at the scene or organizing farmers and technical staff in agricultural enterprises to train; 3) Agricultural results need to test during R&D and displaying periods when it encounters practical problems, experimental site can be the carrier. Obviously, these advantages are explained the irreplaceable role of offline promotion network in agriculture scientific and technological achievements transformation.

However, the constraints of offline channel, such as slowly promoting, low input-output rate, geographical limitations and so on, indicate that there are some limitations to offline promotion network, the offline channel alone can not meet the requirements of modern agriculture development, there is urgent need for a strong complement which is the online promote network.

3.2 Online promotion network

With the development of modern computer technology and the popularity of internet, for agricultural scientific and technological achievements promotion, on one hand, it can maintain the traditional channel; on the other hand, it can build an exchanging and promoting platform based on modern information technology in a larger context. Online promotion network constructed in this paper refers to a comprehensive promotion service platform kernelled achievements transformation, the convenient internet as promoting media, in order to streamline the transformation links of agricultural scientific and technological achievements by using modern advanced information technology, break geographical restrictions to integrate conversion chain of agricultural achievements, and to share resources that achievement resources of agricultural research institutions, policy resources of government, financial resources of financial institutions, publicity resources of agricultural intermediary organizations and requirement resources of users. Through online promotion network, to achieve effective docking between supply and demand and between regions, accelerate the conversion rate, shorten the conversion cycle, thereby improving the efficiency of agricultural achievements transformation, and promoting the development of modern agricultural industrialization in China.

Online promotion network uses internet as promoting carrier, which determines the unique advantages of this online conversion channel different from offline channel, mainly in the following four aspects: 1) Break the limitations of the geographical space, integrate and share resources required during the transformation process, achieve more efficient transmission of information between transformation subjects; 2) Low cost, online exhibition on the achievements do not need to build the physical campus, which can save conversion costs and improve achievements transformation rate; 3) Accelerate the speed of agricultural achievements propagation and application, effectively shorten the transformation cycle; 4) The establishment of online interactive platform provides an information place for results evaluation and needs feedback. Accordingly, online promotion network also exists trust crisis on information, training needs on technical problems and poor benefited access of some farmers, a single online channel can not achieve effective agricultural scientific and technological achievements transformation, led to the need for offline promotion network as the support.

3.3 Synergy mechanism of online and offline promotion network

In the process of agricultural science and technology achievements transformation, single online channel or single offline channel is difficult to meet the needs of modern agriculture development. Pure online promotion network must be supported by offline promotion network, which is the basis, and offline promotion network needs to be complemented by online promotion network, which provide systematic resource network and associated support for achievements transformation. Generally, offline channel will be in the form of an entity like rural zone located in various regions, which makes a double value in outcome test and show. Communicating with each other through the network leads coordinate operations more flexible. Therefore, the collaborative mechanism based on online and offline channel is able to break through the bottleneck of agricultural scientific and technological achievements transformation, to solve the problems about low conversion efficiency. Figure 2 is the synergy mechanism of online and offline promotion network to promote agricultural science and technology achievements transformation.

Collaborative theory maintains that within the complex system, cooperative behavior of each subsystem can produce effect beyond their respective elements alone, to form the unified action and joint action of the entire system (Song Wenwen,2013). Although online and offline promotion network transform in different ways, but in the context of modern agriculture development, there is a mutual

influence and mutual cooperation relationship between the two channels. Offline network supports online network, online promotion network is an extension of the offline channel. Online and offline synergy is not a simple collection of each other, but an orderly combination that mutually supporting and closely linked with each other, to form a close fit between the different channels. The "double channel" operate coordinated around common goals, integrate "visibility and sensibility" of offline channel and convenience of online channel to form complementary advantages, the combination of online and offline, to create a composite force, results in the synergy of "1 + 1 > 2".

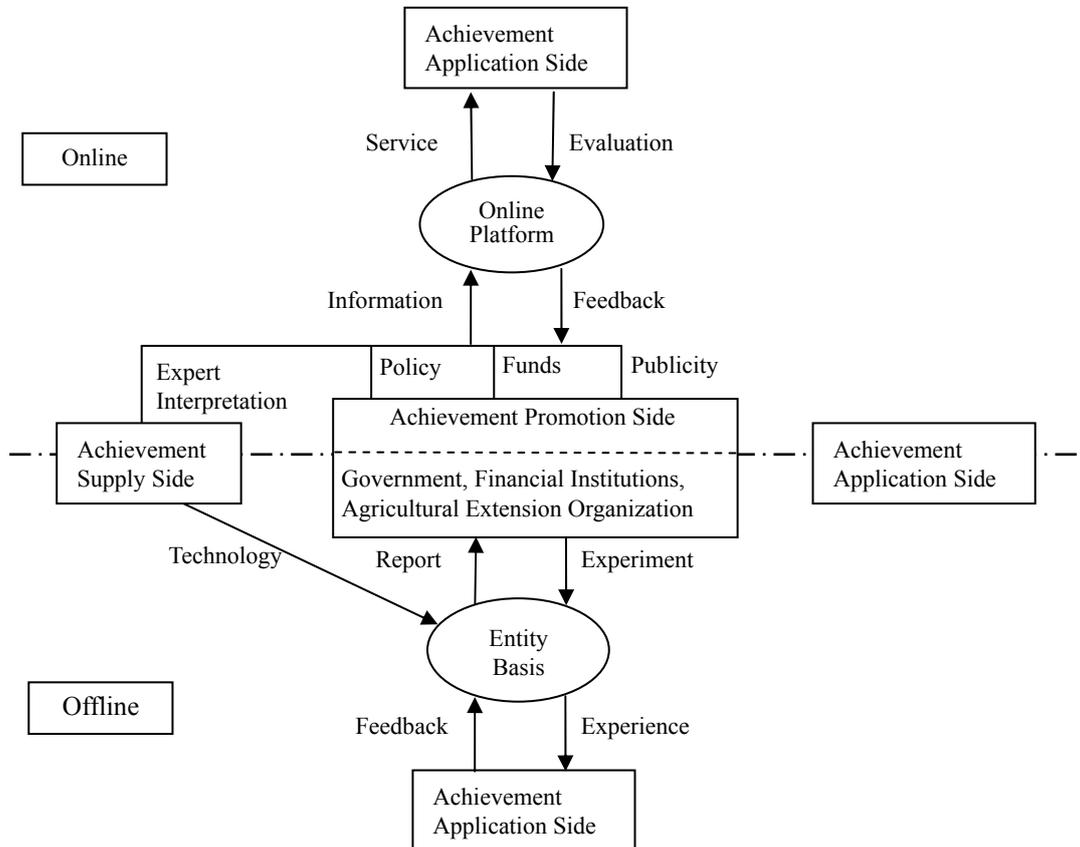

Figure 2 Synergy Mechanism of Online and Offline Promotion Network

4 Conclusions

The development of modern agriculture requires higher standards for agricultural science and technology achievements transformation subjects, achievements transformation needs to integrate capabilities of research, testing, marketing, financing and application, needs to operate coordinated between participants. Therefore, we must strengthen the close cooperation between the main subjects, accelerate the construction of online and offline promoting platform, fully integrate and efficiently allocate resources during transformation process.

Suggestions to perfect collaborative network of online and offline contains the following three points: 1) Strengthen the construction of online and offline platform, to promote resource collaboration of transformation subjects; 2) Complete interactive mechanism between online and offline, to create information collaboration in transformation process; 3) Establish and improve the incentive system for transformation, to promote subjects operating collaboration. Due to the limitations of existing theories and research level of personal not high, this study roughly discusses transformation channels of agricultural science and technology achievements. Just I hope this writing can make a little contribution to promoting agricultural science and technology achievements transformation in China, to promote the coordinated development of agricultural science and technology and social economy.

Study of Incentive Mechanism about Intellectual Property Based on Enterprise Technological Innovation

Tan Ying

Wuhan Huaxia Institute of Technology, Wuhan, P.R. China, 430223

(E-mail: 4918686@qq.com)

Abstract: The intellectual property regime itself is an incentive mechanism. Based on the internal characteristics of technological innovation and the benefit-oriented incentive mechanism of intellectual property, the incentive measures which can promote the national enterprise technology innovation and the implementation of intellectual property strategy, should be based on the benefit-oriented incentive, for giving full play to the function of benefit-oriented incentive from technological innovation and intellectual property regime. By the document arrangement, case analysis and other methods, this paper made an in-depth research in the existing incentive mechanism of intellectual property rights in the current China, conducted an in-depth analysis of its implementation environment and put forward that the construction of the incentive mechanism about intellectual property of enterprise technological innovation should be started from the business concepts, government support, institutional innovation of intellectual property and other aspects.

Key words: Enterprise; Technological innovation; Intellectual property strategy; Incentive mechanism

1 Introduction

Both the enterprise technological Innovation and the implement of intellectual property strategy have their own inner incentive mechanisms. The creation of the incentive mechanism for accelerating enterprise technological innovation and the implement of intellectual property strategy, which can better give full play to the incentives and the safeguard to technological innovation and then can improve its capacity, is a major task for implementing the intellectual property strategy and promoting the construction of technological innovation project. This paper researched it from several aspects like the theoretical basis, the analysis of environmental implementation and the mechanism construction.

1.1 Overseas research status

With the rapid development of knowledge-based economy, the foreign experts and scholars in this field have also paid more and more attention and research on technological innovation and intellectual property regime. The current international research on technical innovation and intellectual property is mainly conducted from two perspectives: the inner part of economies and the intellectual property protection in the economic opening and association.

William M. (2010), the famous American economist as well as the professor in Harvard, pointed out that analyzing from the perspective of welfare economics, we should take the relationship between creation and spread of knowledge and social welfare as the important content of research. This new idea lays a solid theoretical foundation for later analyzing the intellectual property as an effective way of resource allocation. Ruth Towse (2006), the famous American economist as well as the professor in Yale, studied of the intellectual property regime, and then came up with a model of intellectual property regime (for example, patent) which is equipped with the optimal protection period. There is a very sensitive relationship between the optimal patent protection period and social discount rate, therefore the faster the cost of innovation decreases, the shorter the patent protection period will be. About the intellectual property management, the Harvard University Professor Michael Porter (2013) talked in his "competitive strategy: skills for analyzing industries and competitors" that for the intellectual property management of a company is not only the responsibility for its leaders or for the company itself, but also the responsibility for everyone in this company. We have to establish a sound management and cooperation regime for achieving it. Country and government should publish complete laws and policies for protecting the intellectual property of companies, and should encourage and guide companies to carry the efficient management on the intellectual property.

1.2 Domestic research status

Domestic experts and scholars have also concerned about the intellectual property protection regime on the technological innovation. Though the research of intellectual property protection, the Peking University Professor Wang Dingding (2003) put forward that in a specific period of social development, we need to provide effective economic incentives to promote the creation and progress of knowledge, therefore, it is necessary to effectively protect the intellectual property. Cao Qianyou (2012)

from the perspective of institutional economics, made the in-depth study on the relationship between enterprise technological innovation and intellectual property regime, and described the mechanism of the intellectual property regime and its encouragement on technological innovation. From the perspective of economics, Bu Wei tried to build a game model between the leading innovators and the followers of technology, for specifically analyzing different influences on the development of enterprise technological innovation by different arrangements in the intellectual property regime. Lv Wei (2004) thinks that our intellectual property system needs the protection system which takes the encouragement of technological innovation and competition as goals and regards the development as orientation; needs to vigorously promote the reasonable diffusion and movement of intellectual property, for consolidating the enterprise's subject position on creating and applying intellectual property as well as advancing the utilization ratio of intellectual property; needs to expedite the establishment of the intellectual property service system; needs to limit the abuse of intellectual property, punish the tort on intellectual property and promote the fair competition in intellectual property.

For researchers, up to now, the overseas and domestic research on the enterprise technological innovation and the protection of intellectual property regime has not only made great theoretical achievements, but also obtained rich fruits on practical application. However, with the in-depth development of economic society, the reality as the base of theories is changing all the time. Therefore, theories also need to be advanced with times. Research on technological innovation and intellectual property protection should be deeper and wider.

2 The Basic Connotation of Incentive Mechanism about Intellectual Property

2.1 The basic connotation of incentive mechanism

The incentive mechanism and its corresponding incentive theory are subjects for the study in disciplines like economics, management, organizational behavior and even the law. For instance, in the management, Barnard who put forward the social system theory pointed out in *The function of the Executive* in 1938 that the motivation of individuals' collaboration includes egoistic motives of self-preservation and self-gratification, while objective and subjective incentives are factors to generate these motives.

In management, theories like comprehensive incentive theory and expectancy valence theory show the process incentive theory. This theory is to study the relationship between motivation and target-choosing of human's behavior, and this theory includes the opinion that human will only be completely motivated if they expect that their behaviors can help achieving certain goals, and then will take actions to accomplish goals (Nash, 1951). Represented by Porter and Lawler, the expectancy theory of 1960s pointed out that the motivating force is subject to various factors, including the success of specific matters, gained remuneration and understanding and evaluation of the related impact. In economics, the incentive mechanism and theory take the rational economic person as the starting point and aim to obtain the maximum profit or best effect.

2.2 The intellectual property regime

The intellectual property regime itself is an incentive mechanism which should fully play its role, to implement the innovation of intellectual property regime and to establish a system in favor of the IPR creation, transformation of innovation achievements and value realization. From the perspective of institutional incentives, the longstanding policy applied in our country is the science and technology award (Smith, et al, 1973). Under the current incentive system of intellectual property, though the science and technology award certainly has its historical origins, its existence space is limited. We should be more inclined to the intellectual property regime to encourage enterprises to create knowledge and transform innovations (Dixit, et al, 2009). The reason is that the science and technology award and the intellectual property regime are two fundamentally different systems. The former one is engaging in scientific research activities in accordance with the National Science and Technology Plan not the market. Therefore, it isn't guiding or stimulating the technology industrialization and commercialization. The intellectual property regime includes the guide and mechanism of encouraging the innovation industrialization and commercialization, and the industrialization and commercialization of technological achievements is the ultimate purpose for enterprises to carry on the technological innovation (Hirshleifer, 2000).

2.3 The IP-oriented incentive mechanism

The IP-oriented institutional incentive mechanism, with the encouragement for enterprises to create knowledge and transform innovation, in essence, is a kind of incentive mode and mechanism by taking

the property rights incentive institutions as both the base and the core. The property rights incentive, including the intellectual property, is considered as the basic system to stimulate the subject of market economy to engage in creative activities. Effective system of property rights can form clear expectations for defining the rights, obligations and responsibilities of all stakeholders, to avoid negative externalities in creative activities and to provide protections for stakeholders to occupy themselves in R&D and other related activities (Huang Liping, Li Chaoming, 2010).

Therefore, to promote China's enterprises technological innovation and the implement of intellectual property strategy, it is important and meaningful to establish the incentive mechanism of technological innovation with IP elements involved, to reform the current scientific and technological achievements evaluation system, and to set a scientific evaluation system to promote the technological innovation.

3 The Motive Mechanism of Enterprise Technological Innovation

The reason why the technological innovation can become the conscious actions of company is that it is driven by the enterprise internal motive mechanism and influenced by the enterprises external environmental. The interplay of these two factors constitutes the motive mechanism of enterprise technology innovation.

Based on technological invention, the enterprise technological innovation is the process to realize the economic benefits by the technological productization and marketization. The enterprise technological innovation on the one hand meets the needs of society, on the other hand also achieves its own profits, and therefore obtains a certain competitive advantage in the market (Xiong Qiang, et al, 2014). The internal driving force of it comes from enterprises' pursuits to economic interests by using innovative resources and innovative ability. The innovators are motivated by profits brought by their innovative products.

Under the intellectual property regime, the driving force of enterprise technological innovation mainly comes from monopolistic interests which generated in the intellectual property protection for innovative fruits. This driving force originates from the market competition in essence. As some scholars have pointed out, "if enterprises don't take the enterprise internal impetus and the market competitive impetus as the leading factors to improve the level of patent technological innovation, they would never have real capability of technological innovation." (Chen Lei, et al, 2008) And some scholar indicates that under the intellectual property regime, the mechanism for enterprises to develop intellectual property includes four aspects: technical innovation mechanism of competition, cooperation and diffusion as well as technical standardization mechanism (Nonaka, 1998).

For the external environment, enterprise technological innovation can be implemented on the base of market demands, technological opportunities, market competitiveness as well as government's guiding and supporting policies and institutions on technological innovation. For example, the brisk market demand provides external impetus for enterprises to carry out the technological innovation on certain aspects; ideas and experiences that the advanced technology will equip enterprises with market competitiveness, also offer the driving force to enterprise technological innovation (Toni Laaksonen, 2008). Government's supporting policies and incentive systems related to the enterprise technological innovation are also conducive to create a social environment of technological innovation and to guide the enterprise technological innovation, thus actively promoting policies and strategies of enterprise technological innovation. The market competitiveness is also a vital motivation for enterprises to engage in technological innovation. Competition will pose pressure on enterprises to generate a sense of crisis, and force them to develop better technologies and products than their competitors to win competitive advantages. However, the influence from external environment eventually needs to be converted to the internal motive mechanism for enterprise technological innovation (Zhang Feng, 2002).

In fact, the internal motive mechanism is the benefit-based incentive mechanism. That is, only if a direct and positive correlation exists between the proportion of innovation put by innovators and their interests, there will be high enthusiasm for enterprises to engage in technological innovation.^[17] Of course, though the enterprise technological innovation belongs to the individual behavior of enterprises, it will still have huge social benefits. In order to maintain the social effects of technological innovation, we need to balance private profit rate and social profit rate on technological innovation (Robert, 1988).

4 The Construction of Incentive Mechanism about Intellectual Property Based on Enterprise Technological Innovation

The intellectual property regime itself is a mechanism to protect and stimulate the knowledge creation. If enterprises want to integrate the technological innovation and intellectual property strategy, they should make full use of the incentive mechanism in the intellectual property regime from its start point: promoting the knowledge creation. For the important role of the incentive mechanism, enterprises should also establish a set of mechanisms with benefit as the core, in the aspect of promoting knowledge creation. This paper holds the view that we should mainly pay attention to the following strategies:

Firstly, we need to establish a people-oriented concept, pay attention to the role of intellectual capital in enterprise development, and build incentive mechanisms for encouraging innovative talents. From the perspective of human resources theory, the reason why the great importance lies in the incentive measures which can promote the enterprise technological innovation and the implementation of intellectual property strategy, is that human capital is one of the most important factors of production for enterprises, and it is both the subject of R&D, production-manufacturing and marketing campaigns enforced by enterprises as well as the base of integrating resources, managing other factors of production and achieving the optimum economic benefits (Paul, 1987). It is undoubtedly that if we want to enhance the important role of human capital played in business activities, we need to fully mobilize the enthusiasm and creativity of employees, for adequately stimulating the vitality of work. The incentive measures which take the guarantee for economic and spiritual interests of employees as its core is naturally the important factor and measure to stimulate the vitality of the human capital and promote the enterprise innovation (Grossman, 1991). Training creative talents is the precondition to promote the knowledge creation in enterprises, because creative talents are subjects of knowledge creation.

Secondly, we need to establish a sound system of enterprise innovation, for fully stimulating the vitality and potential of innovative talents to engage in the knowledge creation. It is so important for enterprises to set the internal incentive mechanisms for encouraging innovation. From the experience of foreign enterprises, the enterprises in developed countries generally have established a fairly sound system for encouraging technical personnel to be engaged in the technology research and development. For example, IBM in the United States has established a sound incentive mechanism of creation. The company set up a points-based reward system: the inventor can get some points after getting patents, and the inventive patent is 3 points; when accumulated points reach to 12 points, the inventor can get the performance award of \$ 3,600 (Paul, 1990). From the situation of China's enterprises, some enterprises set up a similar incentive reward system for knowledge creation, and greatly promote their intellectual property creations and technological capabilities through the establishment and improvement of the inner system of encouraging innovation. For example, Zhengzhou Yutong Group Co., Ltd. of Henan province focus on the creation of independent intellectual property, establishing a research and development pattern of "producing a generation, trial-producing a generation, developing a generation and pre-research a generation" (Philippe Aghion, 1992).

Thirdly, government needs to give policy and institutional support for the technological innovation in enterprises, and to establish policies, systems and cultural concepts for encouraging technological innovation. There is the plentiful content in government policies and institutions for stimulating technological innovation, like protection policies on innovation fruits, encouragement policies and guidance policies on innovation (Fritz Machlup, 1962). For example, policies based on technological innovation and intellectual property protection published by state and local governments include investment and protection for innovation resources, conservation and awards for innovation fruits, guidance for subjects of technological innovation to engage in innovative activities and so on. It should be said that on the aspect of external incentives, a great significance lies on effective policies and institutions published by the government. These policies and institutions are especially reflected in normative documents which can promote technological innovation and intellectual property strategies. In April of 2011, Hubei Province issued "Comprehensive Evaluation Regime on Scientific and Technological Innovation of Cities and Counties in Hubei Province (on trial)." This regime settled the comprehensive evaluation index on scientific and technological innovation of cities and counties which includes three kinds (gross indicators, quality indicators and speed indicators) and seventeen small indicators. Among these indicators, the number of granted patents and the ten-thousand people patent possessive quantity were respectively listed as one of the first gross indicators and quality indicators.

Fourthly, when establishing the property ownership of intellectual creation, we should hold principles of farthest mobilizing the enthusiasm of creators and fully protecting the legitimate rights and interests of creators, practicably implement the intellectual property which formed by the science and technology fund project or the science and technology plan with financial funds, and seriously realize

the system of "One Award Two Payment" for creators (Window & Bramer, 1994). On the base of using state-owned fund or national financial subsidy to carry out scientific and technological innovation projects, enterprises, as the undertaking unit, can take ownership of their achievements of technological innovations with patents innovations and intellectual property rights, unless these achievements involve in the national security, national interests or great public interests. For the intellectual property owned by enterprises, besides the implement by themselves, enterprises can also gain earnings by means like permission, transfer, pledge financing and evaluation in terms of shares. When companies cooperate with universities, research institutes and other units on innovation, they can stipulate the ownership of intellectual property by contracts. Above provisions undoubtedly help to mobilize the enthusiasm of enterprises to engage in innovation, and provide institutional incentives for enterprises to be the undertaking units to launch technological innovation with state-owned fund or national financial subsidy. The key is that after gaining the related intellectual property rights, how enterprises implement these rights in appropriate means, to make them become the guarantee for improving enterprises' competitiveness and technological innovation level.

Fifthly, we need create the atmosphere and culture of innovation in enterprises. The enterprise technological innovation is an economic and technological process with risks and exploratory. To achieve goals of technological innovation, we need to establish an effective mechanism of stimulating knowledge innovation. In addition, we also need to create an external environment which is conducive to innovation, and it is also very important to create a favorable atmosphere for the enterprise innovation.

5 Conclusions

Through document arrangement, this paper clarified the basic meaning of incentive mechanism about intellectual property as well as arranged and analyzed the basic contents of incentive mechanism, intellectual property mechanism and intellectual property-oriented incentive mechanism. Applying environmental analysis, this paper deeply analyzed inner and outer environments for enterprises to implement the incentive mechanism about intellectual property, which can lay a foundation for constructing mechanisms by realizing the environmental advantage. Finally, based on the enterprise technological innovation, the incentive mechanism about intellectual property can be constructed from many aspects, like constructing the humanistic concept, setting and perfecting the enterprise innovation mechanism as well as making awards real, providing governmental policy and institutional support for enterprise technological innovation, implementing policies and creating innovative atmosphere and culture.

Acknowledgement

This project is supported by research of improving Hubei foreign trade enterprise competitiveness, base on the new type of industrial cluster (13021).

Study on Process Management Innovation of Scientific Projects in Universities in Context of Big Data

Wang Jun

Institute of Science and Technology Development, Wuhan University of Technology, Wuhan, P.R.China, 430070

(Email: xmb@whut.edu.cn)

Abstract: For universities and colleges, scientific research plays a very important role in improving the level of aggregation, reserving further development power and enhancing international influence. At the same time, the level of management can greatly influence the efficiency of the scientific research. The big data era provides new research scopes, and gives rise to new research tools and paradigms as well. On this basis, we need to put big data as a productivity, and establish the service platform for research projects data and to make the development of process management more dynamic, diversified and scientific.

Key words: University; Scientific projects; Process management; Big data

1 Introduction

The universities and colleges, processing rich talents and technologies resources, have the basis of undertaking scientific tasks. So they are the fresh force for national scientific research. In recent years, with the promotion of hi-tech innovation capacity, the universities have been undertaking more and more projects than before. Therefore the requirement for management of scientific research projects is increasing. To strengthen the process management is an important approach to improve the level of scientific research management.

Scientific research work in China has achieved rapid development over the years. However, the backward management concept restricts the research management level and performance. But now it is the era of big data. All kinds of data can add up and grow very quickly in size, as shown in Figure. 1(Tien James M ,2013). Xu Zhejun et al (2014). briefly described the concept of big data and the challenges to the traditional scientific research management then suggested the application of big data technologies in scientific research management informationization. Yang Weirong (2015) stated that we also need to strengthen the building, matching and docking of external demand databases and university research library. It is also essential to strengthen the “big data” propaganda and promote the transformation of the concept of scientific researchers. Big data has penetrated various areas and sectors of human society including industry sectors, technology, transportation, electricity, health care, finance, social security, defense, and public safety (Jiang et al,2014; McAfee A et al,2012; Liu et al,2014).

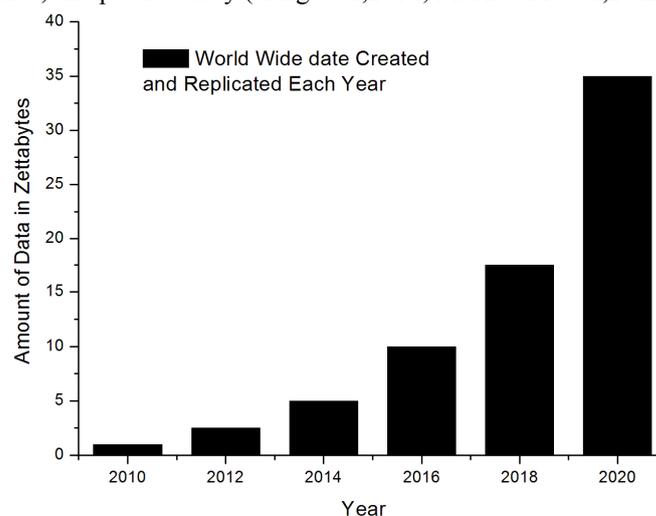

Figure 1 Growth in Data

The big data technology can play a positive role in research assessment, project determination, resources distribution, project monitoring and so on, and provide guarantees on the performance of

research project management and well development of scientific research.

2 The Necessity of Strengthening the Scientific Research Project Management in Universities

The dynamic process of scientific projects management can be divided into several stages, including projects declaration, control execution and final projects measurement. For a long time, people mainly focus on the projects declaration and final measurement. But there is not enough dynamic monitoring for the whole research process. This kind of management mode cannot satisfy the requirement of the researches in nowadays. So the scientific research management department in the universities must enhance the process management of scientific projects (Golston D, 2008).

To strength the process management of scientific research project, the management department needs to achieve two main points. First, they should know the progress situation at any time, that is, make sure that the research projects are under monitoring and quality controlling at all the stages. Second, they need to response the problems and remove the obstacles in time. If necessary, the research plan should be modified to keep the research project innovative and prospective and promote the quality of research achievements (Li Guojie, Chen Xueqi, 2012; Huang Hengzhen, Zhou Guohua, 2015).

3 Big Data Era's Influence on the University Scientific Research Project Management

In big data era, the new requirements of university scientific research project management request the big data to play a positive role. The appearance and development of big data supply a significant opportunity for the research management from tradition to informatization. The information management contributes to the pertinence of project selection. It's also helpful to the duplicate checking to avoid resource waste and interest confliction. In addition, the big data can optimize the monitoring system of academic morality; also promote the transformation of research achievements from data sharing (Meng Xiaofeng, Ci xiang, 2013).

3.1 Big data is helpful to improve the pertinence and scientificity of research topic selection.

Scientific projects start from topic selection. So the scientificity of the selected topics directly affects the feasibility and innovation of the project. The research projects from the nation, provinces or ministries first started from topics collection in some specific scopes. Then the research guide was issued followed by the corresponding research work in the institutes. The problem is that the information asymmetry during regions and ministries easily lead to the overlap in research directions and content. What's more, as the topics are always limited in specific scopes, the managers who supply the topics may be not expert in the social demand, research hotspot or research ability, which could result in the mismatch during the three aspects. The big data technology can dig out the demand of science and technology in social public, business enterprise, government/public institutions, and other nonprofit organizations. It can even distinguish which is the most impendent and beneficial demand, and then promote the pertinence and realize the scientization of topic selection. In big data era, research management departments have the ability and responsibility to guide researchers in topic selection.

3.2 Big data is helpful to the transformation of research achievement

The universities now mainly focus on the innovation of scientific and technology, but rarely on the demand for achievements from social public, business enterprise and government/ public institutions. The situation leads to the mismatch between research achievements and social demand, and results in the low rate and speed of achievement transformation as well. Moreover, the researchers in universities communicate very limited with the potential demanders. So even though some research achievements in universities may be really important for solving the problems form personage, the enterprise/ public institutions and government, they cannot be applied because of the information asymmetry. Aiming at this situation, the scientific research management department in universities could establish the platforms for research achievements and social demands using the big data technology, achieve the match and joint between them, and so promote the achievement transformation and realize the social and economic benefits.

3.3 Big data is helpful to promote the efficiency and precision of scientific research project management

With the high speed development of information and explosive growth of all kinds of data, the statistic and analytical functions of the old management system are too simple and in low correlation.

The research managers can only get to the original data and basic functions of project number, project budget, achievement entry, query and report. In the old working model, the research managers are the bridge to convey instructions and appeals and only play a role in collecting and organizing data. Under the background of big data, the managers in universities should bring the subjective initiative into play with the big data technology. They need to extract the depth information that is useful to the final decision from the mass data, and supply the objective, scientific and high level support to the researchers.

4 Exploration of Building New Model for the Scientific Research Project Management under the Big Data Perspective

From the development tendency, the scientific research project management model in universities at present cannot satisfy the requirement of the achievements' quality for the major research project. In big data era, the new process management model for scientific research projects should be established based on data analysis, and realize the interrelation, interaction and interplay by the management activities from different levels. The activities and resource in every stages of the process should be combined organically. The final target needs to be divided into small targets in every stage for better monitor and control, and followed by the rearrangement and modification through the feedback in process management. The present management model should be transformed thoroughly into the whole-process management, which faces to the self-inspection, mutual inspection and quality inspection for the projects. The dynamic evaluation system of scientific research project management must be built based on big data. With the analyzing of the big data and continuous controlling and modifying of the project, it's probably to realize the quality controlling and promote the transformation rate of scientific research achievements radically. The key point to achieve the target is making the best of the data platform, collecting and analyzing all the related data in research management process, and realizing the overall control during project application, process management and achievement management.

Firstly, the managers need to collect the internal and external data, followed by filtrating and collating. Then the data are input into the project management platform and form the database. Secondly, the data will be analyzed and transformed into knowledge to support the projects from plan establishment, projects declaration, control execution, process management to final projects measurement. Thirdly, the data formed in the whole process can be recorded into the database as well to realize a virtuous circle. In this way, the efficiency of achievement can be promoted. The diagram of the process management based on big data for scientific research projects in universities was shown in Figure 2.

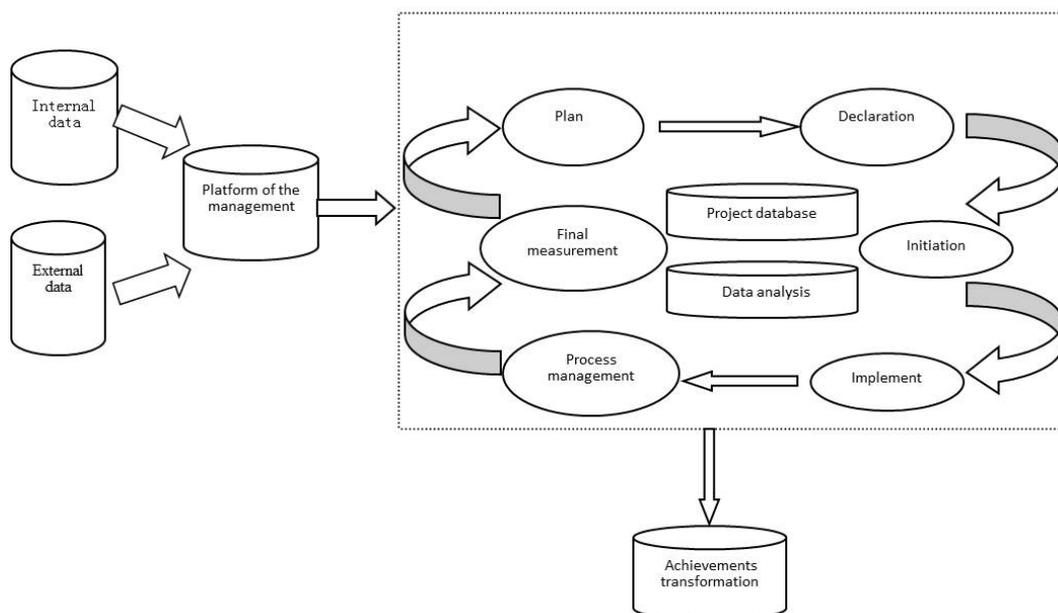

Figure 2 The Diagram of the Process Management based on Big data for Scientific Research Projects in Universities

In addition, the concept of the research managers in universities needs to be refreshed from the “management” to “supporting and service”. The information Mining should be more progressive by analyzing the demand from society and nation to make the research target valuable and pertinent. The service also should be more prospective by analyzing and digging out the data in time to support the researchers with the data or conclusion they need.

5 Conclusions

The development of big data provides a good opportunity for the research management from the traditional to the information. The new process management model for scientific research projects could be established based on big data technology. Through the analysis of the big data and continuous controlling and modifying of the project, the quality control has been realized and the improvement of the transformation rate of scientific research achievement has been promoted.

Abstract: Quality has become a universal goal for organizations to sustain competitive merits. Control charts are one of the powerful tools often used by management to achieve cost savings by minimizing process variation and reducing rework, scrap and the need for inspection. However, most of the control charts were proposed based on a deterministic shift size while in reality, practitioners may not know the shift size due to a lack of data. Therefore, this paper develops a variable sampling interval (VSI) chart to monitor the coefficient of variation (CV) with unknown shift size, thereby allowing practitioners to select optimal parameters without specifying the shift size. Optimization design strategies based on the expected average time to signal (*EATS*), subjected to constraints in terms of the in-control average time to signal (*ATS*) and in-control average sampling interval (*ASI*) is presented. The *EATS* of the chart is numerically compared with its competing charts. The VSI CV chart outperforms the Shewhart CV and synthetic CV charts, while the EWMA- γ^2 chart outperforms the VSI CV chart. Significant cost savings can be obtained from a quicker detection of the shift.

Key words: Average time to signal (*ATS*); Coefficient of variation; Expected average time to signal (*EATS*); Optimization design strategies; Unknown shift size; Variable sampling interval

1 Introduction

Superior quality of products and services ensures sustainability of an organization. Statistical Process Control (SPC) concepts within the organization have been a key factor in leading to continuous quality improvement and successful business management. Among the seven tools in SPC, control chart is the most technically sophisticated. Quality practitioners used control charts to monitor the process by determining whether the process is in-control or out-of-control. When the chart signal an out-of-control condition, the process must be stopped to remove the assignable causes before a large quantity of defective units are produced. Therefore, a control chart is considered to be better than its competitors if it is able to detect the out-of-control condition in a shorter time without giving many false alarms.

Most of the control charts in the existing literatures monitor the mean and/or standard deviation. Nevertheless, in some processes, the mean and the variability are dependent of one another, where the mean is expected to fluctuate and the variance is a function of the mean. In these cases, monitoring the mean and/or standard deviation is dubious. For such situation, the coefficient of variation (CV) can be used to quantify the variation in the measurements. The CV is defined as the ratio of the standard deviation (σ) to the mean (μ). Since the CV is a unit-free measure of dispersion, it is widely used to compare the variability among data sets of distinct units or distinct mean values.

The CV is broadly applied in many different fields. In the context of finance, the CV allows the investor to determine the volatility or risk in comparison to the amount of return the investor expects from the investment (Curto, J.D. & Pinto, J.C.,2009) Besides that, the CV is also used to measure the stability of dividend yields of Hang Seng index (Pang, W.K., Yu, B.W,2008). The CV is also very popular in the field of manufacturing and material engineering. For instance, tool cutting life and several properties of sintered materials (Castagliola, P., ,2011; Castagliola, P., Achouri, A. ,2013). Apart from that, the CV is adopted in health science. For example, the CV is used to measure the variation in the mean synaptic response of the central nervous system (Faber, D.S. & Korn, H, 1991) and to diagnose the presence of a disease based on the amount of certain chemicals in the patient's urine and blood (Tian, L,2005). In chemical and biological assay quality control, the CV is used to validate results (Reed, G.F,2002; Seyler, C,2005). In ecology, the CV is used in predictive ecosystem modelling and aquatic management (Håkanson, 2003).

The pioneering work on the CV chart was presented by Kang, Lee (2007). The CV chart proposed by Kang, Lee (2007) is a Shewhart-type control chart which is only sensitive to large shifts but is less

sensitive to small and moderate shifts. Driven by this reason, numerous works and extensions on control charting methods have been made to find the most effective control chart for a quicker detection of process disturbance. Hong, E.P. et al (2008) developed an Exponentially Weighted Moving Average (EWMA) CV control chart, Castagliola, P., Celano, G. (2011) suggested two one-sided EWMA- γ^2 charts, Calzada and Scariano (2013) proposed a synthetic control chart to monitor the CV and Castagliola P., Achouri A. (2013) developed a Shewhart-type CV chart with supplementary run rules. More recently, Zhang, J. et al (2014) suggested a modified EWMA CV chart. Finally, a multivariate version of the CV chart is proposed by Yeong, W.C. et al (2016).

Shewhart-type control charts are often adopted due to its simple implementation. Shewhart-type control charts perform well in detecting large shifts, but the detection speed in small and moderate shifts is insufficient. Extensive research in recent years has developed adaptive control charts. (Castagliola, P., Achouri, A., 2013) proposed a variable sampling interval (VSI) control chart to monitor the CV, while Castagliola, P., Achouri, A. et al (2015) and Yeong, W.C., Khoo (2015) monitored the CV using the variable sample size (VSS) charts. The results showed that adaptive control charts improved the detection speed significantly.

The VSI chart works by allowing the sampling interval to vary as a function of the prior sample position. (Reynolds, M.R., 1988; Reynolds, M.R., 1989; Runger, G.C., 1991) showed the optimality of two sampling intervals. The VSI chart divides the chart into three regions using warning and control limits. If a sample point falls in the central region which is bounded by warning limits, then the next sampling interval should be long due to a low probability for the process to go out-of-control. However, if a sample point falls in the warning region which is bounded by warning and control limits, then the next sampling interval should be short as the probability for the process to go out-of-control is high. Lastly, if a sample point falls in the out-of-control region which is outside the control limits, then the process is considered to be out-of-control and corrective action is needed to eliminate the assignable cause.

In the existing literature, most of the controls charts were proposed based on an assumption that the shift size is known a priori. Nonetheless, in many real-life applications, the practitioner may not be able to specify the exact value of the shift size due to lack of historical data or the shift size is not deterministic and varies according to some unknown stochastic model (Castagliola, 2011) showed that the run-length properties are seriously affected if the practitioner selects the optimal parameters due to incorrect specification of the shift size. Thus, it is crucial to cope with this unknown shift size problem. Adaptive control charts that monitor the CV with unknown shift size cannot be found in the existing literature. Thus, this paper proposes a VSI CV chart with unknown shift size. Through the chart proposed in this paper, practitioners will be able to obtain the optimal chart parameters even when the shift size is unknown.

The rest of the paper is structured as follows. In the next section, the VSI CV chart is reviewed. Then, the VSI CV chart with unknown shift size is proposed. Next, some results and discussion are provided. Finally, some concluding remarks are provided.

2 The VSI CV Chart

In this section, a brief overview of the VSI CV chart proposed by Castagliola, P., Achouri, A. (2013) is provided. The chart signals an out-of-control situation when the sample CV falls outside the upper and lower control limits. The sample CV, $\hat{\gamma} = \frac{S}{\bar{X}}$, where \bar{X} and S are the sample mean and sample standard deviation of a sample of n independently and identically distributed normal random variables.

The cumulative distribution function (c.d.f.) of $\hat{\gamma}$ is

$$F_{\hat{\gamma}}(x|n, \gamma) = 1 - F_t\left(\frac{\sqrt{n}}{x} \mid n-1, \frac{\sqrt{n}}{\gamma}\right), \quad (1)$$

where $F_t(\cdot)$ is the c.d.f. of the non-central t distribution with $n-1$ degrees of freedom and non-centrality parameter $\frac{\sqrt{n}}{\gamma}$. Inverting $F_{\hat{\gamma}}(x|n, \gamma)$ gives the inverse c.d.f. of $\hat{\gamma}$ as

$$F_{\hat{\gamma}}^{-1}(\alpha|n, \gamma) = \frac{\sqrt{n}}{F_t^{-1}\left(1-\alpha \mid n-1, \frac{\sqrt{n}}{\gamma}\right)}, \tag{2}$$

where $F_t^{-1}(\cdot)$ is the inverse c.d.f. of the non-central t distribution.

The sampling interval of the VSI CV chart is varied at two levels, which is the long sampling interval (h_L) and the short sampling interval (h_S). To apply the VSI CV chart, control and warning limits are needed. The control and warning limits can be computed as follows:

$$UCL = \mu_0(\hat{\gamma}) + K\sigma_0(\hat{\gamma}), \tag{3}$$

$$LCL = \mu_0(\hat{\gamma}) - K\sigma_0(\hat{\gamma}), \tag{4}$$

$$UWL = \mu_0(\hat{\gamma}) + W\sigma_0(\hat{\gamma}) \tag{5}$$

and

$$LWL = \mu_0(\hat{\gamma}) - W\sigma_0(\hat{\gamma}), \tag{6}$$

where K and W are the control and warning limit parameters with the condition $K > W > 0$, while $\mu_0(\hat{\gamma})$ and $\sigma_0(\hat{\gamma})$ are the mean and the standard deviation of $\hat{\gamma}$ when the process is in-control. Since there is no closed form for $\mu_0(\hat{\gamma})$ and $\sigma_0(\hat{\gamma})$, approximations proposed by Reh, W. et al(1996) are adopted in this paper, such that

$$\mu_0(\hat{\gamma}) \approx \gamma_0 \left[1 + \frac{1}{n} \left(\gamma_0^2 - \frac{1}{4} \right) + \frac{1}{n^2} \left(3\gamma_0^4 - \frac{\gamma_0^2}{4} - \frac{7}{32} \right) + \frac{1}{n^3} \left(15\gamma_0^6 - \frac{3\gamma_0^4}{4} - \frac{7\gamma_0^2}{32} - \frac{19}{128} \right) \right], \tag{7}$$

$$\sigma_0(\hat{\gamma}) \approx \gamma_0 \left[\frac{1}{n} \left(\gamma_0^2 + \frac{1}{2} \right) + \frac{1}{n^2} \left(8\gamma_0^4 + \gamma_0^2 + \frac{3}{8} \right) + \frac{1}{n^3} \left(69\gamma_0^6 + \frac{7\gamma_0^4}{2} + \frac{3\gamma_0^2}{4} + \frac{3}{16} \right) \right]^{\frac{1}{2}}. \tag{8}$$

The average time to signal (ATS) and the average sampling interval (ASI) is provided by Castagliola, P., Achouri, A. (2013) as follows:

$$ATS = \frac{h_S p_S + h_L p_L}{q(1-q)} \tag{9}$$

and

$$ASI = \frac{h_S p_S + h_L p_L}{1-q}, \tag{10}$$

where $p_L = F_{\hat{\gamma}}(UWL|n, \gamma_1) - F_{\hat{\gamma}}(LWL|n, \gamma_1)$ is the probability of the sample falling in the central region, $p_S = F_{\hat{\gamma}}(UCL|n, \gamma_1) - F_{\hat{\gamma}}(LCL|n, \gamma_1) - p_L$ is the probability of the sample falling in the warning region and $q = 1 - p_S - p_L$ is the probability of the sample falling in the out-of-control region.

3 The VSI CV Chart with Unknown Shift Size

When the quality practitioners are unable to specify the shift size or the shift size is not deterministic, the optimal chart parameters should be obtained using an alternative method. The expected average time to signal ($EATS$) should be used instead of the ATS . The $EATS$ can be computed as follows:

$$EATS = \int f_{\tau}(\tau) ATS(n, h_S, h_L, W, K, \gamma_0, \tau) d\tau, \tag{11}$$

where $f_{\tau}(\tau)$ is the probability distribution function of the shift τ . The $EATS$ can be considered as the expected value of the ATS over the distribution function $f_{\tau}(\tau)$. Note that the $EATS$ does not quantify any statistical property of the chart for a specific shift size. As it is often difficult to fit the actual shape of $f_{\tau}(\tau)$, a simple non-informative solution consists of choosing some discrete uniform distribution over $[0.5, 1)$ for the decreasing case and over $(1, 2]$ for increasing case (Castagliola, 2011). Gauss-Legendre quadrature is used to obtain an approximation of the integral as the integral in Equation (11) cannot be obtained easily.

In order to implement the optimization algorithms, the values of (h_S, h_L) need to be fixed. In this

paper, we consider $(h_S, h_L) \in \{(0.5, 1.5), (0.3, 1.7), (0.1, 1.3), (0.1, 1.5), (0.1, 1.9), (0.1, 4.0)\}$, which are the combinations recommended by (Reynolds, 1989), and were also adopted by (Castagliola, P., Achouri, A., 2013). For the optimization criterion, we select (W, K) which minimizes $EATS_1$ such that

$$(W, K) = \arg \min_{(W, K)} EATS_1(n, h_S, h_L, W, K, \gamma_0, \tau_{\min}, \tau_{\max}), \tag{12}$$

subject to the constraints

$$ATS_0 = 370.4 \tag{13}$$

and

$$ASL_0 = 1. \tag{14}$$

4 Numerical Analysis

Table 1 Optimal Chart Parameters (W, K) And The Corresponding Out-Of-Control $EATS_1$ Of The VSI CV Chart With Unknown Shift Size, For $\gamma_0 \in \{0.05, 0.10, 0.15, 0.20\}$ And $n \in \{5, 7, 10, 15\}$

In this section, we consider $n \in \{5, 7, 10, 15\}$, $\gamma_0 \in \{0.05, 0.10, 0.15, 0.20\}$ and $(h_S, h_L) \in \{(0.5, 1.5), (0.3, 1.7), (0.1, 1.3), (0.1, 1.5), (0.1, 1.9), (0.1, 4.0)\}$ for increasing shift size. The motivation of

choosing the increasing case is because (Castagliola, P., Achouri, A, 2013) and (Yeong, 2015) found that CV charts with varying chart parameters lead to poor performance when it is adopted for the decreasing case. The optimal chart parameters (W, K) which minimize the out-of-control $EATS_1$ ($EATS_1$), subject to constraints $ATS_0 = 370.4$ and $ASI_0 = 1$ is obtained using the algorithm presented in the previous section. Next, the $EATS_1$ values is computed with their corresponding optimal chart parameters. Practitioners may refer to the table of optimal chart parameters provided in this section to facilitate a quick implementation of the VSI CV chart with unknown shift size.

Table 1 shows the optimal chart parameters (W, K) in the first row and the $EATS_1$ values in the second row. Based on Table 1, the best performance is obtained for the combination (0.1, 4.0). The larger the spread between h_s and h_L , the faster the detection of the shift. From Table 1, a smaller $EATS_1$ is obtained for larger values of n . For example, by considering $(h_s, h_L) = (0.1, 1.3)$, when $n = 5$, $\gamma_0 = 0.05$, the $EATS_1$ is 24.18, while the $EATS_1$ is only 12.90 when $n = 15$ for the same (h_s, h_L) combination and γ_0 value. The $EATS_1$ value is slightly larger for larger values of γ_0 , but the impact is minimal.

Table 2 shows the comparison of the VSI CV with that of three competing charts in terms of the $EATS_1$ values and the percentage increase. The percentage increase shows the percentage increase in the $EATS_1$ values when the competing charts are adopted instead of the VSI CV chart. The fixed sampling interval of the Shewhart CV, Synthetic CV and EWMA- γ^2 charts is set as unity so that the ATS_1 values of these charts are the same as their corresponding ARL_1 values. For the VSI CV chart, the (h_s, h_L) combination is set as (0.1, 1.3). From Table 2, for all values of n and γ_0 considered, the $EATS_1$ values of the VSI CV chart is always smaller than the Shewhart CV and the Synthetic CV charts, but generally greater than the EWMA- γ^2 chart. As an example, when $n = 5$, $\gamma_0 = 0.05$, the $EATS_1$ values for Shewhart CV, Synthetic CV, EWMA- γ^2 and VSI CV charts are 38.06, 27.18, 15.72 and 24.18, respectively. Even though the VSI CV takes a longer time to signal the out-of-control condition compared to the EWMA- γ^2 , the VSI CV chart is easier to understand compared to the EWMA chart.

Table 2 A Comparison Of The Out-Of-Control $EATS_1$ Values Of The Shewhart CV, Synthetic CV, EWMA- γ^2 With VSI CV charts, For $\gamma_0 \in \{0.05, 0.10, 0.15, 0.20\}$ And $n \in \{5, 7, 10, 15\}$

5 Conclusions

Control charts are one of the useful tools used in manufacturing to detect the presence of assignable cause(s) which results in an out-of-control condition. One of the approaches to improve the performance of control charts is by adopting variable sampling intervals (VSI). The existing VSI charts

monitoring the CV is based on the assumption that the shift size is known. However, in reality, the shift size is rarely known. Thus, this paper proposes the VSI CV chart for unknown shift sizes. The VSI CV chart proposed in this paper allows practitioners to select optimal chart parameters when the shift size is unknown. Comparisons are also made with other existing CV charts based on unknown shift size. Comparisons show that the VSI CV chart outperforms the Shewhart CV and synthetic CV charts, but does not outperform the EWMA- γ^2 chart.

Research on the Efficiency of Technology Service of National Model Productivity Promotion Centers

Huang Juan, Xu Hongyi

School of Management, Wuhan University of Technology, Wuhan, P.R.China, 430070

(E-mail: 12178125377@qq.com, steven_64@163.com)

Abstract: As technology intermediary organizations, Productivity Promotion Centers have many important missions, including serving for enterprises and the regional technology innovation, building the bridge and bond between the government and the enterprise, promoting scientific and technological achievements into productivity and so on. It aims to provide a full range of technological service for the government, enterprises and individuals. In this paper, the DEA method is used to calculate the total factor productivity of national model Productivity Promotion Centers of 26 provinces (cities) in China. The leading factors influencing the total factor productivity are deeply studied in this paper so as to provide reference for improving the total factor productivity of the national model Productivity Promotion Center.

Key words: The national model productivity promotion center; The total factor productivity; DEA

1 Introduction

The productivity promotion center is the new type sci-tech agency that provides the service in terms of technology innovation for small and medium-sized enterprises, and it is one crucial part of national innovation system. The productivity promotion center is a non-profit technology service entity regarding small and medium-sized enterprises and township enterprises as the main service object, and it brings science and technology strength such as technology, achievements, talents, information and so on into the small and medium-sized enterprises and township enterprises. It provides services for enterprises in a variety of ways in order to promote enterprise's technological progress and improve the market competitiveness of enterprises.

Since China established the first productivity promotion center in Yantai, Shandong in 1992, productivity promotion center system has been continuously improved after 23 years of construction and development. And it is actively exploring the new mode of the combination of technology and economy all the time which strong support for the construction of the national innovation system, and gradually formed the pattern of diversification of the subject of investment and institutional properties, and constructing and improving the productivity promotion system suitable for Chinese national conditions. At present, Productivity Promotion Center has become the backbone of technological innovation services. But there are still some problems in our productivity promotion center such as unbalanced development, weak infrastructure, lagging of talent team construction, operation mechanism is not flexible enough and so on on the whole, which restricts overall development of Chinese Productivity Promotion Center.

2 Literature Review

One major constraint to the success of many invention-based ventures proves to be the high degree of uncertainty about their profitability. Apart from technical difficulties, Heidrun C. Hoppe and Emre Ozdenoren thought another important reason is that it is often hard to assess the commercial value of inventions. As a result, profitable new technology may not be adopted by investors. However, intermediaries between creators, financiers, and users of new inventions can play in mitigating this uncertainty problem (Heidrun C. Hoppe,2005). Jeremy Howells thought the functions of science and technology intermediary service industry mainly are embodied in the collection and processing of information, partner selection, evaluation of innovation criteria and results, transfer and exchange of technical knowledge and suggestions on intellectual property protection and so on. And science and technology intermediary service industry can reduce the obstacles of information exchange between the two sides of technology supply and demand, and promote the smooth implementation of innovation activities (Jeremy Howells,2006). Mirjam Knockaert and André Spithoven focus on studying the impact of technology intermediary organizations on the enterprise by enterprise network capacity instead of additional cognitive ability. They distinguishing R & D activities what the R & D institutions and technology intermediary organizations involved in. Results show that absorption ability of technology

intermediary organization in R & D activities does not influence additional cognitive ability produced by the enterprise, but the use of science and technology intermediary service more, the enterprise has more high level of absorptive capacity, resulting in higher levels of additional cognitive ability (Mirjam Knockaert,2014). Zhang Ming and Liu Chunxiao divided the 26 provinces in China into the eastern, central, western and northeastern parts and they use the DEA model to calculate the total factor productivity of national model Productivity Promotion Centers of the four regional. The research shows that the total factor productivity has a significant regional difference, and the technical efficiency is the main factor of the productivity growth of the national model Productivity Promotion Center (Zhang Ming,2013). Xu Shuiping and Yin Jidong used the DEA method to study the relative efficiency of the productivity promotion center of Jiangxi Province of China from 2001 to 2011. They found that the service efficiency of the productivity promotion center of Jiangxi Province of China is increasing unceasingly and factor input ratio is relatively reasonable. Although the scale efficiency scores are low, but it has been increasing year by year. They think Jiangxi Province of China should continue to increase investment in Productivity Promotion Centers (Xu Shuiping,2013).

3 Model

DEA (Data Envelopment Analysis) was proposed by the famous American operational research experts Charnes, Cooper and Rhoades in 1978. It is a model to evaluate the relative effectiveness of decision making units with multiple inputs and outputs. DEA model is divided into input oriented and output oriented in two forms, and the input oriented model is enable the least input in a given output while the output oriented model is enable output reaches the maximum in a given input. CCR model is proposed by Charnes, Cooper and Rhoades using the fixed scale hypothesis. It uses linear programming method to estimate production boundaries and then measures the relative efficiency of each decision making unit (DMU). But in reality, not every DMU production process is under constant return of scale, so based on CCR model, Banker, Charnes and Cooper proposed BCC model which assumes that return to scale can be changed at any time. BCC model can distinguish the pure technical efficiency and scale efficiency. The formula is the scale efficiency is equal to the technical efficiency divided by the pure technical efficiency. It can measure whether the evaluation unit is in the state of optimal production scale under the given production technology.

This paper will use the Malmquist index based on output constructed by Fare et al, which is generally used by researchers. From phase t to phase $t+1$, Malmquist index measure the growth of the total factor productivity is represented as follow.

$$M_0(X^{t+1}, Y^{t+1}, X^t, Y^t) = \left[\frac{D_0^{t+1}(X^{t+1}, Y^{t+1})}{D_0^{t+1}(X^t, Y^t)} \times \frac{D_0^t(X^{t+1}, Y^{t+1})}{D_0^t(X^t, Y^t)} \right]^{1/2} \quad (1)$$

In formula (1), (X^{t+1}, Y^{t+1}) and (X^t, Y^t) represent respectively input and output vector of phase t and phase $t+1$.

Technology T in phase t as the reference, Malmquist index based on the perspective of output can be represented as follow.

$$M_0^t(X^{t+1}, Y^{t+1}, X^t, Y^t) = D_0^t(X^{t+1}, Y^{t+1}) / D_0^t(X^t, Y^t) \quad (2)$$

Similarly, technology $T+1$ in phase $t+1$ as the reference, Malmquist index based on the perspective of output can be represented as follow.

$$M_0^{t+1}(X^{t+1}, Y^{t+1}, X^t, Y^t) = D_0^{t+1}(X^{t+1}, Y^{t+1}) / D_0^{t+1}(X^t, Y^t) \quad (3)$$

In order to avoid the differences in the randomness of the period choice, imitating constructing method of Fisher ideal index, Caves et al used the geometric mean of the formula (2) and (3) measures the Malmquist index of productivity vary from phase t to phase $t+1$. If $M_0(X^{t+1}, Y^{t+1}, X^t, Y^t) > 1$, it represents the total factor productivity of the evaluation industry is growing. If $M_0(X^{t+1}, Y^{t+1}, X^t, Y^t) < 1$, it represents deterioration of the total factor productivity of the evaluation industry. In addition, the Malmquist index can be decomposed into the technical efficiency change index (EC) and the technical progress index (TC) under the assumption of constant return to scale. The formula is as follow.

$$M_0(X^{t+1}, Y^{t+1}, X^t, Y^t) = \frac{D_0^{t+1}(X^{t+1}, Y^{t+1})}{D_0^t(X^t, Y^t)} \times \left[\frac{D_0^t(X^{t+1}, Y^{t+1})}{D_0^{t+1}(X^{t+1}, Y^{t+1})} \times \frac{D_0^t(X^t, Y^t)}{D_0^{t+1}(X^t, Y^t)} \right]^{1/2} \quad (4)$$

$$= EC \times TC$$

EC represents the technical efficiency change index, and it measures the change of the maximum possible output approaching degree represented by actual production and production frontier of each

observation industry from phase t to phase $t+1$. TC represents the technical progress index, and it measures the movement of production frontier from phase t to phase $t+1$. If EC is greater than 1 (less than 1), it indicates that the efficiency is improved (reduced). If TC is equal to 1, it indicates that there is no technical progress from phase t to phase $t+1$. If TC is greater than 1 (less than 1), it indicates that there is technical progress (regress).

4 Data

According to the availability of data and the need of empirical research, this paper selects national model Productivity Promotion Centers which is distributed in 26 provinces in China as the research object. The data from “China Torch statistical yearbook” and the annual report of national model Productivity Promotion Centers range from 2007 to 2014.

In this paper, the input indicators are selected as the total number of personnel and the total assets. The total number of personnel is used as an indicator of labor input, the total assets are used as indicators of capital investment. The number of service enterprises, increased sales of enterprises, increased profits and taxes, increased employment number for society and total service revenue of the productivity promotion center are selected as the output indicators.

5 Empirical Analysis

According to the output oriented Malmquist productivity index model and input and output data, we use data envelopment analysis software package DEAP software for analysis. The results are shown in Table 1.

Table 1 Total Factor Productivity Index and Decomposition

year	effch	techch	pech	sech	tfpch
2008	1.097	0.999	1.129	0.971	1.096
2009	1.147	0.895	1.071	1.071	1.026
2010	0.908	1.145	0.988	0.919	1.040
2011	1.112	1.000	1.017	1.094	1.113
2012	1.036	0.945	1.003	1.033	0.979
2013	0.988	0.938	1.004	0.984	0.926
2014	0.844	1.269	0.883	0.955	1.071
mean	1.013	1.020	1.011	1.002	1.034

From table 1, we can find that the total factor productivity of national model Productivity Promotion Centers of the 26 provinces (cities) was increasing from 2007 to 2014 on the whole, and the average growth rate was 3.4%. The change of the total factor productivity of national model Productivity Promotion Centers of the 26 provinces (cities) showed a clear turning point in eight years from 2007 to 2014. The total factor productivity has been rising from 2007 to 2011, and it was at a stage of decline from 2012 to 2013, but it began to show an upward trend from 2013 to 2014. During these years, the growth of the total factor productivity in 2011 was most obvious and the average growth rate was 11.3% while in 2013 the decline of the total factor productivity was most significant and the average decline rate was 7.4%.

As far as the technical efficiency change is concerned, it increased in 2008, 2009, 2011 and 2012 while declined in 2010, 2013 and 2014. And in 2009 the technical efficiency increased most obviously, in 2014 it declined most obviously. In 2010 and 2014, technology was progressive, and the technical progress of 2014 was most significant. The level of technology was not change in 2011 and the technical regress of 2009 was most significant. Regarding the pure technical efficiency, it declined in 2010 and 2014. In 2008 the pure technical efficiency increased most significantly while declined most significantly in 2014. The growth of the scale efficiency change was most remarkable in 2011.

6 Discussion and Conclusions

From 2011 to 2014, the change of the total factor productivity showed obvious fluctuation. In 2011, the growth of the total factor productivity is most obvious, but the total factor productivity has been in a state of decline in 2012 and 2013. From table 1, we can find that although the technical efficiency increased by an average of 3.6% in 2012, the technical change declined by an average of 5.5%. The

positive contribution of the technical efficiency is less than the negative contribution of the technology regression. As a result, the total factor productivity showed a negative growth in 2012. In 2013, both the technical efficiency and the technical change were reducing, resulting in the lowest total factor productivity. And for 2014, although the technical efficiency was declining and declined most obviously during 8 years, the technical change increased by an average of 26.9%. The decline of technical efficiency is less than the growth of technological progress, so the total factor productivity in 2014 was growing.

During 8 years, the total factor productivity of national model Productivity Promotion Centers in China was increasing on the whole, which indicated that national model Productivity Promotion Centers in China are developing very well and they will get better and better development. Meanwhile, it showed that China is paying more and more attention to the development of Productivity Promotion Centers and small and medium-sized enterprises. And China has made a number of policies to support the development of Productivity Promotion Centers. Although the general trend of development of Productivity Promotion Centers is good, there are also some problems. So China should further increase investment in innovation to improve the ability of value added service in Productivity Promotion Centers. In addition, China should encourage cooperation between national model Productivity Promotion Centers and foreign VC firm and introduce venture capital, promoting global competitiveness. National model Productivity Promotion Centers should actively seek opportunities for international cooperation and communication and study experience in the management, operation and service of foreign technology intermediary to improve their professional proficiency and service level.

Abstract: In Yamaguchi University, we opened Research and Development Strategy Theory Course as a required subject of Graduate School of Science and Technology for Innovation established on April, 2016. The number of the study taking this course became to over 400, and it was necessary to plan the efficiency of the summative evaluation for the course. Therefore, in this article, we introduced a new Multiple-Choice Question and rating rule based on the issue of the adopted Multiple-Choice Question as a form of the examination that a great many students take at the same time conventionally.

Key words: Summative evaluation; Multiple-choice question; Partial score depending on the degree of the agreement

1 Introduction

Yamaguchi University established Graduate School of Science and Technology for Innovation in April, 2016. Graduate School of Science and Technology for Innovation is the general physical science graduate school which unified an engineering graduate course, a science graduate course and agriculture graduate courses. We started graduate school education to balance innovation with scientific research.

The new education of Yamaguchi University aims at upbringing of the interdisciplinary human resources who can drive a technique to evolve and business to change intensely by rapid progress. As interdisciplinary educational program, we opened a course in research and development strategy theory for all graduate students. The total number of the student taking this subject become to over 400. The learning target of this subject is to be able to explain a technology development strategy, research and development strategy and business model as methodology to let the business in the research and development type company succeed.

We adopted the examination by the new Multiple-Choice Question (MCQ) to carry out the summative evaluation of this subject. In this article, we examine the effectiveness of the learning evaluation by the new multiple-choice question.

2 Background

The MCQ form is one of the test method to perform the learning evaluation of a large number of students effectively. In Japan, the center examination (national united mark sheet-style examination) for high school students is the largest-scale of MCQ form. In addition, MCQ has been adopted in a Medical Doctor National Examination in Japan.

In this article, we look back about the form of the MCQ that has been adopted in the Medical Doctor National Examination of Japan. The MCQ to choose one as among five choices is called as A type. It is the simplest questions form. This form has a characteristic that an another score is added to a score based on the certain knowledge. The another score is got by the insufficient knowledge of the solver. We cannot necessarily evaluate the ability (this case, ability as the medical doctor) of the solver by using this method definitely. The questions ratio of A type among doctor national examinations becomes around 30% now.

A type : Choose one correct answer among the following choices:(a), (b), (c), (d), (e).
You can find “no answers in above” as (e).

Therefore, improvement was carried out in order to avoid a solver getting a score by insufficient knowledge. The number of correct answers was increased to two or three. On the other hand, a form to use an answer cord was devised to plan efficiency of the reduction of the burden on problem creator and the marking. We call the MCQ with two answer cords as K2 type, three answer cords as K3 type.

As for the more than 2 many limbs multiple-choice questions, the combination of choices is complicated a choice in comparison with A type. It is difficult to get a correct answer when the knowledge of the solver is insufficient. However, the pair of the answer is given in K2 and K3 type as an answer code beforehand. As an answer cord number is limited, it is known to decrease the superiority by

plural choices (Hirokazu Saito,1982).

K2 type

Choose one correct answer among the following choices of answer codes.

- a. (1), (2)
- b. (1), (5)
- c. (2), (3)
- d. (3), (4)
- e. (4), (5)

K3 type

Choose one correct answer among the following choices of answer codes.

- a. (1), (2), (3)
- b. (1), (2), (5)
- c. (2), (4), (5)
- d. (2), (3), (4)
- e. (3), (4), (5)

A form of K' type which gave a random combinatorial answer cord was suggested to evade this problem. The Saito and et.al. considered the score of the student when the student with the insufficient knowledge answered a MCQ of K' type under the condition as; the number of choice costs five, this student shall understand one original choice and one unjust choice in five choices. A knowledge rate of this student is 40% because the student understands two in five choices. Therefore, the fair evaluation score should become 40. However, the Saito and et.al. showed that the student could get 60 as scores with probability of more than 75%.

In the case of K' type, there is the upper limit of the answer cord number. In the case of this article, it is five. This upper limit restricts a combination of choice, and some answer cords become the consecutive choices certainly. The combination of consecutive choices has a certain constant regularity. Therefore, the solver can suppose a correct answer based on the regularity.

As a result, the solver can choose a correct answer with relatively high probability when a solver does not have the knowledge about all choices. The examination questions of K' type are not adopted now by this reason.

K' type

Choose one correct answer among the following choices of answer codes.

- a. (1), (3), (4)
- b. (1), (2)
- c. (2), (3)
- d. (4) only
- e. (1) - (4) all of choices

A form not to give an answer cord was devised to make up for the fault of the problem of the K type. We call this Xn type. n is the number of the answers to choose. Difference between Kn type and Xn type is only difference in how to choose choices. Then, the questions producer can make a question of Xn type without changing the purpose of the problem. Xn type is equal to MCQ of A type to choose the choices (n=2, 3, ...), and the answer cord is not given. Therefore, the correct answer rate based on the insufficient knowledge for Xn type lowers than that of Kn type.

X2 type

Choose two choices among five choices: a, b, c, d, e.

X3 type

Choose three choices among five choices: a, b, c, d, e.

Ikebukuro generalized a calculating formula to lead relationship between quantity of knowledge (the number that a solver was able to judge whether a choice was a correct answer, or it was a non-correct answer) and the expected correct answer rate in Xn type. Using the general formula, Ikebukuro considered relations between quantity of knowledge and the expected correct answer rate in Xn type MCQ which did not appoint the number of the correct answers. Ikebukuro led 0.4 as value of an expected correct answer rate in case of quantity of knowledge N=2 under instructed correct choice number I=2, (X (I=2, N=2)) using his original numerical formulas (Kenichi Ikebukuro,1999).

Ikebukuro showed quantity of knowledge and the list of correct answer rates based on this expression of relations in the case of I=2. He also calculated a correct answer rate in the case of 0 to 5 quantity of knowledge. Based on the results, a correct answer rate curve was created. From the correct

answer rate curve (Kenichi Ikebukuro,1999), we can observe X type evaluating it more fairly than K type in ranges from quantity of knowledge 0 to quantity of knowledge 4. However, it was recognized that neither of X type and K type could not estimate a difference of quantity of knowledge 4 and quantity of knowledge 5.

Therefore, Ikebukuro suggests a MCQ not to give instructions correct choice number to solve this problem. He generalized the above-mentioned expression of relations and applied to a MCQ not to give instructions correct choice number. He created an expected correct answer rate curve for the MCQ not to give instructions correct choice number. And he showed that the MCQ not to give instructions correct choice number could distinguish a difference of quantity of knowledge 4 from quantity of knowledge 5(Kenichi Ikebukuro,1999).

3 Discussion

The above-mentioned discussion suggests that the MCQ has a potential to make a learning evaluation for huge number of student effectively. In this article, we examined a new test method based on a MCQ not to give instructions correct choice number proposed by Ikebukuro. The examination of this course is different from the Medical Doctor National Examination. Because a purpose of the examination is to measure quantity of knowledge of the examinee, in the case of the Medical Doctor National Examination, the partial score is not considered.

On the other hand, in the case of this subject, we measure and evaluate an understanding level of the student on the concept for strategy and innovation. When the answer of the examinee accords with a right choice, the score of the student is a perfect score. We give a partial score depending on degree of the agreement when an answer does not accord with a right choice. In this article, we made MCQs consisted of four choices.

A sample of MCQ we made is shown as below.

Sample XA type

Choose the choice that you think to be right among the following.

Attention, the number of correct choice may not be one.

- a.
- b.
- c.
- d.

Table 1 Rating for Figure 2

The number of the right choices by a question-master	Correct answer rates[%]	Rating
4	100	A
3	75	B
2	50	C
1	25	D
0	0	E

Figure 1 is the matrix which expressed an agreement degree of the answer when a solver chose all four choices. The rating depends on the number of correct answers that a question-master set. The element indicated with crossed line in the figure 1 shows an impossible combination. It is found that there is five ways of rating when a solver chooses all four choices. Rating is shown in Table 1.

Allocation of points for the rating is shown in Table 2.

Table 2 Score for Rating

Rating	Score
A	S : Full Score
B	0.7 x S
C	0.5 x S
D	0.3 x S
E	0 : Score less

			Number of Right Choice				
			0	1	2	3	4
Number of Selected Choice by Student	4	0	E				
		1		D			
		2			C		
		3				B	
		4					A

Figure 1 Matrix of an Agreement Degree

Figure 2 is the matrix which expressed an agreement degree of the answer when a solver chose nothing of choice.

The rating also depends on the number of correct answers that a question-master set as below.

Table 3 Rating for Figure 3

The number of the right choices by a question-master	Correct answer rates [%]	Rating
0	100	A
1	75	B
2	50	C
3	25	D
4	0	E

			Number of Right Choice				
			0	1	2	3	4
Number of Selected Choice by Student	0	0	A	B	C	D	E
		1					
		2					
		3					
		4					

Figure 2 Matrix of an Agreement Degree

We would like to expand the above-mentioned rating matrix and show all combinations for the choice (0-4) by the solver and the right answers (0-4) by question-master in Figure 3.

			Rating	Number of Right Choice				
				0	1	2	3	4
Number of Selected Choice by Student	0	Number of Correct Choice	0	A	B	C	D	E
			1					
			2					
			3					
			4					
	1	Number of Correct Choice	0	B	C	D	E	D
			1		A	B	C	D
			2					
			3					
			4					
	2	Number of Correct Choice	0	C	D	E	D	
			1		B	C	D	
			2			A	B	C
			3					
			4					
	3	Number of Correct Choice	0	D	E	D		
			1		C	D		
			2			B	C	
			3				A	B
			4					
4	Number of Correct Choice	0	E					
		1		D				
		2			C			
		3				B		
		4					A	

Figure 3 Symmetric Frequency Distribution of the Rating

We can assign a unique ID number as an index using by three information (the number of selected choice by student, the number of correct choice, and the number of the right choice in the question) for each element in Figure 3 as shown in Figure 4. Then, we can find a symmetric frequency distribution of the rating in Figure 3 as shown in Table 4. It is suggested that we can make a smooth scoring from zero to perfect by using of this symmetric property of rating.

I000	A	I010	B	I020	C	I030	D	I040	E
I100	B	I110	C	I120	D	I130	E	I141	D

4 Conclusions

In Yamaguchi University, we opened Research and Development Strategy Theory Course as a required subject in Graduate School of Science and Technology for Innovation which Yamaguchi University established on April, 2016. We evaluated the learning by the Multiple-Choice Question not to give instructions correct choice number to perform a summative evaluation in this course effectively. We introduced a rule to give a partial score depending on the degree of the agreement when an answer by student did not completely accord with a correct choice. As a result, we were able to give a smooth rating score from zero to perfect using new MCQ and rating rule.

Intelligence of Industrial Complex*

Kazuya Inaba

Graduate School of Innovation & Technology Management, Yamaguchi University, Japan
(E-mail: inaba@yamaguchi-u.ac.jp)

Abstract: Circumstances that surround the oil and petrochemical industry recently have been severe. Oil and petrochemical companies are in a situation where they should deal with various problems. In such a severe situation, oil and petrochemical companies came up with the idea of business cooperation in the same region in order to acquire global competitiveness. In this proceeding, I introduce a case of RING (Research Association of Refinery Integration for Group-Operation) in Japan. And the approach and ways of the high-level integration for group operation in petrochemical complex are analyzed, the meaning of the plan is declared, and the economy that arises from the group operation business is considered. Many industries now need further advancement to obtain global competitiveness. One of the answers is effective application of IoT (Internet of Things). RING as the central figure has promoted some projects of group operation in petrochemical complex to overcome the “wall of capital”, “wall of person” and “wall of geography” on the slogan “Kombinat Renaissance” (Renaissance of Petrochemical Complex) since 2000. And industrial complexes should improve more productivity and efficiency to follow the changes of global competitiveness. “Intelligent of Industrial Complex” will overcome their disadvantages of small or middle sized factories in the complexes, especially on the conditions of importing oil and materials. This must establish some innovations in oil, petrochemical, and chemical industry.

Key words: Industrial complex; Oil and petrochemical industry; Group operation; Business cooperation; IoT (Internet of Things); Semiconductor sensor

1 Introduction

Strengthening cost competitiveness is requested in oil and petrochemical enterprises in Japan. In the latter half of the 1990's, the merger and reorganization had advanced, and cost reduction had been attempted with efficiency improvement of production facilities. They had pulled out of unprofitable businesses. Positive investments in core business and growth business and participation in foreign complexes had made the business integration and competition stronger. However, the reorganization and integration of oil and petrochemical companies in Japan, if it is seen in the scale, is internationally the medium-scale one. It has faults that many operational companies are independent and production facilities have been distributed to many places. The equipment of oil and petrochemical companies in petrochemical complexes are widely distributed to eight places in the whole country. One company has production facilities in some complexes. The consolidation and expansion of manufacturing scale, efficiency improvement in manufacturing process, and reduction in cost of manufacturing are more necessary to obtain global competitiveness. But one company can't do them alone.

It has been said that weak points of oil and petrochemical companies in Japan are halfway of cost reduction in medium-scale production, excessive competition, surplus of production scale, low degree of rate of profit. Petrochemical complexes of Japan have production facilities at a medium-scale level. It is in the situation in which economies of scale cannot be requested. And the equipment of one company is distributed to two or more districts. It is also difficult to consolidate these in one place. Many enterprises, concentrated in the same district, often belong to different capital groups. There are examples of producing same products by different manufacturing methods in the same district, too. In such a system, each company respectively has continued to conduct business actions, making decisions independently. Unfortunately, if the company is different, the organizational culture is also different and the spoken jargon tends to be dissimilar. There was an assumption not to communicate with each other easily in the situation. They have called these things "wall of person", "wall of capital", and "wall of geography"

To solve the problems, 20 companies in oil industry and chemical industry gathered round at first. Under the Research Association of Technology Law, Research Association of Refinery Integration for Group-Operation (RING) was established in 2000. RING has acted group-operation programs in complex, which the Ministry of Economy, Trade and Industry has supported since 2000. In RING

* This proceeding is written, based on my presentation paper in ICIM 2013, 2014, 2015, EBHA-BHSJ Paris 2012 and IFSAM2014, and I added retouches and corrections to it.

projects, they have tried to find new methods of integrated management, exceeding types of business and a frame of capital, developing some latest technologies, aiming at efficiency improvement and optimization. It is important that one complex is thought of as virtual one factory. If it is so, the integrated management could be practiced. As a result, new effects, economies and innovations by new technological development would be achieved. These practices are difficult for one company to do alone.

One company perhaps tends to attempt single survival and optimization. Even if it notices the importance of cooperation, the priority level might be low. There are only two choices whether to execute it or not in one enterprise. Therefore, the government needs to put out a subsidy at first as a trigger, and it is necessary to establish the third-party institution in order to give the motivation to business cooperation. It is important to build the organization to adjust common interest. The support of the government for RING projects is a pump-priming policy. And the enterprises have recognized new possibilities in business cooperation. They would begin to mix well with them, and come to analyze a system of production with each other. They would examine construction of system of production and technological development accommodating wasted gas, heat, and energy etc. And profits between enterprises, which one company cannot conceive, would begin to be recognized, and their interest would spread various contents such as treatment of waste, contribution to the region, joint power generation etc. Innovations have progressed in an upward spiral through cooperation between enterprises beyond the limit of single company business. The new idea of business cooperation has arisen one after another.

2 Common Integration

Strengthening cost competitiveness is requested in oil and petrochemical enterprises in Japan. The consolidation and expansion of manufacturing scale, efficiency improvement in manufacturing process, and reduction in cost of manufacturing are more necessary to obtain global competitiveness. The RING project is an attempt of joint operation and business cooperation in oil and petrochemical business. The project assumes current production facilities, capital tie, and business activities. On that assumption, it is necessary for two or more enterprises to cooperate and work on reduction of environmental burdens facing the world. Different from the strategy that one company pursues productivity and efficiency, same kind of effects may be achieved by cooperation between enterprises and different types of business. Whole optimization will be achieved by the system in group operation. And they can implement simultaneously two strategies, Cost Leadership and Product Differentiation.

In addition to economies of scale and economies of scope, some social interests will be pursued. When collaboration with many enterprises is achieved, ‘commons’ will be necessary for cooperation. Therefore, the aspects to social interest will arise: joint energy use, efficiency improvement, regional contribution, establishment of safety technology, positive commitment to environmental measures, and cooperative treatment of waste etc. And enterprises will pay more attention to practices of social activities: greening of the complex, ownership of joint power generating equipment, security cooperative relationship etc. I call these effects “Economies of combination”. This is defined as some economic effects which group operation produces; whole optimization and efficiency, simultaneous implementation of two strategies, pursuit of social interests, innovations with group management, management of sustainability. And common integration is defined as the concept of presenting social and economic effects, observed from the development of complexes in Japan, caused by group operation.

3 Intelligence of Industrial Complex

Many industries now need further advancement to obtain global competitiveness. Then how should we level it up? One of the answers is effective application of IoT (Internet of Things). I want to promote one attention here. It is to introduce open IoT, not closed IoT. We often see news of introducing some IoTs in manufacturing industry. But, in many cases, I am anxious about the plans that concluded only in the company. In this way, their proposals will reproduce a defeat pattern seen in some industries. Huge companies of Internet business can hold hegemony in IoT of manufacturing industry, and they will decide standardization and specifications of IoT in the near future. Many companies which have developed closed IoT must be pressured by open system of IoT and may move second and lose initiative. Therefore, each industry must build the system which utilizes IoT, AI (artificial intelligence), big data by oneself, on the assumption of open IoT.

Many companies in industrial complex currently have IoT plans that productivity, maintenance,

and safety management of plural factories in one company. However, to put it accurately, these utilization is partial optimization, and not the level that whole optimization of industrial complex. It is important for them to achieve partial and whole optimizations at the same time. And it is necessary for them to build a cooperative system. When they could establish a system of utilizing big data among other firms and between different types of business, this would be called open IoT.

I explain the steps of open IoT. Firstly, each company systemizes IoT in individual districts of industrial complex. Secondly, to revitalize the whole oil, petrochemical, and chemical industry, they set up information networks among the industrial complexes and create a system of IoT to apply big data. In this stage, I can call it “Intelligent of Industrial Complex”. Thirdly, they establish a system of whole optimization of almost industries in the whole country. Fourthly, they may organize a worldwide system of whole optimization among every industry. This is IoE (Internet of Everything).

Similarly, “Intelligent of Industrial Complex” powerfully require development and design of semiconductor sensors (IoT semiconductor). We should install variable networks and produce new IoT semiconductors to utilize sensing of industrial complex. These semiconductors expect to be applied to manufacturing in other industries. Industrial complex can realize the first stage of open IoT and give introductive opportunities of it.

4 Conclusions

RING as the central figure has promoted some projects of group operation in petrochemical complex to overcome the “wall of capital”, “wall of person” and “wall of geography” on the slogan “Kombinat Renaissance” (Renaissance of Petrochemical Complex) since 2000. And industrial complexes should improve more productivity and efficiency to follow the changes of global competitiveness. “Intelligent of Industrial Complex” will overcome their disadvantages of small or middle sized factories in the complexes, especially on the conditions of importing oil and materials. This must establish some innovations in oil, petrochemical, and chemical industry.

Abstract: The current paper presents an intriguing issue in the business and economic areas: the potential relationship between innovation and firm's internalization strategies. Due to deep transformations (i.e. social and economic) in the domestic and international markets, innovation seems to be the only guaranteed strategy to survive in this so competitive environment, especially in developing country such as Brazil. To approach this issue, the authors decided to investigate the internationalization process of one of the largest companies in Brazil, Construtora Norberto Odebrecht (CNO). Using the case study methodology, the investigators concluded that innovative practices such as the Odebrecht Entrepreneurial Technology – OET facilitated the process of CNO's internationalization. This managerial tool, based on two pillars: planned delegation and administrative decentralization created a competitive advantage (i.e. flexibility for local decisions) and made possible the company to grow and develop in multiple fronts, particularly in foreign markets.

Key words: Innovation; Internationalization; Entrepreneurship and competitive advantage

1 Introduction

Innovation is a double spectrum phenomenon which affects companies and countries, domestically and internationally. It seems to be influenced by a wide variety of factors such as the development of new technologies, public policies, financing mechanisms and the entrepreneur behavior, among others. As consequence, it provokes impacts on firms' market position, dilutes risks, attracts new investments, promotes companies' growth and facilitates the internationalization processes of organizations.

Nowadays, in a social and economic scenario based on pillars such as globalization and competitiveness, innovation may be the only way to guarantee a winning strategy towards firms' survival, particularly in developing countries such as Brazil.

In the past twenty-five years, Brazil has been strongly affected by transformations in social and economic areas; companies had to go through a deep modernization process influenced by the globalization of markets and the dynamism of technological changes.

Organizations in different areas from manufacturing to construction sectors had to face challenges in the market arena due to the irreversible need to innovate in order to survive. Many of these innovations in products, services and organization and marketing strategies have created conditions to stimulate firms' internationalization process; then, many Brazilian companies, mostly the big ones, decided to go overseas as a result of this competitive scenario and a weak domestic market.

In this sense, the authors have decided to investigate how the phenomenon of innovation has contributed to the process of internalization of Construtora Norberto Odebrecht (CNO), the largest Brazilian representative of the engineering and construction industry in the world.

CNO is a Brazilian global organization with presence in over 27 countries, which operates in the engineering & construction sector, industry and development and operation of infrastructure and energy sectors. According to Fundação Dom Cabral Ranking of internationalization of Brazilian multinationals in 2015 (FDC, 2015), CNO is the second Brazilian company with the highest degree of internationalization (see figure 1).

The Ranking of Internationalization is carried out by Fundação Dom Cabral, using a sample of 49, mostly Brazilian capital and ownership companies, which develop international activities of manufacturing, assembly, services, research and development centers, bank agencies, franchising, commercial offices, warehouses and logistics centers abroad. The internationalization index is based on the calculation of the transnationality index, measured by the weighted average of some indicators, as seen below in figure 2.

POSITION	COMPANY	TRANSNATIONALITY INDEX	INDEX VAR. 2015/2014
1	Fitesa	0,720	—
2	Construtora Norberto Odebrecht	0,644	▲
3	InterCement	0,573	—
4	Gerdau	0,560	—
5	Stefanini	0,559	—
6	Marfrig	0,536	—
7	Artecola	0,521	▲
8	Metalfrio	0,500	—
9	CZM	0,492	▲
10	JBS	0,488	—

The importance of this study, then, is due to the fact that as far as the macro construction sector in Brazil is concerned, it was responsible for approximately 13,9% of the Brazilian Gross Domestic Product (GDP) in 2014 (Serasa Experience, 2015). Moreover, regarding the macro sector's core business - the construction itself - accounts for the highest income produced in the activity in that year, which was around 7, 8% of the country's GDP.

In terms of economic performance, the last three years was fully positive for the sector, mainly due to the completion of the construction and renovation of the host stadiums for FIFA's World Cup and related events as well as to the Olympic Games this year in Rio de Janeiro. However, a slowdown in investments of infrastructure was perceived since the second half of 2014, as part of the complexity of the economic scenario Brazil is facing. This picture has led to the reduction or postponement of important projects in the country due to, in particular, cutting off governmental investments, as result of progressive budget deficits and lack of public funding, reducing the resources for investments of the Brazilian Nacional Bank for Economic and Social Development (BNDES) (Serasa Experience, 2015).

Until recently, one of the most popular firm's internationalization process theory argued that organizations go abroad as an external expansion movement as response to internal demand constraints.

2 Short History of CNO and the Internationalization Process

Norberto Odebrecht, an engineer, founded the Construtora Norberto Odebrecht S.A, in 1944 in the city of Salvador, State of Bahia, Brazil. In the second half of the decade of 40's and the following decade, the company was involved in important construction projects, first in Salvador, and later in other cities in the State of Bahia and cities in other States such as Ceará and Pernambuco.

In 1962, CNO opened the first office branch in Recife, State of Pernambuco and started its expansion in the Northeast region of Brazil. Due to the rapid expansion, CNO had to acquire and to develop new competences in all areas: from engineering to management. In the engineering area, CNO was involved in bigger projects such as larger buildings which required new technologies, a large number of workers and use of a great volume of different materials; therefore, the challenges and need for innovation were immense (Odebrecht, 2015). At the end of 60's, CNO already counted with more than 500 construction projects, most of them large and highly complex ones.

In late 60's, CNO expanded its businesses to the Southeast region of Brazil. The first mega project

in that region was the construction of the building of headquarter office of Petrobras, the Brazilian oil company. Other important projects were also important such as the main campus of the Federal University of Rio de Janeiro (UFRJ), Galeão International Airport and the thermonuclear power plant “Angra I”, in the county of Angra dos Reis. These projects were responsible for enabling the company to definitively consolidate CNO’s business expansion within the Brazilian territory.

In the 70’s, the ability of managing and operating many construction projects at the same time and in different regions, allowed CNO to take advantages of that economic scenario in Brazil: The so-called economic miracle. During that period, the country’s GDP grew in average of 7% a year. The economic growth stimulated manufacturing and the urbanization phenomenon which demanded for continuous infrastructure projects in all forms. However, the scale and duration of large engineering programs began to lose momentum at the end of 70’s.

The economic and financial difficulties faced by Brazilian Military Government at the end of the decade, made large scale projects, trademark of the military government, increasingly less frequent. As a result, CNO started looking for new opportunities to assure its ongoing growth. One of the selected strategies was the search for foreign markets. For CNO, external markets could be a solution when globalization was not in the business radar of the Brazilian companies nor it was a common practice, and did not appear often in the economic section of newspapers and magazines (Odebrecht apud Barcelos & Cyrino, 2006).

Hence, in 1979, the first international contracts were signed: one in Peru (Charcani V Hydroelectric Dam) and other in Chile, project to re-route Maule River to the Colbún Machicura Hydroelectric Dam. Both projects were the start point of the successful international trajectory of the CNO. The expansion in Latin America happened chronologically as follows:

- i. Argentina, in 1986, with the construction of Pichí Picun Leufú (PPL) Hydroelectric Dam, in Patagonia;
- ii. Ecuador, in 1987, with the project of Saint Elena Irrigation, in Guayaquil;
- iii. Mexico and Venezuela, in 1992, respectively with a construction of Los Huítas Dam and of El Lago Commercial Center;
- iv. Colombia, with the construction of La Loma-Santa Marta railway, in 1993;
- v. And during the decade of 2000, CNO began to conduct work in the Dominican Republic (2002), in Panama (2004), in Cuba (2010) and in Guatemala (2013).

In others regions such as Africa and Europe, the expansion of operations happened as follow:

- i. Angola in 1984 with the signing of the contract to the building of the Capanda Hydroelectric Power Plant, capable of generating 520 MW; and,
- ii. Europe, operating in Portugal since 1988 through the acquisition of the Portuguese construction company José Bento Pedroso & Filhos and the building of the bridge Vasco da Gama in Lisbon. Later, CNO started operations in England (1991), through the acquisition of SLP Engineering, specialized in building of offshore petrol exploration rigs.

In 1990, CNO started operations in the United States of America (USA). CNO was the first Brazilian company to carry out a public construction project in the country. The first project in the American territory was the Miami Metromover project, an elevated train system that serves Miami downtown area. Other such as the Seven Oaks Dam, in California was also successful projects. This one in particular, earned the construction company of the year award, in 1999, an honor awarded by the US Army Corps of Engineers.

In 1995, International operations were responsible for half of CNO’s total revenue and stands in this high level until today, allowing the organization to have a certain independence from the domestic market.

3 Theoretical Reference

To understand the process of innovation of CNO in connection with the expansion to foreign markets, the authors provide an overview of the main theoretical subjects involved in this case study: entrepreneurship (the influence of the entrepreneur’s profile), innovation and theories of internationalization.

The main objective is to understand from the theoretical point of view, how the entrepreneurial and innovative profile of the CNO’s founder has allowed the creation and adoption of new management practices that ultimately resulted in the creation of its own management tool – Odebrecht Entrepreneurial Technology (OET) – used as the main vector to the process of internationalization of the

company.

3.1 Innovation – A bridge to the future

Over the last decades, the theme of innovation has called attention of many scholars, government and entrepreneurs as both business strategy and economic phenomenon. Researches from many fields, from economic geography to business management have been discussing innovation from their own perspective; thus innovation seems to be a multifaceted issue hardly explained by a single point of view (Melo et al., 2015).

To Michael Porter (1990), for instance, the companies gain competitive advantage by innovative actions and according to Bessant and Tide (2015), innovation in its broader sense, include both: new technologies and new ways of doing things.

Additionally, Rothwell (1994) explained that innovation might be associated to the result of the expansion of the networks model and the increase of technological changes. He recognizes the importance of the social interaction of different actors in the innovation process. It seems to be that successful innovation is a result of a combination of social elements and ideas which must be based on a landscape of abundant cooperation and networking (Chesbrough, 2003). In fact, Chesbrough's proposition is a social interpretation of Schumpeterian vision of the process of innovation, which stresses innovation as a result, or combination of internal and external factors able to generate wealth.

To Joseph Schumpeter, innovation as a complex mechanism of the introduction of a new product, process and service, method or production, opening a new market, new source of raw material or the establishment of new business (Schumpeter, 1979). In 2005, Schumpeter's definition was the main reference used by the Oslo Manual to define innovation: innovation is any product/service, process or marketing and organizational changes which are new or significantly improved to the firm or to the market (OECD/Eurostat, 2005). In this context, most of the authors in this area seem to agree that innovation happens inside the organization, therefore is an organizational phenomenon, despite has an impact and depends on factors from the external environment.

Considering the organizational perspective, some authors, such as Melo et al. (2011) associate innovation to the generation and dissemination of knowledge and as consequence new technologies, which have accelerated new innovation initiatives, forcing organization to adopt new practices rapidly. Therefore, one of the main strategies to innovate and to develop new technologies is the firm's capacity to generate knowledge through training and educational programs which tend to improve creativity and new solutions inside organizations. Thus, innovation outcomes depend on how organizations improve their internal capabilities and conditions to stimulate the continuous learning process among employees.

The constant changing in the working environment and in the society have required new techniques and models which are based on the evolutionary management process and the technological development. The technology responsible for many of these changes, including management models, is linked to technical and scientific aspects of the improvement of the means of production and the advancement and improving of the new management techniques. Management technology comprises a set of knowledge, information, techniques and strategies used by managers, aiming to control the production process and the work processes.

In, summary, it seems that both external and internal knowledge sources are important references to new solutions for operational and organizational problems and all innovation theories since Schumpeter are somehow associated to the crucial presence of knowledge and therefore for the development of the companies and progress of nations (Melo et al., 2015).

3.2 Internationalization approaches

In the context of the global competitiveness, internationalization is mandatory not an option. Many theories try to explain how and why firms go abroad. In general, the theories on the firm's internationalization process can be divided into two major areas, representing very different approaches: the economic and the behavioral. The economic theories cover the following main theories: economic power, internalization and eclectic paradigm. On the other hand, the main behavioral theories are: Uppsala model, networks and international entrepreneurship.

Regarding the economic theories, one of the most famous academics, Stephen Hymer, developed the theory of economic power in 1960. This theory develops the argument that there are three reasons for direct investments abroad: the neutralization of competition, the competitive advantages and the internalization of market imperfections. According to him, the decision of companies to operate internationally aims to neutralize the action of the main competitors, to reduce dependence of the domestic market and to seek for competitive advantages, generally derived from intangible assets such

as cost, technology or economies of scale. Lastly, Hymer ruled that for the adequate protection of these assets, the company may prefer to conduct direct investments abroad rather than adopting entry modes and simpler operation; for example, export (Almeida & Rocha, 2006, p.18).

Another theory of internationalization based on economic approaches is the eclectic paradigm. It is the result of John Dunning's works and explains reasons why a company decides to produce abroad. Companies that decide to internationalize should be prepared to compete, and to do so, should use advantages such as (i) ownership, represented by factors that can be created or developed by the company (intangible); (ii) internalization, which makes more convenient the use of its own structure and arise from market imperfections and the level of government intervention; and lastly, (iii) location, which occur when the local government seeks to attract multinational companies through incentives or when the combination of multiple locations allows better conditions of financial arbitration and management of exchange risk (Almeida & Rocha, 2006, p.23-25).

At last, the theory of internalization, developed by Peter Buckley, Mark Casson and Alan Rugman, was based on the assumption that the greater the risk of a firm losing expertise, the greater the incentive to internalize transactions. Some of the benefits of internalization are as follow: reduction of time to coordinate activities between several economic agents, price control, increasing bargaining power, less government intervention, and others (Almeida & Rocha, 2006, p.20-21). In this scenario, managers compare external (transaction) costs to internal costs (cost to support operations on their own management control). The balance between these two types of costs will determine the company's scope at any time period, including in relation to internationalization (Buckley, 2009).

On the other hand, the so called behavioral theories, in their turn, seek to explain processes of internationalization as well as forces acting in the course of this process, and not the reasons that lead companies to invest abroad (Almeida & Rocha, 2006, p.25). Thus, the decision to start international operations are not only market needs or perspectives of economic gains, but it seems to start "inside" the organization itself, either for the entrepreneur's profile or for the business relationship network (Silva, 2014, p.13).

The most famous representative of the behavioral theories is the Uppsala model. In this model of internationalization, which has the theoretical base in the behavioral theory of the firm and Penrose's theory of the growth of the firm, is seen as a process in which the enterprise gradually increases its international involvement.

Uppsala model explains that whatever the entry modes in international markets are, it is always the results of series of incremental decisions and commitments which gradually increase according to the growth of knowledge and experience (Almeida & Rocha, 2006, p.25-27). In this context, it was developed the concept of "psychic distance" (i.e. cultural, language, economic and political conditions) which indicates that companies are likely to first seek the markets considered closer (similar) to its domestic market and then going later, into markets "more distant".

In additional, the Networks' theory is based on the concept of social networks that are composed of long-term relationships, developed and maintained between different economic agents in a certain market. Participating in a network means to have access to resources belonging to other agents, resources that are unique or exclusive of the latter, not being possible to retain them, except for the establishment of long-term ties with those who hold them.

The links between members of the network can be technical, social, cognitive, financial, logistic or legal. In these terms, the entry in the foreign market is understood as a coalition of interest groups. The degree of internationalization of the company becomes depend on the internationalization degree of the network in which it is inserted (Almeida & Rocha, 2006, p.28). Network relationships have an impact on foreign market selection as well as on the mode of entry in the context of ongoing network processes (Johanson & Vahlne, 2009).

Finally, the theory of international entrepreneurship establishes a direct relationship between the internationalization process of the company and the entrepreneur's profile (i.e. risk taking, innovative and proactive cross borders). The most common entrepreneur's profiles are as follow: (i) technical entrepreneur who seeks new technologies and innovation; (ii) commercial entrepreneur seeking new markets and opportunities; (iii) structural entrepreneur who seeks expansion of the organization via joint venture, merging, or acquisition; and (iv) entrepreneur with a focus on marketing - seeking new distribution channels.

According to the theoretical references above, the internationalization process of CNO can partially be explained by the work of Stephen Hymer: the economic and financial difficulties faced by the Brazilian Government at the end of the 70's forced the company to seek for alternatives: foreign markets,

reducing the dependence on the domestic market was the solution.

Other theories such as Eclectic paradigm, Uppsala model, Networks' theory and the international entrepreneurship can also explain the internationalization of CNO. The theory of international entrepreneurship, in particular, had a significant weight in this process, as the CNO's founder profile, Norberto Odebrecht, was crucial for the initial push of the CNO's internationalization. The organizational culture and the leader's profile were key elements to explain the reasons that led the organization to seek for foreign markets.

4 Methodology

There are several ways of doing academic researches such as surveys, experiments, analysis of archival information and case studies, among others. The decision of what the best strategy depends on the research question, the control of the investigators has over the events and the focus on contemporary as opposed to historical phenomena (Yin, 2003).

For this paper, the authors decided to use the case study methodology in order to understand the complexity and characteristics involved in the use of the Odebrecht Entrepreneurial Technology (OET) as a managerial tool that facilitated the process of internationalization of CNO.

According to Yin (2003, p. 3), "...case studies allows an investigation to retain holistic and meaningful characteristics of real-life events such as individual life cycles, organizational and managerial processes, neighborhood changes, international relations, and the maturation of industries."

In this sense, the use of case study method helped significantly to explain and understand how CNO using a managerial tool such as the OET was able to deal with the challenges of international experiences in different markets and organizational cultures.

5 The Odebrecht Entrepreneurial Technology (OCT) - An Innovative Managerial Tool for the Internationalization

It can be stated that CNO has its development and growth history closely linked to the innovative DNA of its founder, Norberto Odebrecht. He developed a managerial model so called The Odebrecht Entrepreneurial Technology (OET), based, mostly, on full and decentralized delegation. This tool was very innovative, in particular, in the construction sector, where administrative centralization used to prevail and it was determining factor for the internationalization of the company.

The lessons learned with several crises faced by the company since its foundation, and experience of Mr. Odebrecht in the construction and engineering sector were sources of inspiration for the conception of the framework of the OET. The Odebrecht Entrepreneurial Technology (OET) is the foundation of the culture of the Odebrecht Group and guides the actions of the associates and employees around the world. This managerial tool made possible to meet customers' needs, add value to shareholder equity, and has allowed the company to grow on multiple fronts such as in foreign markets (see figure 3).

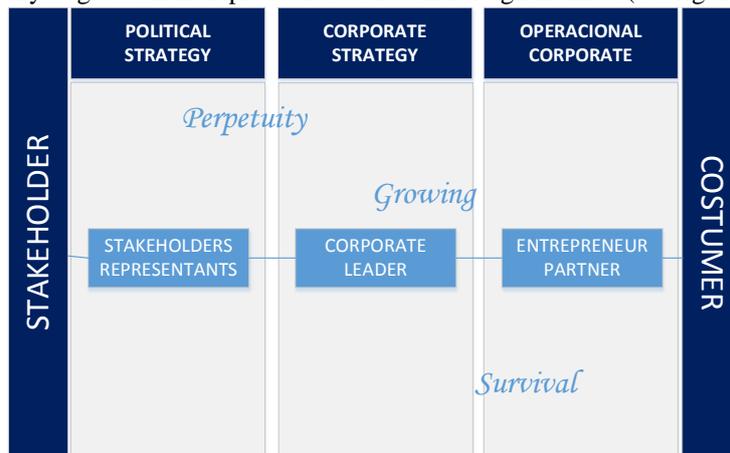

Figure 3 The Three Areas of Odebrecht's Entrepreneurship Line

Source: Odebrecht, 2015

The first steps demanded, in addition to hard work, a great dose of creativity and innovation to enable the completion of construction projects. Norberto Odebrecht sought the support of customers, as well as

employees and even creditors. With each of them, he set a specific agreement. With the creditors, it was signed a political pact, turning them into allies, thus ensuring the necessary resources for the completion of the construction project. With customers, it was signed an economic pact, under which they would be assured the accomplishment of the deadlines and cost reductions. Regarding the employees, it was established a social pact with delegation of responsibility based on trust and sharing of profits as a result of a full commitment in increasing and improvement of productivity (Odebrecht, 2015).

One of the main pillars of OET is of crucial importance to the success of CNO’s internationalization: decentralization of the managerial processes. This managerial strategy was very innovative, in particular in the segment of heavy construction. According to Norberto Odebrecht, decentralized organizational structure might turn problems into challenges and consequently into opportunities. In addition, he believed that delegation and the practice of trust, adopted in all levels of the hierarchy would enhance the potential of human being, allowing employees to obtain better solutions and results in different environments. This model was referred to as "delegation of responsibility". It decentralizes and expedites the work, in addition to stimulating the productivity of CNO’s employees (Brito & Oliva, 2009).

CNO, then, started to value and practice decentralization, planned delegation and partnership. The decentralization was used as an administrative strategy and allowed the approximation of CNO and customers, through a closed contact between its employees (contract leaders) and customers as well as the use of the concept of partnership as a higher form of planned delegation, by which every CNO’s contract leaders become responsible for the results of their respective area (Magalhães, 1998, p. 44).

This innovative model of management has contributed to the development of new and continuous changes in design, production, and marketing methods. In scenarios of diversities and globalization, decentralization and planned delegation showed efficiency and strength, especially given the global dispersion of the construction projects and the geographical distance of the team leaders and employees. Therefore, OET was crucial for the company's internationalization process. For Odebrecht (2015), much of what would happen in the internationalization process would be unpredictable. However, the practice of decentralized management strategy, based on trust and planned delegation was given plenty of agility in managerial decisions.

Transformation requires new technologies and new strategies. Great part of the CNO’s model of management is focused on team and contract leaders. They must create and innovate together with the customers as well as to understand customers’ needs in a way of mobilizing creativity and innovation in search of solutions that comes to satisfy customers and as consequence increasing project productivity.

Figure 4 Summary of Philosophical Concepts of Odebrecht Entrepreneurial Technology
 Source: Odebrecht, 2015

In summary, there are eight general topics that influence the thinking and action of CNO’s members: (i) human beings are the basis of all company values; (ii) each employee must focus on clients’ and shareholders’ satisfaction simultaneously; (iii) educational and entrepreneurial skills are inseparable; (iv) employees must always be alert on improving results and new opportunities; (v) Every employees’ action must contribute to the general company’s result; (vi) employees must always be open to recognize errors

and willing to quickly correct them; (vii) what matters and make difference are those which is built based on clients' satisfaction and the well-being of the whole company; (viii) team leaders must provide safety operations, quality of life for themselves and for those they lead and the duty to promote environmental preservation of the communities and localities they operate.

The fundamental principles and basic concepts of OET (see figure 4) were published in the book "Sobreviver, Crescer e Perpetuar", written by Norberto Odebrecht himself and published in 1983 in Brazil. The purpose of the publication was to spread out the CNO's philosophy throughout the organization (Odebrecht, 2015).

6 Conclusions

In a global environment increasingly integrated and competitive, the continuing growth and development of companies are directly tied to their ability to act globally and to innovate in a continuous learning process. CNO, the second Brazilian most internationalized company according to Fundação Dom Cabral Index in 2015, stands out among the large organizations in the country.

In this sense, internationalization and innovation processes seem to be directly related. CNO achieved an outstanding success in the international arena due to the development of managerial tools such as the Odebrecht Entrepreneurial Technology (OET) which is based, mainly, on two main pillars: planned delegation and administrative decentralization. OET is a result of a strong entrepreneurial ability of the CNO's founder, Norberto Odebrecht, who stimulated a continuous innovation process resulting in new operational and administrative practices which guided the expansion of the company, including its successful international journey.

OET provides the philosophical basis for all CNO's leaders and supported company's expansion in carrying out construction and engineering projects in several regions inside and outside Brazil. Moreover, it allowed strengthening and deepening relationship with the different customers and enabled the organization to add new technical and entrepreneurial competences. Thus, Innovativeness and Competitiveness acquired through learning and interactions with external partners and customers generated complementarities and synergy which can be considered one of the company's success factors.

Finally, the continuous growth and achievements of CNO, including international expansion, have created a strong competitive advantage and seems to be a result of a strong internal culture, expressed in values, philosophy, working methods, pursuit of excellence and focus on innovation.

Abstract: This article aims to reflect on the role of education in building civil liberties in the five Brazilian regions so that individuals have autonomy and ability to make choices and exercise their rights (Sen, 2010). As for methodological procedures, it was used a quantitative approach by using Minitab for the statistical treatments, and Box plot charts to analyze the results. Data were obtained from the platform Atlas Brasil (2013), which provides indicators to compose the HDI (Human Development Index) of Cities. The results presented in charts describe that there are two types of Brazil, and education in Brazil presents the best results in the early school years and decreases according to the years advance. Another important point is that the best results are concentrated in the South, Southeast and Midwest, and education issues in Brazil has been discussed in two apparently contradictory ways: as a solution to the major issues of the country and as a problem that still remains. In this scenario, pledges of change and solutions to the historical bottlenecks and barriers to the development of education in Brazil are proposed. However, strategies to move towards solutions cannot be derived from established general formulas, and results will be superficial and not achievable if there is not a well-structured planning or well-targeted resources.

Key words: Citizenship; Education; Rights

1 Introduction

Every citizen of a country is entitled to have their rights guaranteed in order to exercise full citizenship. However, in a society where opportunities are scarce and freedom of choice is questionable, citizenship is restricted to access to health, education or culture in precarious conditions or even to the lack of these.

In this manner, in order to promote access to opportunities and rights in a country, citizens are required skills and motivation to participate in social and economic life of the country. In addition to this description of constraints, and based on a system thinking between people's autonomy and access to rights, this article assumes that access to education generates more autonomy for individuals since it provides them with the freedom to choose, exercise or fight for their rights.

Therefore, individuals need access to rights in order to have their full citizenship ensured, but this is only possible when education is taken as a state policy, because when individuals are empowered of an ability to discern and choose, they can take advantage of local and worldwide opportunities

Moreover, in this context, access to education is a requirement for the development of aware and emancipated citizens. The ongoing lack of basic levels of public services such as health, education and culture promotes an infrastructure that imprisons their poorest citizens (Sachs, 2008). Thus, better prepared individuals can fight for their active condition of citizen even in contexts of restrictions on their rights, and education can lead to either a situation related to submission and oppression or to liberty and autonomy (Rousseau, 2005; Sen, 2010; Freire, 2014).

Therefore, access to general education can lead individuals to a position of active subjects in their own lives. Incidentally, it is worth remembering that the ability to read and write is associated with the use of technology to work, as well as an awareness of the real situations experienced by individuals. Based on this idea, it is highlighted the content inserted in the 1988 Brazilian Federal Constitution, which places education as a social right and results from the protection and the need to extend this right to all citizens (Brasil, 1988; Camara, 2013).

In this manner, education aims at a kind of freedom designed and made more reasonable into the background of the individual (Freire, 2014), but also reflects on the society as a whole. In addition, reflection on a civic dimension in implementing policies on education generates contradictory behaviors that range from the recognition of the importance of the citizenship and its consequent social engagement to the expressions of astonishment on the educational processes in Brazil (Moura, 2012).

Given these facts, a point regarding education that deserves to be approached is regional

differences. Brazil is a continent-sized country and has local characteristics that describe needs and opportunities in relation to public policies. Therefore, the present paper aims to answer a question: how is access to education in the five Brazilian regions presented?

In order to do so, our main objective, by means of variables presented in the platform of human development, is to verify regional differences when it comes to education. In addition to this objective, specific objectives were established: i) to describe the situation of access to income in the five Brazilian regions; ii) to describe the situation of longevity in the five Brazilian regions; iii) to present a descriptive table of the evolution of access to education in the Brazilian regions

It is worth noting that the purpose of this study is not to qualitatively deepen the behavior and the situation of individuals in each region, but to highlight regional differences and generate subsidies to new debates on education, citizenship and quality of life of Brazilian individuals, then allowing innovations in public administration within this scenario.

In order to justify the argument presented in this study, we point out that education strategies should be conducted to established partnerships for the common good in a local, regional, national and world scope since many projects that benefit social and economic issues may have as origin schools. Thus, Brazilian educational institutions should extend the scale or broader sectors of society in search of assertive actions to their communities (Dejors, 1996).

The latter point is the core argument of the present paper because education, in its system as a whole, can be understood as the major factor of human development generation. Access to the school environment now has a role of civilizing role and catalyzes human development, thus, innovative and feasible strategies for education are required.

2 Theoretical Reference

2.1 Liberty to human development

In the twenty-first century, access to human rights and political freedom has become a fight subject in several nations and institutions. An example is the events related to the so-called Arab Spring (Joffe, 2011), and the rallies of June 2013 in Brazil (Gohn, 2013). Considering these events, it is worth mentioning Sen (2010, p. 9): "the twentieth century established the democratic system as a preminent model of political organization."

However, this reality of struggles for access to human rights is possible only when individuals have a high degree of autonomy or ability to understand the role of a citizen in democratic governments. Note that this idea is aligned to the thought of Rousseau that the sale of liberty from an individual to another is a conscious concession of people themselves (Rousseau, 2005). Nevertheless, this transfer can take place by means of brutal force, or even by ignorance, applied to those who were subject to this removal of the individual freedom.

Thus, in contexts where there is restriction of access to work, education, health and other rights that should be guaranteed by public policies, individuals are guided by a reality of poverty and inferiority. In this scenario, individuals could not take advantage of a favorable environment for civil liberties.

According to Sen (2010, p. 21), "the rejection of the freedom to participate in the labor market is one of the ways to keep subjection and captivity of labor, and the battle against deprivation of the existing freedom in the postscript work [...] ". It should be emphasized that this kind of work is forced and often unhealthy, given by a condition of submission due to the state of lack of livelihood of individuals.

This same issue, by the way, is back to the agenda with Piketty (2014), who addresses the condition of access to income by private individuals of higher paying job since higher income provides greater freedom to have a dignified condition of access to rights. Thus, a wealth of condition can give a better educational preparation, which allows access to jobs with higher payment.

Thus, to improve access to human rights is one resource to improve educational level. The income should not be the main objective of a nation, but increasing the distribution of wealth can also guarantee right of choice to their individuals. Moreover, access to better standards of education and work can promote better access to quality of life, culture, and other needs that guarantee the rights to live in dignity to individuals of a society.

Based on this idea of access to individual freedom and human rights, it can be stated that the country as a whole is benefited. As stated by Piketty (2014, p. 75) "[...] the poorest economies reduce the gap with the richer in that it can achieve the same level of technological knowledge, labor

qualification and education, but not when they become property of the richest." Therefore, by increasing the capacity of individuals of a city, state or country as a whole, their ability to compete and develop is also increased, although better prepared citizens claim more effectively for their rights, which requires a more active and effective state.

The discussion of strategies that should be adopted to promote improvements in education is recurrent. In 2000, 164 countries met in Dakar and committed to pursue six goals of "Education for All" by 2015, when the next conference would be held. These goals are related to the care and education in early childhood, universal basic education, youth and adult skills, adult literacy, gender equality, and quality of education. The purpose of this meeting was to propose a common agenda of education policies to EPT for the strengthening of citizenship and the promotion of skills necessary to a full and sustainable human development. These challenges are being addressed in different ways in educational systems around the world, and significant collective efforts have been developed to provide means to improve the living conditions of children, youth and adults through education. The next conference, to be held in South Korea this year, is to establish new commitments for medium and long term, also incorporating the challenges established at previous conferences.

2.2 Education to promote access to civil liberties

Discussions on the role of education can have as a starting point the report coordinated by Jacques Delors to UNESCO "Learning: The Treasure Within" (Delors, 1996), where Delors (1996) states that education has as core objective to develop human being in society. Thus, learning has a civilizing role, acting as a tool for development of cultures and values, besides fostering socialization environments. It also emphasizes that the civilizing role of education occurs regardless of the place and the means it is promoted since it has to be generated with a view to development and to the creation of bonds between people.

Education, therefore, has the role of preparing and integrating people for a better life in society. Individuals who are entered actively in society can relate and share spaces in a more civilized and constructive way, that is, in a more citizen way.

However, even arguing that the access to education facilitates the construction of a behavior which is more citizen-like, this access is given by a change in the behavior of individuals, and a civilized attitude is only achieved with a clear awareness of rights and duties in society. Vasconcelos (2007) corroborates this idea by questioning the role of education in citizenship-building process. The author counteracts the myth that social mobility occurs via diploma by concluding that this is not effective. Thus, only access to school is not enough, and a redefinition of the education's role in building citizenship is necessary.

Thus, a major citizen behavior is possible when school is a fundamental space in its building process because it provides a wider scope for the child or young individual in what concerns life. An example is the kindergarten, where children live their first experiences of democracy. To the extent that people have the opportunity to socialize with others and learn to live in groups, the fact of community experiences is consolidated (Delors, 1996; Vasconcellos, 1997; Freire, 2014).

Based on this thinking, it can be deduced that educational and social processes are directly connected, and when analyzed together, this link hides any significant reform in education if there is no compatible reform of the social plan (MESZAROS, 2008).

Educational environment becomes a mirror that reflects the social reality of a country. However, this impact can be changed in both directions because individuals may require a change in the current system, as well as the system can generate a change in the behavior of individuals. This can be a relationship of liberty and restrictions, but which shows to its participants the existence of rights and responsibilities when living in society.

Therefore, the school environment can teach individuals about the concept of freedom from the perspective that it is the power to make choices, take action and make decisions, and that their behavior should be directed to the personal and social situations related to real opportunities available. Moreover, this scenario can lead up to the abolition of civil liberties such as to vote (or any other political or civil law) or to have access to public services such as health, culture and education (Sen, 2010).

Thus, in relation to education, government is responsible for mapping the context in which global and local conditions are established, and for guiding individuals towards the reality they are faced with. Thus, taking into account the global context marked by different means for dissemination and storage of information and communication, the adjustment and the role of education are paramount in this sense.

It is worth noting that the learning perspective offers people the means to build a conscious and militant citizenship, and this condition can only be fulfilled by every participant in democratic societies

(Sen, 2010; Delors, 1996). Although there are levels of education, none is complete because education is interminable, and knowledge is built by means of ongoing overcoming (Freire, 2014).

On the other hand, it is necessary to be careful so that this reality does not hinder the update, deepening and enrichment of the first knowledge obtained by someone. An accumulation of knowledge only is not enough if these are not developed throughout life and do not prepare individuals for a world in constant change (Delors, 1996).

When dealing with access to education in Brazil, it is emphasized that education for the construction of full citizenship comes along a history of struggles of the civil society organized by the establishment of democratic liberty. Vieira (2001) points out that from the 1988 Constitution onwards education has been treated as a legal right. Therefore, with the movement of educators, some learning requirements were introduced in the text of the 1988 Brazilian Constitution (Brasil, 1988; Camara, 2013).

A significant advance in the Brazilian education was the consolidation of the Law of Directives and Bases of National Education (known in Portuguese as the acronym LDB), n. 9394, enacted on 20th of December, 1996. LDB rules the educational system in Brazil, and as it stands, "education is a duty of family and State. Its purpose is the full development of the student, his/her preparation for the exercise of citizenship, and qualification for work" (Brasil, 1996).

Thus, early childhood education, and elementary and high school are described by LDB as school levels of education in Brazil. The first level corresponds to day care and pre-school period, from 0 to 3 years old, and from 4 to 5 years old, respectively. At this stage, children do not fail the school year, and the goal is the development of the children. In elementary school, one of the objectives is to develop the ability to learn, and the minimum period of this phase is nine years, while in high school, whose minimum is three years, there is the deepening of studies, and one of the purposes is the preparation for the work life (Brasil, 1996; Mortatti, 2010).

In what concerns responsibilities, cities are responsible for early childhood education (day care and pre-school). Elementary education is a priority of the cities co-operated by the State, and the high school is the priority of the States. According to the 1988 Constitution / LDB, Art. 69, the Union must fund education with the minimum investment of 18%, while the States, the Federal District and the cities are expected to contribute with 25% of tax revenue.

Regarding the reality of education in Brazil, the 1990s was marked by a significant progress with the advent of education programs, which ensured a considerable increase in the number of children in school, although there was a questioning about school quality and education in this period.

As if in answer to this progress, besides the necessity to advance in quality, there was the creation of the Education Development Plan (known in Portuguese as the acronym PDE) April 24th, 2007. PDE determines some goals to be achieved by the application of projects that aim to obtain an opinion of Brazil's education, analyze it and promote the improvement of education's quality (Munhoz, 2007).

In this manner, when dealing with education as a civilizing instrument that promotes access to the liberties that grant full citizenship, it is noteworthy that provide only access to an enrollment in school does not guarantee the development of citizenship skills. However, even if this stage of insertion of individuals in school is reached, the rights of the citizens may be restricted. In addition, civil liberties require choices and autonomy, otherwise, lack and necessity can lead to oppression and submission.

3 Methodological Procedures

The methodological procedures adopted in the present paper were adopted based on the discussion on access to education in Brazil. Therefore, it was used an exploratory approach using the data available on the platform Atlas Brasil of Human Development in Brazil (Atlas Brasil, 2013) as source of information. The platform is available for consultation of the HDIC (Human Development Index of Cities) of 5.565 Brazilian cities, 27 States, 20 districts, and their Human Development Units (HDU). Atlas Brasil also offers more than 200 indicators of demography, education, income, employment, housing, and vulnerability.

Thus, initially it was sought to build, by means of literature review, categories of analysis that would support and justify the discussion on access to education. Therefore, it was necessary to describe what we understand in this article about access to civil liberties (Rousseau, 2005; Sen, 2010; Piketty, 2014), and about the role of education in the development of individuals in society (Brasil, 1988; Delors, 1996; Freire, 2014; Meszaros, 2008; Vasconcellos, 1997).

After the development of the theoretical framework, indicators were consulted and selected at Atlas

Brasil platform (Table 1) to give subsidies to understand the situation of education in Brazilian regions, as well as variables that demonstrate access to income and longevity that influence access to citizens' individual liberties.

Table 1 Variables in Education and Human Development

VARIABLE	MEANING	TYPE	MEASUREMENT UNIT
HDIC_L	Index of the dimension Longevity, which is one of the three components of the HDIC. It is obtained from the indicator Life Expectancy at the birth.	Quantitative Variable	Index
IHDM_E	Synthetic index of the dimension Education, which is one of the three components of the HDIC.	Quantitative Variable	Index
IHDM	Human Development Index of Cities. Geometric average of the dimensions income, education and longevity, with equal weights.	Quantitative Variable	Index
RDPC	Ratio of the sum of income of all individuals living in permanent private households and the total number of these individuals. Values in Real in August 1 st 2010.	Quantitative Variable	Percentage
T_FUND11A13	Ratio of the population aged from 11 to 13 who attend the final four years of elementary school or completed the basic school, and the total population in this age group multiplied by 100.	Quantitative Variable	Percentage
T_FUND15A17	Ratio of the population aged from 15 to 17 who completed the basic school in any modality (regular annual basis, non-annual, youth and adult education programs) and the total of people in this age group multiplied by 100.	Quantitative Variable	Percentage
T_FUND18M	Ratio of the population aged 18 or over who completed the basic school in any modality (regular annual basis, non-annual, youth and adult education programs) and the total of people in this age group multiplied by 100.	Quantitative Variable	Percentage
T_MED18A20	Ratio of the population aged from 18 to 20 who completed the basic school in any modality (regular annual basis, non-annual, youth and adult education programs) and the total of people in this age group multiplied by 100. People aged from 18 to 20 still attending the 4th grade of basic education were considered as concluded.	Quantitative Variable	Percentage
T_FREQ5A6	Ratio of the population aged from 5 to 6 who was attending any school grade, and the total of people in this age group multiplied by 100.	Quantitative Variable	Percentage

Source: Authors, 2015 (Atlas Brasil, 2013)

The exploratory analysis technique with a quantitative approach allowed using appropriate arithmetic to synthesize data (Anderson; Sweeney; Williams, 2011). Minitab data processing program was used, providing great capabilities for creating tabular summaries and graphical data. The graphical method presented in this work is Box plot.

Note that the scheme drawings of Box plot enable an exploratory data analysis considering the rule of the five things to know: minimum value, first quartile, median, third quartile and maximum value. Moreover, Box plot goes without the calculation of mean and standard deviation (Anderson; Sweeney; Williams, 2011).

In the data analysis, the classification according to the regions in the Atlas of Human Development in Brazil (Atlas Brasil, 2013) was made. The separation of regions into North, Northeast, Midwest, South and Southeast made it easier to analyze the regional differences in Brazil.

4 Data Presentation and Analysis

At first, and by using Box plot, the five regions in Brazil were studied regarding T_FREQ5A6; T_FUND11A13, T_FUND15A17, T_FUND18M, t_MED18A20 and IDHM_E. The result of this

analysis is shown in figure 1.

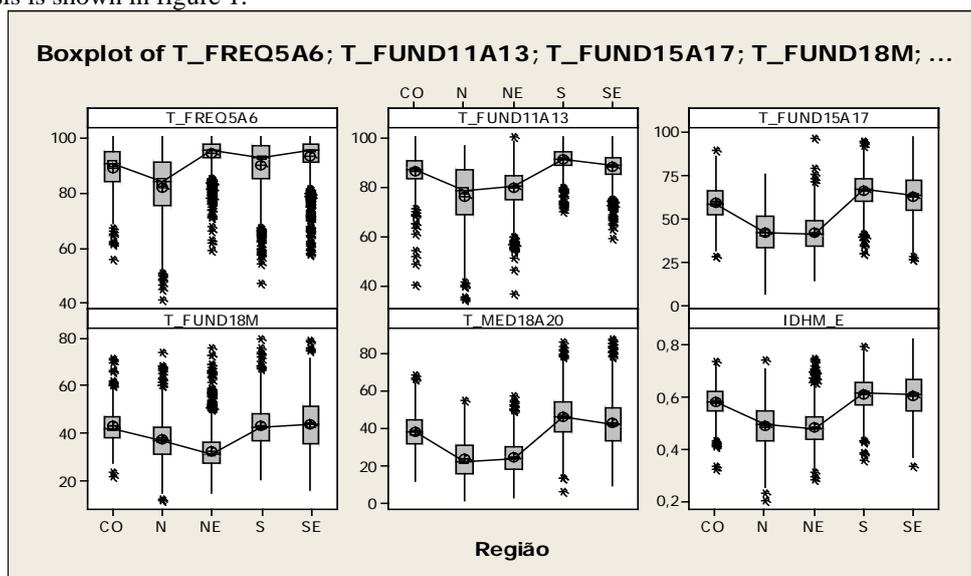

Figure 1 Box Plot of the Variables Education and human Development Atlas Brazil, 2013
 Source: Authors, 2015 (Atlas Brasil, 2013)

For the indicator T_FREQ5A6, it is verified that northeast has the highest rate, followed by South and Southeast. The lowest index for this indicator was found in the North, whose median is 84.11%, when most regions are close to 100% in this variable. Also, there is considerable variability in data from northern compared to other regions in Brazil.

T_FUND11A13 indicator showed the highest rate in South, Southeast and Midwest. On the other hand, the lowest rate is in North, with a median of 78.34%, where this variable is near 90% in most regions. Moreover, there is greater variability in the distribution of data in the cities of the North. As for the South, Southeast and Midwest have lower variability of the data. The degree of variation from regions to region is high (743.32) and the p-value indicates that the information is reliable.

For T_FUND15A17 indicator, the rate is higher in the South, Southeast and Midwest, and North and Northeast present median values near 40%. So, it is worth noting that medians of regions with better performance are close to 60%, and the degree of variability among regions is high (1327.12). Moreover, when the analysis of p-value is analyzed indicates that the information is reliable and there is no chance that this value will be different.

The result of the analysis of T_FUND18M indicator shows better results in the South, Southeast and Midwest, and the lowest rate was found in the Northeast. Nevertheless, the five regions present average below 50% for this variable, and the cities that showed better results were considered in this analysis as outliers, that is, as atypical information. The greater variability of data is in the Southeast, and the region with less variability is the Northeast. The degree of variation among regions is high (413.92), and the p-value indicates that the information is reliable.

T_MED18A20 indicator showed that the best results are in the South, Southeast and Midwest, while the lowest rates are in the North and Northeast regions. For regions with the highest rate in this variable it was found that the average is closer to 50%. However, cities that showed the best results were considered in this analysis as outliers. The degree of variation among regions is high (1031.13), and the p-value indicates that the information is reliable.

The analysis of the IDHM_E indicator showed that the highest rate was found in the South and Southeast, whereas North and Northeast showed median values near 40%. It is important to note that for this variable, the medias of regions with better performance are near 60%, and that the degree of variation among regions is high (884.60). P-value indicates that the information is reliable.

Another analysis performed in this study was the scenario of income in Brazilian regions, as can be seen in Figure 2. The indicator applied was the RDPC, with the highest value in the South and Southeast regions. The lowest rates were found in the North and Northeast, the latter being the region with the lowest results for this variable. The average is R\$467.65. Moreover, it was noticed that the difference between the highest and the lowest income is more significant in the North compared to the Northeast,

although the median is greater in the North.

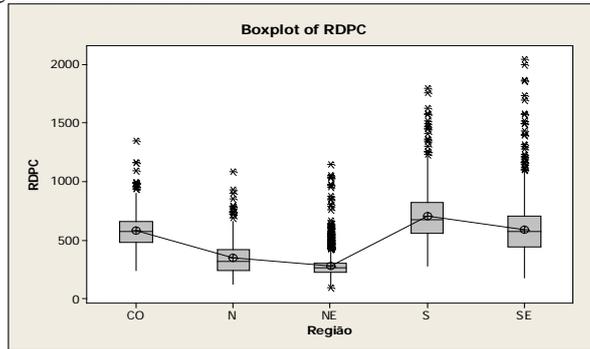

Figure 2 RDPC Variable per Region
Source: Authors, 2015 (Atlas Brasil, 2013)

A point to underline in this analysis is that the cities that showed the best results were considered outliers, and these values were far apart from the middle of the Midwest, North and Northeast. It is important to note that the highest concentration of outliers with higher values is in the Southeast and South. It was also possible to realize that the greater variability of data is in the South and Southeast regions; the degree of variation among regions is high (1432.31), and the p-value indicates that the information is reliable. Besides the issues of education and income, the present study aimed to describe longevity in the five regions in Brazil by applying the IDHM_L indicator to explain regional differences, as shown in Figure 3.

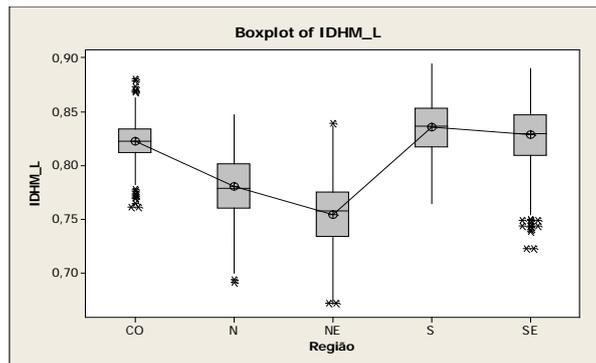

Figure 3 IDHM_L Variable per Region
Source: Authors, 2015 (Atlas Brasil, 2013)

Previous information indicates that there are regional differences that must be taken into account in the discussion of public policy. Correlations to understand this reality in each region based on selected indicators were not used. However, the inferences obtained pave the way to discuss the relationship between access to education and the freedom to exercise full citizenship that impacts on the quality of life of individuals.

5 Conclusions

The present study aimed at an innovative reflection on human development and how it should be focused on people and on the increase of their well-being. This approach used variables related to education, income and longevity. It is worth noting that access to better conditions of income and distribution of wealth is not an end in itself, but it means that people can develop and seek better living conditions. This view corroborates Sen (2010) when he discussed freedom of choice of individuals.

Therefore, economic growth of a society does not automatically translate into quality of life, and the reinforcement of inequality is often observed (Piketty, 2014). However, with a better ability to achieve subsistence or to strive for autonomy in their activities, individuals can build their own ways.

As presented in the previous section, this study aimed to describe the major indicators related to education and to show the scenario of income and longevity presented in the Atlas Brasil report 2013.

Based on this analysis, it was concluded that education in Brazil presents better results in the early school years and decreases throughout the years. Another important point in this study is that the best

results are concentrated in the South, Southeast and Midwest, which is also repeated when the variables are income or longevity.

These definitions indicate that cities have large disparities in the variables studied, emphasizing that this occurs mainly in relation to the North and Northeast regions compared with the others. It is worth noting that the observations of the charts describe that there are two types of Brazil, that is, the data about the Southeast and the South, often followed by the Midwest, are very similar and have better results in the issue of education, income and longevity, while the data in the North and the Northeast regions are also close, but showed the worst results for the indicators.

The comparison of the rates indicates that education up to 13 years old presents average results over 50%, close to 80% in some cases, which is generally good results regarding the completion of the education cycle in a given age range studied. However, outliers change position as age advances, which is negative for the Brazilian population in general.

For the variable income, it is relevant to note that the values are around R\$500, 00 per month, and cities whose values are considered high are diagnosed as outliers. It is important to emphasize that the highest outliers are in the Southeast and South. In order to understand how each region is developing in terms of education, income and life expectancy, it would be required to concurrently compare a qualitative analysis so differences and regional needs could be better understood. In fact, this is a proposal for future research to foster the discussion of regional public policies to ensure full citizenship. Innovations in this area are necessary because the education strategies implemented so far are certainly not promoting the expected improvement in public education levels. The issue of education in Brazil has been discussed in two apparently contradictory ways: as a solution to the major issues of the country and a problem that still remains. In this scenario, pledges of change and solutions to the historical bottlenecks and barriers to the development of education in Brazil are proposed.

Experience, however, shows that the answers to the challenges of Brazilian education are often far from rhetoric and generalizing speeches. There is no ready or general formula. Changes and improvements must be developed in a daily basis, and therefore the paths to be followed are not and should not be the repeated.

The diversity of action strategies and means also characterizes cities able to improve their indicators, according to a study conducted by the United Nations Children's Fund (UNICEF). The qualification and the working conditions of teachers are seen as the major factor for the advance of Brazilian education. Factors such as school infrastructure and access to textbook materials also influence learning, but the teacher's role is crucial to the academic achievement of students at all levels.

The qualification of the teachers directly impacts the results of efforts for education. When there is lack of well-structured planning and no funds are allocated for education, the results are superficial and not feasible. One example is Korea, a country that has invested 10% of its GDP in education for two decades and became a world power in this area.

In a nutshell, the issue of citizenship of individuals of a country should be approached based on their regional characteristics, and in this manner, learning provides preparation for access to rights, but also enables everyone to have autonomy and freedom of choices. Thus, the issue of income is only one more intermediate factor for civil liberties, and not an end in itself.

Abstract: Implementation of democracy finds resistance in political economy, which dominates and sets the rules of the game, both at the national and international level. Indicators show the panorama worldwide: protests about civil liberty, economic difficulties and corruption which have introduced new divisions between elites and unsatisfied citizens. How can partnerships be made more harmoniously with respect to people, the planet, aiming at common prosperity and peace? This study aims to offer an approach that fosters awareness of meaning of the issues for decision making: as well as an analysis of the correlation among democracy and corruption through 16 variables divided in seven synthetic indicators and nine analytical indicators, in 132 countries. Secondary data was analyzed for all variables through Minitab Statistical Software – Version 16. Results show that the synthetic indicator Social Progress Index (SPI) is high, positive and statistically significant with all variables ($p < 0.01$). Social Progress Index (SPI), Human Development Index (HDI), Governance (GOV), Environmental Protection Index (EPI), Political Rights (PR), Private Property Rights (PPR), Political and Economic Transformation (PET), and Corruption Perceptions Index (CPI) explain 79.55% of the model. New indicators may be an impulse to conscious interpretations of the issues involved, letting awareness of worth emerge, as the axis of practical philosophy of the characteristics of democracy: respect to the person, acceptance of pluralism and quest for peace, when creation is used constructively, away from corruption.

Key words: Democracy; Corruption perception; Social progress; Interdisciplinarity; Awareness

1 Introduction

The dimension of meaning of the word Democracy - from the Greek 'dimos' and 'kratos' – power of the people - has evolved from a specific kind of government to a way of being and thinking. Regardless of the definition by different thinkers, nowadays Democracy shows to be an open, fraternal society, with 3 characteristics: respect to the person, acceptance of pluralism and quest for peace, which constitute, respectively, the foundation, method and object of Democracy, where awareness determines the rhythm of development. Democracy is a policy that removes obstacles to development and fosters an integral sense, with freedom from negative conditioning and encouragement of positive possibilities (Abbagnano, 2012, pg. 277).

The attitude to Knowledge plays a very important role in letting awareness emerge to accelerate development. In the past 50 years, Interdisciplinarity has encouraged the integration of Knowledge. According to Fazenda (2002), Interdisciplinarity does not only refer to the integration of disciplines from different fields of Knowledge, but also to the creation of Knowledge, besides reproduction of Knowledge.

Hence adding the contribution of Complexity by Morin, referring to the importance of letting perceptions emerge, we open way for creation. Syrgiannis (2013), who focuses on the experience of the inner creative processes using the 4 quadrants by Ken Wilber, offers an approach that allows issues to be understood in depth. The main element of awareness that emerges is the own worth, which can be transferred to the others and the environment. The approach can be used by professionals, scholars and citizens to expand understanding of issues for decision making, individually and collectively. Partnerships become easier then. Building alliances at all levels to advance development does not seem to be an easy task for the different actors, both public and private. However, everybody wins with democratic countries, which are inclusive and sustainable.

The more the process of creation is understood, constructive action will prevail, not destructive like corruption. Recently, we have been observing the unveiling of corruption and mass mobilization of citizens against corruption, as in Brazil, Guatemala, Australia and North Korea. Leaders must revise their efforts and take measures to reduce the impunity of corruption. It is worrying to see corruption in other

countries, too like Hungary, Macedonia, Spain and Turkey. To address corruption, not only laws and regulations are necessary to be put in action, and media to be truly a contribution for freedom and social progress, but also increase everybody's awareness on the issue of destructive creation.

2 Development

The crisis of politics is universal. The parties have to rethink everything. Representative democracy by itself is no longer answer to the aspirations of people to be building part of society. Democratic countries seek alternatives to deal with the civil war, combat poverty, help refugees, reduce the high number of deaths in regional conflicts, in addition to numerous tensions that continuously emerge on the planet. These threats are worrying, because they do not respect the values and rights of society and restrict the freedom of individuals.

Even in some democratic countries, the political opposition and civil society force autocracy. The protests about civil liberty, economic difficulties and corruption have introduced new divisions between elites and unsatisfied citizens. Some democratic countries faced crises that feed the xenophobic feeling; other countries have undermined the economies of States dependent on the sale of natural resources and increased the power of authoritarian regimes. All this contributes to a decade of decline in global freedom (Democracy Index, 2015).

Bearing in mind that the foundation of Democracy is respect to the person, the question is acceptance of pluralism and the object is quest for peace, how can we practice this? It is urgent that all of us go deeper into the meaning of things and the use of creation in a constructive way and develop further high social impact innovations.

2.1 Democracy

For the purpose of working with indicators in this paper, we are going to use the following additional definition for Democracy. The democracy of a country may be measured by the following kind of variables: a) political rights which involves the evaluation of three subcategories of political law: electoral process, participation and pluralism, Government management; b) Freedom of speech which is the extent to which freedom of expression and the press are affected by Government censorship, including the ownership of the means of communication; c) Freedom of assembly/association which is related to the extent freedom of association and union are subject to governmental restrictions or limitations; d) Freedom of movement which is the measurement of the sum of two variables: freedom of movement to foreigners and citizens of own country; e) Private property rights which is the degree to which the laws of a country protect the rights of private property and the degree to which their Government enforces these laws; f) Freedom over life choices which is the percentage of respondents satisfied with the question: are you satisfied or unsatisfied with your freedom to choose what you do with your life?; g) Freedom of religion is a combined measure of 20 types of constraints, including the efforts of the Governments to ban certain beliefs, prohibit, limit preaching or giving preferential treatment to one or more religious groups; and h) Democracy Index which is the civil liberties based on five categories: electoral process and pluralism, civil liberties, Government management, political participation, and political culture (Freedom House)., events that make us reflect on context and trends of democracy around the world.

Can this trend be reverted? What is the Dynamics of the Process?

When we have the opportunity to experience our inner creative pro2016)

Moreover in addition to the above variables, the democracy of countries is based on the processes of transformation and political management that may be classified in two indexes: a) Situation Index; and b) Management Index. The Situation Index has two factors for analytical dimensions of political and economic transformation, which identify if the individual countries assessed are developing democracy under the rule of law and social market economy (Bertelsmann Stiftung's Transformation Index, 2016).

The economical authority crisis blames democratic powers, which was evident in China in 2015, when major economic forces were concentrated on work at the expense of human rights and political repression. Autocracy is also visible in the aggressiveness of Russia in relation to liberal values, in the increase of terrorism in Arabian countries promoted by the civil conflicts, in the rise of anti-democratic politicians in Venezuela and the rampant corruption in Brazil.). Such events that make us reflect on context and trends of democracy around the world.

Could this trend be reverted? What is the Dynamics of the Process?

When we have the opportunity to experience our inner creative, letting words emerge on a topic, registering them in an exercise of inner individual consciousness; then, looking at the words and correlating them by colors in an exercise of outer individual consciousness to be able to tell the meaning of

correlations as an idea that emerged, then we become the authors of meaning. This individual achievement may be shared with others, in such a way that we can keep on adding anything that others say that makes sense to our meaning, exercising then an inner collective consciousness; then, looking at the notes taken and correlating them together in an exercise of outer collective consciousness and it relates to what Nonaka and Takeuchi (1995) consider in Knowledge Creating Organizations; and nowadays this may be happening all the time through the social networks that also may be followed by Big Data Analysis.

This may represent the real time emerging of raw material for joint Creation, which is now going to be consciously analyzed for selection, for a proposal like the trunk of a tree. Two or three main ideas are chosen to be the main branches, with illustrations for each one. The formation of the tree follows Fibonacci sequence: 0, 1, 1, 2, 3, 5, 8, 13, 21, 34, 55, 89, 144... This stage defines the Unity of the proposal. During this constructive and consistent process, it reflects our own constructive consistence. Next, is as an exercise to find our Way to bring our proposal in a rhythm that flows, has clarity and harmony, we ask ourselves whether there is anything to be changed in our proposal. If there is, it is time to perform the adjustments, before the implementation. Finally is Achievement, where we can now choose a style that better fits to the implementation of our proposal, making sure it will bring prosperity for all the parts involved, feel happy and manifest the proposal. That stage is generally followed by a sense of Self Realization. It is through these 4 movements: Creation, Unity, Way, Achievement that the approach by Syrgiannis (2013) reveals to bring worth into awareness as the axis of any attitude and action in life. All of us may benefit from using it.

2.2 Corruption perception

According to Aristotle, corruption constitutes, together with its opposite, the generation of 1 of the 4 kinds of movement, more specifically the substantial movement, due to which the substance is generated or destroyed. 'Corruption', says Aristotle, is a change that goes from something to the not-being of this something, specific when it goes to the opposite specification -in the Dictionary of Philosophy (Abbagnano, 2012, pg. 250).

Corruption impacts societies in a multitude of ways. In the worst cases, it costs lives. Short of this, it costs people their freedom, health or money. The cost of corruption may be divided into four main categories: political, economic, social and environmental. On the political front, corruption is a major obstacle to democracy and the rule of law. In a democratic system, offices and institutions lose their legitimacy when they're misused for private advantage. This is harmful in established democracies, but even more so in newly emerging ones. It is extremely challenging to develop accountable political leadership in a corrupt climate (Transparency International, 2015).

Corruption corrodes the social fabric of society. It undermines people's trust in the political system, in its institutions and its leadership. A distrustful or apathetic public may then become yet another hurdle to challenging corruption. One country has to comply with the commitments it has taken and disregarded to restore confidence. The mistrust is with the policy, but also with the business world, with religious institutions. There is a questioning of the elite. The countries elites need to question themselves about what they have been doing and reinvent itself to keep playing the role which corresponds to the political parties, the only organization that may offer a nation a collective idea. We need a policy close, clean, transparent, and concerned with people.

The transparency is about shedding light on rules, plans, processes and actions. It is knowing why, how, what, and how much. Transparency ensures that public officials, civil servants, managers, board members and businesspeople act visibly and understandably, and report their activities. And it means that the general public can hold them to account. It is the surest way of guarding against corruption, and helps increase trust in the people and institutions on which our futures depend (Transparency International, 2015). In addition to this, development of awareness of worth will foster constructive creation.

3 Methodology

For the quantitative part of this study, we deal with data from the Observatory Red Iberoamericana de Prospectiva - ORIBER (2016) that considers 132 countries divided into three groups: a) AIBER, formed by 21 Latin-American countries plus Portugal and Spain; b) Advanced Economies (AVECO), formed by 27 countries, including advanced economies located in Europe, as well as Japan and South Korea (Asia), New Zealand and Australia (Oceania), the United States and Canada (North America); and c) Other Countries (OTHERS), formed by the other 84 remaining countries.

This study aims to analyze the relationship between democracy and corruption through 16 variables divided in seven synthetic indicators and nine analytical indicators, respectively: 1) Social Progress Index

(SPI); 2) Human Development Index (HDI); 3) Governance (GOV); 4) Environmental Protection Index (EPI); 5) Happy Planet Index (HPI); 6) GINI Index (GI); and 7) Democracy Index (DI) from the Program of the United Nations Development (2014). Additionally, the nine analytical indicators: 1) Political Rights (PR); 2) Freedom of Speech (FS); 3) Freedom of Association (FA); 4) Freedom of Movement (FM); 5) Private Property Rights (PPR); 6) Freedom over Life Choices (FC); 7) Freedom of Religion (FR) from Freedom House (2016); 8) Political and Economic Transformation (PET) from Bertelsmann Stiftung's Transformation Index (2016); and 9) Corruption Perceptions Index (CPI) from International Transparency (2015), in 132 countries. It's important to mention that for the purpose of the study all the indicators considered were Normalized (0 – 100) and Positivized - the higher the better.

When the indicators are used in the experience of the inner creative processes, meaning emerges with clarity and choice for constructive proposals in partnership may lead to a way of being and thinking close to the new dimension of the word Democracy.

4 Considerations

Figure 1 show the degree of correlation of all variables, in particular that the correlations among the (color red) variables Social Progress Index (SPI), Human Development Index (HDI), Governance (GOV); Environmental Protection Index (EPI), Happy Planet Index (HPI), Democracy Index (DI), Corruption Perceptions Index (CPI), Private Property Rights (PPR), Political Rights (PR), Political and Economic Transformation (PET) were high, positive and statistically significant each other.

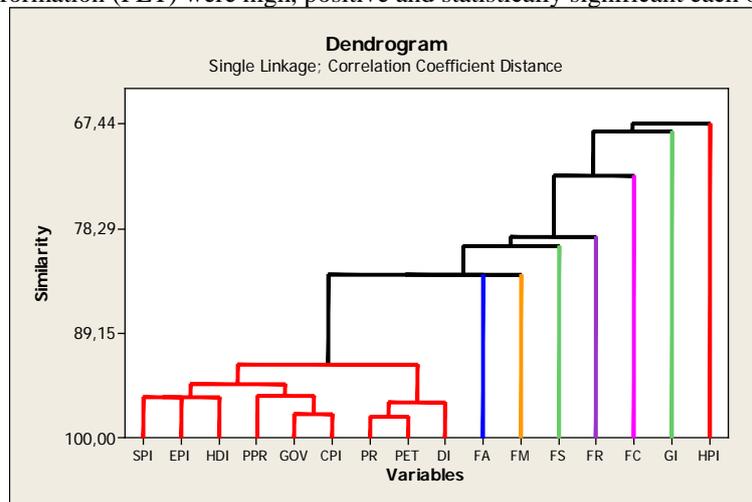

Figure 1 Dendrogram
Source: by authors

The Kaiser-Meyer-Olkin (KMO) technique was used with the aim to compare the simple correlation with the partial correlations, show an excellent result with a KMO of 0.89. The extraction of a limited number of factors to represent the structure of the original variables by means of Principal Component Analysis, show that the most relevant variables were the Social Progress Index (SPI), Human Development Index (HDI), Governance (GOV), Environmental Protection Index (EPI), Political Rights (PR), Private Property Rights (PPR), Political and Economic Transformation (PET), and Corruption Perceptions Index (CPI) that explain 79.55% of the model; and in particular that the Social Progress Index (SPI) has the highest representation.

It is observed from the results that a model of development based on economic progress alone is incomplete. Economic growth alone is not enough. A society that fails to address basic human needs, equip citizens to improve their quality of life, protect the environment, and provide opportunity for many of its citizens is not succeeding. We must widen our understanding of the success of societies beyond economic outcomes. Inclusive growth requires achieving both economic and social progress.

Social progress is the capacity of a society to meet the basic human needs of its citizens, establish the building blocks that allow citizens and communities to enhance and sustain the quality of their lives, and create the conditions for all individuals to reach their full potential. The countries with very high Social Progress are Finland (90.09), Canada (89.49) and Denmark (89.39), the very low are Chad (36.38), Afghanistan (35.89) and Central African Republic (30.03). Research shows the correlation between

economic progress and social progress, and our study reveals that the correlation is high with all the variables, which indicates that the social progress is related to economic performance. Hence, economic performance alone does not fully explain social progress (Social Progress Index, 2016). Figure 2 show the correlation among economic progress and social progress, which as may be seen is not linear: SPI grows very fast with GDP PPP per capita at the beginning up to \$ 20000 and then go slow; and moreover there are 3 oil producer countries where SPI didn't improve after reaching this SPI kind of tipping point...

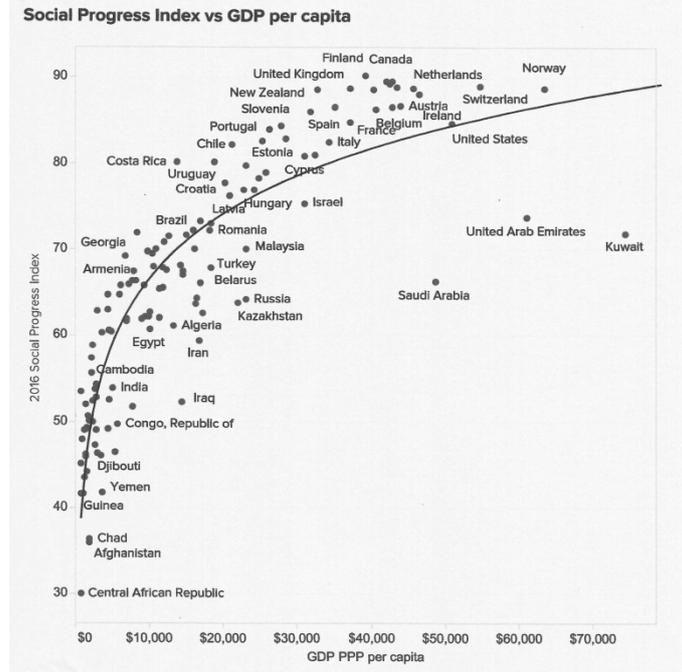

Figure 2 Relation Among Economic Progress and Social Progress

Source: <https://www2.deloitte.com/content/dam/Deloitte/mx/Documents/about-deloitte/Social-Progress-Index-2016-Report.pdf>

As the world faces increasingly complex challenges, the SPI is a roadmap that guides investment policies and business decisions. One of the main conclusions of the index is that we should expand our understanding of what is a successful society in addition to the economic results. Growth requires economic, social progress, political rights and civil liberties. Figures 3, 4 and 5 compare the regions with all variables of this study.

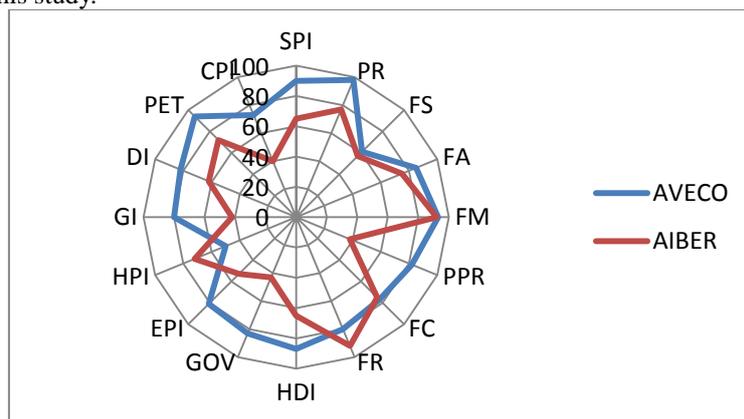

Figure 3 Comparing the Regions AVECO and AIBER

Source: Produced by author

The AVECO countries as a whole are doing better than the AIBER, except Freedom of Religion (FR) and Happy Planet Index (HPI), while the difference is the greater the other way around concerning Private Property Rights (PPR), Governance (GOV) and Corruption Perception Index (CPI). The variables

Freedom of Speech (FS) and Freedom of Movement (FM) are near in both Regions.

The results show that the Freedom of Religion is very important for a country; however the influence of the religious dogmas about the inner workings of political systems once again increased. The results show that the influence of religions like Islam in politics continues to grow in some parts of the world like the Arab countries, as well as Iraq, Libya, Syria and Turkey; and now days Fundamentalist Terrorism acts and Migration because of violence are becoming more and more common.

Moreover in many Asian countries, there was a relation in 2015 between the strained political institutions and forms of nationalism or religious extremism. The Hindu nationalist government of India, under pressure to fulfill campaign promises in 2014, failed in containing violence and intimidation anti-Muslim, sometimes to encourage or take advantage of religious divisions for political again. As was seen in the Islamic radicals who carried out a series of attacks in secular Shiites and foreign writers.

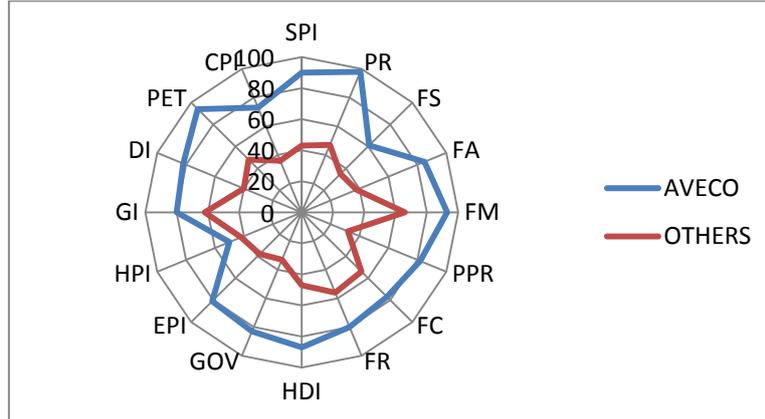

Figure 4 Comparing the Regions AVECO and OTHERS
Source: Produced by author

The AVECO countries as a whole are doing much better than the OTHERS. The Happy Planet Index (HPI) is near in both Regions. It shows that while the challenges faced by rich resource-intensive nations and those with high levels of poverty and deprivation may be very different, the end goal is the same: to care of a healthy Planet for a better life to live now and in the future. The best results are in Costa Rica, Mexico and Colombia. Countries like Costa Rica, that are closer to managing to build sustainable economies that deliver relatively high wellbeing, and long life expectancy, without a large ecological footprint. Although no country is yet well enough, the countries that are doing better may offer valuable insights into the types of policies which would lead to sustainable wellbeing (Happy Planet Index, 2016).

As the Good Country Index, that is a new way of looking at the world. The Index does aim to do is to start a global discussion about how countries can balance their duty to their own citizens with their responsibility to the wider world, because this is essential for the future of humanity and the health of our planet. Finland ranked second after Ireland (Anholt, 2016).

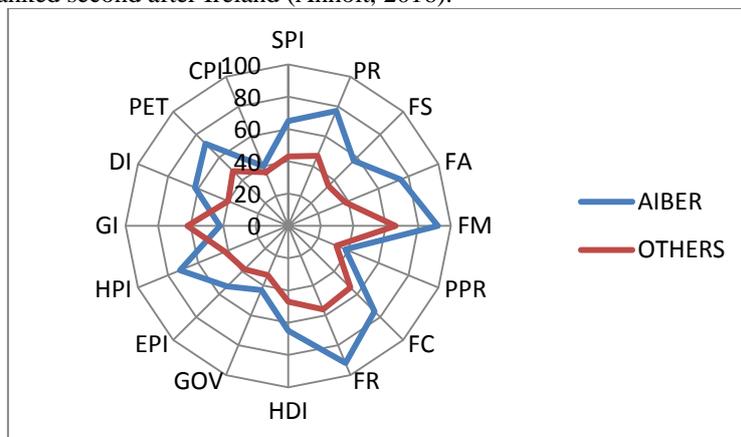

Figure 5 Comparing the Regions AIBER and OTHERS
Source: Produced by author

The AIBER countries as a whole are doing better than the OTHERS, except GINI Index (GI). The variables Private Property Rights (PPR), Governance (GOV) and Corruption Perceptions Index (CPI) are near in both Regions. As one could see social policies continue to be a major weakness. The conflicts and crises of transformation are related to social limitations. Poverty, inequality and the lack of economic opportunities are aspects of bad governance. Most Governments are not yet well prepared to deal with these challenges. Only six countries Uruguay, Chile, Taiwan, Estonia, Poland and Lithuania have an excellent quality of Government. The highlight Turkey by prioritizing the inclusive growth and robust through collective action, which was expressed in the three pillars of the Turkish Presidency: implementation of past commitments; investments to strengthen the economic recovery and the growth potential of countries; and promotion of inclusivity.

The proportion of democracies and autocracies remained relatively stable, Iraq and Thailand continue with the autocracy. However, Guinea, Madagascar, Mali and Nepal meet minimum standards of democratic Government. But participation rights are still restricted in democracy. The status of political transformation has deteriorated in many democratic Governments in aspects such as, free and fair elections, the freedoms of association, assembly and expression, the separation of powers; and even civil rights have been further restricted.

The anti-corruption policy presents the worst aspect of performance of all Government indicators, especially with regards to Africa, the Middle East and Eurasia. Singapore is the only autocrat country with integrity mechanisms. Only the Central East and South-Eastern Europe stand out positively, with significant improvements, especially in Latvia and Poland.

The human cost of corruption is enormous. The leaders with notoriously corrupt records continue to enjoy a life of luxury at the expense of people living in poverty. Figure 6 presents the rate of corruption in Latin America. It is vital we change the mindset which accepts corruption. Corruption will stop when we fight against it.

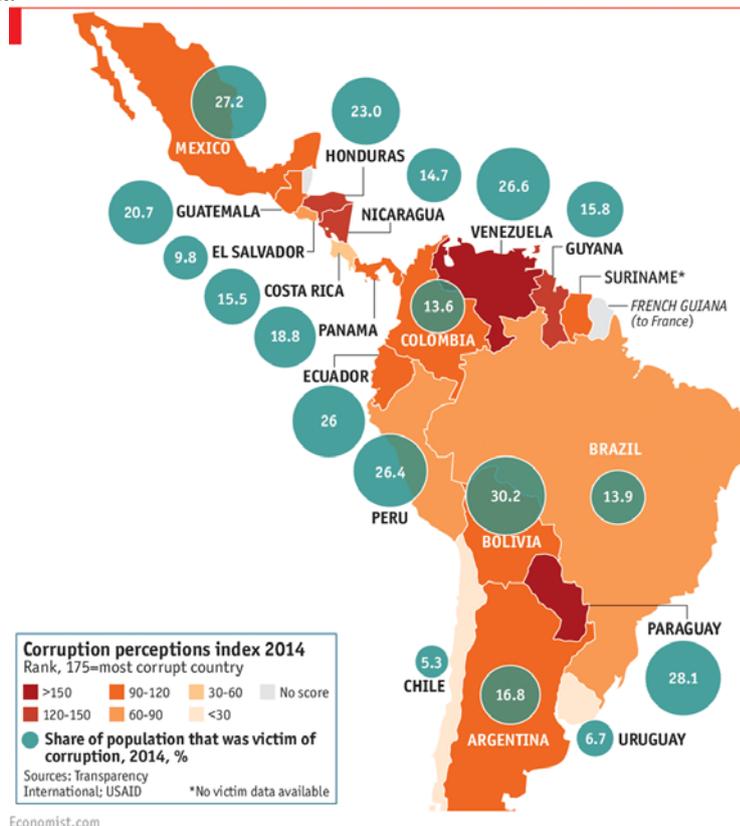

Figure 6 Corruption Perceptions Index in Latin America

Source: <http://www.economist.com/>

The world's dominant trends in the economy and in society exacerbate the contradictions of a development style that became unsustainable. The deep economic, social and environmental imbalances

have motivated the search for responses by the international community, through efforts maturing along at least the last two decades.

5 Conclusions

A strong democratic State is not a State closed, but open to access information, social values and practices of collaborative policy. It is a State that develops systems for planning, evaluation, and participation in the formulation and implementation of public policies. The open Government involves the modernization of public administration, based on transparency, accountability, citizen participation and collaboration of all actors to produce value. Open Government policies drive the practices, values and cultures that favor the establishment of an open and collaborative platform.

In this sense, evolutionary public administration focuses on the complex interactions between systems and the non-linear development of governance structures, processing through time when they attempt to adapt and cope with the ongoing changes in their environment (Teisman, Van Buuren & Gerrits, 2009). This transformation requires long-term vision and a new political and social forces correlation that may allow to implement four basic mechanisms of governance: a) international coordination of economies in favor of the sustainable expansion of investment, based on fiscal policies that prioritize low-carbon projects and greater energy efficiency; b) a new international financial architecture to reduce the volatility of prices and progress in reforming the international monetary system; c) governance of trade and technology on a multilateral basis in order to facilitate and expand the access to technology and financing for the dissociation between growth and environmental impact, leading to the closure of asymmetries between countries and regions; and d) the governance of the essential components of the digital economy shared globally and at a regional level.

The same tendency can be related to the complexity science on the public policy, as the areas may present higher or less degree of complexity. The economics has already developed indexes in the complexity science, such as the 'Economic Complexity Index' (Hausmann et al., 2014), promoting diversified tools for analysis. The complexity economics converges more with strategy, and archetypal constructions, like the artificial stock market, for example.

Leicester City Triumph: Engagement Execution or Pure Luck?

Muhamad Roslan Muhamad Yusoff, Ahmad Rahman Songip

Management of Technology Department, Malaysia – Japan International Institute of Technology,
Universiti Teknologi Malaysia Kuala Lumpur, Jalan Sultan Yahya Petra, 54100 Kuala Lumpur, Malaysia
(E-mail: rytiecs@gmail.com, ahmadrs08@gmail.com)

Abstract: This study focuses on the astonishing accomplishment of Leicester City Football Club in overcoming the English Premier League Season 2015/2016. Despite the fact that their voyage is by all accounts like children's fables we cannot avoid our self from the science behind it. Broad desktop research has been directed to uncover the noteworthy variables for Leicester triumph. Taking team sport, for example, football otherwise known as soccer as a contextual analysis to characterize an example of overcoming adversity giving us a superior point of view particularly as far as the genuine implications of engagement and execution.

Key words: Sport case study; Engagement; Execution; Excellence; Leicester city

1 Introduction

It is quite typical for most organization nearly a third to the extreme of fifty percent of their workforce is disengaged. Participation is a bit poor, turnover is high, and profitability or adequacy is average. In astounding organizations seventy five percent or a more unmistakable measure of the workforce is secured, feels enabled, gives more thought and thought and commitment to the relationship since they see their work as basic and feel that the connection knows and ponders them as people (Jim Clifton, Stephanie Holgado.2013). They are adjusted to organization objectives; they are exceptionally required in their work and give it their best exertion since it mirrors their qualities and effectively uses their ability and information at an abnormal state (James W. Marcum.2014).

On occasion exceptional initiative achieves extraordinary accomplishment by moving individuals to put forth a strong effort, to extend and accomplish more than they suspected they could. An exceptional coach can shape a formal or even social event into a triumphant get-together; an influenced maker like Stalin or Hitler can make a world-propelling alliance; an engaging speaker like Barack Obama can make a political change. Regardless, such mixes of capacities and personality are remarkable. Luckily phenomenal learning and abilities are not required. An understanding of human instinct merged with practices that are learnable can ensure an engaged organization (James W. Marcum, 2014).

2 The Execution Enigma

Execution excellence has for quite some time been a center methodology utilized by organizations to manage change and enhance their aggressiveness. Extensive experience and best practices have been created to help organizations enhance the rate, expense, and nature of their center operations (Sajiv Anand, 2016). They keep on deploying these procedures with expectations of fighting the difficulties of the new ordinary, yet frequently these methods lead to incremental, as opposed to leap forward, upgrades. This methodology frequently abandons them uncompetitive when pace and many-sided quality are quickening much quicker than in customary times.

Recently, there has been a noteworthy movement in center toward execution advancement. Development frequently gives an achievement level of change that can re-characterize an association's aggressiveness. Instead of depend on incremental change that can be jumped, organizations wish to influence new innovation and different advances to accomplish a really practical favorable position. Advancement in execution can take numerous structures all through the Enterprise, including plan of action, working model, procedure, or calculation. Luckily, the broadness of new innovation, new accomplices, new materials, and so on is exhibiting a rich arrangement of inputs to supercharge execution advancement.

The perfect reaction is to make magnificence in development, execution and linkage between the two. Much like the Gartner Group's outstanding "enchantment quadrant", firms who can exceed expectations at both creating and sending leap forward development will be all around situated to lead later on (Gartner, Inc, 2015). At the point when greatness is accomplished in both orders, a profoundly prudent circle is made. New developments are effectively and immediately incorporated into existing operations, which abbreviate the basic time-to-quality gauge, enhance speculation ROI, and in particular

enhance operations. At the point when execution results are caught and nourished back to the development procedure, critical knowledge into business sectors, contenders, and clients is utilized to enhance the velocity, expense, and nature of the following advancement cycle.

Looking ahead, the persistent difficulties of rivalry, direction, and globalization will wear out organizations that are not all around situated with driving innovation and execution capacities. Accordingly, business must discover better approaches to influence existing Intellectual Proprietary (IP), stimulate synergistic improvement, and assemble outside linkages all while managing a legacy of exceedingly appropriated information, applications, and infrastructure.

3 The Engagement Sensation

The most ideal approach to manage definitive accomplishment today is not publicizing, or cash related impact, or range; the key is getting a charge out of the eventual outcome of the data, experience, creative limit and duty of the association's family. Basically, the key is workforce engagement (Jim Clifton, Stephanie Holgado, 2013).

The idea of engagement rose as of late as a main component to compelling work and learning. Engagement happens when individuals attempt assignments identified with their fitness, learn ceaselessly, submerge themselves and persevere due to the worth they credit to the work. Engagement can be treated as a procedure and continuous action, not an occasion. Its deciding qualities are learning and inclusion. Applying the idea to data association, researchers use a sliding size of engagement beginning with withdrew acknowledgment, moving to talk, to presentation or instructing, at last to use in every way that really matters (Davenport, Thomas H., Lawrence Prusak, 1998). This process serves to handle data over-burden, a progressing issue, and supplements the movement engagement approach.

Engagement is fundamentally the same as Intrinsic Motivation (IM). IM essentials, as indicated in previous research incorporate weightiness, decision, skill, and advancement (Kenneth Thomas, 2009 (a)). Yet, compensates additionally stay focal in "overseeing" IM, as does an emphasis on initiative qualities to get inspiration "going." There remains a certain yearning with respect to the "inspiration business" to accept it can be educated and oversaw. Simply said, engagement cannot be "made to happen". The action stays with the individual, no matter whether an expert or understudy (Kenneth Thomas, 2009 (b)). Engagement is more a kind of "base up," grassroots marvel that can't be coordinated from the top.

To reiterate the above argument, engagement is something very different from motivation. The following table (Table 1) highlights those differences:

Table 1 Motivation vs. Engagement

KEY ELEMENTS	MOTIVATION	ENGAGEMENT
Aim	Initiate, Activity Focus	Learning, Knowledge Transfer
Accountability	Management	Individual, Team
Action	Planned, Triggered	Ongoing, Continuous
Belief	Human Biological Need	Self Realization
Power	Top Down, Subtle : "rewards"	Self Determination
Perspective (Worker)	Employee	Partner
Philosophy	Atomistic, Linear	Holistic, Complex

Source: Adapted from Intrinsic Motivation at Work by Kenneth Thomas, 2009 (b).

With a specific end goal to completely draw in the whole workforce a very surprising association style is required: not a controlling, coordinating style, yet rather a visionary, honing, facilitator scrambling to stay aware of the pack is the fitting model. He or She will have impeccable position of the unleashed learning, establishment, data and obligation of the pulled in bit of the association looking for development and perfection.

Engagement can be nurtured despite the fact that it cannot be directed or commanded. Various authors, scholars, and experts offer apparatuses, procedures and strategies to build representative engagement (Driscoll, Maurice John and Evans, and Robert Hugh, 2009). These offerings are coordinated to directors and pioneers of companies to improve profitability. These frequently are upheld by broad information, as we see with the Gallup association's reports on enhanced money related execution consolidated with recommendations that their specialists and methodology can get it going for the forthcoming customer.

The admonishment here is that every one of these tries offers a top-down push to guarantee a

positive showed result. Since expenses are joined, there is thought concerning giving quantifiable results in sensible time to legitimize those expenses. Ordinarily, this procedure falls by the day's end into the solicitation and control suspicions of most affiliations today; it falls into the same trap, as does the "prizes" approach evaluated prior in this talk. The longing to tail thusly is totally sensible yet may not satisfy a complete motivation driving engagement. Review that engagement starts with individual decision and is portrayed by learning and responsibility. This is nonsensical for a couple however key for honest to goodness engagement. In light of current circumstances, what should be possible?

Consider a tool by which the individual measures their own engagement in their present position. These advancements the relationship of the effort from a top-down to a typical power grass roots attempt more inclined to reveal a driving forward change in the organization's lifestyle. This in itself would exhibit the advantage of continuing with the improvement. A true example of engagement endeavour can be pick up from the most popular sport i.e. football aka soccer. Leicester City triumph during 2015/2016 English Premier League distinctly serves as an eye opener in terms of Execution Engagement Excellence.

4 Leicester City Case Studies: Execution Engagement Excellence

Leicester City winning the English Premier League title is presumably the best underdog story in the historical backdrop of games basically in light of the fact that the league is the most focused, competitive and wealthiest games association in the planet. In fact, Leicester's title is the first by a non-"Big 4 Clubs" in the propelled Premier League time (1992-present) since Blackburn Rovers were assigned champs in 1995 (Borden, Sam, 2016). Likewise, and still, toward the day's end, Blackburn finished second the season some time as of late. Leicester finished fourteenth last season. It's the reason this impossible run blind-found the entire world of soccer.

One way to deal with perspective Leicester City's (famously known as the Foxes) outlandish title is through wagering possibilities. Prior to the season started, British bookmakers recorded Leicester — as a 5,000-to-1 to be crown as champion. The shocking wagers raised lots of hope for pundits even though it's a kind of fairy tales (Igor Mello, 2016).

5 The Journey

The phenomenal journey of Leicester started as early as on APRIL 4, 2015. With nine games left, the Foxes are in danger to be relegated as they are sit at the bottom of English First League. However a week in the wake of King Richard III's remains is reinterred, they beat their rival (West Ham United) with a single goal. Coincidentally it's King (Andy King) that put the ball behind West Ham United goal post. Call it a blessing and the Foxes never look back. They keeps on winning the remaining seven last games thus confirmed its inclusion to the top flight (The Premier League). This marks the beginning of its journey, which among its most significant events (Sky Sport, ESPN, 2015):

5.1 New boss, new approach

JULY 13, 2015 - Leicester City new owner (a Siamese) bring appealing news to the club by naming an Italian citizen as the new Chief Coach (Borden, Sam, 2016 (a)). The selection of Claudio Ranieri, whom just recently being sacked by Greece, is a shock decision by the club's Thai owner. Coaching Leicester would be Ranieri's 16th attempt in becoming a supremo in soccer. True enough in his first press conference; he states that his ultimate goal is to avoid relegation and his plan simply for Leicester to gain a minimum 40 points (Borden, Sam, 2016 (b)).

5.2 Great start

AUGUST 8, 2015 - In their premier season opening, Leicester surprised everybody including themselves by beating Sunderland, 4-2. Three of their goals come from their "season" but not forgotten player Riyad Mahrez (2 goals) and Jamie Vardy (1 goal) (Borden, Sam, 2016 (a)). Thinking back, it is purely an execution — by those two players and by the gathering — it is critical of what is yet to come.

5.3 With pizza we deliver

OCTOBER 24, 2015 - Winning 8 out of 9 games have make Leicester overjoyed with their solid beginning. However, they begin to be sloppy in defence and let an easy goal. Hoping to propel his players, Ranieri guarantees that in the event that they can hold a rival scoreless, he will purchase every one of them pizza (Borden, Sam, 2016 (a)). At the point when Leicester finally creates its first shutout in its tenth games by beating Crystal Palace 1-0 — Ranieri makes an even better offer. He extends "pizza party" to cover their upcoming games as well hence delighted the entire team.

5.4 New year, new perspectives ...

DECEMBER 29, 2015 – In the verge of New Year, a 0 – 0 draw with Manchester City provided Leicester another pizza party despite losing to Liverpool earlier. As 2015 shut, the Foxes are in their best ever position in the Premier League i.e. sharing the same points with the Gunners - Arsenal (Borden, Sam, 2016 (a)).

5.5 Blessing in disguise

JANUARY 20, 2016 - A 2-0 defeat to Spurs during FA Cup does not jeopardize Leicester title chances, however it is undoubtedly put Leicester's out of other contention (Borden, Sam, 2016 (a)). This has given Leicester a solid focus and enough rest while its nearest rivals juggle their fitness with Cup matches. In addition they are having another two competitive battle in the prestige Champions League and Europa League, which totally challenged their stamina. The changes in perspective makes Foxes fans start to believe in their dream. The fantasy might now become a reality!

5.6 An assertive viewpoint

FEBRUARY 6, 2016 - "We're going to win the League" a few thousand Leicester fans chanted a marching song after they beat Manchester City, 3-1. The win has built a clear 5-point lead on the table standings. Even though several tacticians had predicted that Ranieri might play for a tie; rather, Leicester keeps on pressing and scores (Borden, Sam, 2016 (b)). The rest is history, confirming their aspire to be the new king of English Premier League.

5.7 In defense we trust!

APRIL 3, 2016 - Leicester 1-0 win against Southampton moved them 7 points ahead of Spurs with six matches to spare (Borden, Sam, 2016 (b)). Pizza becomes a norm as the Foxes maintained their clean sheets to fifth shutout from six matches. The following week, the Foxes extended their record to six out of seven games impressively by beating Sunderland 2-0.

5.8 Three points ... just three points more

APRIL 24, 2016 - The Foxes impactful run continue by beating Swansea City, 4-0. Leicester is inside a solitary triumph the following day as Tottenham Hotspur just managed to seal a draw with West Bromwich Albion (Borden, Sam, 2016 (b)). Leicester's fans are in jovial mood — can't hide their eagerness for the Sunday game, as they can finally lifted the trophy with a triumph over the Red Devils (Manchester United) at their home ground - The Old Trafford.

5.9 A tie and a title

MAY 2, 2016 - Leicester City missed a chance to secure the title early when it tied, 1-1, at Manchester United on May 1. In any case, when Chelsea struggled back to tie Tottenham, 2-2, somewhat more than 24 hours sometime later, the plan was accomplish. Leicester surpassed Spurs in the standings by 7 points with two matches to go, which implies the Foxes couldn't be beaten. Clearly, Leicester City players and fans, celebrated vigorously.

6 A View from Engagement and Execution Perspectives

The following table (Table 2) represents Leicester City Engagement Matrix, which summarize the chronology of its debut since the start of the season till they lifted the trophy. It's clearly shown how the team treat different situation with different principles; hence the decision to solve their complications.

Table 2 Leicester City Engagement Matrix

Situation	Principles	Decision
Normal	No Harm Done – Keep Trying	Business As Usual (Operational)
Tricky	Face 1 by 1 – Focused	Business As Usual (Tactical)
Complex	Do or Die – Calculative yet Simple	Strategic Moved

The team are really onto it since the very beginning where they simply just trying their best to outperform other teams. During this Normal situation (5.1 New Boss, New Approach, 5.2 Great Start and 5.3 With Pizza We Deliver) it's merely kinds of day-to-day operation for Leicester. However when the thing get tough (5.4 New Year, New Perspectives ..., 5.5 Blessing in Disguise and 5.6 An Assertive Viewpoint) Leicester approach are more focused and they start treating each and every team differently. Their "business" has changed from "Operational" to "Tactical" in order to meet the course.

When they entering the end of season their situation has dramatically changed from Tricky to Complex mainly because of the intense of the league itself. Leicester circumstances (5.7 In Defense We Trust! 5.8 Three Points ... Just Three Points More and 5.9 A Tie and a Title) and agony does not help either. At this junction their title contender – Tottenham still have the chance surpassing them provided they scored the maximum available point while Leicester drop a game. The playing field has totally

changed. Leicester need to incorporate Strategic Move in every remaining game. Their slogan has turn into “Do or Die”. A simple plan, which is to avoid any defeat, was establish. Very calculative strategic moves towards their opponent threats.

Table 3 Leicester City Execution Matrix

Situation	Rules	Impact
Normal	Guided	LOW
Tricky	Semi-Guided	MODERATE
Complex	Simplified	HIGH

The above (Table 3) delineates the effect of Leicester City execution as for their system decisions to beat challenges all through the season. As the circumstance changed from Normal to Tricky to Complex; so does the guidelines in their execution methodology. Complex circumstance required a more unwind and rearranged rules contrasted with Normal circumstance that entirely guided. The effect here are fluctuates also whereby the straightforward principles delivering a high effect to the group and supporters. Case in point, the administration straightforwardly announced "Pizza" as their menu for any diversions they won and the supporters can participate in the festival. The activities appear to be next to no however the effects for the solidarity are astonishing.

7 Conclusions

Consequences of execution and engagement are liable to the circumstances in which it is grasped. One methodology and structure can't fit in all situations. In general, right awareness towards a critical fit helps a relationship to see the fitting merger and securing open gateways, which helps it to make higher execution. Skills transferred across different business entity reached it maximum impact when both strategic execution and engagement exists (blended accordingly).

Genuine execution of an engagement is controlled by the technique institutionalization in the utilization environment. In any case, the level of execution may reduce if the use environment variables veer off from their expected behavior. A case of vital fit is shown by computers' maker Dell, which has aggressive procedure to give an assortment of adaptable tablets and PCs at a sensible cost to their clients, however postponed conveyance when contrasted with another organization's in-house offering approach crosswise over entrances and retail outlets (Christopher Calnan.2016). In such case, an inventory network system that guarantees adaptability and responsiveness is a perfect fit for Dell rather than another organization's strategy to create expanded items, with higher expense of managing business (Chopra, S., & Meindl, P.2006).

The alignments between internal and external elements relevant for the company is necessary to create a strategic fit correspond to corporate strategy (Scholz, C.1987). Leicester City success highlights the importance of stimulating both engagement and execution to create value for them. Balancing the two in an appropriate way creates a supportive environment to achieve their mission and goals hence produced the desired outcomes. Viva Leicester!

A Modified Model for the Evaluation of the Academic Conferences' Quality

Sun Zehou, Zheng Zhongxia, Li Jiantao, Zhang Hongmei

School of Management, Wuhan University of Technology, Wuhan, P.R.China, 430070

(E-mail: szh-63@163.com, 281783429@qq.com, 6552388@qq.com, 568539082@qq.com)

Abstract: This paper uses the method of literature review and summarizes the two perspectives of the quality evaluation of the academic conferences, including the perspective of the status of academic conferences and influential factors of the quality, and building and evaluating an evaluation index system for the quality of academic conferences. The evaluation system of American Customer Satisfaction Index (ACSI) is a widely used to evaluate the quality accurately, it is necessary to consider academic conferences as the process of servicing delegates and considering delegates as service consumer, and based on this, this paper establish a modified model.

Key words: Academic conferences; ACSI model; Quality evaluation

1 Introduction

With the increased level of globalization, the development of science and technology in China and abroad is getting increasingly closer, and academic exchange activities also continue to increase. By the end of 2015, 60000 Academic exchange activities were organized by the Association for Science and Society, which had 5.72 million participants and 1000,000 papers were presented. With the increase in domestic and international academic exchanges, the number of associated activities and participants are rising. The organization of academic conferences in China is still developing therefore, most of academic conference themes are not clear, the communication level of participating academic papers and conference reports is not high, and countless problems such as unreasonable organizational formats and agendas always emerge. Although some academic conferences are organized on a large scale, the participants do not get much valuable gains¹. Moreover, some of the academic conferences are organized without considering their academic effectiveness and just for fulfilment of formality. Consequently, these flaws lead to a huge waste of conference resources (Xiao Jianhua, et.al, 2009). According to a survey, the overall quality of academic conferences organized in China is not high and the experience of participants is poor (Chen Shijun, Liu zhou, 2008). Therefore, improvement of the quality of academic conferences has become a significant issue that is faced by researchers, conference organizers and the Association for Science and Society. In order to improve the quality of academic conferences, scientific evaluation of their quality should be made first.

2 Research and Evaluation of the Quality of Academic Conferences

The research on the quality of academic conferences started late in China. At present, research on the quality of academic conferences is mainly classified into two categories: one is focused on the status of academic conferences and influential factors of the quality; the other is focused on building and evaluating an evaluation index system for the quality of academic conferences.

1) Influential Factors of the quality of academic conferences

Liu Xing-ping considered that the quality of academic conferences depends not only on the target system, organizational structure, communication, operational processes and other factors, but also on the level of each factor and the degree of coupling between elements of various factors (Liu Xingping, 2010). Huo Guoqing and others have found that the quality of academic conferences in addition to be related to the use of language is influenced by many other factors like the theme, level of papers, the attitude of representatives and so on (Huo Qingguo et al,2008).

2) Building and evaluation of the evaluation index system for the quality of academic conferences
Liu Guo-wei systematically analyzed the process of academic conferences and proposed that the evaluation index system of the quality of academic conferences should be built by considering five aspects i.e. subject content, the overall level of papers, the level of seminars, and reflections of the participants (Liu Guowei, 1991). Zhang Zi-li evaluated that the quality of conferences is mainly based

¹ Han Qi-de. The speech on the National SocietyConference [EB/OL].

<http://www.cast.org.cn/n435777/n435794/n435819/n1081647/42523.html>, 2007-4-25/2009-04-21

on conference topics, the level and efficiency, the atmosphere and affairs etc. He also proposed that the evaluation should be done according to the type of conference (Zhang Zili, 1991). Based on the principles of fuzzy set theory, Yang Zhi-wen established a multidisciplinary comprehensive quality evaluation system of academic conferences, mainly including the theme, papers, academic communication, data management etc. (Yang Wenzhi, 1992). Yang Min considered using the fuzzy set model for the evaluation is too complicated to operate. He put forward scorecard method of the five indicators of the conference and the level of papers to evaluate the quality of academic conferences (Yang Min, Bi Xiao-jing, 1994).

3 Modification of the ACSI Model

3.1 ACSI model and its application

The evaluation system of American Customer Satisfaction Index (ACSI) is a widely used CSI system designed and improved by Dr. Fornel according to the Swedish Customer Satisfaction Index improved model (SCSB). It is a new type of measurement system focused on the customer to evaluate and improve organizational performance, and is organized and implemented by the American Society for Quality (ASQC), the University Of Michigan School Of Business Administration, and the National Quality Research Center (NQRC) (Wu Jiannan, Zhang Meng, Huang Jiawei, 2007).

Construction of the entire structure of evaluation is based on cause and effect that places ACSI in a chain of causation. The chain of causation starts from early factors like quality expectations, perceived quality and value which influence the customer satisfaction, and ends in customer complaints and/or loyalty (Lin Hui, 2005).

Specifically, the customer satisfaction is determined by feelings of the customer in the purchase and use of the product experience, Product quality and value generating actual experience. If there is low customer satisfaction, it will produce customers' complaints and it will decrease the degree of customer loyalty.

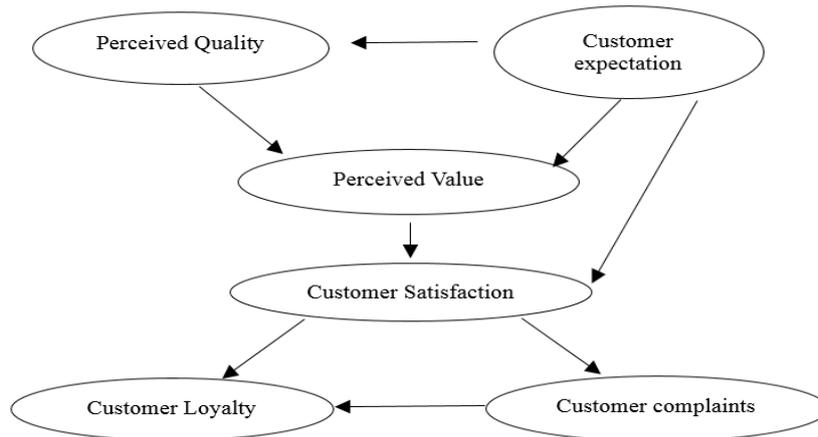

Figure 1 ACSI Evaluation System Diagram

3.2 Modification of the ASCI model and the connotation of variables

We can use the ACSI to evaluate the quality of academic conferences by considering academic conferences as the process of servicing delegates and considering delegates as service consumer. There are similarities between academic conferences and the traditional service, but there are some differences as well. Therefore, if the ACSI model is used in evaluating academic conferences in China, modification of this model is necessary for incorporating its unique characteristics. Hence, factors such as the academic status of organizers and conference level determines that a conference have the ability to generate high level academic papers and reports, propose innovative topics, and attract influential experts and scholars. Considering that the conference level has a relatively great impact on quality expectations, perceived value and satisfaction of delegates, on the basis of the original model we include the conference level as the exogenous variable. The modified ACSI delegates' satisfaction model as shown in Fig.2.

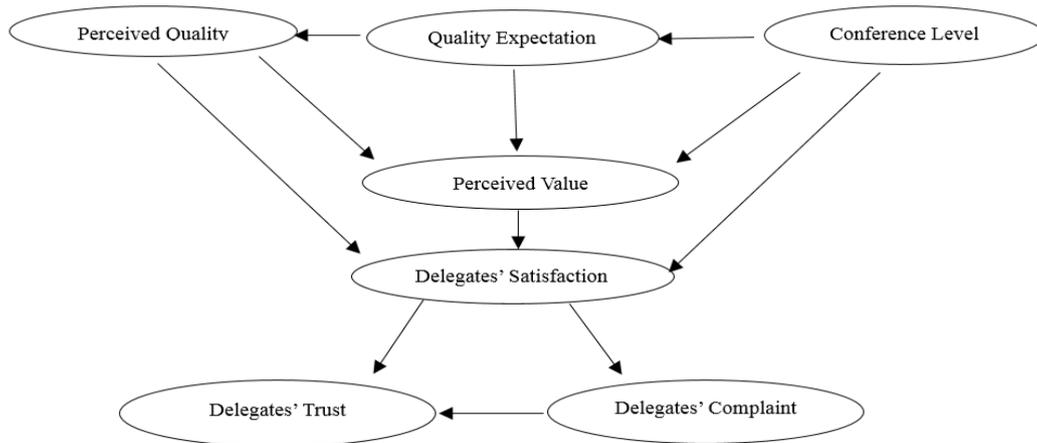

Figure 2 The Modified ACSI Delegates' Satisfaction Model

The delegates' satisfaction model includes two parts: one is measurement model representing the relationship between latent variables and observed variables; the other one is structural equation model indicating a causal relationship between latent variables. Formula for the structural equation model is given as:

$$\eta = B\eta + \Gamma\xi + \zeta \tag{1}$$

In the formula, $\eta = (\eta_1, \eta_2, \eta_3, \dots, \eta_m)$ and $\xi = (\xi_1, \xi_2, \xi_3, \dots, \xi_n)$

are endogenous and exogenous latent variables respectively; ζ is a stochastic disturbance term; η is the unexplained part; $\Gamma(m \times n)$ is the coefficient matrix of the exogenous variables ξ , describing effects of the exogenous variables ξ to endogenous variables η ; $B(m \times n)$ is the coefficient matrix of endogenous variables η , influencing each other; m is the number of endogenous latent variables, and n is the number of exogenous latent variables, and $E(\xi) = E(\zeta) = E(\eta) = 0$.

The latent variable expression of delegates' satisfaction model is given as formula (2):

$$\begin{bmatrix} \eta_1 \\ \eta_2 \\ \eta_3 \\ \eta_4 \\ \eta_5 \\ \eta_6 \end{bmatrix} = \begin{bmatrix} 0 & 0 & 0 & 0 & 0 & 0 \\ \beta_{21} & 0 & 0 & 0 & 0 & 0 \\ \beta_{31} & \beta_{32} & 0 & 0 & 0 & 0 \\ 0 & \beta_{42} & \beta_{43} & 0 & 0 & 0 \\ 0 & 0 & 0 & \beta_{54} & 0 & 0 \\ 0 & 0 & 0 & \beta_{64} & \beta_{65} & 0 \end{bmatrix} \begin{bmatrix} \eta_1 \\ \eta_2 \\ \eta_3 \\ \eta_4 \\ \eta_5 \\ \eta_6 \end{bmatrix} + \begin{bmatrix} \gamma_{11} \\ 0 \\ \gamma_{31} \\ \gamma_{41} \\ 0 \\ 0 \end{bmatrix} \xi + \begin{bmatrix} \zeta_1 \\ \zeta_2 \\ \zeta_3 \\ \zeta_4 \\ \zeta_5 \\ \zeta_6 \end{bmatrix} \tag{2}$$

While, The exogenous latent variable ξ = conference Level, the endogenous latent variable η_1 = quality expectations of delegates, the endogenous latent variable η_2 = perceived quality, the endogenous latent variable η_3 = perceived value, the endogenous latent variable η_4 = delegates' satisfaction, the endogenous latent variable η_5 = delegates' complaint, the endogenous latent variable η_6 = delegates' trust.

The model of exogenous observed variables:

$$X = \lambda_x \xi + \delta \tag{3}$$

X is the vector of 2×1 , which is two observed

variables of the exogenous latent variable ξ ; λ_x is the matrix of 2×1 , which is a matrix composed of observed variables and latent variables; ξ is the vector of 1×1 , the exogenous latent variable; δ is the vector of 2×1 , which is the measurement error of observed variables influencing exogenous latent variables.

The formula (4):

$$\begin{bmatrix} X_1 \\ X_2 \end{bmatrix} = \begin{bmatrix} \lambda_{11} \\ \lambda_{21} \end{bmatrix} \xi + \begin{bmatrix} \delta_1 \\ \delta_2 \end{bmatrix} \tag{4}$$

X_1 is the influence depth and level of academic conferences; X_2 is the academic status of organizers in the field.

The model of endogenous observed variable:

$$Y = \lambda_y \eta + \varepsilon \tag{5}$$

Y is the vector of 25×1 , which is the observed variable of endogenous latent variable η ; η is the vector of 6×1 , which is 6 endogenous latent variables; λ_y is the matrix of 25×6 , which is the impact factor of observed variables and endogenous latent variables; ε is the vector of 25×1 , which is the measurement error of observed variables influencing endogenous latent variables.

The delegates' satisfaction is consistent with the calculation of ACSI method, as shown in formula (6).

$$CSI = \frac{E[\xi] - \min[\xi]}{\max[\xi] - \min[\xi]} \times 100 \tag{6}$$

In the above formula, ξ (the η_4 in the formula (2) is the latent variable of the delegates' satisfaction, $E[\xi]$, $\min[\xi]$ and $\max[\xi]$ respectively represent the expected value of variables i.e. the minimum and maximum values.

Formula (7) and (8):

$$\min[\xi] = \sum_{i=1}^n \omega_i \min(x_i) \quad (7) \quad \max[\xi] = \sum_{i=1}^n \omega_i \max[x_i] \tag{8}$$

In the formulas, x_i is three observed variables of the delegates' satisfaction, which are delegates' satisfaction on the overall quality of conferences, the conference's satisfaction compared with the expectation, and the conference's satisfaction compared to the idea of conference; n is the number of measured variables; ω_i is the weight; the scope of the delegates' satisfaction is [1,10]. Because numbers in the scope are non-standard measuring values, weights in the formula are calculated by non-standard weights, and the calculation formula can be simplified to the formula (9):

$$CSI = \frac{\sum_{i=1}^3 \omega_i \bar{x}_i - \sum_{i=1}^3 \omega_i}{9 \sum_{i=1}^3 \omega_i} \times 100 \tag{9}$$

By specifying measurement of the satisfaction of conference through the participants only, we create an evaluation model focused on the "delegates' satisfaction". The core values of academic conference are; the spread of academic information, the realization of knowledge sharing, and the promotion of scientific and technological innovation (Xiao Jiahua, etal, 2009)^[3]. Therefore, in addition to structural variables of the ACSI itself, this paper adds other indexes in the ACSI model system, such as conference's organizational level, the level of papers and reports, participating costs of delegates and so on. The evaluation index system of the delegates' satisfaction is shown in Tab. 1.

Table 1 Evaluation Indicators of the Delegates' Satisfaction

The secondary indicators	The third indicators
Conference level ξ	x1= The influence depth and level of academic conferences x2The academic status of organizers in the field
Conference quality expectations η_1	y1=Before attending, overall quality expectations y2=Expectations for the conference organization and hardware facilities y3=Expectations for the degree of preparation and the agenda y4=Expectations for the academic and democratic atmosphere y5=Expectations for academic papers and reports y6=Expectations for the theme y7=Expectations for research achievements in related fields y8=Expectations for the ability to resolve the pending issues in related fields
Conference quality perceptions	y9=After attending, the overall quality Perceptions y10=Perceptions for the conference organization and hardware facilities

Delegates' trusts η_6	y24=The possibility of recommending colleagues or peers to attend y25=The possibility of participating again

4 Conclusions

This paper focuses on establishing a modified ACSI model to evaluate the quality of academic conferences. To incorporate Chinese unique characteristics, the modified model contains the following factors: perceived quality, quality expectation, conference level, perceived value, delegates' satisfaction, delegates' trust, and delegates' complaint (shown in Figure3).

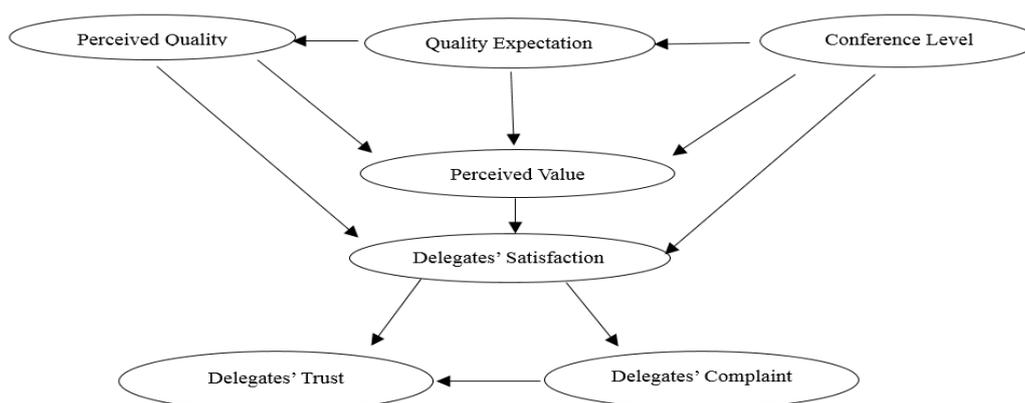

Figure 3 The Modified ACSI Delegates' Satisfaction Model

As an applied research of the ACSI model, the research aims to find a method suitable to evaluate the quality of academic conferences. However, there is no empirical method in this paper, and further research is needed to testify the reliability and representativeness of the index system. With the development of the quality evaluation system for academic conferences we can gradually establish a database of the quality of academic conferences on regional and national level which can improve the quality of academic conferences.

Abstract: Under generally social background of fierce employment competition at present, “mass entrepreneurship and innovation” has been regarded as a new engine of economic development in China, presenting a new pattern, a new type of operation and a new highlight of economic development. This article is based on researches of predecessors and puts forward that knowledge is the basis, ability is the core and character is the guiding direction of innovation quality of college students. Meanwhile the paper thinks that knowledge, ability and character are three dimensions of innovation quality, building the paths to improve innovation quality of college students “through correct values to shape good character of college students, through innovative practice to promote mutual transformation of knowledge and ability and through humanistic quality education to promote integrated development of college students”. It concludes that the improvement of innovation quality of college students “not only needs government, school and family to create good conditions but also needs college students to extend individuality in self-education and self-cultivation”.

Key words: Innovation ability; College students; Knowledge; Ability; Character

1 Introduction

The concept of “innovation” is first proposed by the American-born Austrian economist J.A. Joseph Alois Schumpeter in the book “Theory of Economic Development” in 1912. In recent years, many scholars have study on “innovative quality” and some of them think that innovative quality of human is resulted from interaction of several factors, which include individual's intrinsic motivation, innovation ability and skills as well as knowledge and abilities in related fields (Ambile, 1983). American scholar in mental development John Chaffee proposed the five methods to cultivate innovative quality: fully and further discuss creative environment, try to develop the best state of mental resources, make efforts to promote the production of creative thinking spark, reserve time for making creative thinking, timely catch and track the creative thinking spark (John Chaffee, 2001). From the general constitution of innovative quality, Zhang Shuchun divides the universal creative quality into five contents, including basic skills, innovative thinking ability, practical ability, innovative spirit and innovative personality (Zhang Shuchun, 2007). Chen Hong thinks that innovative quality is the core of talent quality, consisting of three basic elements, such as innovation consciousness, innovation ability and innovation personality (Chen Hong, 2009). Xie Chenlan and Wang Yan conclude the content of innovative quality into three aspects of innovation awareness and innovative thinking, professional scientific innovation ability and innovation personality traits (Xie Chenlan, Wang Yan, 2012). According to national strategic deployment, universities of China are positively exploring law of growth of innovative talents and carrying out cultivation of innovative talents. However, theoretical problems such as the composition of innovation quality of college students and how to improve innovation quality of college students very important for innovative talent training need further investigation. This article tries to analyze structure of innovation quality of college students, builds paths to improve innovation quality of college students and provides theoretical reference for innovative talents training of China.

2 Structure of Innovation Quality of College Students

It is well-known that comprehensive quality of people is a multi-layered and complicated system structure of “all around development of moral, intellectual, physical, aesthetics and labor education” and embodied in knowledge, intelligence, technology, ability, mentality, physical power, emotion, thought and morality. At present, it is impossible to use unified and accepted developmental standard to standardize quality structure of a people. Scientific research shows that various types of talents with comprehensive quality required by the society can be shaped through modern scientific education. “Quality is the integration of relatively stable accomplishments such as knowledge, ability and character of individuals formed and developed under combined action of influence factors such as congenital physiological basis and acquired environment and education.” Innovative knowledge, innovation ability

and innovative character naturally form structure of innovation quality of college students, namely three dimensions of innovation quality of college students. They are relatively independent and interpenetrate. Knowledge is the basis, ability is the core and character is the guiding direction of innovation of college students.

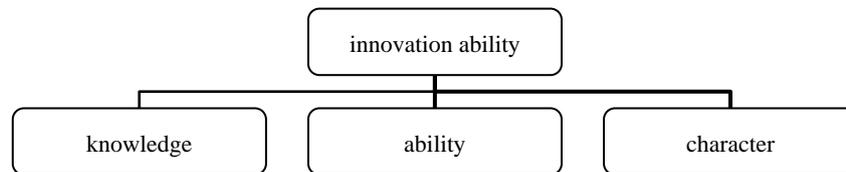

Figure 1 Structure Chart of Innovation Quality

2.1 Knowledge is the basis of innovation of college students

As achievement of human perception, knowledge plays an important role in breeding of human being and social development process, as a concentrated expression of spiritual civilization of human being. The conception of knowledge is always one of the themes of academic exploration of human being. Because knowledge is multidimensional, complicated and uncertain, and the connotation is extended continuously, people have not reached a consensus on it. Up to this day, there is not a universally accepted definition of knowledge. Understanding of researchers in different fields on knowledge is different. One of the reasons is that it lacks “restriction” on knowledge, without a core domain and research basis. Innovation bases on profound knowledge of human being. In the process of innovation practice activities, human beings ceaselessly break through existing cognition. As a special social group, college students have the advantage that they have solid professional knowledge, which is the basis of innovation of college students as well as core competitiveness of innovation. According to development experience of foreign countries, “scientific and technological innovation and knowledge innovation of college students are important forces to promote structural transformation of the economy and drive the progress of social economy”. Besides, open mind of college students can help them to learn related knowledge on business, management and law to a large extent.

2.2 Ability is the core of innovation of college students

Many countries have focused educational reform on training of students’ ability since the 1990s. As essential power of people, ability contains knowledge and character of a person. However, in different historical background, the connotation endowed by the society on people is different, too. In modern society, knowledge economy begins to take shape. Multiple intelligences burst out freely. Core technology is venerated by people. Ability will become important condition to produce knowledge and innovate in technology. It is embodied in ability of people to respond to nature as well as creatively break through all sorts of bottlenecks in practice process (Yang Jie, 2014). “Ability” is the substantive characteristic of “what makes us human”. Ability includes many aspects with multiple layers and has close relationship with external existence, life and development of people as well as awakening, production and satisfaction of inner consciousness of people. For college students, it is also the same. Education experience of different college students may be similar and professional knowledge and technology reserved by them is also similar, but the innovative results may be totally different. Tracing to its source, the “ability” plays a vital role. The ultimate purpose of innovation education is not to let students master more and more knowledge. After receiving knowledge, students only have materials for innovation. The key is to extract, analyze, select and classify related knowledge, and then reprocess and reproduce through appropriate compound, recombination and adding new components. This process is very important for improving innovation ability of college students. Improvement of ability is the essential embodiment of individual innovation development, the core of innovation quality of college students. In practical activities of innovation, it is embodied as self-survival and self-development. It is the ability to smoothly realize innovation objective and self-conscious response to conform to the era of knowledge economy.

2.3 Character is the guiding direction of innovation of college students

Character is not a new vocabulary. Since the time of Ancient Greece, one of the responsibilities of education is to let people become smart and better and focus on shaping character. “Genius is always worshipped by people, but character can win respect of us. The former is rich fruit of superior intelligence; the latter is achievement of noble soul. However, in the long run, soul is the master of man’s life. Geniuses win social status by virtue of their intelligence, but people with noble character gain reputation with their conscience.” “Teaching wisdom instead of teaching morality is like cultivating

the root of the trouble.” “Talent” and “wisdom” here mean that this man is very smart and brilliant, and mainly refer to “knowledge and ability” mastered by people. “Morality” focuses on “ideology and morality and ideological character” of people. In the final analysis, it refers to “character” of a people. Sima Guang makes incisive explanation in his work of History as a Mirror, “Ability is the support of morality; morality dominates ability”. Confucius says, “If simplicity surpasses literary talent, people become crude. If literary talent surpasses simplicity, people become superficial. Gentleman shall have proper temperament and etiquette. ... People take righteousness as the noblest moral character. If people have foolhardiness without righteousness, they will rise in revolt. If vile characters have foolhardiness without righteousness, they will steal.” Here, the “literary talent” refers to “knowledge”. “Foolhardiness” refers to “ability”. “Simplicity” and “righteousness” refer to “character”. Gentleman shall have matched knowledge, ability and character. It is exactly the same as “equal stress on integrity and ability” and “taking morality as first” frequently mentioned by us. Knowledge and ability become different forces if they are mastered by different people. It involves character of people. If people have knowledge and ability but without good character, especially for high-level talents, such as college students, if they lack morality, the more knowledge they grasp, the stronger ability they have and the more dangerous they will be, even become disaster. Knowledge and ability must be restricted by character. Character guides direction for innovation quality of college students as well as important guarantee for sustainable development of college students.

3 Paths to Improve Innovation Quality of College Students

Main path to improve innovation quality of college students is to carry out innovation education. Innovation education is to solve problems of life purpose and meaning of college students fundamentally. Innovation education focuses on letting college students set up correct values and shaping good innovative character, promotes mutual transformation of knowledge and ability through innovative practice and strengthens humanistic quality education and facilitates comprehensive development of college students.

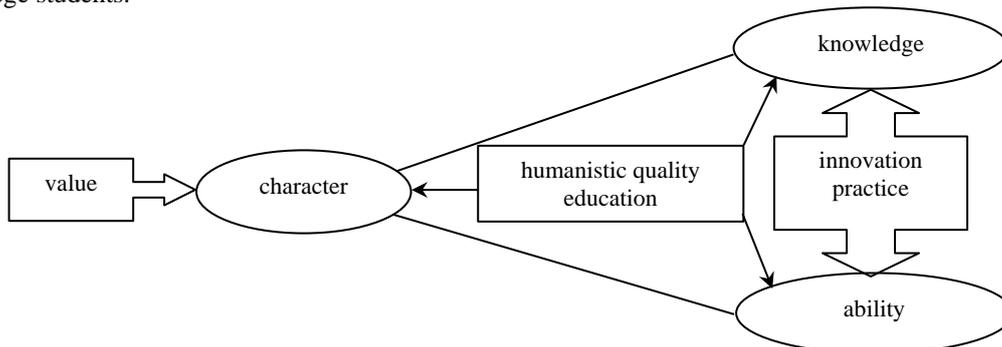

Figure 2 Path Diagram of Improvement of Innovation Quality

3.1 Set up correct values and shape good innovative character of college students

During transformation period of society, in real life, many “talented people” pursue personal petty profits, do not honor credibility and lack morality, swindle and bluff, even do things through violating the law and discipline at the cost of sacrificing national interest. When college students see funny business, they will be influenced, lack countermeasures and become “confused”. As time passes, they gradually lose “ego”, make original ideal and faith begin to shake, lose lively personality, give up the construction of self-spiritual home and go with the stream in collective unconsciousness. In the final analysis, the values go wrong. Innovation activities have close relationship with various interests, with many temptations. Values are “calcium” of college students on the way to innovation. Without correct values, the “ideal and faith” of college students will become infirm. College students will “lack calcium” and suffer from “chondropathy” and do harm to the society. Setting up correct values can help college students to cultivate good ideological and ethical standards, correctly analyze, judge and make decisions on the road to innovation and deal with relations between individual and society, individual and nation, individual and collective, reality and ideal as well as interest and morality in future development, comply with social morality, honor credibility, observe law and discipline and shape good innovative character. The process of shaping of college students’ innovative character is also the process for them to unceasingly correct their understanding for innovation. It requires college students to recombine their

ideal and faith, find and affirm meaning of self-value in real life and continuously position themselves in society. In this process, college students shall establish corresponding innovative knowledge and innovation ability as well as acquire due attitude, emotion and value, connect personal lifecycle with innovation activities, choose “pure, noble and moral” innovative manner, experience meaning and value of life in innovation practice, pursue happy life and excellence and then continuously reach ideal state with improvement of innovation quality of college students under the background of “mass innovation”. Heidegger says that the existence of people is survival. A person shall live “like this”. To live is survival. “Like this” means the process of continuous production, self-creation and self-actualization. Base on true meaning of people, depend on understanding of life meaning, integrate college students with living world of innovation, and then change quality of college students into language of living practice (Li Qingyan, Yi Lianyun., 2009).

3.2 Pay attention to innovation practice and promote mutual transformation of knowledge and ability

Knowledge and ability have difference and connection, with mutual penetration and connection. Knowledge itself does not represent ability, but refer to basis of ability. The main purpose of learning knowledge is to form and develop ability. Meanwhile, the formation and development of ability also need the support of knowledge. Innovation activities have characteristics of strong practicality, wide sociality and big comprehensiveness and involve knowledge of many disciplines as well as need very strong ability to finish. But the energy of a person is limited. It is unrealistic also impossible to master all knowledge and ability. The selection of knowledge that needs to be used in innovation process shall base on actual requirements. It requires college students to apply their knowledge, practice while learning and improve ability to learn. From the perspective of current situation of higher education, “scissors difference” exists between theoretical knowledge mastered by college students and practical ability. That is to say, the theoretical knowledge mastered by them is superior but the level of practical ability is relatively low. Practical ability lags behind mastering of theoretical knowledge. Obvious degree of difference often exists between theoretical knowledge and practical ability. To achieve successful innovation, except for essential theoretical knowledge, college students must have innovation ability, which is the key to decide successful innovation of college students. It involves mutual transformation of knowledge and ability. Practice is the effective method for mutual transformation of innovative knowledge and innovation ability. In implementation process of innovation practice, it contains knowledge and experience of the world and people as well as value orientation of character and morality. Both of them are integrated and embodied in practical ability of people. In the process of innovation practice, college students will inevitably contact with real situation, understand all kinds of situation and encounter various difficulties and show “unification of value concern about ‘what should I do’ and rational question of ‘how should I do’” in the process of getting out of trouble and overcoming difficulties. Finally, college students gain experience that “knowledge and ability can realize mutual transformation”, and train real ability to deal with problems. For this purpose, on one hand, schools shall pay close attention to practical requirements of college students, add scene of social practice to classroom teaching design, establish effective model of innovative practice, confront real and complicated practical problems faced by innovation, and set up various forms of cooperative relationships with government, enterprise and association and enrich practical experience of college students through forms of “invite in” and “send out”; on the other hand, attach importance to close combination of theoretical knowledge and practice, help college students to timely and effectively integrate theoretical knowledge in innovation practice and promote mutual transformation of knowledge and ability through application of theoretical knowledge in practice.

3.3 Strengthen humanistic quality education and promote comprehensive development of college students

With progress of science and technology, material life of people becomes increasingly rich. “Irresponsible generation” appears in real life. They blindly indulge in a life of pleasure and comfort and pursue money, without strong social responsibility, only know to pursue material benefits and enjoy achievements brought by science and technology but do not know what they can do for the society. The root cause is education. Because we “pay attention to science and knowledge and think little of humanity and ability” for a long time and lack humanistic education, we cultivate not few talents “with knowledge but without ability and culture”. The report of Education—Contain Wealth written by International Committee for Education in 21st Century for “UNESCO” requires schools to strengthen humanistic quality education and improve moral standards of students as well as to enhance social responsibility. Humanistic quality is also called cultural quality. It is the general performance of inner

self-restraint and temperament and external spiritual style and the basis of all qualities. Humanistic quality education means internalizing excellent cultural achievements into personality, temperament and culture and relatively stable intrinsic character of people through knowledge teaching and edification in environment (Hu Xianzhang, Xu Baogeng, Yuan Dening, 2009). Humanistic quality education that comes from development of people can arouse desire of students for innovation and self-awareness, effectively stimulate creative potential and innovate in inner driving force and make college students actively devote to innovation activities (Chen Hang, 2015). “Building of nine layers begins with a handful of earth”, the bigger and thicker the base, the higher the building will be. For students, in order to complete historical mission of “innovation”, without good humanistic quality as the basis, it is difficult for the building of college students to become high; even it is very high, it is easy for wind to blow it down. Therefore, it is necessary to strengthen humanistic quality education of college students, train humanistic spirit of college students, help college students to perceive survival wisdom and realize correct self-cognition, strengthen their social responsibility and make them become harmonious people with integrated development.

4 Conclusions

On Contradiction of Mao Zedong tells us that factors that decide development and changes of things include internal cause and external course. Internal cause is the basis and external cause works through internal cause. Government, school and family shall take powerful measures to strengthen innovation education, create dense innovation atmosphere, and use wisdom of culture and ecology to guide students to think, perceive and understand in it, lead them to purify soul, sublimate personality and carry out self-cognition, self-evaluation and self-improvement and then promote integrated development of them. College students shall integrate good conditions created by society, school and family with self-cultivation, extend individuality in self-education and self-cultivation and make efforts to realize self-transcendence and self-fulfillment as well as unceasingly improve innovation quality of their own. There are diversified methods and patterns to improve innovation quality of college students. The article only makes preliminary analysis and discussion. The issue on improvement of innovation quality of college students also needs us to keep pace with the times and implement continuous innovation.

Figure 3 Figure of Factors Influencing Innovation Quality

Research on the Optimization of the SECI Model of Knowledge Learning of Leading Cadres in Colleges and Universities and the Design of Its Assessment Mechanism

Sun Yazhong

Organizational Department of CPC, Wuhan University of Technology, Wuhan, P.R.China, 430070
(E-mail: sunyazhong@whut.edu.cn)

Abstract: This paper reveals the importance, necessity and the urgency of knowledge learning of leading cadres in colleges and universities under the background of the deep reform of the new era. Meanwhile, it presents the guiding function of the classical Leadership Competency Model, SECI Model and Kirkpatrick Model for knowledge learning. Based on the characteristics of higher education and the characteristics of knowledge learning of the leading cadres, this paper optimizes the SECI Model and Kirkpatrick Model and puts forward the operating mechanism of the optimized models.

Key words: Leading cadres in colleges and universities; Knowledge learning; SECI Model; Kirkpatrick Model

1 Introduction

The knowledge learning of leading cadres is a process that they are obtaining knowledge, enhancing quality, and improving behaviors in order to better integrate into the organization and the environment, and finally realize their benign development (Guoquan Chen & Lan Li, 2009). Knowledge learning of leading cadres can change the learning atmosphere of the organization, stimulate members within the organization to learn more (Yuklg, 2009), and then improve the group performance of the organization (Hirst, 2004). The importance of knowledge learning of leading cadres for individual and organization has been widely acknowledged by scholars and researchers home and abroad. Systematical researches have been done by them, including the research on the prerequisite knowledge structure of leading cadres, the research on the influence mechanism of knowledge learning of leading cadres on organizational performance etc. At present, the relationship between universities and society has experienced great changes. Meanwhile, the internal management structure of universities urges for optimization continuously. As a result, leading cadres in colleges and universities shoulder more responsibilities and are confronted with more difficult missions. In this context, it is essential for the leading cadres in the higher education to improve their political quality through learning the theories like the socialist core values system, and to enhance their professional skills through knowledge learning. However, the problems regarding to whether the classical SECI Model and the Kirkpatrick Model can effectively guide the knowledge learning of leading cadres in the higher education have never been solved yet. So, this paper optimizes the SECI Model and the Kirkpatrick Model based on the characteristics of higher education and the characteristics of knowledge learning of its leading cadres, attempting to reveal the micro-mechanism of knowledge learning of leading cadres in higher education and to utilize the mechanism to guide the practice of knowledge learning effectively.

2 The Theoretical Foundation of Knowledge Learning of Leading Cadres in Colleges and Universities

2.1 Leadership competency model

General leadership theories emphasize leaders' personality characteristics, while Leadership Competency Model theory attaches greater importance to their behavior and performance when they are at work (Chung-Herrera et al., 2003). The leadership competency of leading cadres in higher education embodies in "doing things right" and "doing right things", however, this leadership competency need them to improve the dimensions and levels of certain ability continuously through systematical knowledge learning. The connotation of Leadership Competency Model theory put forward by the academic world differs from one another, but it is widely believed that different competency leads to different working effects. Leadership Competency Model theory believes that the only and perfect learning method and test standard of knowledge learning has never existed, so the research results about the dimensions and levels of knowledge learning of leading cadres in higher education related to the Leadership Competency Model can not be accepted totally. From the perspective of Leadership Competency Model theory, the practice of knowledge learning that aims at raising the ability of leading

cadres in higher education, should not be restricted to constructing integrated competency model, but to examine the systematicness and effectiveness of knowledge learning (Hollenbeck, et al, 2006). In fact, the knowledge learning of leading cadres has specific goal in specific tasks, so the practice of knowledge learning of leading cadres in higher education should have a focus and be qualified with diversity and pertinence (Hollenbeck et al, 2006). Some scholars shared the opinion that knowledge level exists as a part of Leadership Competency Model and the application of knowledge itself can be seen as a kind of ability. Therefore, it is possible for leading cadres in the higher education to improve their ability through the necessary and effective knowledge learning.

2.2 SECI model

In the classical knowledge learning model of SECI designed by Ikujiro Nonaka and Hirotaka Takeuchi, explicit knowledge and tacit knowledge can transmute into each other through four kinds of patterns, that are socialization, externalization, combination and internalization. According to the classical SECI Model, the leading cadres in the higher education need to strengthen the knowledge learning with the common characteristics, like education management, education economics, organizational behaviors etc. in order to realize the accumulation and quantitative variation of explicit knowledge. Meanwhile, they should summarize, refine and sublimate the knowledge mentioned above by considering the characteristics of higher education in the new era in order to form the tacit knowledge with the characteristics of pertinence, particularity and specificity. Through the tacit knowledge of the leading cadre in the colleges and universities, such as the party spirit faith, the political and self-discipline consciousness etc., is internalize in minds and externalize in behaviors, it is necessary to advertise and popularize the tacit knowledge by various kinds of methods. In the practice of knowledge learning of leading cadres in higher education, the forms like past experience communication, mental model sharing, mutual learning are commonly utilized. These forms help to reveal the techniques and skills that cannot be expressed by words, and subsequently the new tacit knowledge will generate, realizing the transformation from explicit knowledge to tacit knowledge. According to the SECI Model, the knowledge learning must establish under the suitable "condition" and "platform" (Nonaka, et al, 2000), including the condition for internal and external knowledge learning and the learning platform of online and offline in the era of the Internet. With the help of the suitable "condition" and "platform", the learning cadres can realize the transformation of explicit knowledge and tacit knowledge through instructive learning, reflective learning and interactive learning.

2.3 Kirkpatrick model

The Kirkpatrick Model was proposed by professor Donald.L.Kirkpatrick in 1959, it comprehensively assesses the efficiency and effectiveness of training through the level of reaction, learning, behavior, and result. Training is a process that teaching and learning supplement each other and benefit each other. Though the training evaluation model focuses on the evaluation of teaching and training, we should admit the fact that to certain extent, the teaching effect equals the learning effect. As a result, it is safe to say that the Kirkpatrick Model can also be utilized to guide knowledge learning of leading cadres in the higher education. To be specific, the Kirkpatrick Model includes four aspects that are, subjective feeling, objective numbers, practical application and value transformation (Bates, 2004). From the perspective of Kirkpatrick Model, the assessment of knowledge learning has a premise, that is, the leading cadres in the colleges and universities should be satisfied with trainers, training theme, training method, training place etc. Knowledge learning starts with the goal of achieving the knowledge with expected quality, stops at the application of the knowledge been learned, aims at solving the problems the leading cadres of higher education confronted in their work, and finally changes the leading cadres' working behaviors and improving the productivity. The Kirkpatrick Model not only can help to evaluate the training efficiency, but also can be utilized to judge the effectiveness of learning. Based on the analysis above, the knowledge learning of leading cadres in higher education should take personal preference for knowledge as well as organizational value orientation of knowledge into consideration (Farjad, 2012). The knowledge learning of the leading cadres in higher education is a system engineering, covering the object, behavior, process and result of knowledge (Tian, 2015). None of the elements, stages and connection joints of knowledge learning can be ignored. Only in this circumstance, can the evaluation of knowledge learning of leading cadres in the higher education be scientific and effective.

3 The Multiple SECI Model of Knowledge Learning of Leading Cadres in Colleges and Universities.

According to the demands of reformation in educational field, higher education management need to attach greater attention to efficiency and fairness, balance the relation between reform and stability, and emphasize mass education as well as elite education. Moreover, it is essential for management department of higher education to adopt innovative measures based on the new relationship among government, school, and society, the new characteristics of students, and the new demands for talents. Under this circumstance, the explicit and implicit knowledge that the leading cadres in the higher education needed to finish their job is equipped with the characteristic of timeliness, situationality and unicity. Therefore, the classical SECI Model can not satisfy the demands of knowledge learning of leading cadres in colleges and universities, and it is very necessary to optimize the classical SECI Model, as seen figure 1 and figure 2.

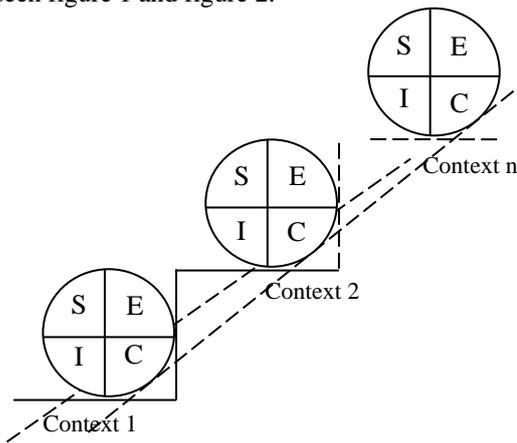

Figure 1 The Optimized SECI Model 1

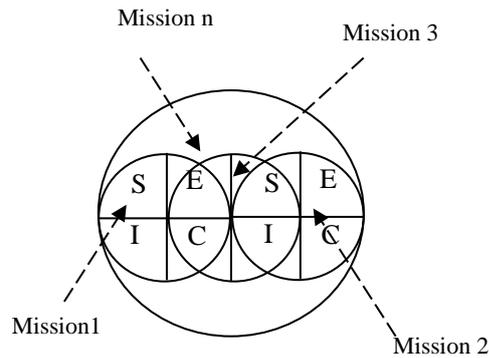

Figure 2 The Optimized SECI Model 2

As seen in figure 1, the knowledge learning of leading cadres in colleges and universities should apply the continuously optimized SECI Model according to the different and escalated problem context. In the new era, the anti-corruption situation in higher education is still very grim, and the accident-prone links of integrity risk continue to upgrade. Colleges and universities still shoulder historic missions and heavy responsibilities of teaching, researches and social service in years to come. It becomes increasingly more important for them to satisfy parents, employing unit, teachers, students etc., and the systematicness of the leading cadres to coordinate the internal and external economic, social and political environment is continuously flourishing. In response to the situation mentioned above, the comprehensive knowledge including administration knowledge, education management, education economy etc., that the leading cadres possessed become increasingly more complex and more comprehensive. So, it is very necessary to upgrade and transform the knowledge accordingly. The optimized model of SECI shown in figure 1 is a multiple SECI Model established on the basis that the explicit and implicit knowledge that the leading cadres possessed continue to upgrade. The operating mechanism of the multiple SECI Model can be listed as follows.

1) Evolution of knowledge state. In different context, it is very essential for the leading cadres in the colleges and universities to promote the evolution of their knowledge state as job mobility raises new requirements for their knowledge and their pre-existing knowledge is experiencing the process of being forgotten. Moreover, it should be mentioned the fact that the value of the knowledge they have is continue to decrease, which makes the evolution of knowledge state more important and more valuable. As shown in figure 1, though the four transformation modes of knowledge (socialization, externalization, combination, and internalization) in different context share the similar form, the initial state of the knowledge transformation in the different context is basically different, and it is a kind of evolution process from socialization to internalization.

2) Knowledge stickiness breakthrough. The characteristics of knowledge stickiness make it very hard for the leading cadres in higher education to transform their knowledge from one context to another. The multiple SECI Model is aimed to break the limit of knowledge application, decrease the ambiguity of knowledge dissemination, and shorten the retardance of knowledge assimilation and transformation. Finally, it can realize the free switch among the four knowledge transformation modes (socialization, externalization, combination, and internalization) in specific context. Therefore, the multiple SECI Model is a rational description of knowledge transformation process that established on the

breakthrough of explicit and implicit knowledge.

3) Upgrading of knowledge energy level. The four different knowledge transformation modes (socialization, externalization, combination, and internalization) shown in figure 1 are in different energy state. Relatively speaking, the simpler the situation the leading cadres in higher education faced, the simpler the contradictions and conflicts they confronted will be. In this context, the knowledge that the leading cadres possessed will present obvious generality and universality and the knowledge ability of the leading cadres shown in SECI Model will be lower. Motivated by the working enthusiasm in education, affected by the specific target and mission, and guided by the pursuing of the answers of specific problems, the leading cadres are highly motivated to promote the upgrading of their knowledge energy level in the process of knowledge learning.

Different with the optimized SECI Model in figure 1, the optimized SECI Model of knowledge learning in figure 2 is the multiple SECI Model constructed under multiple missions. The explicit and implicit knowledge that the leading cadres in colleges and universities possessed has the quality of relativity. For example, the implicit knowledge related to the students' management and communication often manifests as explicit knowledge when communicating with teachers. The implicit knowledge about the management of lower grade students often manifests as explicit knowledge when managing the higher grade students. To be specific, the operating mechanism of the multiple SECI Model shown in figure 2 manifest as follows.

1) Overlap of multiple missions. The multi-dimensional goals of educational quality, scale and benefit in higher education require higher education management continue to pursue the pareto optimal state. The leading cadres in higher education shoulder the responsibility of researching teaching as well the responsibility of administration management. For them, the academic thinking does not equal with administrative thinking. Though some leading cadres' research areas and the administrative work they are responsible have some obvious overlap, the mission of these two areas is often relatively independent. In this context, the leading cadres must know how to realize the SECI transformation of explicit and implicit knowledge that across different tasks. As seen in figure 2, the mission 1 and mission 2 are relatively independent with each other, and when they are involved in the same mission, it is essential to realize the function of the knowledge of socialization, externalization, combination, and internalization and their combination.

2) Cross-border flow. In figure 2, there exist the situation of mission overlap (the situation that SECI with different missions partly overlap with each other) and the situation that mission cross the border (the situation that SECI with different missions tangent with each other). For the second situation, the knowledge that across the border shares the uncertainty of explicit knowledge and implicit knowledge, and it is possible to realize the transformation among the mode of socialization, externalization, combination, and internalization according to the specific requirement of particular mission. Colleges and universities themselves are the clusters for knowledge creation and dissemination and the multiple roles that leading cadres play and the multiple responsibilities they shoulder provide the prerequisite for cross flow of knowledge.

4 The Optimization of the Evaluation Model of Knowledge Learning of Leading Cadres in Colleges and Universities.

By applying the classical Kirkpatrick Model and taking the characteristics of multiple SECI Model of knowledge learning of leading cadres in colleges and universities, this paper design the evaluation model of knowledge learning accordingly.

Table 1 The Evaluation Table of Knowledge Learning of Leading Cadres in Colleges and Universities

Content of Kirkpatrick Model		Knowledge learning evaluation		Knowledge learning evaluation of leading cadres in colleges and universities based on the multiple SECI Model
Reaction evaluation	→	Subjective cognition of knowledge	→	Validity of cognitive classification of explicit knowledge and implicit knowledge
Learning evaluation	→	Knowledge acquire	→	Transformation between explicit knowledge and implicit knowledge
Behavior evaluation	→	Transformation from knowledge to behavior	→	Application of SECI of explicit knowledge and implicit knowledge
Result evaluation	→	Value creation of knowledge	→	Hypercyclicity of SECI of explicit knowledge and implicit knowledge

1) Validity of cognitive classification of explicit knowledge and implicit knowledge. The first level

of Kirkpatrick Model is for the reaction evaluation, to be specific, the trainees judge the subjects, mediums, methods, and channels of knowledge dissemination initially. From the perspective of the subject (the trainees) of knowledge learning, the Kirkpatrick Model focuses on the external factors that influencing knowledge learning, not on the knowledge itself. So, the evaluation of the first stage of knowledge learning of leading cadres in colleges and universities is based on the subjective cognition of explicit and implicit knowledge. And it is necessary to scientifically classify explicit knowledge and implicit knowledge by taking the situation and mission into consideration. From the perspective of multiple SECI Model, the focus of knowledge learning evaluation in the first stage is that whether the leading cadres in colleges and universities effectively and efficiently understand and accept the explicit and implicit knowledge. The answer to this question decides whether the leading cadres can flexibly and efficiently utilize the knowledge in subsequent knowledge learning.

2) Transformation between explicit knowledge and implicit knowledge. The evaluation of knowledge learning of leading cadres in the second stage based on multiple SECI is different with that of Kirkpatrick Model. The Kirkpatrick Model was utilized to judge the acquired knowledge objectively, and it focuses on whether the amount and quality of knowledge the trainees acquired can meet the expected goals. However, from the perspective of multiple SECI Model, the object of knowledge learning evaluation in the second stage is the explicit and implicit knowledge after the process of socialization, externalization, combination, and internalization. In this stage, the knowledge learning evaluation of leading cadres in colleges and universities focuses on whether the different type of explicit and implicit knowledge can transform into each other according to the specific context and missions.

3) Application of SECI of explicit knowledge and implicit knowledge. Similar to the behavior evaluation in the third level of the classical Kirkpatrick Model, the knowledge learning of leading cadres in colleges and universities based on SECI also emphasizes the transformation from knowledge to behaviors. But the difference lies in the fact that the knowledge application in colleges and universities is not just the knowledge application in the low and general level as colleges and universities are the important platforms and bases for knowledge creation. It is based on whether the different kinds of explicit and implicit knowledge and their combination can be applied in specific context and missions. Accordingly, this stage can be seen as evaluation stage for the behaviors and the results of knowledge learning of leading cadres in colleges and universities based on the SECI Model, which is the necessary link for promoting the transformation from knowledge to ability and behaviors.

4) Hypercyclicity of SECI of explicit knowledge and implicit knowledge. As the context of knowledge learning turns out to be more complex and the missions that leading cadres have become more difficult, the multiple SECI Model continues to develop from catalytic cycle and reaction cycle to hyper-cycle. In other words, the factors like thinking mode and political enlightenment of leading cadres in colleges and universities are act as the catalyst in the process of promoting the upgrading of the SECI Model. Accordingly, the knowledge learning evaluation in this stage focuses on efficiency of SECI evolution achieved by the regeneration, duplication, selection and optimization of explicit knowledge and implicit knowledge. It should be mentioned that the evaluation of the hypercyclicity of SECI of explicit knowledge and implicit knowledge is based on learning ability, learning motivation and innovation ability of the leading cadres in colleges and universities.

5 Conclusions

The classical SECI knowledge learning model and Kirkpatrick Model have important enlightenments for knowledge learning and the evaluation of its effects of leading cadres in colleges and universities. However, it is very necessary to optimize these two models according to the characteristics of knowledge learning of leading cadres in colleges and universities. This paper optimizes the SECI knowledge learning model and Kirkpatrick Model from the perspectives of multiple context and multiple missions. Moreover, it explains the meaning and content of the optimized models, and it represents operating their mechanism in great detail. It is believed that this paper contributes to expand the research area and research perspective of knowledge learning of leading cadres. The limits of this paper lie in the fact that this paper concentrates on qualitative analysis, which fails to demonstrate the research results through empirical research.

An Innovative Practice of English Corners at Guangdong Peizheng College

Huang Lihua, Cao Fengting

Foreign Languages School, Guangdong Peizheng College, Guangzhou, P.R. China, 510830

(E-mail: 77412276@qq.com, caoft@whut.edu.cn)

Abstract: This paper is to discuss the innovative practice of English Corner associated with Guangdong Peizheng College (GPC), a private college in Guangzhou, China. As an observation, the questionnaire and interviews were conducted to explain what an effective English Corner can be and how to maintain or increase its vitality. Based on the research, it is confirmed that the learner-based organization of English Corner and the full-play of foreign teachers contribute a lot to increase students' self-confidence, language competence, and communicative skills. It also helps to increase the competitive ability of the students graduating from private colleges or universities in job markets.

Key words: English corner; GPC; Innovative practice; Foreign teachers

1 Introduction

English Corner has been assumed as the best example of Chinese EFL (English as a Foreign Language) learners' independent and autonomous learning (Martyn & Voller, 1995). For this reason, it is very popular with the people, particularly with the students in universities of China. From many journals and newspapers, reports and articles on English corners can be found. They are mainly about how many people the English corner has attracted, how it is functioning and what roles it can play in English study. However, very few systematic practices are done about it, let alone investigations on it.

GPC is a second-class college. As far as English is concerned, most students in GPC are "false beginners". That is to say, although most EFL students in private or vocational colleges arrive with a wealth of vocabulary and a grasp of basic grammar rules after an almost twelve-year study of English, they hardly know their performance (how well they actually speak it). Guangdong is a province vibrant with economic development. Thousands of foreign-owned enterprises, joint venture enterprises are settled here, which provide many job opportunities concerned with English. In order to satisfy the demand of society and enhance the students' competition at this level, GPC employs many more foreign teachers than other colleges to attain its aim of producing high quality talents with solid practical English. Thus English Corner has traditionally been considered as part and parcel of students' life on campus as well as the teaching tasks for foreign teachers. They are not only required to teach regular classes, but also to hold at least one English Corner per week or an alternative activity. English Corner is a time for them to have casual interaction/conversation/presentation with students who elect to come. It's equivalent to a college professor's office hours. The topics of discussion are wide open and often chosen by the students themselves.

As full observers and regular visitors of English Corner at GPC in the past 3 years, the authors worked together with the foreign teachers to innovate English Corner based on the demand from the students who are eager to improve their English language. Many data are collected from observations on which the analysis is made. Also, this study chooses four groups of students at random to do a written questionnaire to explore the effectiveness of the innovative practice of English Corners as case study. Special attention was given to the students' attitude toward English Corners, important benefits the students have received, such as, their confidence, English language competence and communicative skills. The study also includes personal interviews with 6 students who are frequent visitors of English Corners. Lessons learned should have theoretical and practical implications for other private colleges and universities in China.

2 Literature Review

English Corner is a place where people who have the common interest in English come voluntarily and autonomously to practice speaking English. The participants may not know each other before they meet and their English proficiency level may be different. English Corner conforms to the communicative functional theory. According to linguists, Halliday and Brown, language learning has to be obtained in the process of communication by means of language and when learners employ authentic language to achieve meaningful communication in certain specific social context (Halliday, 1973 &

Brown, 1994). The presence of English native speakers in GPC makes it possible to create a favorable and authentic environment for communication according to the needs of the students.

Language learning, especially the foreign language learning, needs large amount of input and practice (Shu, 2006). So it is necessary for EFL learners to learn English spontaneously. Learning motivation has been considered a key point in EFL learning. Generally speaking, there are two basic learning motivations, — integrative motivation and instrumental motivation. The former refers to the great desires the EFL learners have for acquiring the English language and getting to know the people who speak this language. Through the interaction with the native speakers, the EFL learners expect they can have a better communication with them and have a deeper contact with them culturally. The latter refers to the interests the EFL learners have in grasping the English language and using it to attain their goals as a tool (Larsen-Freeman, 2000). It is rather a practical motivation, because it can help the EFL learners to get a better job, increase their income and improve their social status. There is no doubt that English Corner may serve as a place to ensure the students a sufficient comprehensible input and output.

Many linguists believe that the best environment for second language learning is the authentic and natural one. Different people have different personalities, some being extravert, others introvert. In formal classroom teaching the introvert students tend to keep silent, because of being afraid of making mistakes. But in a natural learning environment, they would not be confined to the words or expressions or the sentences they are asked to practice. They would express themselves more confidently (Rod Ellis, 1999). In such an authentic learning environment as English Corner, EFL learners have many opportunities to interact with authentic listeners. Their talks have real meanings. They are free to give their feedbacks and probe into whatever they are interested in. In this sense, English corner allows students to be in a language environment which is close to a natural one and acquire language skills and overall application abilities through language practice so as to achieve beneficial results.

3 Research Methods

The research methods include observation, questionnaire and interviews. They will be discussed separately.

3.1 Observation

One author of this paper has supervised the foreign teachers' teaching affairs for 3 years. This offers her a good opportunity to observe them by any means and from any stance. Since every foreign teacher in GPC is required to have at least one English Corner per week, how to organize the English Corner, how to make these English native speakers happy with those "false beginners" of English, and how to attract those undergraduates to it have become questions for the organizers to answer and consider about.

Effective English Corner relies on foreigners who join it. Giving foreign teachers freedom to be creative in English Corners is essential to their success. In view of the fact that each foreign teacher has at least a few good ideas, and they highly value volunteering and creativity, they are allowed to decide day and time, location and topic for their own English Corners (See Table 1).

The foreign teachers are very happy with the schedule. For saving space, the schedule shown is only concerned with 20 foreign teachers, whose family names are shortened for their sake. Most of them choose to do "open" English Corners, while quite a few would like to do some special topics in their English Corners. Take the IELTS English Corner for example. The students who plan to go abroad after graduation are eager to improve their listening and speaking. The foreign teacher holding this corner knows much as to how an IELTS examiner tests an IELTS student. The interactions with the foreign teacher are like a real test in an IELTS. The frequent practice in the English Corner is very helpful to the students who want to have a good knowledge of a real testing environment. Open talk is very popular with the students in attendance. They show a great interest not only in English but in foreign culture as well. Very often they would discuss with the foreign teachers about study abroad opportunities, job search strategies, and relationship problems they are facing in their daily lives. But "open talk" English Corner sometimes is not quite "open" at all. Before students come to English Corner, they may think of a topic they like to discuss. Students may also choose to go to their favorite English Corners, in which, the "open" talk may vary with each teacher to best suit their personality, style, preferences and values.

Table 1 below shows part of the schedule of English Corners in the fall of 2015. For the purpose of keeping English Corners under supervision, the attendance tracking system is set up and remains to be updated. Some data will be used as the data in research findings.

Table 1 English Corner Schedule (September 2, 2015)

Day	Time	Instructor	Subject	Place
Monday	10:30-12:00	Charity B	Open Talk	2109
	16:30-18:00	Phyllis B	Open Talk	2106
	19:00-20:30	David O	Open Talk	Language Lab A

Friday	12:30-14:00	Bryan G	Open Talk	2118

3.2 Questionnaire

This innovative practice of English Corners in GPC has been implemented ever since 2013. In order to find out students' attitude towards English Corners, their motivation to attend English Corners, the frequency for their participation and their preferred topics, as well as favorable outcomes the students have received, a questionnaire was done among freshmen, sophomores, juniors and seniors, which included 8 items in all. The first two items are about basic information like sex and the grade they are in. The third item is about whether they like or dislike English Corner with the foreign teachers' participation and organization. The fourth one is about how often they attend English Corners. The fifth one is about their purpose of going to English Corners. The sixth one is about their favorite topics to discuss in English Corners. The seventh is what they think have been learned from the English Corner. Finally, they are asked about the biggest problem existing in English Corners. Besides item 5 and 7 which are multiple choices with 4 points, the other 6 items are single choice. 160 questionnaires were released and 149 were valid. Among them, 38 were answered by freshmen, 35 by sophomores, 37 by juniors and 39 by seniors.

3.3 Interviews

Six frequent participants in English Corners were chosen randomly to be interviewed about their personal experience in English Corners, and their ideas about the kind of practice at English Corners. Two students are sophomores majoring in English; two are seniors majoring in law and art design respectively; and the other two are juniors majoring in business administration. The face-to-face interviews contribute much to collecting the first-hand information about whether the practice is effective or not.

4 Research Findings

According to the observation, questionnaire and interviews, some favorable feedbacks about the English Corners at GPC can be obviously found. These will be analyzed specially from the data gathered from the research methods mentioned above.

4.1 Favorable feedbacks

4.1.1 Enjoy English Corners

Information obtained on Item 3 in the questionnaire shows that most of the subjects are satisfied with GPC English Corners with 23% of the subjects thinking highly of them (See Table 2). Two of the interviewed sophomores expressed that they chose to study in GPC simply because they learned that it provides many different English Corners on campus. They put it that they sometimes would come to English Corners 4 times a week, or twice a day. First, it is chiefly attributed to the fact that EFL learners

have many time choices, place choices and more importantly, topic choices (See Table 1). After class, they can choose to go to any English Corner they like. Second, after attending several English Corners, they will finally find the one or two English Corners that can satisfy their needs or fit for their taste. It is evident that English Corners offer a favorable condition for EFL learners.

Table 2 Like or Dislike of English Corners

Like most	Like	Not much Like	Dislike
35	80	34	0
23%	54%	23%	0%

4.1.2 Benefits from English Corners

One of the interviewed juniors put it, “At first, I had much trouble getting across what I wanted to say, only to stop in the middle of the talk because of being laughed at by other students. But now, I could exchange my ideas with the foreign teachers, though I know my English is far from perfect. I like the feelings of talking with them by trying to use what I have just learned in the classroom and expressing it in a real situation”. Item 7 in the questionnaire is a question about the benefits the subjects received from English Corner, to which they can give multiple answers. The statistics on the answer also reveals that the subjects place “to talk with the natives from English-speaking countries in English Corners could make them more confident” as the first important benefit, the improvement of English listening and speaking as the second and the enhancement of their communicative skills as the third important benefit, although 17% of the subjects confessed that they gained nothing from English Corners (See Figure 1). This is coincidentally in accordance with item 5 of the questionnaire, in which most of the subjects expressed that their first purpose of coming to English Corner is to conquer their psychological barrier when talking with foreigners. The purpose of improving oral English ranks the second, making friends with foreign teachers the third, while, on the contrast, only 6 subjects said that their purpose is to find a girl or boy friend (See Figure 2). Based on Figure 1 and Figure 2, it is found that what benefit the subjects most from English Corner is the improvement of confidence to talk with native speakers.

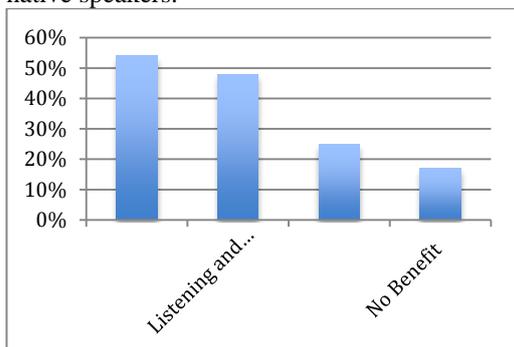

Figure 1 Benefits Received

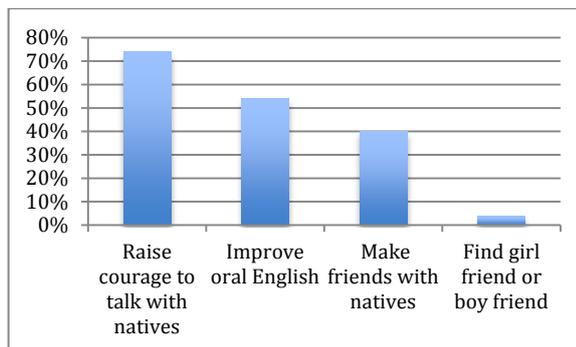

Figure 2 Purposes of Going to English Corner

4.1.3 Horizon widened

From the interviews with a senior who graduated last year and another senior who is going to graduate this year, the authors are happy to find that English Corners do play a great role in the turning point of their life. The graduated student is a girl who has great interests in art design. Her English is “poor”, according to her, as she failed twice to pass CET4. Fortunately enough, she met a woman English teacher from America in the special topic English Corner (drama) who needed to find a student knowing how to do setting design for her drama play. She felt to be needed was a very nice thing. Her after-class time had been occupied by the activities organized by this English teacher ever since. When graduation was close, she found herself having no trouble talking with any foreign teachers at all. With the encouragement of the foreign teacher, she participated in a volunteer project in the United States. This girl, who had never been out of the boundary of Guangzhou, set her first foot on the land of Alaska alone. Four months later, she came back with many surprising stories. “It is a rewarding adventure,” She explained very excited. “It is the first time I made a living by depending on myself in a completely strange country. My successful journey is owing to the practice in English Corners.” Another girl who is going to graduate in June of 2016 said she had got a job offer in a foreign company where she was one of the three who successfully survived almost a hundred competitors. This foreign company did not take diplomas or school backgrounds as the important standard to judge its future employees. What they

cared was about practical ability and the fluency of oral English. “GPC,” as she described, “offers students plenty of opportunities to realize their potentials, to a certain extent.”

Special topics, such as business communication, and world geography in English Corners somehow, serve as the facilitators to attract the students to seek for the knowledge about other countries.

4.2 Existing problems

Though many favorable feedbacks have been mentioned, English Corners at GPC are far from satisfactory. The investigation on the frequency of attendance in the questionnaire shows that 4 subjects come to English Corner 4 times per week on average, 7 twice per week, 27 twice per month, 81 seldom come and 30 never come to it (See Table 3).

Table 3 Frequency of Attendance

Always 4 times per week	Often Twice per week	Occasionally Twice per month	Rarely	Never
4	7	27	81	30
2.6%	4.6%	18.1%	54.3%	20.1%

4.2.1 Motivation

More than 70% of the subjects confessed they rarely or never went to English Corner (See Table 3). This sounds contradictory with Table 2 where, most subjects expressed they liked English Corners. However, liking something doesn't mean doing it or involving in it personally. In this case “instrumental motivation,” a concept introduced by Gardner and Lambert, in which the learner is motivated to learn another language for utilitarian purposes, such as furthering a career, improving social status or meeting an educational requirement (Larsen-Freeman, 2000), can be used to explain this matter. By observation, it is found that those learning English out of their own interest visit English Corner more frequently. According to the survey in the fall of 2015, about 42% of English Corner visitors were freshmen. It can be strongly inferred that they visited English Corners out of curiosity. When their curiosity is gone bit by bit, the number of students going to English Corner would decline definitely (See Table 4).

Table 4 Years (Unique Students)

Freshman	Sophomore	Junior	Senior	Super Senior	Unknown
529	313	271	136	2	0
42%	25%	22%	11%	0%	0%

The question of Item 8 the subjects answered in the questionnaire reveals that students know very well that they don't go to English Corner because of the lack of motivation (See Table 5). Most of them attribute the problem of English Corner to themselves, with only 25% of them thinking the fault should be found with foreign teachers and the organization of it. As most of the interviewed pointed out, “Many of our classmates are lazy enough.” Distinctively, motivation is the biggest problem that has to be solved with the effort of everyone concerned.

Table 5 The Biggest Problem with English Corner

Problem with students	Problem with foreign teachers	Problem with organization	Problem with environment
112	24	13	0
75%	16%	9%	0%

English Corner is an extracurricular activity. As far as learning motivation is concerned, it is a rather complicated development of one's personality. How to make the learners of English interested in it remains to be a question for further discussion among not only the foreign teachers but the administrators of the school.

4.2.2 The problem with foreign teachers

Occasionally, some foreign teachers would complain that they would rather do formal English teaching in the classroom than English Corner, because they were often confronted with the same questions in English Corners, as “What is your name?” and “Where are you from?”. They didn't like to answer the same questions again and again. It is not the fault of English learners, of course, because these are the questions they learned as beginners which were strongly rooted in their heart. They thought these were the very questions they should ask before starting the conversation as a new comer. Chinese education has produced many such mechanical students. So it is necessary for new foreign teachers who first come to China to learn something about English education in China and Chinese culture.

According to the interviewed, some foreign teachers would confine themselves to listening more

than guiding the students on the right way to express themselves in good English. It would be quite a waste of time for students at present listening to one student talk about some meaningless things for long. One of the interviewed reported in frustration that he once encountered a student struggling to tell a story about catching a cockroach in his dormitory at English Corner for more than 5 minutes. So a foreign teacher also needs innovations even in an English Corner. To be a good listener is a good quality. But to make an “open” talk a creative one may be the goal to pursue.

5 Conclusions

All of this being discussed above, it can be concluded that English Corner as an extracurricular activity in colleges is a beneficial and favorable means for those who desire to improve their English proficiency. In a private college like GPC, English Corner has not only attracted more students good at oral English to come, but provide an authentic environment for them to pursue their dreams. That is why most of the students like it in spite of the fact that many of them don't really visit it. Clearly, with the globalization of China, English Corner will not be out of date in a short period of time.

The research on observation, questionnaire and interviews indicates that the presence of foreign teachers from English-speaking countries at different times offers students alternative chances to speak English which meets the need of different participants. This helps the students find suitable topics to discuss and improve their English proficiency further. More importantly, EFL learners can gain confidence from the kind of English Corner.

No matter how popular English Corner at GPC is, it has some problems to be solved. With more than 40 foreign teachers present at English Corner once every week, the number of participants (See Table 4) seems a little small. Creating a study environment on campus is very imperative. On the part of the foreign teachers, they need to have a better knowledge of their students, the culture behind them and the education behind them.

As for the research itself, since the study is only limited to English Corners at GPC, it might not be fully applicable to other English Corners in other places. But in the authors' mind, the research of it may give rise to more innovative practices of it.

Though 3 years' innovative practice, the English Corner in Guangdong Peizheng College has formed its own distinctive features with a large number of foreign teachers involved in the participation and organization and a wide variety of topics covered in the discussion and presentation. However, to ensure a better future development, there's still a lot to do to maintain its advantages and improve its disadvantages. More reflections must be done as to how to take advantage of its abundant resources of foreign teachers, how to increase its popularity to attract more students with different learning motivations, both integrative and instrumental and how to meet the different demands of students. It is strongly advisable to regard English Corner as an effective means of second-classroom learning with its potential to provide a large amount of input and output, which is complementary with classroom learning with its insufficiency of listening and speaking practice due to the limitations of time and space as well as the obligations of curriculum. Meanwhile, in addition to its helping improve the students' English language competence and communicative skills, our attention can also be paid to the great chances English Corner may create to train and enhance the participants' ability of English thinking and critical reasoning.

Applying Badrul Khan's Octagon Mode in the Construction and Management of College English Blended-Learning System

Xiong Xiaoman

School of Foreign Languages, Wuhan University of Technology, Wuhan, P. R. China, 430070
(E-mail: 84887757@qq.com)

Abstract: Combining the advantages of traditional learning and web-learning, Blended-learning emerges as a new approach and brings new challenges. This paper examines the characteristics of Blended-learning mode and analyses Badrul Khan's Octagon regarding the elements to be considered in the course of E-learning. On the basis of the analysis, it offers advice concerning the construction of College English Blended-learning environment, and suggests a multi-dimensional, dynamic managing mode of the system.

Key words: College english; Blended-learning; Construction; Octagon

1 Introduction

It is universally acknowledged that traditional classroom teaching mode has its disadvantages. With its monotonous content and boring teaching methods, traditional courses can hardly arouse students' interest. As far as College English course is concerned, this problem is especially acute. What we usually see in the classroom is teachers imparting knowledge to be passively received by the students. It is generally believed that the passive mode is not likely to develop students' independent learning ability and is responsible, at least in part, for their poor language competence. At this moment, the wide application of multimedia and network technology in education has made the blended-teaching mode possible.

Blended-learning originally means the combination of classroom-based learning patterns such as conferences, labs, books, etc. with other learning patterns. For example, we may combine audio-video media with blackboard, integrate CA learning with traditional mode, or incorporate autonomous study with collaborative study. In recent years, blended-learning has been paid much attention to promote the efficiency in college English teaching. With the widespread of internet and rapid development in E-learning, the terminology finally took its current form in the 1990s. Then in 2006, blended learning system was defined by Bonk and Graham as a learning system that combines "face-to-face instruction with computer mediated instruction" (Curtis. J. Bonk, Charles. R. Graham, 2005). People focus on how to design and development the network teaching platform or teacher-student interaction platform. I think Badrul Khan's Octagon may help us to find the way to construct and manage college English blended-learning system.

According to the most of researchers' opinions, I think the Blended-learning may be understood in the following ways:

1.1 The blending of learning theories

Blended-learning takes place under the guidance of various learning theories intended for different learners and different learning objectives. These theories include constructivism, situated cognition theory, activity theory, exploring learning theory, the theory of humanistic learning, virtuality and reality combination (Sheng Juan, 2013).

1.2 The blending of learning resources

Learning resources, from elaborately developed on-line courses to mouth-to-ear instruction, from experience sharing among students to full-scale data accumulation, are integrated on the one-stop learning platform.

1.3 The blending of learning environments

A blended-learning mode exists in a student-centered environment where learners can participate in multiple learning activities, formal and informal, online or offline, directed or self-paced.

1.4 The blending of learning patterns

The incorporation of E-learning and in-class teaching means the integration of real-time and non-real time instruction, synchronous and asynchronous teaching, group study based on cooperation and net-based autonomous study, as well as discussion and collaboration.

According to Sigh & Reed, blended learning focuses on optimizing achievement of learning objectives by applying the "right" learning technologies to match the "right" personal learning style to

transfer the “right” skills to the “right” person at the right “time”.

2 Badrul Khan’s Octagon

Various elements are to be reckoned with for the construction of an ideal learning System and the effective management of the environment, and blended-learning has even higher requirements. Indian company NIIT released its white book on blended learning in 2002 (Alexander J. Romiszowski, 2004), pointing out that blended learning mode is composed of face-to-face learning, E-learning and self-paced learning. E-learning part being the core component, it is highly advisable to refer to the Octagon designed by Badrul Khan as the guiding principles before constructing the College English Blended-learning mode.

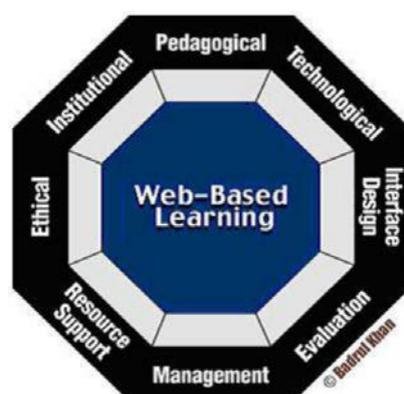

Figure 1 Badrul Khan’s Octagon

According to Khan’s Octagon shown above, the elements to be considered are as follows.

Institutional: organization, management, school affairs and support services.

Pedagogical: learning content analysis, learning objective analysis, web-learning design and strategies.

Technological: LCMS to supervise the learning content and LMS to control the transmission mode.

Interface Design: an interface to support all the composition elements and guarantee the switch from one into another.

Evaluation: assessment of curriculum materials and learner performance.

Management: management of all the learning activities as well as registration and authentication.

Resource Support: resources accessible for all the learners at any time.

Ethical: elements such as equality, multiculturalism and nationality.

Obviously, the construction and management of College English blended-learning system relies on the development in cross-discipline collaboration, involving instructional technologists, educational psychologists, cognitive scientists, computer scientists and engineers, data scientists, and assessment specialists.

3 The Construction of College English Blended-Learning Mode

3.1 Construction of web-teaching platform

Blended learning mode is a mode that combines in-class learning with web-learning. The critical part is the construction of the web-teaching platform (He Kekang, 2004). The first thing to do is establish a teaching resource database consisting blocks of knowledge. Secondly we should design the frame structure of network teaching platform that typically includes the following sections: 1) friendly interface to support all the composition elements; 2) web-learning navigation to specify curriculum resources, learning objectives, activities and tasks so that students won’t get confused. 3) web-based materials as compensation and extension of the course book content, and websites for students to visit to find relevant information; 4) courseware section where students download PowerPoint teaching materials or watch video lectures, which is especially useful for students who want to review what they have learned and those who need to make up missed lessons; 5) on-line interaction module for communication between teachers and students, synchronous or asynchronous; 6) performance appraisal and self-testing section; 7) system management module.

3.2 Implementation of pedagogy

To efficiently improve the quality of College English teaching, it is advisable that teachers adopt task-driven teaching method as shown in figure 2.

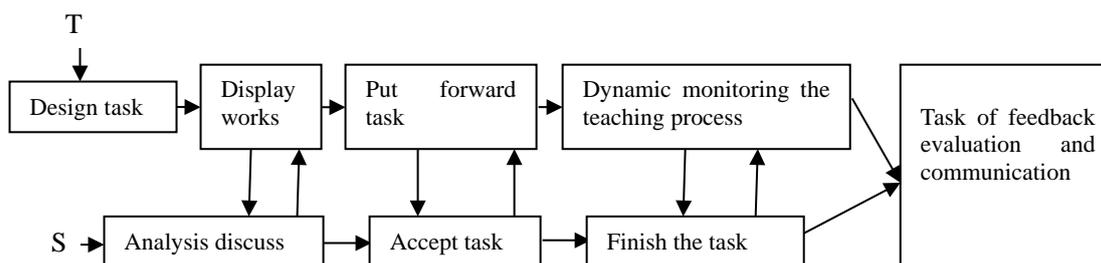

Figure 2 The Task-Driven Teaching Method

Teachers, after creating task situations, provide students with clues to solutions instead of telling them directly how to solve the problem. Students are no longer passive recipient of information from teachers. On the contrary, everyone has access to the database, can evaluate the accessible information independently, manage to accomplish the tasks on his own, and use the on-line testing system to test themselves. In other words, students can implement web-learning in different places any time they need as the system breaks the limits of time and space.

One disadvantage of web-learning is the lack of interaction between teachers and students, and communication among students, which may result in anxiety (Harvi Singh, 2001). Consequently, teachers are advised to adopt innovative teaching methods to avoid the problem. Teacher-student interaction, either synchronous or asynchronous, relies on various communication facilities such as BBS, messages, Q&A, or chat rooms (). Students pose questions on line at any time convenient for them, to be answered by teachers within a fixed amount of time. This guarantees balanced communication between teachers and students, and encourages students' active involvement in College English learning outside the classroom.

In traditional classroom, communication among students may take the form of debate, discussion, dialogue, or role play. In fact these can also be done on the line. For example, teachers can encourage collaboration among students by setting up a virtual learning environment for a group of students to share their learning tasks. This is a private space where this group of students could study together, present their ideas, and load their learning tasks for others to review. Independent learning does not necessarily mean learning single-handed; instead, collaboration with others is an indispensable part of the learning process.

3.3 Feedback of students' performance

According to my teaching experience, students' performance indicate how well they have mastered the teaching content, and teachers' comment helps students adjust their learning strategies to improve learning efficiency. However, in the web-learning environment, the situation might be a little complicated. Since blended-learning means the mixture of traditional learning and e-learning, the performance assessment includes assessment of traditional assignments and that of e-assignments. Regarding the assessment of e-assignments, promptness is critical (Xia Yaowen, 2013). A student finishes the test on line or submits exercises on the platform, but the teacher fails to give a timely feedback. By the time the teacher does give the feedback, the student might have lost his enthusiasm or even forgotten about it. Thus feedback needs to be prompt, given soon after student completes a piece of assignment. In terms of web-learning, only when teachers incorporate their prompt feedback with students' e-portfolio can they have an all-round assessment of the students' abilities.

4 The Management of College English Blended-learning Mode

The management of the teaching process is one of the many important factors to decide the quality of education. Multimedia and web technology exerts profound influence on College English teaching, and brings new opportunities and challenges. In view of the characteristics and developing trend of Blended-learning system, it is recommended that universities implement a multi-dimensional, dynamic mode of management.

4.1 Teaching organization establishment

The management of Blended-learning mode involves various divisions and departments in the university: office of teaching affairs, finance section, state-owned property management office, modern

educational technology center, language labs, just to name a few (Yuan Pengfei, 1999). It is essential that all the sections join hands and work together to ensure the smooth running of the Blended-learning system. Under new circumstances of web-learning, the content and manners of management are subject to change, too. Administrators are expected to grasp the objective law of teaching and renew their ideas in accordance with the new trend. In order to do this, they need a good command of pedagogy, management and network techniques, and should communicate with technical support, teaching staff and students to take their advice.

4.2 Teaching process management

Blended-learning mode combines teacher-student communication with man-machine interaction, and supplement in-class teaching with independent study. It is vital that teachers change their concepts and abandon the old teaching manners (Bates. A.W. Technology, 2005). In the Blended learning environment, teachers are no longer the center of the teaching process, but the instructors and directors. They design and organize class activities, guide and supervise students' autonomous study, evaluate their performance and provide emotional support for them. Meanwhile, teachers should have a good command of PC operation skills and network technology, which means they have to update their knowledge so as to adapt to the new environment and meet the requirements of Blended-learning mode.

4.3 Multi-dimensional assessment system

A scientific and objective assessing system is extremely important to any teaching process. Student evaluation is given on the basis of in-class performance and web-learning experience. Weighting coefficients like learning time, learning content and learning effects are necessary quantitative indexes for internet autonomous study evaluation (Morrison G. R., Lowther D, 2005). For example, apart from one hour's in-class learning each week, students are supposed to spend at least two hours on web-learning each week, totaling 32 hours every semester. Autonomous study results take up 30% of the final score. What's more, students should be able to tell expected behavior from unexpected behavior. They need self-regulation to refrain from violating the rules of web-learning. If any one takes advantage of the web environment to do things irrelevant to College English teaching, he will be punished. Meanwhile, mutual assessment is encouraged between teachers and administrators, students and administrators, in the form of surveys, forums, seminars, and random interviews

Administrators play a leading role in the management of Blended-learning mode, but they are not the only ones responsible. Everyone, including administrators, teachers and students, should take an active part in the managing process.

5 Conclusions

College English teaching is meant to cultivate students' integrated language competence. But at present, traditional English teaching mode in China is being accused of failing to provide an efficient language learning environment. It goes without saying that in this new era of information when College English teaching calls for prompt improvement, Blended-learning mode offers a unique opportunity to blend learning theories, learning resources, learning environments, and learning patterns, to integrate traditional teaching with brand-new learning approaches. A well-designed and properly-managed College English Blended-learning mode should fully embody its rich resources and strong interactivity. Teachers implement student-oriented teaching to cultivate learners' innovation spirit; students carry out independent study to develop autonomous learning ability. Thus the design and management of a Blended-learning mode is of great importance to guaranteeing the efficiency of College English teaching.

A fact noteworthy is that Blended-learning is an emerging field that bridges the fields of education, technology and psychology. The construction and management of Blended-learning environment relies on the collaboration of everyone involved: administrators, technical staff, teachers, and students. While designing a College English Blended-learning mode, we need to attach great importance to the construction of web-teaching platform, the implementation of pedagogy and the student performance assessment system. In regard to the management of the mode, an all-involvement managing system is highly advisable.

An Analysis of Influence Factors in Chinese College Students' Major Selection Based on ISM

Guo Ying, Li Di, Cao Jun

School of Management, Wuhan University of Technology, Wuhan, P.R.China, 430070

(E-mail: 63511514@qq.com, lidilee@163.com, caojunwhut@126.com)

Abstract: On the basis of analyzing the related research on specialty-free recruitment and college students' major selection, the paper proposes 15 factors that influence Chinese college students' major selection, establishes interpretative structural model (ISM), analyzes the relationship of these factors, and summarizes them into personal factors, family and peer factors, major factors, and social factors. At last, the paper makes recommendations to collegiate specialty construction and guidance of college students' major selection.

Key words: Specialty-free recruitment; Chinese college students; Major selection; ISM

1 Introduction

Since the implementation of the "Yuanpei Program" in Peking University in 2001, the practice of specialty-free recruitment and training has received increasing attention. More and more domestic universities implement the specialty-free recruitment mode, that is, to change the traditional pattern of recruitment and training according to the specialty, instead is the new pattern that implement recruitment according to the subject (in college or department) and let students themselves select the major after a period of time of the entrance (Lv Cixian, Li Weihua, 2014). Morrow and Wirth (1989) defined major selection as "the degree of identification and involvement of a major. Yu Fang (2015) believes that college students' freedom to choose majors and courses is an important embodiment of their interest in learning, personal needs and interests. After a year of study since their enrollment, students have a deeper understanding of each major in their department. Therefore, they will rethink the professional choice according to their scores, interests, hobbies, expertise, and even consider the social demand and future life planning, thus avoiding the blindness of choose their major just after the college entrance examination and protect their learning autonomy and the right to choose the learning content.

However, under the specialty-free recruitment and training, there are still existing trend of blindly follow, bringing new challenges to the higher education institutions. Studying the influencing factors and the mutual relations in College Students' major selection can help colleges and universities adjust their professional setting and construction according to students' requirements. This paper analyzes the influencing factors of college students' major selection based on ISM and makes recommendations to collegiate specialty construction and guidance of college students' major selection.

2 Determination of Influence Factors in Major Selection

Through literature analysis, this paper reviewed the related literature of college students' major selection. Lv Cixian (2014) pointed out that Chinese students usually select major according to their characteristics, such as hobbies, discipline, family and peer factors etc., and professional status, such as professional employment situation, level of teachers, specialty strength. Fan Mingcheng (2013) believe that the main factors that influence major selection is their interest, job opportunities and career development potential and their ability to learn, and the influence of parents and family. WANG Zuojun (2014) argued that the influencing factors of college students' major selection mainly includes market outlook, the influence of others, personal and professional characteristics. Ma Liping (2016) found that there exists gender differences between male and female students in major selection through the investigation.

Through literature research, the factors that affect the major selection of college students are initially obtained, in order to draw a more reasonable influence factors, we set up an ISM group. The ISM team was made up of two vocational development teaching and research personnel, three employment guidance center teachers, three college counselors and three senior professors of different professions. At the same time, in order to verify the relationship between the factors, 100 questionnaires were recycled from colleges and universities full-time undergraduate students in Wuhan. In the end, 15 influencing factors and their correlation are identified, as shown in Table 1.

Table 1 Influence Factors in College Students' Major Selection

Number	Factor	Factors affected
S_1	Employment Situation	$S_2, S_3, S_4, S_5, S_6, S_7, S_8, S_9, S_{10}, S_{11}, S_{13}, S_{15}$
S_2	Career Development Potential	$S_3, S_4, S_5, S_6, S_7, S_8, S_{10}, S_{11}, S_{15}$
S_3	Major Social Popularity	$S_1, S_2, S_4, S_5, S_6, S_7, S_8, S_{10}, S_{11}, S_{13}, S_{15}$
S_4	Profession' Social Status	$S_1, S_2, S_3, S_5, S_6, S_8, S_9, S_{10}, S_{11}, S_{15}$
S_5	Profession' Salary Level	$S_6, S_7, S_8, S_{10}, S_{11}, S_{12}, S_{13}, S_{14}$
S_6	Teachers' Level	$S_7, S_8, S_{10}, S_{11}, S_{12}, S_{13}, S_{14}$
S_7	Learning Atmosphere	$S_6, S_{11}, S_{12}, S_{13}, S_{14}$
S_8	Curriculum	$S_6, S_{11}, S_{12}, S_{13}, S_{14}, S_{15}$
S_9	Family Background	S_{12}, S_{13}, S_{14}
S_{10}	Other People's Advice	S_{13}
S_{11}	Peer Selection	S_{13}
S_{12}	Personal Ability	S_{13}, S_{14}
S_{13}	Interest	S_{12}, S_{14}
S_{14}	Score Advantage	—
S_{15}	Gender Difference	—

3 Construction of ISM of Influencing Factors of College Students' Major Selection

Interpretative Structural Modeling Method (ISM) is used to decompose a complex system into a number of subsystems, and construct the system into a multistage ladder structure model using people's practical experience and knowledge as well as the computer (Zhou Dequn, 2005).

3.1 Construct the adjacency matrix

According to the relationship between the factors and the factors identified in Table 1, the adjacency matrix is $A = (a_{ij})_{15 \times 15}$. If S_i has effect on S_j , then $a_{ij} = 1$; else $a_{ij} = 0$. "Has effect" indicates a direct effect, not consider the indirect effect. And the adjacency matrix is as follow:

$$A + I = \begin{pmatrix} 1 & 1 & 1 & 1 & 1 & 1 & 1 & 1 & 1 & 1 & 1 & 0 & 1 & 0 & 1 \\ 0 & 1 & 1 & 1 & 1 & 1 & 1 & 1 & 0 & 1 & 1 & 0 & 0 & 0 & 1 \\ 1 & 1 & 1 & 1 & 1 & 1 & 1 & 1 & 0 & 1 & 1 & 0 & 1 & 0 & 1 \\ 1 & 1 & 1 & 1 & 1 & 1 & 1 & 1 & 1 & 1 & 1 & 0 & 0 & 0 & 1 \\ 0 & 0 & 0 & 0 & 1 & 1 & 1 & 1 & 0 & 1 & 1 & 1 & 1 & 1 & 0 \\ 0 & 0 & 0 & 0 & 0 & 1 & 1 & 1 & 0 & 1 & 1 & 1 & 1 & 1 & 0 \\ 0 & 0 & 0 & 0 & 0 & 1 & 1 & 0 & 0 & 0 & 1 & 1 & 1 & 1 & 0 \\ 0 & 0 & 0 & 0 & 0 & 1 & 0 & 1 & 0 & 0 & 1 & 1 & 1 & 1 & 1 \\ 0 & 0 & 0 & 0 & 0 & 0 & 0 & 0 & 1 & 0 & 0 & 1 & 1 & 1 & 0 \\ 0 & 0 & 0 & 0 & 0 & 0 & 0 & 0 & 0 & 1 & 0 & 0 & 1 & 0 & 0 \\ 0 & 0 & 0 & 0 & 0 & 0 & 0 & 0 & 0 & 0 & 1 & 0 & 1 & 0 & 0 \\ 0 & 0 & 0 & 0 & 0 & 0 & 0 & 0 & 0 & 0 & 0 & 1 & 1 & 1 & 0 \\ 0 & 0 & 0 & 0 & 0 & 0 & 0 & 0 & 0 & 0 & 0 & 1 & 1 & 1 & 0 \\ 0 & 0 & 0 & 0 & 0 & 0 & 0 & 0 & 0 & 0 & 0 & 0 & 0 & 1 & 0 \\ 0 & 0 & 0 & 0 & 0 & 0 & 0 & 0 & 0 & 0 & 0 & 0 & 0 & 0 & 1 \end{pmatrix}$$

3.2 Calculate reachable matrix

The reachable matrix M can be obtained by calculating the adjacency matrix A:

$$M = (A + I)^{n+1} = (A + I)^n \neq \dots (A + I)^2 \neq (A + I)^1 \quad (1)$$

According to the Boolean operation rules, the reachable matrix M is obtained as follows:

$$M = \begin{pmatrix} 1 & 1 & 1 & 1 & 1 & 1 & 1 & 1 & 1 & 1 & 1 & 1 & 1 & 1 & 1 \\ 1 & 1 & 1 & 1 & 1 & 1 & 1 & 1 & 1 & 1 & 1 & 1 & 1 & 1 & 1 \\ 1 & 1 & 1 & 1 & 1 & 1 & 1 & 1 & 1 & 1 & 1 & 1 & 1 & 1 & 1 \\ 1 & 1 & 1 & 1 & 1 & 1 & 1 & 1 & 1 & 1 & 1 & 1 & 1 & 1 & 1 \\ 0 & 0 & 0 & 0 & 1 & 1 & 1 & 1 & 0 & 1 & 1 & 1 & 1 & 1 & 1 \\ 0 & 0 & 0 & 0 & 0 & 1 & 1 & 1 & 0 & 1 & 1 & 1 & 1 & 1 & 1 \\ 0 & 0 & 0 & 0 & 0 & 1 & 1 & 1 & 0 & 1 & 1 & 1 & 1 & 1 & 0 \\ 0 & 0 & 0 & 0 & 0 & 1 & 1 & 1 & 0 & 1 & 1 & 1 & 1 & 1 & 1 \\ 0 & 0 & 0 & 0 & 0 & 0 & 0 & 0 & 1 & 0 & 0 & 1 & 1 & 1 & 0 \\ 0 & 0 & 0 & 0 & 0 & 0 & 0 & 0 & 0 & 1 & 0 & 1 & 1 & 1 & 0 \\ 0 & 0 & 0 & 0 & 0 & 0 & 0 & 0 & 0 & 0 & 1 & 1 & 1 & 1 & 0 \\ 0 & 0 & 0 & 0 & 0 & 0 & 0 & 0 & 0 & 0 & 0 & 1 & 1 & 1 & 0 \\ 0 & 0 & 0 & 0 & 0 & 0 & 0 & 0 & 0 & 0 & 0 & 1 & 1 & 1 & 0 \\ 0 & 0 & 0 & 0 & 0 & 0 & 0 & 0 & 0 & 0 & 0 & 0 & 0 & 1 & 0 \\ 0 & 0 & 0 & 0 & 0 & 0 & 0 & 0 & 0 & 0 & 0 & 0 & 0 & 0 & 1 \end{pmatrix}$$

3.3 Decompose reachable matrix

According to the reachability matrix M, reachable sets $R(S_i)$, antecedent sets $A(S_i)$ and intersection sets $C(S_i)$ can be obtained, in which $R(S_i)$ is the set of all the factors that can be reached by S_i , $A(S_i)$ is a collection of all the factors that can reach S_i , and $C(S_i) = R(S_i) \cap A(S_i)$.

According to $R(S_i) = C(S_i) = R(S_i) \cap A(S_i)$, determine the highest level of elements successively, and decompose reachable matrix, then the hierarchical structure of influencing factors of College Students' major selection is got. According to Table 2, $R(S_{14}) = C(S_{14}) = R(S_{14}) \cap A(S_{14})$, $R(S_{15}) = C(S_{15}) = R(S_{15}) \cap A(S_{15})$, the elements of first level $L_1 = \{S_{14}, S_{15}\}$ can be obtained. Remove corresponding rows and columns of S_{14}, S_{15} from the reachable matrix, second level of reachable sets and antecedent sets can be obtained, then the elements of second level is $L_2 = \{S_{12}, S_{13}\}$. Similarly, we can get $L_3 = \{S_9, S_{10}, S_{11}\}$, $L_4 = \{S_6, S_7, S_8\}$, $L_5 = \{S_5\}$, $L_6 = \{S_1, S_2, S_3, S_4\}$.

Table 2 First Level of Reachable Sets and Antecedent Sets

S_i	$R(S_i)$	$A(S_i)$	$C(S_i)$
S_1	$S_1 \sim S_{15}$	$S_1 \sim S_4$	$S_1 \sim S_4$
S_2	$S_1 \sim S_{15}$	$S_1 \sim S_4$	$S_1 \sim S_4$
S_3	$S_1 \sim S_{15}$	$S_1 \sim S_4$	$S_1 \sim S_4$
S_4	$S_1 \sim S_{15}$	$S_1 \sim S_4$	$S_1 \sim S_4$
S_5	$S_5 \sim S_8, S_{10} \sim S_{15}$	$S_1 \sim S_5$	S_5
S_6	$S_6 \sim S_8, S_{10} \sim S_{15}$	$S_1 \sim S_8$	$S_6 \sim S_8$
S_7	$S_6 \sim S_8, S_{10} \sim S_{14}$	$S_1 \sim S_8$	$S_6 \sim S_8$
S_8	$S_6 \sim S_8, S_{10} \sim S_{15}$	$S_1 \sim S_8$	$S_6 \sim S_8$
S_9	$S_9, S_{12}, S_{13}, S_{14}$	$S_1 \sim S_4, S_9$	S_9
S_{10}	$S_{10}, S_{12}, S_{13}, S_{14}$	$S_1 \sim S_8, S_{10}$	S_{10}
S_{11}	$S_{11}, S_{12}, S_{13}, S_{14}$	$S_1 \sim S_8, S_{11}$	S_{11}
S_{12}	S_{12}, S_{13}, S_{14}	$S_1 \sim S_{13}$	S_{12}, S_{13}
S_{13}	S_{12}, S_{13}, S_{14}	$S_1 \sim S_{13}$	S_{12}, S_{13}
S_{14}	S_{14}	$S_1 \sim S_{14}$	S_{14}
S_{15}	S_{15}	$S_1 \sim S_6, S_8, S_{15}$	S_{15}

3.4 Build ISM model

According to the reachable matrix, we can get the ISM model of the influencing factors of College Students' major selection, as shown in Figure 1.

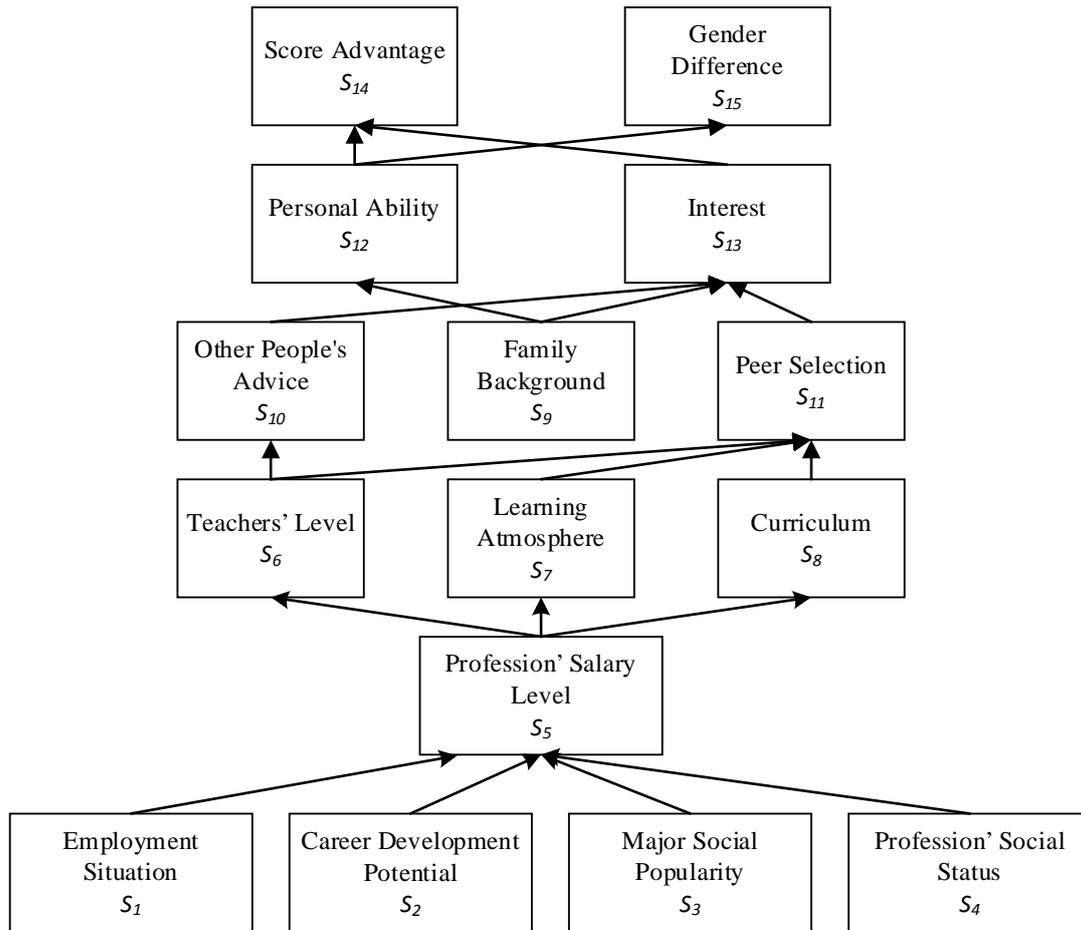

Figure 1 ISM of Influencing Factors of College Students' Major Selection

4 Results

According to the output of the structural model, the influencing factors of College Students' professional selection are summarized into four layers.

The first layer is the student's personal factor, including personal ability, interest, gender differences, and score advantage etc., is the most direct factors influencing college students' major selection. With the enhancement of College Students' self-consciousness, students have more independent consciousness in major selection, therefore, personal ability and interests are the decisive factors for students to choose the major. Influenced by different factors, such as the physiological differences, the education differences and the social roles differences, the choice of different genders of students in professional learning and employment is also different.

The second layer is the family and peer factor, including family background, other people's advice and peer selection, which is the indirect factor influencing the major selection. The important influence of parents and family reflects the characteristics of China's traditional culture, family centrism, and children receive higher education is seen as a family event, so students are easily affected by family when choosing profession.

The third layer is the major factor, including teachers' level, learning atmosphere and curriculum, which is the indirect factor. Specialty-free recruitment and training pattern gives the students more freedom to choose, and students can make major selection after considerable understanding of school subject status, professional setting, and training objectives.

The fourth layer is the social factor, including the employment situation, career development potential, major social popularity, profession social status and profession' salary level. It is the basic factor that affects the major selection of college students. Now China's overall employment situation is grim, college students have to bear huge employment pressure, thus professional employment situation

has become a factor that students have to consider in major selection. In particular, the profession's salary level is the direct embodiment of the employment situation, career development potential and occupation social status, so it is the most intuitive factor for college students to consider the professional employment prospects.

5 Conclusions

The paper proposes 15 factors that influence Chinese college students' major selection, including personal factors, family and peer factors, major factors, and social factors, and uses ISM model to determine the relationship and hierarchy between factors of college students' major selection under specialty-free recruitment. According to research results, the paper put forward 3 points to the construction of college major and guidance of student's major selection:

Firstly, being demand-oriented and strengthening the construction of professional strength. The demands mainly mean the demands of students to professional structure and select major, and the demands of labor market, that is what kinds of talent that society needs. And college should improve the curriculum system and teaching organization and strengthen students' independent study consciousness, and develop self-learning ability and lifelong learning habits.

Secondly, effective guidance is still needed to allow students recognize importance and necessity of selecting major to their future. So that students can select a major that helps students to achieve life goals and reinforce the knowledge base according to their strengths, aspirations, interests and hobbies.

Lastly, the major selection should enhance students' awareness of specialty and career. That is to guide students to make scientific development of career by "students-professional- career" match, and choose a major and occupation under their own situation, enhancing the scientific and loyalty of major selection.

Abstract: National development and prosperity are closely related to the population quality. Basic education and public library are two basic causes of improving the population quality, so their development level has aroused extensive concern. In this paper, certain indicators are selected to measure the development of basic education and public libraries in China, then the relationship between them is analyzed by correlation analysis method. The results show that the development of basic education is closely related to the development of public libraries in China. It is, therefore, suggested that we should improve the quality of basic education and enhance the library consciousness of the citizens, thus promoting the harmonious development of basic education and public library in China.

Key words: Basic education; Public libraries; Development; National quality; SPSS

1 Introduction

With the rise of knowledge economy, countries in the world pay more and more attention to the promotion of nationals' quality. The basic education and the public library, two main causes of improving the quality of nationals, their development level has aroused extensive concern. Basic education is the foundation project of boosting the quality of the nationals, while the public library is the social device to improve the quality of people. School is the first classroom for students to study, in which students receive systematic education and obtain preliminary development and enlightenment of Dezhitmei; library, as a hub of human culture, becomes the second class of people to learn, through providing knowledge and information for individuals to create development opportunities. The development of basic education and public libraries are the key factors to measure the strength of national culture. Furthermore, the development of basic education and the library jointly promote the development of human and social progress.

The purpose of education is to enable everyone to exert his or her potential, creative and critical spirit, to realize their ambition and happiness, and to become a good citizen and producer. Basic education is the radical of education. The basic education stage is the key period of talent training, the cultivation of good habits and interests will affect the whole life of students, and restrict the student's activity, creativity. Just as the proverb says great oaks from little acorns grow, without good basic education, there is no first-class higher education. Therefore, basic education is a key part of the whole education system, which plays a very important role in our country's quality-oriented education and personal training. The Public Library Manifesto stated that the mission of the public library is to develop and to strengthen the early reading habits of the children, and to support the education of the individual's self and the formal education at all levels. Now the function of public library has been extended; its cultural atmosphere and educational value have played an important role in the development of people. Library is not only a social institution entity, but also a social literature and information transmission mechanism. In such a mechanism, people have free access to gain knowledge and information. Improving the quality and development level of basic education and public library is an effective way to improve the quality of people.

2 Literature Review

After the 1990's, the basic education of our country has made great progress in both quality and quantity and been basically popularized. At the same time, the number of public libraries in our country is increasing at an alarming rate. In theory, the relationship between basic education and public library should be mutual support and coordinated development. The two parties are interrelated unity, and they are complementary in function and thus forming a complementary relationship. As a systemic whole, the two must work together to support the development of human.

The research on the relationship between education and public library in China is still in its infancy and has little related research. Many of the existing articles are focused on a single category of education

(such as higher education, vocational education, lifelong education, etc.) rather than basic education or the whole education system. Yu Anyi (1988) puts forward a good library and information system can make the university education to achieve better results, but he is only focused on the relationship between higher education and the university library. Sima Lihua (2003) believes that the relationship between education and library is close. Education reform needs the library, and the library can update the expansion of classroom knowledge, promote the development of education. Yang Ming, Wei Meizhen and others look at the relationship between vocational education and the library. Xu Zhenyun (2005) focuses on the relationship between quality education and library. Sun Yihua (2010) explores the role of library in promoting quality education and put forward to cultivate the library consciousness and ability to promote the development of the two. Chen Yongmei (2011) points out that the ideas advocated by the great education such as the concept of integrated education, lifelong education of the whole people, and the autonomy and creativity of the study have lots of correspondence with the educational functions of the library. She also stressed that the educational function of the library should conform to the development trend of education. Gao Maixing (2012) mentions that library and higher vocational education is an interdependent relationship. On the one hand, higher vocational education depends on the library to obtain knowledge and accelerate the development of education; On the other hand, through the construction of higher vocational colleges, the library has promoted its own grade, and has enriched the quantity of the collection.

The research on the relationship between library and education mostly belongs to qualitative research; quantitative research is rare. Exploring the relationship between the development of basic education and public libraries has certain guiding significance for the better planning of the basic education and public libraries. Therefore, this paper analyzes the development level of the public library and the development level of basic education by looking up the data, and tries to study the correlation between the two parties, puts forward countermeasures and suggestions for coordinated development of the two.

3 Data and Method

We use and select some indicators to measure the development of education and public libraries. Based on the existing research, this paper designs the indicator of basic education development level and public libraries development level. The basic education development level indicators mainly include the elementary school and junior high school enrollment rate (V1), the rate of school age children in primary school (V2), average number of students in primary schools of one hundred thousand population (V3), number of ordinary primary schools (V4), primary school students' average operation expenses (V5), the number of ordinary primary school graduates (V6), Ratio of primary school teachers and students(V7); public library development level indicator includes number of public libraries(V8), total collection of public libraries (V9), number of employees in public libraries (V10), public library flow trips (V11), The number of books borrowed (V12), public library funds expenditure(V13) .

We collected the data from China Statistical Yearbook, China Library Yearbook and Educational Statistics Yearbook of China. Considering the comprehensiveness and availability of data, this paper selected the indicator data interval in 16 years between 1997 and 2012. After collecting the data, we use SPSS software to analyze the correlation of the indicators. Generally, in order to accurately describe the linear correlation between variables, the correlation coefficient can be calculated by calculating the correlation coefficient. In statistics, the correlation coefficient 'r' is generally used to infer the overall correlation coefficient. In this paper, Pearson simple correlation coefficient is used to express the linear relationship. The calculation formula is as follows:

$$r = \frac{\sum_{i=1}^n (x_i - \bar{x})(y_i - \bar{y})}{\sqrt{\sum_{i=1}^n (x_i - \bar{x})^2 \sum_{i=1}^n (y_i - \bar{y})^2}} \quad (1)$$

Pearson simple correlation coefficient of the statistical test is to calculate the statistics, and the formula is:

$$t = \frac{r\sqrt{n-2}}{\sqrt{1-r^2}} \quad (2)$$

4 Results

Using SPSS19.0 analyzes the correlation between the 7 indicators of development level of basic education and the 6 indicators of the development level of public libraries. The results are shown in table1.

Table 1 Pearson Correlation Coefficient Between Indicators

	(V8)	(V9)	(V10)	(V11)	(V12)	(V13)
(V1)	.730**	.719**	.661**	.722**	.464	.710**
(V2)	.872**	.870**	.906**	.846**	.645**	.896**
(V3)	-.840**	-.854**	-.838**	-.866**	-.705**	-.854**
(V4)	-.867**	-.881**	-.850**	-.893**	-.728**	-.884**
(V5)	.977**	.990**	.972**	.993**	.830**	.994**
(V6)	.692**	.711**	.605*	.689**	.599*	.696
(V7)	-.848**	-.863**	-.851*	-.877**	-.719**	-.890**

Note: ** . At the level of.01 was significantly correlated (bilateral).

* . At the 0.05 level (bilateral) significant correlation.

It is not difficult to find that most of the indicators between the development level of the public library and the development level of basic education show a moderate degree of correlation. Some of the indicators show a high positive correlation, while some shows a high negative correlation.

As we can see from the tables above, the elementary school and junior high school enrollment rate (V1), the rate of school-age children in primary school (V2), primary school students' average operation expenses (V5), the number of ordinary primary school graduates (V6) respectively are highly or moderately positive correlation with the indicators of public library development level. Results demonstrated that with the popularization of compulsory education in our country, the education cause and library cause are developing forward. The popularization of education promotes people's learning and reading consciousness to a certain extent, and it plays a promoting role in the development of the library cause.

The table above shows that the average number of students in primary schools of one hundred thousand population (V3) and the indicators of public libraries are highly negative correlation, which is not to say that the development of the library has a negative effect on education. Through analysis we can find that, the reduction of school-age children and the increase in the number of schools have influence on these indicators. Because of improper selection of indicators and technical deficiencies, this indicator fails to explain the relation between the development level of education and public library. That means the relationship between the average number of students in primary schools of one hundred thousand population and the public library is uncertain, pending further study.

The teacher student ratio (V7) is highly negative correlation with the development level of the library. The reduction of teacher-student ratio reflects the improvement of the education quality in our country. That indicates our country's input to the basic education teachers has effect on the improvement of education. There is a positive correlation between the improvement of education quality and the development of the library.

5 Conclusions

According to the research, the development of basic education and the development of the public library show correlation. Although the conclusion of this paper has some limitations, it still has some guiding significance. The orderly development of education can effectively improve the degree of human civilization, inspire people's educational needs, such as the emergence of the idea of quality education and the concept of lifelong learning. To meet the education needs of citizens, the school is the first choice; while library, as a continuation and supplement of school education, is particularly important. Under the impact of lifelong education and the wave of quality education, the public library has obvious advantage in improving the basic education development level.

The development of basic education is highly consistent with the development of public library. It is not difficult to find that a country's education is developed, then the country's development of the public library is developed. Vice versa. Among all the countries that pay attention to education, we can conclude that it is necessary to pay attention to the role and function of the library. The public library

has become an important part of education, so we need to create conditions for the education and public library going hand in hand. When the education is still primitive in one country, the cause of the public library is bound to fall behind. But when they begin to pay more attention to education, the library will develop at a faster pace. However, the construction of public library in China lags behind education development, and has failed to meet the general and extensive education needs of the people. Therefore, in the process of improving the quality of basic education, we should also speed up the development of public library through cultivate citizen's library consciousness. Library consciousness means that the public can take the initiative to use and integrate into the library. We should make policy to coordinate the development of basic education and public library.

Research on the Quality Evaluation of Employment Guidance for College Students Based on Fuzzy Mathematics

Zeng Ziwei, Pan Lianbo

School of Business, Wuhan Huaxia University of Technology, Wuhan, P.R. China, 430070

(E-mail: 176131283@qq.com, 515819587@qq.com)

Abstract: Under the circumstances that the employment difficulty of graduates is increasingly prominent, and on the basis of analyzing the existing problems of employment guidance work for college students, this article establishes the evaluation index system and uses AHP (Analytic Hierarchy Process)---fuzzy comprehensive evaluation to evaluate the quality of this work in the author's university, then puts forward key influencing factors and suggestions to improve college students' employment guidance.

Key words: Fuzzy mathematics; APH; Fuzzy comprehensive evaluation; Employment guidance for college students

1 Introduction

With the in-depth process of Chinese higher education system reform and the rapid development of educational popularity, the number of graduates has been increasing quickly. From 2005 to 2016, the number of graduates rose from 3.38 million to 7.65 million, which means the employment pressure of college students will keep in a high level in a quite long time. In this background, the college students' employment guidance becomes especially important. However, scientific evaluation on the quality of this work is the first step for further improvement. Establishment of Evaluation System of College Students' Employment by Zhang Peide (2007), sets out three levels for evaluation system, which the first level includes employment guidance, satisfactory procedure, service charge and supporting system; the second level includes 17 items, and the third level includes 49 items. Although there are different levels in the article, he just endows index with weight and point by experience. Research on the Comprehensive Evaluation Index System of College Students' Employment Work by Wang Pan (2009), adopts CIPP evaluation mode, which establishes evaluation system of college students' employment mode on the basis of four dimensions about background evaluation, inputting evaluation, process evaluation and achievement evaluation. Research on the Comprehensive Evaluation Index System of College Students' Employment Work by Wang Xiao (2010), analyzes synthetically four employment compositeness evaluation index system including background factor, knowledge structure, basic ability and quantity. It also determines each weight of index system from the perspective of employer. Construction of College Students' Employment Compositeness Evaluation System Based on Market Demand by Guan Liguang (2015), combs the gradual progress of college students employment compositeness from two aspects of theoretical research and qualitative research. Moreover, it also sorts out college students' employment compositeness system by Delphi technique method and draws conclusion of 10 dimensions and 47 indexes, such as knowledge level, professional competence, team work and scientific research innovation, which should be put great emphasis from the view of employment market demand. Empirical Study on the Evaluation System of Employment Quality of College Graduates Based on the Fuzzy Comprehensive Evaluation Method by Peng Jianzhang (2015), analyzes the existing problems of employment. It also leads to fuzzy comprehensive evaluation and establish evaluation system of college students employment from three aspects—the evaluation about employer to school, the evaluation about employer to college graduates and the evaluation about employer to employment guidance for college students of school (Peng Jianzhang²⁰¹⁵).

2 Analysis on Existing Problems of Employment Guidance for College Students

2.1 Deficient in sustainable and long-term work

Many universities have set up relevant employment guidance courses, but most schools' courses are set in the senior year, and some are even taken during the "mutual selection". The contents of the guidance are often comparatively narrow and short of the forming of mind and ideas. Specifically, these courses are usually instilled into students' minds by graduate employment mobilization, employment situation report and so on, but few of them provide specialized guidance and consultation for students' personalities. It is very hard to take effect for the employment guidance lacking of chronicity since

universities do not regard it as a long-term job at all and the temporary tendency is serious.

2.2 Outmoded guidance ideas

From the deep learning of current employment guidance in China, most universities disregard the social needs and are used to focusing on the employment rates during the guidance work, believing that the higher the employment rates are, the more remarkable the effect of the guidance is. Under the outmoded ideas about guidance, the work often lacks the employment education and career direction for students, causing their plain professional consciousness and blind choices of the employment. In this situation, even though getting jobs, they will also face the layoff and re-employment soon, which leads to a lack of fine long-term cultivation for the students' abilities in the future as well as the inconsistency of their personalities and specialties with their jobs.

2.3 Unprofessional employment guidance personnel

At present, many universities have gradually established a special employment guidance department, in which the guidance personnel carry out the relevant works. However, it is not difficult to find from the investigation that many of the guidance personnel are transferred from administrative department, hence they are short of specialized learning, systematic training and abundant employment guidance experience, not to mention provide practical help for students. Their jobs are restricted to transmitting national employment policy and briefly introducing the employment situation. Yet the guidance personnel are evidently inexperienced on the self-positioning and employment choice, which causes a large obstacle for the guidance work.

2.4 Weak systematic ness of employment guidance

The college students' employment and the professional learning, the employment choice and future career are related to each other as a whole, so the systematic guidance is needed. However, the employment guidance work in many universities is developed only around graduation and employment and is indifferent to low-grade students. The guidance work does not care about aspects aside from employment, such as major, occupation and the development of career, nor do they track the career changes of students after graduation, lacking further understanding for the students' employment choices. Students who are short of systematic employment guidance cannot clear their life goals and career planning, unknowing how to strengthen and complete during the study, which will seriously affect their future employment and the achievement of their life goals.

3 The Introduction of Fuzzy Mathematics Method

Many phenomena are with characteristic of fuzziness in real life, which is evaluated by the fuzzy mathematics established by professor L.A.Zadeh, an American scientist in the 1960s. Fuzzy mathematics can synthetically consider various influencing factors and use the fuzzy statistical approach and the theory of fuzzy mathematics to evaluate the pros and cons of things. At present, university graduates hunting for jobs in China has been brought more and more to the attention of universities and the country. The quality of employment guidance work not only represents the level of universities, but also shows the attitude given to the students. However, how to evaluate the quality of employment guidance for college students is a difficult problem, and it has gradually become an issue to which many universities attach great importance. Now, the quality of employment work no longer compares with the employment rate, but it requires various levels and indexes to evaluate comprehensively and scientifically. But many of those indexes are qualitative and ambiguous, so how to transform these qualitative and fuzzy indexes into scientific and reasonable quantitative ones is a key problem to be solved in the evaluation of college students' employment guidance work. Moreover, the employment guidance is a highly comprehensive work affected by many aspects. Therefore, it can't be evaluated simply by a single figure, which also matches its characteristic of fuzziness. For different university graduates, the indexes used to evaluate the quality of employment guidance work are various, so is the process of choosing the indexes. Different types of universities lay different emphasis on the weight setting of each index as well. All these uncertainties show that it is feasible and suitable to use the fuzzy mathematics to evaluate the college students' employment guidance work.

4 Establishment of Quality Evaluation Index and Weight System of Employment Guidance for College Students

4.1 Establishment of quality evaluation index system

According to what is mentioned above, based on the index optimization and combination principle, practical principle, dynamic improvement principle and so on, this article mainly refers to Construction

of College Students' Employment Competitiveness Evaluation System Based on Market Demand by Guan Ligu (2015), Research on Evaluation Index System of College Graduates' Employment Competitiveness by Wangxiao (2010), and Research on the Construction Method of Comprehensive Quality Evaluation Index System of College Students' Employment Guidance Work by Wang Xuhui (2009), then modifies and verifies the evaluation system after fully collecting data and combining the experts' arguments in the author's university. From the four aspects up to 16 indexes including employment guidance and services, market organization and effect, infrastructure and team building, professional setting and demand, the article evaluates the quality of college students' employment guidance. As is shown in the following chart:

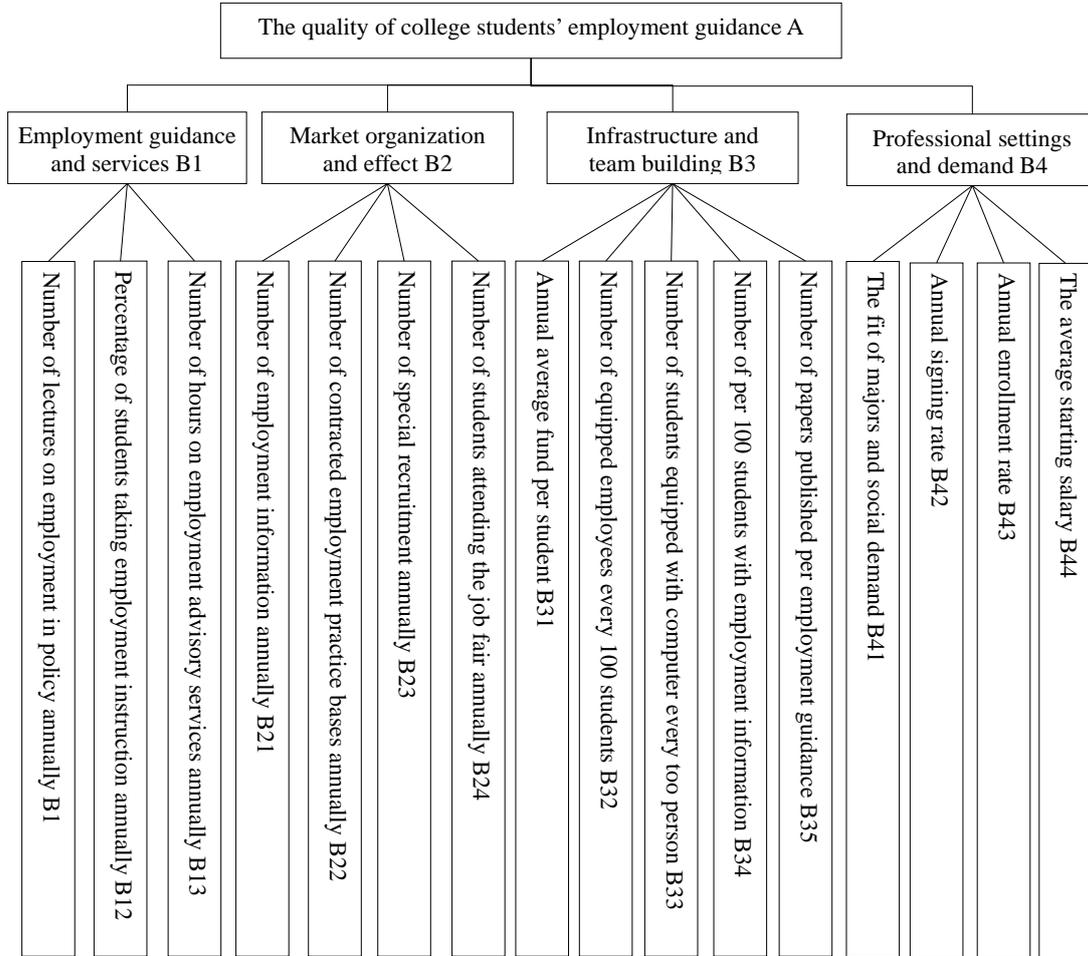

Figure 1 Evaluation Index System of College Students' Employment Guidance

4.2 Establishment of quality evaluation index weight system

This article uses AHP to confirm the weight of evaluation index weight system of college students' employment guidance work by adopting Saaty Nine Scale method. The author invites a specialist in college students' employment guidance to compare B1 and B4 in pairs and compares each secondary index of B1 and B4 in pairs. The judgment matrix is as follows:

Table 1 Target A Judgment Matrix

A	B1	B2	B3	B4	Normalized feature vector	CR figure
B1	1	2	1/3	1/6	0.10345	0.052
B2	1/2	1	1/3	1/7	0.070012	
B3	3	3	1	1/3	0.23435	
B4	6	7	3	1	0.59219	

Table 2 Index B1 Judgment Matrix

B1	B11	B12	B13	Normalized feature vector	CR figure
B11	1	1/2	5	0.32551	0.008
B12	2	1	8	0.60436	
B13	1/5	1/8	1	0.07013	

Table 3 Index B2 Judgment Matrix

B2	B21	B22	B23	B24	Normalized feature vector	CR figure
B21	1	1/2	2	2	0.27071	0.042
B22	2	1	3	2	0.41816	
B23	1/2	1/3	1	1/2	0.1205	
B24	1/2	1/2	2	1	0.19063	

Table 4 Index B3 Judgment Matrix

B3	B31	B32	B33	B34	B35	Normalized feature vector	CR figure
B31	1	2	8	9	9	0.49066	0.091
B32	1/2	1	7	8	9	0.35147	
B33	1/8	1/7	1	2	3	0.074725	
B34	1/9	1/8	1/2	1	2	0.048914	
B35	1/9	1/9	1/3	1/2	1	0.034228	

Table 5 Index B4 Judgment Matrix

B4	B41	B42	B43	B44	Normalized feature vector	CR figure
B41	1	2	7	3	0.47841	0.023
B42	1/2	1	6	2	0.29179	
B43	1/7	1/6	1	1/5	0.049727	
B44	1/3	1/2	5	1	0.18007	

Input[v_i, d_i]= eigs (A_i) in the Matlab, and then normalize the above feature vector. The specific calculation is to input: $V_i (: 1) / \sum (V_i (: 1))$ into the Matlab, the results are as follows:

$$W_0 = [0.10345 \quad 0.070012 \quad 0.23435 \quad 0.59219]; \tag{1}$$

$$W_1 = [0.32551 \quad 0.60436 \quad 0.07013]; \tag{2}$$

$$W_2 = [0.27071 \quad 0.41816 \quad 0.1205 \quad 0.19063]; \tag{3}$$

$$W_3 = [0.49066 \quad 0.35147 \quad 0.07472 \quad 0.048914 \quad 0.034228]; \tag{4}$$

$$W_4 = [0.47841 \quad 0.29179 \quad 0.049727 \quad 0.18007]. \tag{5}$$

The above results are incorporated in chart 1 to chart 5.

When checking the consistency, make the random consistency ratio is CR:

$$CR = \frac{CI}{RI} \tag{6}$$

The RI figure is checked by the table:

Table 6 Random Index Numbers

n	1	2	3	4	5	6	7	8	9	10
RI	0	0	0.58	0.9	1.12	1.24	1.32	1.41	1.45	1.5

Note: the “n” in the chart indicates the order of the matrix.

Inspection: when $CR < 0.10$, it is assumed that the judgment matrix is with satisfactory consistency, otherwise the matrix needs to be adjust to be with satisfactory consistency and the obtained data is incorporated into chart 1.

5 Empirical Analysis on Quality Evaluation of College Students' Employment Guidance

According to the targets of the evaluation, the author divides the results into four grades: a collection of comments about quality evaluation: $V=\{v1(\text{excellent}), v2(\text{good}), v3(\text{average}), v4(\text{poor})\}$. Take the author's university for example, 16 people including experts on college students' employment guidance and human resources personnel from enterprises are invited to comprehensively evaluate the quality of the work. The obtained data is as follow:

Table 7 Comment Index Collections of College Students' Employment Guidance in the Author's University

Index		The quality of college students' employment guidance work			
		Excellent	Good	Average	Poor
B1	B11	12/16	4/16	0	0
	B12	0	7/16	8/16	1/16
	B13	0	8/16	8/16	0
B2	B21	14/16	0	1/16	1/16
	B22	4/16	8/16	4/16	0
	B23	3/16	2/16	11/16	0
	B24	2/16	5/16	9/16	0
B3	B31	4/16	4/16	7/16	1/16
	B32	1/16	2/16	13/16	0
	B33	10/16	5/16	1/16	0
	B34	1/16	4/16	9/16	2/16
	B35	10/16	3/16	3/16	0
B4	B41	7/16	8/16	1/16	0
	B42	4/16	4/16	8/16	0
	B43	0	1/16	10/16	5/16
	B44	2/16	4/16	9/16	1/16

The fuzzy judgment matrix collected by above comments \bar{R}_1 、 \bar{R}_2 、 \bar{R}_3 、 \bar{R}_4 are as follow:

$$\bar{R}_1 = \begin{matrix} & V_1 & V_2 & V_3 & V_4 \\ \begin{matrix} B_{11} \\ B_{12} \\ B_{13} \end{matrix} & \begin{bmatrix} 0.7500 & 0.2500 & 0.0000 & 0.0000 \\ 0.0000 & 0.4375 & 0.5000 & 0.0625 \\ 0.0000 & 0.5000 & 0.5000 & 0.0000 \end{bmatrix} \end{matrix} \tag{7}$$

$$\bar{R}_2 = \begin{matrix} & V_1 & V_2 & V_3 & V_4 \\ \begin{matrix} B_{21} \\ B_{22} \\ B_{23} \\ B_{24} \end{matrix} & \begin{bmatrix} 0.8750 & 0.0000 & 0.0625 & 0.0625 \\ 0.2500 & 0.5000 & 0.2500 & 0.0000 \\ 0.1875 & 0.1250 & 0.6875 & 0.0000 \\ 0.1250 & 0.3125 & 0.5625 & 0.0000 \end{bmatrix} \end{matrix} \tag{8}$$

$$\bar{R}_3 = \begin{matrix} & V_1 & V_2 & V_3 & V_4 \\ \begin{matrix} B_{31} \\ B_{32} \\ B_{33} \\ B_{34} \\ B_{35} \end{matrix} & \begin{bmatrix} 0.2500 & 0.2500 & 0.4375 & 0.0625 \\ 0.0625 & 0.1250 & 0.8125 & 0.0000 \\ 0.6250 & 0.3125 & 0.0625 & 0.0000 \\ 0.0625 & 0.2500 & 0.5625 & 0.1250 \\ 0.6250 & 0.1875 & 0.1875 & 0.0000 \end{bmatrix} \end{matrix} \tag{9}$$

$$\bar{R}_4 = \begin{matrix} & V_1 & V_2 & V_3 & V_4 \\ \begin{matrix} B_{41} \\ B_{42} \\ B_{43} \\ B_{44} \end{matrix} & \begin{bmatrix} 0.4375 & 0.5000 & 0.0625 & 0.0000 \\ 0.2500 & 0.2500 & 0.5000 & 0.0000 \\ 0.0000 & 0.0625 & 0.6250 & 0.3125 \\ 0.1250 & 0.2500 & 0.5625 & 0.0625 \end{bmatrix} \end{matrix} \quad (10)$$

Namely:

$$\bar{R} = \begin{pmatrix} W_1 \times \bar{R}_1 \\ W_2 \times \bar{R}_2 \\ W_3 \times \bar{R}_3 \\ W_4 \times \bar{R}_4 \end{pmatrix} = \begin{pmatrix} 0.2441 & 0.3808 & 0.3372 & 0.0378 \\ 0.3878 & 0.2837 & 0.3115 & 0.0169 \\ 0.2158 & 0.2086 & 0.5388 & 0.0368 \\ 0.3048 & 0.3603 & 0.3082 & 0.0268 \end{pmatrix} \quad (11)$$

The fuzzy comprehensive judgment vector is obtained with the synthetic operation between matrix W_0 and \bar{R} : $\bar{B} = W_0 \times \bar{R} = (0.2835 \quad 0.3215 \quad 0.3655 \quad 0.0296)$. (12)

6 Conclusions

1) Seen from the fuzzy comprehensive evaluation vector \bar{B} , 28.35% experts think the author's university's quality of employment guidance is excellent; 32.15% experts believe it is good; 36.55% experts deem it is average, 2.96% experts think it is poor. From the maximum subordination principle of fuzzy comprehensive evaluation, the author's university's quality of employment guidance is average.

2) According to the experts' suggestions, one weight is given to one comment: V_1 is 25, V_2 is 50, V_3 is 75, V_4 is 100. The comprehensive score of Wuhan Huaxia University's quality of employment guidance is 53.535, it shows that the university's quality of employment guidance has been improved.

3) Through the comparison from chart1 to chart5, the weights of B_4 , B_3 are 0.59219, 0.23435, and the largest weights in B_4 , B_3 are B_{41} , B_{42} , B_{44} , B_{31} and B_{32} . Therefore, it has been analyzed that the important influencing factors of the quality of college students' employment guidance work are professional setting, social demand fit, annual signing rate, the average starting salary of employment, annual average fund per student, the number of equipped employees and so on, which is of certain reference significance in the guidance work.

4) From chart7, it can be easily seen that the author's university does poorly in job fairs, average fund per student, the number of employment guidance personnel, enrollment rate and starting salary, while these are the key factors to evaluate the employment guidance work of a university. To improve the work requires embarkation on these aspects.

5) A more comprehensive and objective understanding of the quality of a certain university's employment guidance work can be drawn by the quantitative research of the fuzzy thing--employment guidance work condition, thus taking some targeted improving measures accordingly, which has a great significance to the healthy long-term development of the quality evaluation of the college students' employment guidance work in our country.

Analysis on the Methods to Foster the Social Responsibility of Contemporary University Students

Zhang Li

Wuhan Huaxia Institute of Technology, Wuhan, P.R.China, 430223

(E-mail: 187199805@qq.com)

Abstract: In this research, the college students' sense of social responsibility is studied by cultivating the existence question and the countermeasure. This article uses the research method of literature analysis, combined with field survey and research. Through the questionnaire and the forum, we can grasp the new period college students' sense of social responsibility to cultivate the existing problems and to find the main problem of young college students' social responsibility in the new era. It made an analysis on the social responsibility of the modern university students from both quantitatively and qualitatively. Many effective strategies have been proposed including strengthening university students' ambitious and beliefs, fostering the great spirit of hard working and propagating the spirit of the era as well as that of the nation and develop social practices.

Key words: University students; Social responsibility; Methods to foster

1 Introduction

Responsibility it means the condition of being responsible: having the duty of looking after someone or something, so that one can be blamed (by the stated person) if things so wrong; of a person or his character) trustworthy ;(of a job)needing a trustworthy person to do it."(Longman English-Chinese Dictionary Of Contemporar,1988).UNESCO published report "learn to survive: to determine the basic ideas of a guiding education development direction" a person, as members of the citizens, family and society, to undertake a variety of expensive, deliver the development of human beings to gradually perfect."(UNESCO international education development committee,1996)

"Responsible citizens" this concept is proposed by the U.S. government in the 20th century 70 s. Colleges and universities in the United States put "responsibility citizen education as the main content, which can play a role of main channel of cultivating college students' social responsibility. The sense of responsibility education of colleges and universities stressed "four core", that is fair and reasonable, honesty and trustworthiness. France introduced the education of the main responsibility. Singapore carried out moral education in an all-round way to cultivate students' sense of social responsibility and social consciousness. (WuMan, 2015)

Since the 1950s, many psychologists in the world actively explore the strategies of cultivating college students' social responsibility from the relevant factors that affect college students' social responsibility and obtained remarkable results. But there are still some shortcomings: integrity and systemic is not strong, and it just emphasizes the research on one area or one side; Most studies are the list of the phenomenon, lacking of systematic and dialectical theoretical construction and empirical research.

In order to analyzing the social responsibility of the modern university students quantitatively and qualitatively, I made 30 multiple-choice questions, gave out 1200 questionnaires and did a research to those students who are in grade one, grade two and grade three from 6 universities of China. After analyzing the present situation of it objectively, some conclusions of the multiple-choice questions are shown as followings:

Table 1 The Statistics of Question: What is your Feeling about the Present Situation of the Social Responsibility to Modern University Students?

Choices	Having the social responsibility but confused	Lacking the social responsibility with a strong self-awareness	The social responsibility can be occurred in the time of emergency	Do not care about it at all
Percentages	48.1	35.7	10.5	5.8

Table 2 The Statistics of Question: What Methods do You use to Know the Social Responsibility of Modern University Students?

Choices	Mainly on watching news, reading newspapers and occasionally from class	From class occasionally	From others	Without knowledge
Percentages	60.6	17.2	15.0	7.2

Table 3 The Statistics of Question: Personally, what are the Patriotic Ways do You Think?

Choices	Studying and living well, doing your own duty well	Focus on the national affairs and actively engaged in the revitalization of China's patriotic cause	Attention to civilization and environmental protection, start with the little things around	With no feeling. Can not feel it in ordinary time, but can be inspired when others mention it.
Percentages	75.0	51.0	83.8	10.8

Table 4 The Statistics of Question: If You are Needed to Go to Those Areas like Northwest and Southwest Where Lack Developed Economy and Convenient Traffic, then What do You Think?

Choices	Go, because the nation needs me.	Go, because it is benefit to the future development	Stay, because of the family	Stay, because of the bad environment
Percentages	19.3	26.5	43.7	10.4

Table 5 The Statistics of Question: What are the Lacks do You Think to Modern University Students?

Choices	The hope to future	The enthusiasm to life	Belief	The serious attitude to things	Personal ideas
Percentages	17.5	20.6	28.2	28.1	5.7

Table 6 The Statistics of Question: What are the Reasons do You Think that Cause the Decrease of the Social Responsibility to Modern University Students?

Choices	Influenced by the social environment and other people	The conflicts among different ideas and cultures	The ignorance of the education about responsibility from family and school	The personal inner quality	The misleading of mass medias	School has the simple model educational administration without practice
Percentages	74.3	39.0	48.4	47.0	36.3	57.8

Table 7 The Statistics of Question: Do You Focus on National Affairs or Social Trends?

Choices	Always	Occasionally	Never	Only focus on the significant affairs
Percentages	33.0	55.8	4.5	6.7

Table 8 The Statistics of Question: What can Modern University Students do for the Realization of the National Dream?

Choices	Work hard and get further knowledge	Joining in work early and earning money to support family	Nothing can be done with tiny strength	Problems are existed in the education system
Percentages	60.0	57.5	40.4	14.6

Table 9 The Statistics of Question: What Campus Activities would you like Best to Join to Improve your Social Responsibility?

Choices	The volunteer activities organized by school	To improve the social responsibility through symposiums or lectures	Taking part in class activities like the CYL organizations(democratic) meetings	Volunteer services of other social qualities
Percentages	70.3	39.2	27.4	46.6

Table 10 The Statistics of Question: What are the Educational Ways do You Think that can Realize the National Dreams?

Choices	Fully develop the main channel of the Ideological and Political Theory Course, educating the university students with ideals and beliefs	Fostering diligent and strict style of study, strengthening the capability and skill of university students to realize dreams	Propagating the spirits of ethics and era, fostering the great quality of university students to work hard	Developing various practices and activities, strengthening the cohesion force and centripetal force of university students	Strengthening the legal quality of university students, avoiding the "nightmares"	Others
Percentages	53.1	72.7	66.1	72.3	44.3	16.5

2 Analysis on the Present Situation About the Social Responsibility of Modern University Students

The above statistics can show easily that modern university students have positive spirits, with enthusiasm to lives and hopes to futures. But part of them have some problems in the aspects of ideals and beliefs, value orientations, social ethics and sense of law as well as principles.

2.1 Some university students have unclear social responsibility with weak ideal and belief

In childhood, most people have great ideals and firm beliefs. With the growth of their age, many university students have lost their ideals and beliefs because of various realistic pressures and cruel social competitions. They don't talk about great ideals of futures any more but turn to focus on some more realistic things. They have the stronger utilitarian awareness and pay more attention to the present needs of materials, so how to make money has been the priority. Many university students cannot keep calm to do their studies, they addicted to play games on the internet and some other entertainments or busy doing part time jobs to earn few money. It is hard for them to calm to plan their own university lives for their ideals.

2.2 The value orientations of some university students have been distorted

With the influences of various social unhealthy atmospheres and the pressures of different social cruel competitions, part of university students have distorted value orientations. When the conflict among personal benefit, social benefit and other people's interest occurred, they pay more attention to the personal interest, choosing their own active ways from personal interests. They pursue self-independence, individual autonomy and personal dignity, and they focus on the self-value while ignore the social value. Their sights are restricted to their personal interests, but ignoring the necessary social responsibilities.

2.3 Some university students have weak social ethics and weak awareness of law and principle

Moral and law are the two basic methods to maintain the social order, it is the necessary obligation for everyone to obey the law and adhere morals. Those things of disobeying morals and disrupting law and principles of the contemporary university students occurred from time to time. Some college students lack of learning motivation, disrupting classroom discipline during classes, cheating in exams, breaking public properties, spreading unhealthy information on the internet and getting used to those things of breaking the law and discipline or disobeying morals.

2.4 Some university students confused to their social identities

People, as a social existence, need to assume certain social roles and fulfill certain social responsibilities. As Marx once said: "as a certain people, the real human being, you have principles, missions and tasks, it does not matter whether you have such an awareness or not."(Marx and Engels. German ideology, 2008). However, the contemporary university student is such a generation which grew up in the era background of the economic globalization, cultural diversity and a variety of values existed with each other. They not only advocate themselves, pursue their self-values and self-realizations, but also pursue the individuality and the various social lives. To some extent, that makes their expectations to the social responsibility full of many uncertainties, leading to confusion and mess of the social identities and making many university students just have the so called name, "university students", without knowing "the responsibility of university students."

3 The Methods to Foster the Social Responsibility of Contemporary University Students

3.1 Strengthening the education of ideals and beliefs to university students and improving their wills and determinations

Establishing lofty ideals and having great ambitions are the necessary prerequisites for any career success of contemporary college students. "Great accomplishments require ambition and tireless effort." Ideal shows the direction of life, faith determines success or failure of the career. Contemporary college students shoulder the hope of country and nation and bear the trust of the family and society. They should not only improve the level of knowledge, enhance practice ability, but also strengthen the scientific and lofty ideal and faith, clear the foundation of conducting themselves. (Editorial committee, 2015)

Therefore, universities must focus on strengthening and improving the methods or strategies of the ideological and political work, enhancing the ideological and political education with effectiveness and pertinence. Ideological and political education in colleges should be combined with the revolutionary traditional education, hardworking education and student's studying life, realizing the connection among

the historical education and national education as well as the real life and the virtual life, solving the practical problems of students in learning, emotion, interpersonal communication and achieving the successful goals, improving the learning enthusiasm and initiative of the students. So that it can stimulate the deeper thinking on the social development and the social value to them, and finally they will sublime ideals and faiths to specific actions to achieve the prosperity of the country.

3.2 Fostering the good learning style of hard working, improving the knowledge and skills of university students

In the 30 years since the reform and opening up, China's comprehensive national power has strengthened gradually day by day and people's living standard has been greatly improved, with making remarkable achievements. But we must also clearly realize that socialism is still at the primary stage which will last for a long time, the main contradiction of the primary stage is still the contradiction between people's growing material as well as cultural needs and the backward social production. To completely change the backwardness of the state, a large number of innovative talents are needed to construct and develop their own countries.

College students should first cultivate diligence and rigorous good style of studying, calming down to devote themselves to science and hard working. They should work hard with practical skills and they should think independently, combine study with practices and learn with enlightenment. Contemporary college students should not only strive to learn their professional knowledge, but also to focus on the expansion and extension of knowledge, achieving the goal of independent study, innovative study, comprehensive learning and lifelong learning, strengthening the abilities and skills of knowledge to realize their own dreams.

3.3 Propagating the national spirit and the Era spirit, fostering the characteristics and qualities of university students

People should have such a spirit of struggling and hard working. General Secretary Xi Jinping stressed: "Chinese dream must be carried forward with the propagation of the Chinese spirit, which is the national spirit with the core of patriotism and the era spirit with the core of reform and innovation. That is the cohesive spirit which is the soul that can strengthen the nation." (Editorial committee, 2013) We should guide students to carry forward the national spirit and the spirit of the times, constantly learning, understanding and practicing it. In the classroom teaching and practical teaching in daily life, paying more attention to cultivate students' spirits of patriotism, solidarity, hardworking, brave and strong and the spirit of unremitting self-improvement as well as honesty and trustworthiness, guiding students to improve their own quality in science and technology, and meanwhile, strengthening the ideological and moral cultivation, learning to behave, act, coexist and learning how to learn. They should combine the theory and practice, knowledge and ability, scientific and technological as well as literature qualities together organically and foster the noble character to achieve the dreams of the nation.

3.4 Developing the social practical activities, strengthening the practical abilities of university students

"Fostering the will in actual combats and enhancing the ability in practices", it is the real reflection for Chinese to seek, pursue and achieve dreams. The opinion, practice is the priority, is the basic point of the Marxism epistemology, it is also a must in the education sector of university education. The Decision of CPC Central Committee and the State Council on Deepening the Reform of Higher Education in a Comprehensive Way to Recommend Quality Education pointed out: "higher education should strengthen social practices, organize students to participate in scientific researches, technology development and promotion activities as well as social service activities."

We must guide the university students come out of schools and step into the society, letting them know the society in social practices as well as learning social knowledge, improving skills and practicing willpower. Making them conscientiously perform the necessary obligation and responsibility to others and the society in the process of practices.

4 Conclusions

Through questionnaires, I have analyzed the present situation about the social responsibility of the modern university students quantitatively and qualitatively, have discussed the existed problems on the ideals and faiths, value orientations, social ethics and law awareness of some university students and have proposed to educate and guide them from the education on beliefs, knowledge and skills, characteristics and qualities and the practical ability, etc.

Study on the Relationship Between College Students' Psychological Capital and Physical Exercise Effects

Wang Mengxing, Li Yong

Department of Physical Education, Wuhan University of Technology, Wuhan, P.R.China, 430070
(E-mail: 875611692@qq.com, 2234457421@qq.com)

Abstract: Taking college students in Hubei Province as the research object, the article investigates the psychological capital level and the effect of physical exercise through the "Questionnaire on Psychological Capital Level of College Students", and has a general understanding of the status of physical exercise effect and psychological capital of college students, so as to further analyze the relationship between psychological capital and physical exercise effect and provide empirical evidence for enhancing the psychological capital level and physical exercise effect of college students. The research has shown that: there exists a positive correlation between psychological capital and physical exercise effect of college students.

Key words: College students; Psychological capital; Physical exercise; Exercise effect

1 Introduction

The research on psychological capital originates from the development of positive psychology, which advocates interpreting human's psychological phenomena and behaviors in a positive way of thinking, and focuses on human's emotional experience and positive personality traits. With the vigorous development of positive psychology at home and abroad, an increasing number of psychological researchers begin to focus on individuals' positive psychological strengths and virtues. Psychological Capital refers to a positive mental energy and resource that individuals manifest in their growth and development process, including self-efficacy, hope, optimism and tenacity in general (Karatepe om, Karadas G, 2014). The scholar Yang Zhao believed that college students could enhance their willpower and optimism and gain the competitive advantage of psychological capital through various forms of physical activities (Yang Zhao, 2008).

With the popularity of various fitness activities, fitness becomes a hot word in people's well-being, and studies have shown that psychological capital can effectively predict the level of mental health (Huang Hui, 2011). Sports have positive effects on the various dimensions of individual psychological qualities. Positive psychological capital is of great significance to either individual development of students or competitiveness enhancement of schools or social development (Ji Liu, Zhang Liwei, 2007). This article attempts to investigate the status of physical exercise of college students and reveal the relationship between psychological capital and physical exercise effect, so as to provide empirical evidence for enhancing college students' psychological capital level.

2 Subject and Method

2.1 The respondents

The selected respondents in this article are college students in Hubei province, including students from Wuhan University of Technology, Central China Normal University, Wuhan University, and Wuhan Textile University. It randomly selects 800 students from different grades and issues a total of 800 questionnaires, with 768 valid ones and 96% effective rate, including which there are 398 boys and 370 girls.

2.2 Research tools

The measuring tool of college students' psychological capital used in this paper is "positive psychological capital questionnaire" (PPQ). Zhang et al followed Luthans' view, based on the related measurement tools and literature at home and abroad, and compiled "positive psychological capital questionnaire" (PPQ) containing self-efficacy, optimism, tenacity, and hope with 26 questions (Zhang Kuo, Zhang Qian, 2010). The research group of all questions in the questionnaire is for domestic college students, which accord with the using standards of psychological questionnaires to higher reliability, validity, local appropriateness and stability. The adoption of this questionnaire is based on the consideration of the structural stability and the subject of college students.

2.3 Statistical analysis

This paper applies the statistical software SPSS17.0 to have a descriptive analysis of the collected

effective questionnaires, and carries out descriptive statistics, variance analysis, and correlation analysis of the data.

3 Result and Analysis

3.1 Overall condition of collegestudents' psychological capital level

In order to achieve the stability and reliability of psychological capital questionnaire, the article uses the statistical software SPSS17.0 to carry out a reliability test. The results show: the correlation coefficient R of psychological capital questionnaire is 0.87; $P < 0.001$; the reliability test α value is 0.807; which fully proves the credibility of the content and data of psychological capital questionnaire.

Table 1 Reliability Test Results of Psychological Capital Questionnaire

Questionnaire Item Number (item)	Psychological Capital
	Cronbach's Alpha (α)
26	0.807

3.1.1 The gender differences of psychological capital in college students

The paper carries out an independent sample T-test on psychological capital of students with different genders, and the results are shown in Table 2: boys' scores in four dimensions of psychological capital are higher than girls'. The paper carries out a statistical test on the four dimensions of psychological capital, namely, self-confidence, hope, tenacity, and optimism, and calculates P value is less than 0.05, from which can be seen significant gender differences on self-confidence, hope, tenacity, and optimism of college students. Combined the psychological capital mean and standard deviation of male and female college students, it can be drawn: there exist differences on psychological capital (self-confidence, hope, tenacity, optimism) of male and female college students, boys relatively better than girls.

Table 2 Gender Differences of Psychological Capital in College Students

Variable dimension	Male (n = 398)	Female (n = 370)	P
Confident	28.37 \pm 2.820	26.86 \pm 3.209	0.003
Hope	21.93 \pm 1.187	21.01 \pm 1.715	0.018
Tenacity	23.20 \pm 1.891	22.35 \pm 1.437	0.010
Optimism	22.95 \pm 2.023	21.89 \pm 2.457	0.014

3.1.2 Grade differences of psychological capital in college students

The paper has a one-way anova analysis of psychological capital of students from different grades, and the results are shown in Table 3: the average value of psychological capital scores of college students with four grades are almost the same, among which the second-year college students' psychological capital scores highest.

Table 3 Grade Differences of Psychological Capital of College Students

	Grade	M+SD	F	P	Multiple Comparisons
Confidence	Freshman	27.31 \pm 3.391	6.940	0.123	
	Sophomore	27.75 \pm 2.933			
	Junior	23.92 \pm 2.369			
	Senior	23.78 \pm 2.006			
Hope	Freshman	21.29 \pm 1.830	5.438	0.726	
	Sophomore	22.51 \pm 1.393			
	Junior	21.91 \pm 2.096			
	Senior	21.78 \pm 1.732			
Tenacity	Freshman	22.20 \pm 1.749	8.122	0.026	Junior: Freshman(P=0.018) Sophomore (P=0.008) Senior (P=0.138)
	Sophomore	26.81 \pm 1.216			
	Junior	23.34 \pm 2.586			
	Senior	26.18 \pm 1.880			
Optimism	Freshman	22.32 \pm 2.596	5.243	0.866	
	Sophomore	22.44 \pm 2.183			
	Junior	21.70 \pm 2.099			
	Senior	22.00 \pm 1.320			

It regards four grades in college as independent variables, and carries out single-factor and multiple comparison analysis by defining four dimensions of college students' psychological capital as dependent

variables, including self-confidence, hope, tenacity, and optimism. The data shows that: the P values of self-confidence, hope, and optimism are greater than 0.05 on average, indicating that there is no difference on confidence, hope, and optimism. While the P value of tenacity is 0.026, less than 0.05, indicating that the tenacity of psychological capital of college students varies from different grades. The paper adopts LSD method of pairwise comparison to have multiple comparisons and finds out: the tenacity of freshmen and sophomores are significantly different from the ones of juniors and seniors tenacity ($P = 0.018 < 0.05$, $P = 0.008 < 0.01$, $P = 0.138 < 0.01$), and no significant difference in other pairwise comparison groups. Therefore, the psychological capital of college students exist part diversity in different grades.

3.1.3 Native place differences of psychological capital of college students

The paper has an independent sample T-test on psychological capital of college students from different native places, and the results are shown in Table 4: non-rural students score higher than rural students in four dimensions of psychological capital.

The paper has statistical tests on the four dimensions of psychological capital, namely, self-confidence, hope, tenacity, and optimism, among which the P values of self-confidence, hope, and tenacity are greater than 0.05 on average. It can be seen that no difference existing on self-confidence, hope, and tenacity among college students from different native places.

The P value of optimism is 0.002, less than 0.05, indicating that there are significant differences in optimism and non-rural college students' psychological capital scores are higher than rural students'.

Table 4 Native Place Difference of Psychological Capital in College Students

Variable Dimensions	Non-rural (n = 345)	Rural (n = 423)	P
Confidence	28.07 ± 3.134	27.19 ± 3.021	0.085
Hope	21.60 ± 1.482	21.35 ± 1.527	0.484
Tenacity	22.80 ± 1.565	22.48 ± 1.241	0.362
Optimism	23.15 ± 2.060	21.81 ± 2.390	0.002

3.2 Correlation analysis on college students' psychological capital and exercise effect

In order to understand the relationship between psychological capital and physical exercise effect of college students, the article has correlation test by regarding exercise effect (exercise fun, health effect, ability effect, appearance effect, and social effect) and psychological capital (self-confidence, hope, tenacity, and optimism) as variables and the results are shown in Table 5.

Table 5 Correlation Analysis on Various Dimensions of Psychological Capital and Exercise Effect

		Correlation				
		Exercise Fun	Health Effect	Ability Effect	Appearance Effect	Social Effect
Self-confidence	Pearson correlation	.652**	.588**	.499**	.462**	.416**
	Significance (bilateral)	.000	.000	.000	.000	.000
Hope	Pearson correlation	.481**	.518**	.528**	.394**	.401**
	Significance (bilateral)	.000	.000	.000	.000	.000
Tenacity	Pearson correlation	.567**	.609**	.537**	.342**	.358**
	Significance (bilateral)	.000	.000	.000	.000	.000
Optimism	Pearson correlation	.670**	.624**	.614**	.525**	.503**
	Significance (bilateral)	.000	.000	.000	.000	.000

** . Significant correlation on .01 level(bilateral)

Table 5 lists in detail the correlation analysis results on various dimensions of psychological capital and physical exercise effect, from which can be seen: self-confidence, hope, tenacity, optimism and physical exercise effect (fun, health, ability, appearance, and social) have correlation. It also shows that obvious synthetic correlation exists between four dimensions of psychological capital and physical

exercise effect, namely, the higher four dimensions of psychological capital are, the better physical exercise effects are.

4 Recommendation

The study has shown that there exists a positive correlation between psychological capital and physical exercise effect of college students, and differences exist in the four dimensions of college students' psychological capital (self-confidence, hope, tenacity, and optimism). Therefore, in order to ensure the physical and mental health of college students and cultivate innovative talents with comprehensive qualities for the society, it is practical to develop and promote college students' psychological capital, envisage the differences of college students' psychological capital, and adopt the measures of individualized teaching to achieve the goal of improving physical exercise effect of college students.

4.1 Development and Promotion of College Students' Psychological Capital

1) Increase self-efficacy. Schools, families and society should create various conditions, focus on cultivating college students' awareness of actively participating in physical exercise, helping college students set workout goals in line with SMART principles and support their implementation. The continuous achievement of the stage goals strengthens the success experience of college students, so that students have over achievement motivation sense, and their self-confidence and sense of self-efficacy are improved.

2) Build a better hope. Concern about and pay attention to quality-oriented education of college students, and increase the confidence of college students in face of difficulties and pressure calmly and are hopeful to the future by raising the expectation level of college students.

3) Cultivate tough quality. Cultivate college students' ability to calmly face adversity, overcome adversity, achieve the ultimate goal, actively explore their inner potentials and combine with advantageous external resources to turn difficulties into challenges, so as to cultivate the tough quality of college students.

4) Establish a positive attitude. Improve the cognitive ability and level of college students, and guide them to face the challenges in life and learning with a more positive and optimistic attitude. Train their courage to deal with unexpected things in physical exercise, and convince that they have the ability to handle any problems, so as to establish the positive and optimistic attitude and anti-frustration ability of college students.

4.2 Envisage Differences and Teach Individually

1) Set reasonable work-out goals according to the differences of male and female students, and choose different exercise programs based on the different physical features between male and female students. Especially organizes regular sports competitions in light of girls' interests and hobbies, so as to urge girls to actively participate in sport activities and help shape their positive qualities.

2) Focus on cultivating freshmen and sophomores' adaptive capacity and anti-pressure ability, enhancing their tenacity and encourage their courage to complete the challenging tasks in exercise. Physical exercises with long time and high frequency can help college students to hone strong will, and cultivate the faith of perseverance, thereby enhancing their level of tenacity.

3) Targeted at students from different native places especially rural students, develop their optimistic attitude, learn to actively face learning and life, and dare to present their exercises to classmates and teachers to have a smooth experience. By taking exercise, master certain physical exercise skills, improve the ability of self-assessment, and enhance their self-confidence.

5 Conclusions

1) Male and female college students are different in psychological capital (self-confidence, hope, tenacity, and optimism), males are relatively better than females.

2) There are differences in psychological capital's tenacity of college students from different grades, and that is no difference in self-confidence, hope, and optimism. The tenacity of freshmen and sophomore year students is significantly different from that in senior year.

3) No difference exists in self-confidence, tenacity, and hope of college students from different native places, but there are differences in optimism, and the non-rural college students' psychological capital scores are higher than that of the rural students.

4) It can be drawn from correlation analysis that a positive correlation exists between psychological capital and physical exercise effect of college students.

Abstract: As a highly effective community-based rehabilitation mode, community-based physical rehabilitation has been promoted in most areas in China. Yet in practice it faces many predicaments, which lead to exploration of the academy society into modes of social work intervention into community-based physical rehabilitation. Selecting a representative district Jiangnan District in Hubei Province as object of study, taking reality as basis, this essay holds that intervention of empowerment-oriented social work model into community-based physical rehabilitation work is an important means of community-based physical rehabilitation on persons with disabilities in China. Therefore, this essay constructs a social work model which intervenes into community-based physical rehabilitation on persons with disabilities in China from individual, family, group, organization, community and country level.

Key words: Community-based physical rehabilitation; Social work model; Empowerment; Persons with disabilities

1 Introduction

1.1 Domestic and international research on the current situation of physical rehabilitation of persons with disabilities

Chinese scholar Jin Ning is the pioneer for Physical rehabilitation research in China. He believes that physical rehabilitation therapy rose in foreign countries as early as in the late 1940s, and it promoted development of sports for persons with disabilities. Physical rehabilitation therapy is a rehabilitation therapy through which physical function of persons with disabilities is improved by way of trainings in sports and entertainment, as well as their mental state. Also the therapy plays an important role in promoting interpersonal communication and their return to society. It is recognized internationally that persons with disabilities may improve their adaptability to life, explore their potentials, improve quality of life and integrate into society through physical rehabilitation trainings. Many countries have carried out physical rehabilitation trainings on persons with disabilities, and taken physical rehabilitation activities in the community as focus. In addition, Jin Ning also introduces physical rehabilitation work progress in Norway and Japan, and finds that physical rehabilitation of persons with disabilities and community are inextricably linked in foreign countries. (Jin Ning, 1998)

In *The Development Status and Countermeasures of Physical Rehabilitation of Persons with Disabilities*, Kong Fan, Yuan Feng and Wang Meichun suggest that physical rehabilitation is development and extension of exercise therapy: by means of PE and various sports, it treats diseases and injuries, prevents complications, brings an end to negative mental health, and promotes the comprehensive recovery of body functions, so as to achieve the goal of rehabilitation. They put forward countermeasures for the career of physical rehabilitation for persons with disabilities, including establishment of correct physical rehabilitation view, training of physical rehabilitation talents, providing support on policy and funds, and research and development of sports suitable for rehabilitation of persons with disabilities. (Kong Fan, Yuan Feng, Wang Meichun, 2007)

Other scholars have conducted in-depth research on special physical rehabilitation therapy for various disabilities or illnesses. For example, Liu Qingshan has indicated in *Physical Rehabilitation Method for Ankylosing Spondylitis* that the purpose of physical rehabilitation training is that through active movement combined with whole body movement and parts movement, increasing the movement of the joints up, down or surrounding the ankylosing joints, so as to develop compensation function; enhancing muscle strengthen and stretching training, so as to further protect the joints and improve the function of the body. And the main rehabilitation methods are: Taijiquan, Qigong, Ba Duan Jin, Qu Qin Xi etc. (Liu Qingshan, 1994)

It can be concluded that, physical rehabilitation is an important part of physical education, which is the combination of physical education and medical science. The key point of physical rehabilitation of

persons with disabilities lies not in competition but in the nature of rehabilitation. By participating in physical rehabilitation exercises, persons with disabilities may improve the functions of all organs and systems, improve capabilities of the body, and maximally compensate the difficulties which have been brought to them with disabilities. Especially in teenager period, possibilities of development of the body are quite huge, and even disabled parts may not be set completely, and there is possibility for transformation.

Foreign scholars generally believe that one quite important standard to measure service quality is "life quality". Schalock etc. (2002) say that quality of life is overall feeling for life, and positive experience in socializing and opportunities. Obviously, personal subjective feeling and sense of worth are key factors of quality of life. That is to say, quality of life is subjective experience, which is the satisfactory degree of one person for the experiences of his/her whole life, inner sense of satisfaction, and the opportunity for self-fulfillment in society.

Moreover, what is equally important is that, change of environment arrangement has direct impact on the quality of life of persons with disabilities. Stancliffe and Keane (2000) believe that only if with sufficient support and services, can living environment exert positive impact on life style and satisfaction. Duvdevany etc. (2002) put forward that development of community environment arrangement plan after the 60s are caused by "de-organization" movement and the importance people attach to the ability of "self-determination". Self-determination is one of the important connotations of quality of life. It is an ability with which a person makes choices according to his/her own will and take actions accordingly, the hypothesis of which is that every grown-up can grasp his own life with certain support. Therefore, support and services should be provided so as that persons with disabilities may make choices in the following fields: (1) select communities for residence and neighbors; (2) determine to live alone or with others; (3) determine whether or not to participate in community activities or join community organizations and make friends; (4) know where and how to get help and support; (5) be able to associate with persons of the opposite sex and deal with relations with them; (6) choose where to work; (7) select medical and therapeutic services.

Felce etc. (2000) hold the opinion that whether or not to provide necessary support for persons with disabilities to live in normal community environment is not only an important indicator to measure the quality of life of persons with disabilities, but also an important standard to judge service efficiency for persons with disabilities. The quality of life of persons with disabilities is determined by the types of services and the attitudes and strategy of relevant service providers. On the one hand, quality of life reflects the satisfaction of persons with disabilities on certain kind of services; on the other hand, the satisfaction of persons with disabilities on quality of life shows their satisfaction on certain type of services. Quality of life is the main indicator for countries all over the world to plan, service and evaluate the effectiveness of service models targeted for persons with disabilities.

It can be concluded that foreign scholars focus their researches on how to improve the quality of life of persons with disabilities and provide services for them (including rehabilitation services).

1.2 The current situation of community-based physical rehabilitation of persons with disabilities in China

With rapid expansion of global economy, social pressure multiplies daily, and it is gradually realized by the society and the government that persons with disabilities as a social vulnerable group, restricted by physical and psychological factors etc., suffer much inconvenience in their life, study, employment, interpersonal interaction and social participation etc., which results in their vulnerable position in society, so it is decided to promote development of the cause of rehabilitation of persons with disabilities. Combining foreign experience with localization, we use a community-based comprehensive rehabilitation model, associating with different organizations and institutions to provide comprehensive services on health care, education, employment, psychology consultation etc., and make it a predominant model for rehabilitation of persons with disabilities in China. To support the development of community-based rehabilitation of persons with disabilities, China has in recent years enacted a series of documents related to rehabilitation of persons with disabilities, which has played a huge role in promoting community-based rehabilitation of persons with disabilities.

Though community-based rehabilitation of persons with disabilities is developing very fast in China, the rehabilitation demands of most persons with disabilities in China are not satisfied, they are not able to enjoy rehabilitation opportunities and conditions. In the process of performing the cause of community-based rehabilitation of persons with disabilities, work staff from the government and the community gradually become aware of the significance of community-based physical rehabilitation, including overcoming their self-obstacles, improving the ability to adapt to life and improving health,

enhancing immunity, improving physical fitness of persons with disabilities for various sports, improving mental state, promoting social integration, showing equal opportunities and improving quality of life etc. However, since development of community-based rehabilitation of persons with disabilities is still not mature in China, and the physical rehabilitation work is not professional or targeted, physical rehabilitation work becomes a mere formality, which affects the service quality and efficiency of community-based rehabilitation of persons with Disabilities. In western developed countries, professional social work values and work methods play a significant role in community-based rehabilitation of persons with disabilities; while in China, community-based rehabilitation of persons with disabilities is lack of effective intervention of professional social work, thus it fails to engage in social work as an active role in the field of community-based rehabilitation of persons with disabilities. Among current researches, researches on how to engage social work into community-based physical rehabilitation of persons with disabilities are quite rare; while to improve the quality and efficiency of community-based physical rehabilitation of persons with disabilities in China, it is indeed necessary to explore how social work engages in community-based physical rehabilitation of persons with disabilities in China. Taking Jiangnan District of Wuhan City as an example, this essay explores a social work model for community-based physical rehabilitation of persons with disabilities in China.

2 Development of Community-Based Physical Rehabilitation in China

Physical rehabilitation therapy rose in foreign countries as early as in the late 1940s, and it promoted development of sports for persons with disabilities. Physical rehabilitation therapy is a rehabilitation therapy through which physical function of persons with disabilities is improved by way of trainings in sports and entertainment, as well as their mental state. Also the therapy plays an important role in promoting interpersonal communication and their return to society. It is recognized internationally that persons with disabilities may improve their adaptability to life, explore their potentials, improve quality of life and integrate into society through physical rehabilitation trainings. Many countries have carried out physical rehabilitation trainings on persons with disabilities, and taken physical rehabilitation activities in the community as focus, since carrying out physical rehabilitation in the community may combine rehabilitation, physical training and health care etc. of the community organically, make their unique roles displayed.

Community sports have developed in China in the late 1980s when there was a strategic shift taking economic construction as the center. Currently, men of insight in the sports community have become fully aware that community is a bridge to connect family sports, school sports and community sports and the carrier for implementation of the national fitness program. Developing community sports is an important way to carry out construction of two civilizations at the grassroots level. (Gu Yuanyan, 2001) Although promulgation of the law of physical culture and sports and implementation of the national fitness program have, to a certain extent, promoted the development of community sports, China is a developing country at the primary stage of socialism, there are not sufficient conditions for development of community sports, whether from the perspective of economic development or social development. The prevailing problems in current community sports are: First, the lack of sports facilities. At present, public sports facilities for community residents are extremely limited in China, and there is a large gap between economically developed areas and underdeveloped regions, which is not able to meet the demands for national fitness. Second, the lack of participants. At present, sports groups involved in community sports in China are mainly the elderly; young and mid-aged people are fewer and persons with disabilities are even fewer. Third, the lack of theoretical and empirical guidance, materialized sports societies in China have not yet reached the grass-roots level so far, thus it is difficult to find organizational reliance or technical guidance for community sports work; the “social sports instructor techniques level system” under implementation has not gone deep to the grassroots level, resulting in a lack of instructors and training opportunities. The above three points hamper the development of community sports, and affect the development for fitness of persons with disabilities at the same time.

In Article 71 of *The World Program of Action Concerning Disabled Persons* (adopted by the United Nations General Assembly at its 37th regular session on 3 December 1982, by its resolution 37/52), it explicitly mentions that “it is basic requirements of life to fully participate in the activities of basic units of the society—family, social groups and community”. Such opportunity of participation and right of equality are stipulated in the *Universal Declaration of Human Rights*, therefore each and every one shall enjoy such right, including persons with disabilities. Along with the reform of the political system and economic system, the implementation of the national fitness program, the foothold of mass

sports must be the most basic unit of society—community sports. With 60 million people with disabilities, their participation in physical fitness in the community directly affects the development of community sports. Over the past decade, the state has issued a number of regulations and policies relating to protection of the interests of persons with disabilities, such as *Law of the People's Republic of China on the Protection of Disabled Persons*, *Tenth Five-Year Implementation Plan for Sports Work of Persons With Disabilities*, *Law Of the People's Republic of China on Physical Culture and Sport*, *National Fitness Program*, etc. all of which have provided a good spiritual environment for persons with disabilities in China to take part in sports activities and sports competitions. Together with the active participation and joint efforts of the majority of persons with disabilities, service providers for persons with disabilities and physical educators, the sports work of persons with disabilities has stepped on the road of rapid development, and has made historic progress. Since 1982, China has participated in five sessions of Paralympic Games, five sessions of "Far South" Games for the Disabled, four sessions of Special Olympics, two sessions of Olympic Games for the Deaf as well as sports meeting for the blind and a number of world championships, winning more than 1600 gold medals, breaking (surpassing) 185 world records. Chinese sports delegation of persons with disabilities entered the world sports "top ten" of persons with disabilities for the first time at the 10th Paralympic Games held at Atlanta in 1996; the Chinese sports delegation ranked sixth at the gold medal table at the 11th Paralympic Games in 2000. Chinese delegation kept ranking first in the number of gold medals and all medals at the 5th, 6th and 7th sessions of the "Far South" Games for the Disabled. With high competitive level, through competitive sports for the disabled, persons with disabilities achieve better results in international competitions; this improves the awareness of sports in more ordinary people with disabilities, motivate them to actively take part in physical exercises, so that mass sports develop constantly. At present, sports activities for persons with disabilities are not popular enough in China, especially in the community (Luo Yong, 2008), such situation has a lot to do with the level of education, the economic situation, and motives for taking part in community sports of persons with disabilities, forms of participation and participating items. Fitness of persons with disabilities in community sports still has a long way to go.

To construct a fitness mode in community sports for persons with disabilities is the need for development of community sports, and also the requirement for development of sports undertaking among persons with disabilities. As vulnerable groups in society, persons with disabilities need more care than normal people in the context of national fitness and community sports development; they need more fitness venues, instruments and methods in community sports. However, survey shows that, fitness situation of persons with disabilities is not optimistic, even in economically developed regions (such as Beijing, Shanghai, Guangzhou) there is still lack of fitness devices and methods for persons with disabilities. Today, disability is already a global problem, and one person in four in the world has disability issues of different degrees, whether for congenital cause or acquired cause, no matter from the perspective of economics or sociology or medical science, the final means is sports, which is the most effective way (Lu Yuanzhen, 2000). With the continuous development and deepening of community sports, fitness and rehabilitation of persons with disabilities is inevitable in community sports, it is also implementation of fitness and rehabilitation of persons with disabilities at the most basic level, which to some extent reflects the significance of community-based physical rehabilitation of persons with disabilities.

3 Present Situation and Problems of Community-Based Physical Rehabilitation of Persons with Disabilities in Jiangnan District

Under the guidance of government policies, Disabled Persons' Federation of Jiangnan District and all sub-districts attach considerable importance to the cause of community-based physical rehabilitation of persons with disabilities, yet for residents in China lacking understanding for community-based physical rehabilitation and insufficiency of professional and theoretical knowledge of work staff in implementation of physical rehabilitation, problems occur frequently in present community-based physical rehabilitation, mainly in the following aspects:

1) Residents' lack of knowledge on community-based physical rehabilitation and enthusiasm for participation

Even though a number of activities have been carried out and lectures have been given on community-based physical rehabilitation in Jiangnan District, most residents still have no idea about the substantial effect of it, so they are more prone to resorting to traditional medical model such as medicine treatment, not to mention going for community help on initiative, and receive physical rehabilitation

services of the community. Meantime, common residents lack understanding for community-based physical rehabilitation, and community work staff do not publicize relevant information in time, instead, they just work following the policies, and this results in persons with disabilities, even community work staff lacking knowledge on community-based physical rehabilitation of persons with disabilities, thus lacking enthusiasm in organizing or participating in community-based physical rehabilitation activities.

2) Lack of professional talents team for community-based physical rehabilitation

Community-based physical rehabilitation services require not only community work staff and volunteers, but also medical workers, PE teachers, social work talents and relevant government departments to cooperate and participate together. While the community-based physical rehabilitation work in Jiangnan District suffer from talents shortage: the work staff generally haven't received much education and provide poor quality service, and a high-level high-quality professional talents team for community-based physical rehabilitation hasn't been constructed. In addition, more often than not front-line field workers such as community facilitators are engaged, lack of engagement of professional social workers and PE specialists, so it is difficult to make experience rise to the height of theory but stay a mere formality, and it cannot be guaranteed that persons with disabilities will get exercises in body and mind from community-based physical rehabilitation.

3) Insufficient funds support for community-based physical rehabilitation

Community-based physical rehabilitation of persons with disabilities belongs to social welfare services, with "diverse investment subjects, public service objects, diversified service modes and professional service teams". But socialized funds raising channels for community-based rehabilitation haven't been established in China, we don't have "diverse investment subjects"; besides, the state funding is limited and difficult to arrive in place in time, and the investment of China Disabled Persons' Federation is limited, local governments have little incentive to implement community-based rehabilitation, hardware such as space, equipment, etc. are in quite shortage, etc. for lack of strong material guarantee, it is difficult to carry on community-based rehabilitation in China smoothly. Thus, the establishment of an effective funding mechanism is imperative in China.

4) Lack of vitality for exclusive control

First, community-based physical rehabilitation in China is lack of standardized management system and job description, physical rehabilitation services are lack of technical specifications, and a system of two-way referral with superior medical institutions has not been established. Then, community-based physical rehabilitation requires cooperation between government departments and other non-government institutions or other government departments, but in China such "multisector cooperation" mechanism has not been developed. Last, the power of civil society organizations has been neglected by our government, thus it is not made full use of in community-based rehabilitation programmes, and only a part of communities has carried out community-based rehabilitation with cooperation with non-government institutions.

5) Unsound community-based rehabilitation network

First of all, resource sharing for community-based rehabilitation hasn't been achieved in China, which is not conducive to the rehabilitation of persons with disabilities to find appropriate community rehabilitation resources and get access to the services. Secondly, mutual support network for persons with disabilities has not yet formed; such mutual support organizations in Jiangnan District are very rare, and have not played substantial roles, which is not conducive to the cause of rehabilitation of persons with disabilities in the community. Finally, a network of volunteers for community-based rehabilitation has not yet been established. Although numerous volunteer activities for community-based physical rehabilitation haven been carried out, in each activity the volunteers are "new faces", who lack sufficient knowledge for the recipients and on physical rehabilitation services, a service network is not formed yet.

4 Intervention of Social Work into Community-Based Physical Rehabilitation of Persons with Disabilities

4.1 Significance and fundamental principles of social work intervention

4.1.1 Significance of social work intervention

Community-based physical rehabilitation has always been holding on to social work professional values, which play an important role in community-based rehabilitation: social workers establish a good professional relationship with persons with disabilities; this is conducive to identifying the rehabilitation demand and objective of persons with disabilities. In the very beginning, persons with disabilities may have limited knowledge on their own situation and surroundings, or their knowledge on

such issues is hidden behind the most desperate demand at the moment, not showing out. Social workers need to establish a further professional relationship with persons with disabilities, become their companions, and learn about their opinions on themselves and community-based rehabilitation and community-based rehabilitation consciousness of them and their family members through in-depth communication with them. Moreover, social workers will assess the power the persons with disabilities perceive with which they could handle these issues or not. Intervention in this level will lay a solid foundation for social work intervention into community-based rehabilitation in the future. The overall goal of community-based physical rehabilitation of persons with disabilities in China is consistent with that in international community, which is to promote the comprehensive rehabilitation of all persons with disabilities, make them enjoy equal opportunities and return to social mainstream. While the objective of social work intervention into community-based rehabilitation of persons with disabilities in this essay is to use the concept and methods of social work to solve the above-mentioned problems in community-based rehabilitation of persons with disabilities in China, and provide reference for the formation of a community-based rehabilitation mode of persons with disabilities suitable to China.

4.1.2 Fundamental principles

1) Socialized work principle

The principle of so-called socialized work principle is brought up mainly targeted for the closed, isolated and taking-on-all-things work style. In specific, it means such a principle: under the unified leadership of the government, relevant departments perform their separate duties while closely cooperating with each other, mine and make use of community resources, mobilize and organize social forces to work together to promote the work. Community-based physical rehabilitation should follow this principle all the way.

2) Low cost, wide coverage principle

“Low cost, wide coverage” means with relatively less manpower, material resources and financial input, most service objects can enjoy services, that is, gain a wide coverage of services. Enhance the effective use of rehabilitation resources, and improve quality of rehabilitation services, go on the road of low cost with wide coverage and low input with high effectiveness. On facilities, make use of the existing places or use one room for multi-purposes to provide rehabilitation services; on equipment, focus on self-made easy training instruments; on training locations, make house training the principal one.

3) Rehabilitation objects taking initiative participation principle

One of the differences between community-based physical rehabilitation service and traditional medical rehabilitation service is the role transformation of rehabilitation objects: from a passive receiving role to an active participating role, they will participate in making rehabilitation physical fitness plans, setting objectives and implementing trainings etc. Persons with disabilities should establish self-rehabilitation consciousness, take the initiative, follow instructions of rehabilitation instructors, and focus on self-training.

4.2 Model selection taking Jiangnan District as an example

It is observed from the existing problems of community-based physical rehabilitation in Jiangnan District that to empower persons with disabilities in the community, improve their living standard and quality of life is the ultimate goal of community-based physical rehabilitation, therefore, we choose empowerment-oriented social work model to intervene into community-based physical rehabilitation of persons with disabilities in Jiangnan District.

4.2.1 Empowerment-oriented social work model

When tracing the historical development of empowerment oriented practice, Simon points out that, social work empowerment practitioners since the 1890s, use different languages in different ages to describe their work, taking the clients as individuals, families, groups and communities with various skills or potentials, no matter how much inferior, incapable, depreciated or self-destructive they may be or actually are. Those social workers design a work relationship with their clients, taking special abilities, resources or demands of clients as precondition, support the clients or client groups in making their daily life more remunerative or in exerting sharing power in their companionship. The purpose of the companionship is to encourage clients to make use of their strengths in the process of pursuing and consolidating their improved self-esteem, health, community, safety, individual and social power. These social workers also try to open the source of power existing in the clients' personality, and resources and restorability that may exist in their family, friends, neighborhood and sub-culture. By guiding the clients and client groups to seriously be the specialist of their own life and be citizen and the demander, they encourage the clients to empower themselves. This empowerment-oriented social work presupposes that,

the core “story” to tell, historically or currently, is a story about the client himself obtaining resources that shall improve his control over his own business. Such social work model is one model that assists clients in finding and making the meanings of their situations, relations and problems. The model believes that, only group members who are devalued or branded stigma are the leading roles. In short, Simon holds that the characteristics of empowerment-oriented social work are: first, establish companionship with clients, client groups and community leaders etc.; second, emphasize the capability of clients and client groups instead of incapability; third, support double focus on individuals as well as his social or physical environment; fourth, admit that clients and client groups are active subjects, and they have interconnected rights, obligations, demands and requirements; five, target professional energy to historically disempowered groups and their members through conscious selection.

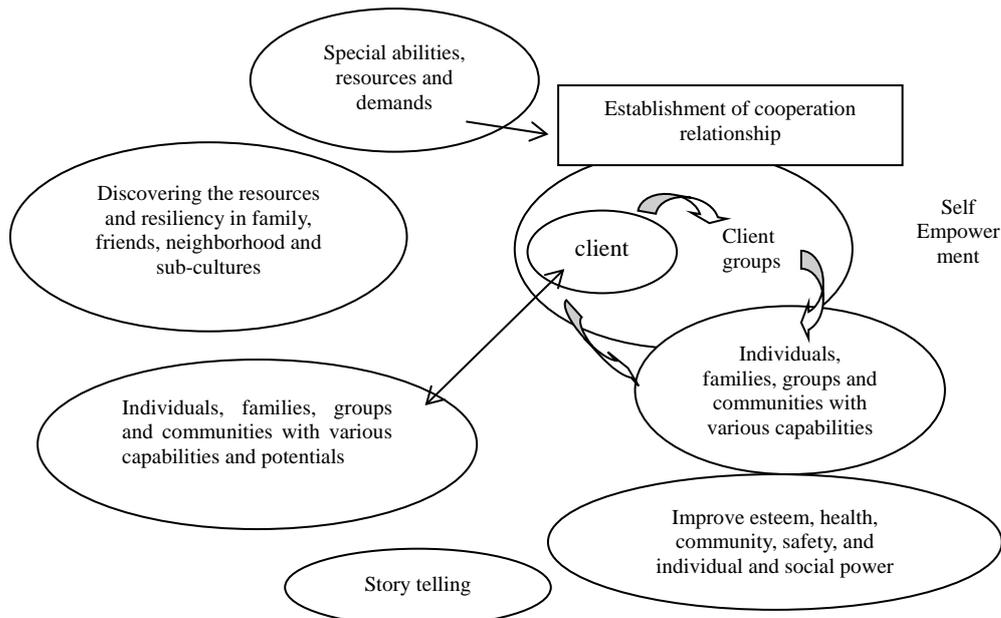

Figure 1 Empowerment-Oriented Social Work Model

4.2.2 Intervention strategies

Among the intervention methods and strategies, we choose to intervene in individual, family, group, organization, community and country level from the following aspects:

1) Social workers establish a good professional relationship with persons with disabilities in the community, and define their rehabilitation demands and objectives. The professional relationship between social workers and clients is critical to successful intervention, so establishment of a professional relationship between social workers and clients is attached great importance in social work practice. That is to say, social workers need to establish a good work relationship with persons with disabilities, assess their demand for community-based rehabilitation and rehabilitation resources, and determine the objectives of community-based rehabilitation of the persons with disabilities. In the very beginning, persons with disabilities may have limited knowledge on their own situation and surroundings, or their knowledge on such issues is hidden behind the most desperate demand at the moment, not showing out. Social workers need to establish a further professional relationship with persons with disabilities, become their companions, and learn about their opinions on themselves and community-based rehabilitation and community-based rehabilitation consciousness of them and their family members through in-depth communication with them. Moreover, social workers will assess the power the persons with disabilities perceive with which they could handle these issues or not. Intervention in this level will lay a solid foundation for social work intervention into community-based rehabilitation in the future.

2) Provide necessary community-based rehabilitation knowledge and skills for community residents, so as to control problems in community-based rehabilitation. To make clients get rid of the feeling of helplessness, we may start from improving the self-efficacy of clients and the role of groups. Promote the concept of community-based physical rehabilitation and enhance education on community-based physical rehabilitation of persons with disabilities. Currently community residents

lack understanding for community-based physical rehabilitation, and have cognitive bias on it with weak consciousness on rehabilitation. Social workers may use group social work method, such as meetings, courses, etc. to carry out community-based physical rehabilitation work, improve the self-efficacy of persons with disabilities so that community residents can correctly understand physical rehabilitation, enhance their awareness of rehabilitation, thus a community-based rehabilitation support network will be established. Social workers may also make use of Day of Persons with Disabilities to strengthen propaganda on physical rehabilitation; make in-depth and persistent propaganda to persons with disabilities and the masses of the whole society on concept, content and function of community-based physical rehabilitation by means of television, broadcast, network and newspaper etc., popularize knowledge of physical rehabilitation on community residents, and enhance their consciousness on physical rehabilitation, to create a public good that is favorable to community-based rehabilitation of persons with disabilities.

3) Establish a sound community-based rehabilitation service network based on community. To empower persons with disabilities, we need to make the current resources in the community, people in the community and the groups of persons with disabilities play their roles, to establish a sound community-based rehabilitation service network, so as to ensure rehabilitation of persons with disabilities can be realized within the community. First, establish a sharing network for community-based rehabilitation resources: based on community, integrate community residents' committees, community service centers and community health service institutions etc., to form of community-based rehabilitation network resources, make full use of existing resources within the community such as enterprises, activity places for persons with disabilities etc., perform well prevention of disabilities and rehabilitation work of persons with disabilities. Social workers should integrate varieties of resources of all institutions in the community, introduce physical rehabilitation into families, make full use of community committees, community service centers, community health care institutions, professional rehabilitation workers, activity places for persons with disabilities, rehabilitation equipment and facilities and relevant staff etc., to form a community rehabilitation resources sharing network, and realize comprehensive community-based rehabilitation. Second, strive to develop mutual support networks among persons with disabilities. Social workers need to provide impetus to formation, consultation, preliminary training etc. of mutual support organizations in the form of group work, provide support to members of the organization, and help them to discover and determine leaders, to promote establishment of mutual support organizations network of persons with disabilities. Social workers do not assume the role of "leaders" in the mutual support organizations, but "outsiders". Third, improve volunteer service network for community-based rehabilitation. The implementation of community-based rehabilitation services should first rely on members of the community. So social workers shall publicize community-based rehabilitation knowledge to community residents, motivate community members to engage in community-based rehabilitation work of persons with disabilities, form volunteer service network for community-based rehabilitation, to support implementation of community-based rehabilitation of persons with disabilities.

4) Take change or adjustment of community environment as the core to intervene. Social issues do not stem from defect of individuals, but from failure of the society to satisfy the demands of all members. As a result, in the practice of empowerment, we do not only work towards individuals, but should also be committed to improving the community environment in which the individual stays. This requires us to pay attention to exploring the impact of community environment in which the persons with disabilities stay to community-based rehabilitation when making social work intervene into community-based rehabilitation of persons with disabilities, and improve the community environment so as to make it promote community-based rehabilitation of persons with disabilities. First, enhance team building of community-based rehabilitation staff, especially to build a professional social workers team for community-based rehabilitation. Social workers shall enhance coordination and cooperation between all medical and health departments and professional PE teachers, to provide technical training and instructions to community-based rehabilitation staff, to improve physical rehabilitation service and management level of the staff, and build one high-quality community-based rehabilitation team of clear division of labor and high quality of services. Then, establish "multi-layer" technical instruction networks in the community. Social workers of community-based physical rehabilitation may organize family members of persons with disabilities and volunteers to conduct physical rehabilitation trainings, make persons with disabilities, their family members and volunteers all master simple rehabilitation training methods, then professional PE teachers manage and assess the rehabilitation services they provide, to establish a rational multi-layer rehabilitation technical system finally, thus to assist persons

with disabilities in physical rehabilitation. Last, establish an effective socialized fund raising mechanism, and increase the fund input to community-based rehabilitation of persons with disabilities. Social workers should pass on the fund demand on community-based rehabilitation of persons with disabilities to relevant superior departments, impel governments of all levels to increase special fund input to community-based rehabilitation, and make government rehabilitation funds put to grassroots communities as focus. In addition, make active propaganda on the financial situation of community-based rehabilitation of persons with disabilities in China. Mobilize all sectors of society, especially the non-government organizations and celebrities to participate in the cause of community-based physical rehabilitation, and raise funds for community-based rehabilitation.

5 Conclusions and Reflection

With the development of the cause of community-based rehabilitation of persons with disabilities, the concept of community-based rehabilitation of persons with disabilities has undergone major changes, community-based rehabilitation of persons with disabilities has transformed from medical method which only pays attention to the physiological function rehabilitation to more comprehensive method which focuses on the overall demands of persons with disabilities, and helps persons with disabilities return to the main stream of society successfully. Community-based physical rehabilitation of persons with disabilities is a successful example guided by comprehensive demands. In the process of professional social work intervening into community-based physical rehabilitation of persons with disabilities, to ensure the smooth implementation and effective development of community-based physical rehabilitation services, it is not only the persons with disabilities that are needed, but also joint efforts from their families and friends, and departments of health, education, labor and employment, and social security etc., as well as care and concern of the public. With support of the government, together with health, civil affairs, public security, education, CDPF etc. other relevant departments of the government or social organizations, taking community as work platform, bring rehabilitation of persons with disabilities into social public service system, make it integrated into construction of community service network, urban and rural primary health care network, comprehensive security management network, grassroots masses spiritual civilization and cultural and recreational services network. Make full use of community service centers, community health service centers, community schools, community cultural centers, and other community organizations to enhance the radiation and guidance of professional organizations to community-based rehabilitation of persons with disabilities, make survey registration on rehabilitation demands of persons with disabilities, establish rehabilitation archives, provide rehabilitation counseling, training and instructions etc., publicize correct concepts of rehabilitation through education and propaganda, so that persons with disabilities can get convenient, effective and practical rehabilitation services and the goal of improving the quality of life of persons with disabilities may be realized more easily.

Yet, community-based physical rehabilitation is dynamic, which requires localization and adaptation to local conditions. China has a vast territory, and different regions have different cultural backgrounds and customs; therefore, it requires constant practice and test to establish a nationally suitable social work intervention model, and the empowerment-oriented social work model selected in this essay is also subject to the test of practice and time.

Review of Chinese Entrepreneurship Education: Based on the Statistical Analysis of Social Science Fund

Wang Chao, Yang Bin

School of Management, Wuhan University of Technology, Wuhan, P.R.China, 430070

(E-mail: 408468369@qq.com, 1292545846@qq.com)

Abstract: Venture tendency of the whole society is in the ascendant, which provides new challenges and demands for Entrepreneurship Education in China. As key funding sources of social science research, National Social Science Fund and Humanities and Social Sciences Fund of Education Ministry play a positive role in promoting relative research in the field of Entrepreneurship education. Based on statistical analysis of projects from the two funds, this paper summarizes the basic framework for entrepreneurship education research, including aspects of object, content, background, theory and methods, which may provide guidance and reference for further research.

Key words: Entrepreneurship education; National social science fund; Humanities and social sciences fund of education ministry; Statistics

1 Introduction

In early 2014, Tsinghua University Center for Entrepreneurship Research definitely pointed out that entrepreneurship education and training was weak in China, in the report "Global Entrepreneurship Monitor Report of China: business environment and Policies". Specifically, the primary and secondary education pays less attention to creativity of students. Education and training for entrepreneurship for market economics is obviously insufficient, which cannot meet the needs of entrepreneurs. "Opinions on Deepening the Reform of Higher Education in Innovation and Entrepreneurship" (2015) also clearly made statement that innovation and entrepreneurship education is the urgent need to implement innovation-driven strategy for national development and to promote the upgrade of the economy quality and efficiency. It is also an important measure to promote the comprehensive reform of higher education, and to increase quality of Employment and Entrepreneurship for college graduates. Therefore entrepreneurship education meets new challenges and requirements.

Since entrepreneurship education experiment official carried out in 1992, at Sichuan Hechuan of China, it has been over 20 years for conducting relative research of entrepreneurship theory and practice (Wang Zhanren, 2015), which made rich accumulation in definition and connotation, necessity and feasibility, problems and countermeasures and other aspects of the entrepreneurship education research results (Zhang Kejing, 2015). To further explore the reviews and methods, paper collected funded project data from the National Social Science Fund, Humanities and Social Sciences Research Fund of Education Ministry (hereinafter referred to as NSSF and HSSFEM) for statistical analysis, and made a conclusive summary about existing framework, hoping to provide reference for researchers.

2 Data and Statistics

2.1 Data sources

This study selected project from the National Social Science Fund, Humanities and Social Science Fund of Education Ministry. Project information came from the official website. Information retrieval carried out twice. First, using the "Entrepreneurship" as a keyword got a total of 893 research projects at searchable database of two funds. Thereafter, using "education", "training", "guidance", "consultation", "cultivation", "counseling" as key words, the "OR" as logical relationship got a total of 246 research projects.

2.2 Statistics

Conduct statistical analysis by Microsoft Office Excel 2007 software.

3 Results and Analysis

3.1 Entrepreneurship education research is an important part of entrepreneurship research

Table 1 shows the number of items for the entrepreneurship and entrepreneurship education in two steps of search, which reflects entrepreneurship education research an important part of entrepreneurship research. Relationship between entrepreneurship and entrepreneurship education is mainly reflected in: 1) Venture practices are the starting point and ending point of entrepreneurship education. The

fundamental goal to strengthen Enterprise Education in China is to develop the entrepreneurial awareness, entrepreneurial thinking, entrepreneurial skills, and other entrepreneurial overall quality, and ultimately being able to engage in entrepreneurship. 2) Entrepreneurship education is an important support for venture practice. With the rapid development of China's economy and the popularization of higher education in recent years, the employment of college students faces serious challenges (Zhang Jin, 2007). As specialized personnel with a higher quality of innovation and entrepreneurship, students are encouraged to start up business, which can not only promote their own survival and development, but also create more employment opportunities for the country. However, college students lack of understanding of social experience, interpersonal skills, business management and other aspects (Mu Zhirong, 2006). Driven by the external and internal factors, such as economic and social development and necessity of self-worth, education reform of higher education aims directly to cultivate the entrepreneurial awareness and ability, which also promotes a higher quality of college graduates start employment initiatives.

Table 1 Number and Percentage of Funded Projects in Two Steps of Search

	First retrieval number	Second retrieval number	Percentage
NSSF	123	19	15.45%
HSSFEM	770	227	29.48%
Total number of items	893	246	27.55%

3.2 Logical basis: entrepreneurship education and training is a major manifestation of entrepreneur cultivation

In order to retrieve as much as possible to complete the study of entrepreneurship and entrepreneurship education in entrepreneurship training-related research projects in the second retrieval process, the paper in a variety of forms of entrepreneurship education practices for keyword search to try to finalize "education", "training", "guidance", "consultation", "cultivation", "counseling" six key words. Figure 1 is the various criteria in the two funds in the project name to retrieve the number of cases.

Conclusively the keyword for "education", "culture" and "training" show the higher frequencies. There is 211 items during searching for "education" and "training" or "talent", which accounts for 86% of the total fund projects. From the point of view of the whole society, entrepreneurship education and training meet the diverse needs of the times for entrepreneurial talent. It also formed the basic logical entry point for research scholars.

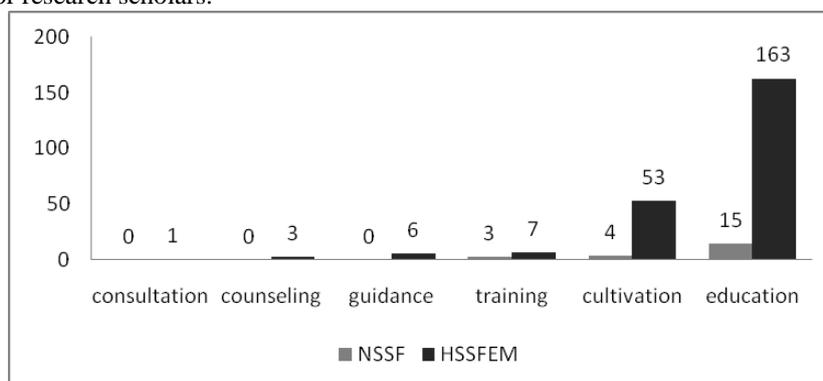

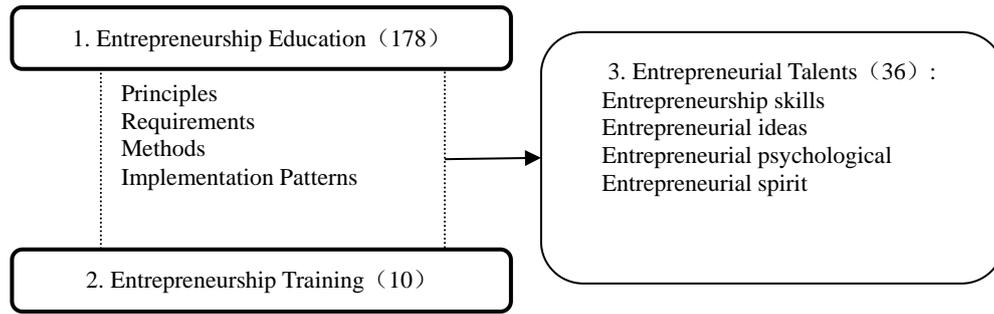

Figure 1 Entrepreneurship Education-Related Keyword Searching Case from National Social Science, Ministry of Education, Humanities and Social Sciences Project

There is 36 items for "Talent", "character" and "human development". Drucker made a point pioneering quality must be promoted through learning and innovation. Researchers focus on the research of entrepreneurship skills, entrepreneurial research ideas, entrepreneurial psychological and entrepreneurial spirit, and many other factors, which contribute to start a business. Based on the goal-oriented principle, the researchers consequently investigate the principles and requirements for entrepreneurship education; expand research methods, implementation patterns and so on. Study logic shown in Figure 2.

Note: Figures in brackets is the number project (the same below)

Figure 2 Research Schematic Logic Diagram for Entrepreneurship Education and Training

Entrepreneurship education and entrepreneurship training are important forms of cultivating entrepreneurial talents. However, some scholars believe that the concept of entrepreneurship education and entrepreneurship training has a different focus and characteristics, which is shown at Table 2.

Table 2 Comparison of Entrepreneurship Education and Entrepreneurship Training

	Entrepreneurship Education	Entrepreneurship Training
Relation	Entrepreneurship education is the foundation of entrepreneurship training	Entrepreneurship training is supplement of entrepreneurship education
Emphasis	Development of entrepreneurship and comprehensive literacy, emphasizing process orientation	Systems knowledge transfer, skills training, focus on practicality and timeliness
Feature	Long-term, popularity, normality, early staged	Timeliness, short-term, targeted, informality
Content	The opportunity to discover and vision ability, dedication and courage, innovation and change, responsibility and perseverance, leadership and coordination	Understanding enterprise, self-assessment, generate entrepreneurial ideas, assessing business idea, business plan formulation
Organization	education sector	human resources and social security departments, associations and social training institutions
Practice Status	"21st Century Education Revitalization Action Plan" (1999), in 2002 the Ministry of Education to determine the nine pilot institutions entrepreneurship education in 2005, KAB entrepreneurship education cooperation projects, "comments on the self-employed work vigorously promote innovation and entrepreneurship education students" (2010) "regular undergraduate school entrepreneurship education teaching basic requirements (trial)" (2012)	1998, Beijing, Shanghai, Suzhou entrepreneurship training pilot "entrepreneurship training pilot guidance" (1999), 1999 students "Challenge Cup" Business Plan Competition in 2010, the "National Students' outstanding entrepreneurial team Competition" in 2011 in Baotou, Jilin Zhangjiakou city employment Promotion pilot project, SYE entrepreneurship training, SIYE entrepreneurship training, Maple billion square "Students' entrepreneurship training systems", YEC program

3.3 Association study of entrepreneurship education and other education

Using “Education” as the key words, there are 165 items, up to 67% of the total number of items. Entrepreneurship education-related research has the maximum number of retrieved projects. Fund research projects also involved other keywords professional education, quality education, vocational education. Putting entrepreneurship education as the core, draw its schematic diagram associated with other types of education, and mark the number of items, as shown in Figure 3.

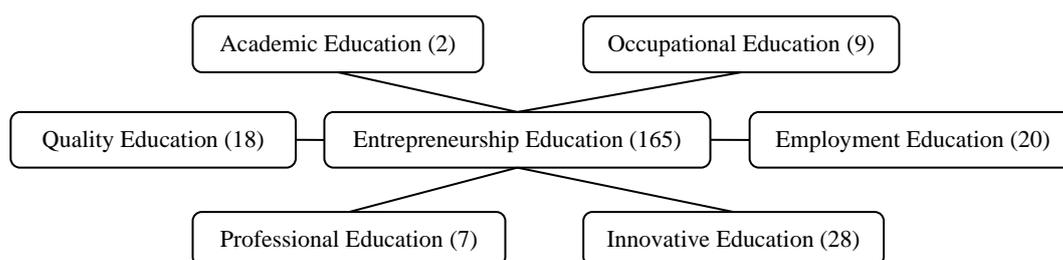

Figure 3 Schematic Figure Showing Connection Between Entrepreneurship Education and Other Ones

National Social Science and Humanities and Social Sciences of Education Ministry project for entrepreneurship education and other types of education in the form of association studies carried out as follows:

1) Entrepreneurship Education and Professional Education

It mainly includes two aspects. Firstly, the systematic study of the integration of both linkage and promotion. The second part is the proposed research about entrepreneurship education theory and practice issues for a particular professional.

2) Entrepreneurship Education: the third passports for the Education

In 1989 at International Symposium for the 21st Century Education of the UN, Dr. Alidade, chairman of the Australia's future Committee, introduced Colin Boll elaboration on education three passports: the academic education, vocational education and entrepreneurship education. So researchers firstly highlighted the important role of entrepreneurship education in personnel education, and raised it to the academic education, vocational education equal importance. Secondly, the researchers focused on the "complex model" questions among entrepreneurship education and academic education, vocational education, emphasized learning in practice and using of professional knowledge and professional skills, achieving comprehensive development of human through employment and entrepreneurship.

3) Entrepreneurship Education and Innovative Education

Innovative education is global and structural education reform and development, pursuing cultivation of creative spirit, innovation, innovation ability. Innovative education must launch from childhood, and is an important basis for entrepreneurship education. Entrepreneurship education is the best path to achieve and reflect innovative education. Some scholars conduct comparative study about differences between innovation education and entrepreneurship education on the analogy of the relationship between innovation and entrepreneurship.

4) Entrepreneurship Education and Quality Education

Quality Education pays attention to people's ideological and moral cultivation, ability, personality, overall physical and mental development. In 2002 on "Entrepreneurship Education" pilot work conference of Education Ministry, experts generally believe that entrepreneurship education is an important aspect of quality education. Entrepreneurial qualities as an important component of overall quality of students, scholars summarized the issues like connotation of employment quality, classification and culture and overall quality of the interaction.

5) Entrepreneurship education and employment education

Research bases on two modes of thinking. Firstly, education and training for employment and entrepreneurship is a whole system, which leads comprehensive studies. Secondly, theoretical studies suggest that entrepreneurship contributes to creating jobs. Scholars have studied the positive effects on the employment impact of entrepreneurship education, including the ability to enhance the employability, to ease the employment difficulties, embedding and deepening for employment education.

3.4 Research subjects: Classification of entrepreneurship education and training

After nearly 20-year development, China's pattern of entrepreneurship education and training has been basically formed, and covered a full range of college students and social groups. Through classifying object of study, summarize project case from the National Social Science Fund and the Humanities and Social Sciences Research of Education Ministry, as shown in Table 3.

By classification, researchers hope to conduct more personalized entrepreneurship education and training, based on the educational philosophy of University, subject characteristics, professional characteristics and stages of study and practice, and investigate the model system design, ways and means of selection, process control and other aspects, thereby improve the overall entrepreneurship

education research system.

Table 3 Research Object Classification of Project Case from NSSF and HSSFEM

Subject	Classification Content
Colleges and Universities	Comprehensive research, Billing Division of characteristics, application technology (science) type, type of teacher education, vocational skills type; Public colleges, private colleges and universities; Colleges, vocational;
student	Research universities, teaching and research university, teaching university; Engineering, science, business, medicine, the arts, political science, etc. Students, undergraduates, graduate students, graduates; Business Administration, tourism professionals, professional e-commerce, traditional Chinese medicine, agricultural professional, music
Social groups	Farmers, migrant workers, women

3.5 Research contents: entrepreneurship education model and system

With keyword searching, make respectively statistical data. Funded by project funds, based on the analysis of current conditions of entrepreneurship education in our country, scholars summarize experiences and lessons from domestic and foreign study. Relative research content includes the design of national and university entrepreneurship education system, as well as the implementation of a planned, step by step to optimize sound process. As shown in Figure 4, enterprise education system consists mainly of the curriculum system of entrepreneurship education, business practices system, teachers system, education system mode, entrepreneurship education assessment system of five parts (Li Weiming, Li Chunyan, etc., 2013). Research results are rich and varied. For example, in the study of curriculum system of entrepreneurship education, the researchers studied the entrepreneurial class of general education curriculum to cultivate professional class entrepreneurship curriculum innovation and penetration, job entrepreneurial practice teaching convergence and other issues; entrepreneurship education model design, the researchers summarized the whole school from practice entrepreneurship education model design experience, and from the perspective of the organization are summarized as follows: magnet mode and radiation mode, mixed mode three (Mei Weihui, 2012).

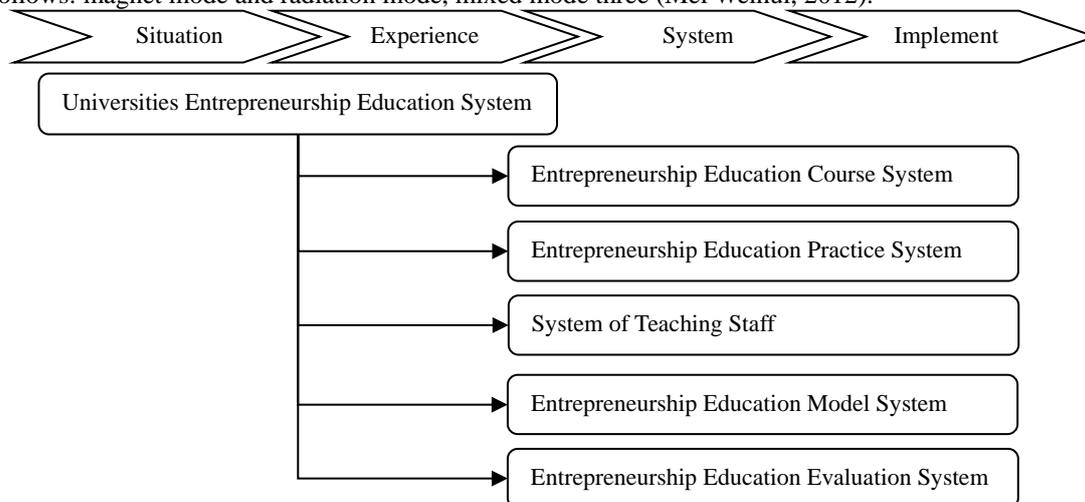

Figure 4 Research Process and Content of Entrepreneurship Education System

3.6 Background, theory and method of the study

Some new trends appear in contemporary higher education. Under this background, Scholars study technology incubators, business incubators, and cooperative Innovation triple helix problems for Entrepreneurship Education and docking practice to make a positive contribution to the promotion of the socio-economic functions and college entrepreneurship service functions (Zhang Tianhua, Liu Yanliang, 2015). In addition, scholars have studied the economic crisis, economic restructuring and university enrollment and other factors, the employment pressure on university students increased impact on students' education, demonstrate entrepreneurship, positive role in employment and entrepreneurship education to ease the employment pressure and do in the implementation of the path, quality assurance, etc. Overall, more research is based on the reality of our society, emphasizing experiential learning; continue to seek the reform and development of entrepreneurship education.

As for the theory and methods, scholars pedagogy theory, entrepreneurship education system design and optimization, in the process, emphasizing the social survey, environmental analysis, management control and quality assessment, the main use of a comparative study, correlation study the method of case studies, qualitative research-based, supplemented by quantitative analysis.

4 Conclusions

4.1 Summary

The research of the National Social Science Fund and Humanities and Social Science Fund of Education Ministry in the field of entrepreneurship education has a significant promoting effect on both theoretical research and practical guidance. Through the National Social Science and the Ministry of Education, Humanities and Social Sciences funded research project statistical analysis, we can learn: After 20 years of exploring the theory and practice of entrepreneurship education, China has basically formed the framework of entrepreneurship education, as shown in Figure5.

On the basis of this framework, scholars mainly studied in three aspects: 1) entrepreneurial economy, innovative culture, science and technology development and national policy guidance and other forces that promote the rise of entrepreneurship. Through the empirical analysis of the macro environment, it is found that the scholars study plays an important role in promoting entrepreneurship education and the development of social economy in China, and set up the guiding ideology of entrepreneurship education, basic principles and overall objectives. 2) Business practices and educational practice in the integration process, the feasibility and necessity entrepreneurship education practice specialties argument. 3) Under the cross of entrepreneurship and education, carry out entrepreneurship education model design, system implementation system and the construction quality assessment.

During the research of Social Science Foundation funded project, scholars tend to the macro-level of the integrity of the analysis and design, the pedagogy theory, the comparative study on practice of entrepreneurship, the correlation studies and case studies. In the study, researchers emphasized the leading role of the State, and local colleges and universities, ignoring the process of teaching instructors and students involved in the role. Studies on Mechanism of Guiding affect both educational effect of entrepreneurship research, education teaching effect during the start-control studies comparing the lack of micro-level. That is, by the introduction of new disciplines theories and methods of entrepreneurship education system dynamics studies.

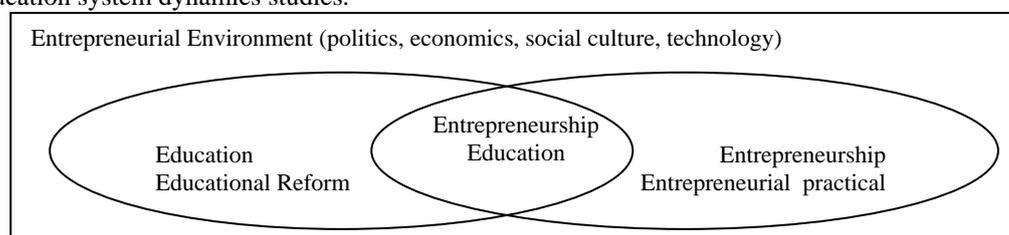

Figure 5 Entrepreneurship Education Research Framework

4.2 Discussion

Under the current framework, the research on entrepreneurship education has a certain level and scale, to enhance the depth and breadth of the research subjects, the theory and method of research and innovation must be achieved, including:

1) Adapt to interdisciplinary research trends, strengthen the theory of management, psychology, sociology and other research applications in the field of entrepreneurship education. In the framework of existing research based pedagogy, the institutional mechanisms to improve innovation and entrepreneurship education in universities as an important entry point, gathering elements and resources, rich curriculum, innovative teaching methods, strengthening of teachers, helping to improve and promote teaching, research, practice closely, breakthrough talent cultivation weaknesses, and enhance students' innovative spirit, entrepreneurial innovation and entrepreneurship awareness. Interdisciplinary research will help to identify problems in the various aspects of the process, padded short board, thinking and perspectives to achieve innovation.

2) Strengthen the joint participation of multiple subjects' entrepreneurship education process. Existing studies emphasize training programs for government educational institutions and universities entrepreneurship education, design and implementation of practice models and evaluation system and

optimization, pay less attention to the study of the interaction between tutors and students of teaching, teaching supervision of third parties and social forces. Through research on entrepreneurship education to introduce new subject, the reform and development of innovation and entrepreneurship education has a positive role in guiding.

3) Enhance research and empirical studies of mutual promotion and complement each other. In theory part, to strengthen the concept of entrepreneurship education training, system design, and implementation, control effectiveness studies, research and other foreign experience of business practice adaptability. In empirical research, to strengthen entrepreneurship education practice tracking investigation, the variable level to strengthen collection and observation raw data statistical tests.

4) Strengthen the research process problems focusing and problem solving in the process of practice-oriented. Innovation and entrepreneurship education Universities discovery and solve outstanding problems are deepening an important focal point of University innovation and entrepreneurship education reform, including issues to explore, question focus, problem analysis and problem solving on the theory and practice of other processes. Among them, the issues of focus and practice-oriented, focusing on in-depth research and refinement, as well as optimization practice has an important role in promoting.

Research on MCDA Approach for Library Ranking: A Case Study on University Libraries in Sri Lanka

S.K. Illangarathne, Luo Fan

School of Management, Wuhan University of Technology, Wuhan, P.R. China, 430070

(E-mail: skillangarathne@gmail.com, sailluof@126.com)

Abstract: This paper presents the nutshells of undergoing survey about the development of a multivariate ranking system for academic libraries in Sri Lanka using MCDA (Multiple Criteria Decision Analysis) approach. Ranking libraries is an interesting topic nowadays, due to most of institutes follow this to evaluate their services and recognize their current passions. There is no any systematic performance evaluation or ranking system for Sri Lankan library context, therefore proposed study will be most innovative among the library leaders of Sri Lanka. The library performance evaluation indicators found from the literature and Analytic Hierarchical Process (AHP) with FUZZY logic used as the tools of this study.

Key words: Library ranking; AHP and FUZZY; MCDA approach; Academic Libraries; Sri Lanka

1 Introduction

Over Thousand years, the library is considered as the heaven of information sources. It exists to collect the record of human experience and to provide intellectual and physical access to that record. The word “Library” was exclusively in bond with three other words; “Silence”, “Classical” and “Books”. However, in this super speed information era, the importance of libraries is gradually swallowed up by the profit oriented, third party information delivery institutions. Electronic resources, the Internet and World Wide Web (WWW) have substituted into the traditional library resources such as books, newspapers, and periodicals. Rapidly, libraries are fully loaded with e-books, e-journals, and bibliographic databases while the size of the library buildings are reducing accordingly. Their physical space requirements will shape up according to the virtual context.

Librarians are supposed to be recruiting after testing their managerial level problem solving aptitudes and ICT skills. Most of the “Chief Librarians” now more like to call them as “Library Managers” (Calvert, 2008). Meanwhile, the increasing expectations of users have challenged libraries to improve their quality of services. Day by day, library managers feel more pressure to exploit available resources entirely. As a result, several libraries and information services have adopted quality management evaluation practices in recent years among the various initiatives implemented ISO 9000 standards, 5S movement, bench marking (Hsieh, Chang & Lu, 2000) and LibQUAL(Fagan, 2014). Therefore, three-fold aspects; “Books”, “Readers” and “Staff” which had assumed as the “Library” by Ranganathan at medieval library era, has typically changed into “e-resources,” “Patrons” and “Managers” respectively (Illangarathne & Yingming, 2014). As a result, they have to practice continuous assessment about their services and customer satisfaction.

When considering the academic libraries, they play the vital role at high education institutes throughout the various ways such as from acquisition the information up to checking the plagiaries issues of their stakeholders’ scholarly works. According to the Miller, for academic libraries, in particular, has a responsibility to conserve scholarly communications as well as be the systematic agent of primary resources (Miller, 2008). Due to the many services provided by the academic library at their institutes, it has long enjoyed their status as the “heart of the university.” (Oakleaf, 2010).

Evaluating the library efficiency and effectiveness is not the novel concept. Most of the standard libraries are always update with the modern library functions and engaged in various dimensions of evaluations to get an idea about what kind of enhancements they achieved and which kind of satisfaction levels of their customers expected. Those library assessments will help the library management to assure the satisfaction levels of their stakeholders as well as nature of their competitors.

Ranking libraries are the ultimate stage of evaluation, and it can be applied to achieve a lot of benefits. Evaluation, the bunch of libraries instead of single library assessment, would be helped library management to understand their proper place which they are among their competitor libraries. Libraries must demonstrate their value and document their contributions to overall institutional effectiveness and be prepared to address changes in higher education (ASQUAL, 2011).

1.1 Problem statement

Library evaluation has investigated in various ways. Library physical resource, website, electronic

resources, and library building space assessments are necessary. Library reference service, online services, staff, and some other service quality evaluations are prominent. Library customer satisfaction, user perceptions, and user need investigations and assessments also taken place. Most of the studies based on a single aspect of above and limit to own library evaluations. Recently, some researchers investigated the performances of the libraries using various approaches. Most of the studies are comparisons between two libraries. There are no adequate studies find for library comprehensive performance evaluations towards rankings. Therefore, it can be seen a gap between library overall performance assessments and rank based on it.

1.2 Objectives of the study

The general objective of this study is to develop a library ranking system based on the library resources, service quality & customer satisfaction for the academic library context in Sri Lanka. Other specific objectives of the study are;

- a) To study the existing quantitative and qualitative library evaluation processes.
- b) To distinguish the appropriate criteria for applying as input to measure the library service quality
- c) To investigate the impact of library service quality on the customer satisfaction.
- d) To apply the MCDA methods to rank libraries.

The proposed study aims to develop a novel library ranking system for Sri Lankan University libraries throughout the multi variable ranking methods such as AHP and FUZZY after investigating the existing literature. This study will be most significant by two ways; using Multiple Criteria Decision Analysis- MCDA approach to measure the values of KPI-Key Performance Indicators of libraries and apply this approach to Sri Lankan University library context.

2 Review of Literature

2.1 Library performance evaluation initiatives and model implications

When search literature it was found several library performance evaluation methods and library assessment models. Major highlighting of them is described as follows;

The list-checking method was used very beginning to evaluate the library collections. By this approach, the third party pre-prepared library book lists such as ALA (American Library Association) book list, Choice's opening day collection, and H. W. Wilson's five catalogs have being used to evaluate the existing collections of the libraries (Hyödynmaa, Kannisto & Nurminen, 2010). Kassim and Kochtanek evaluated library digital resources using five levels; (i) focus group evaluation, (ii) database usage, (iii) weblog analysis, (iv) the web survey and (v) remote usability evaluation (Kassim & Kochtanek, 2003). Nicholson introduced a conceptual framework for the holistic measurement and cumulative evaluation of library services. Satoh et. al. used four dimensions derived from the GAP theory of SERVQUAL assessment; (i) personal effects of service, (ii) library as place, (iii) collections, and (iv) access to evaluate the library service quality (Satoh et. al, 2005). Nejati and Nejati measured the service quality at University of Tehran Library using the SERVPERF service quality evaluation model. The author used 20 different kinds of service quality aspects to evaluate the service quality at libraries (Nejati & Nejati, 2008).

Association of Research Libraries - ARL introduced the library service quality assessment model to measure the customers' perceptions about the services of libraries called LibQUAL (Davis & Kyrillidou, 2011). Alemna proposed the eight criteria for evaluation libraries; (i) library resources; (ii) Effectiveness, (iii) Efficiency, (iv) Cost-effectiveness, (v) Benefit, (vi) Time saved, (vii) Satisfaction, and (viii) Cost-benefit analysis (Alemna, 2012). Noh evaluated electronic resources in academic libraries using an input-output analysis of evaluation indicators. Inputs refer acquisitions of e-resources such as web databases, e-books, e-journals, and outputs refer their usage (Noh, 2012). Asogwa assessed the academic library performance in Nigerian Universities using the eight performance evaluation principles (Asogwa, 2014). Pant evaluates academic library websites based on six variables; (i) usefulness, (ii) efficiency, (iii) effectiveness, (iv) learnability, (v) Satisfaction, and (vi) accessibility to evaluate the library websites (Pant, 2015).

Berndtson & Öström rank public libraries in the European Union throughout six dimensions using more than 65 000 public libraries. The authors calculate the final score from more than 38 inputs and issue a star level 1-6 for good library accordingly (Berndtson & Öström, 2015). American Library Association¹ (ALA) ranks libraries based on four measures; (i) By the size of population served, (ii) By the size of the library collection, (iii). By the number of times items in the collection were checked out, and (iv) By the Number of visits to the library. www.thebestcolleges.org² ranks libraries based on

architectural interest of library buildings and collections interest of library users. www.haplr-index.com³ ranks 7,930 public libraries in the United States using the federal data, which obtained through five inputs and ten outputs measures.

2.2 Library performance evaluation initiatives within Sri Lankan library context

Ranaweera evaluated the collection and service quality of the national library of Sri Lanka based on the user satisfaction (Ranaweera, 1996). Wijerathne evaluated the university library websites using seven criteria. The author mainly focused on the content elements and design features of web site and allocated scores to individual aspects. Finally according to the obtained scores ordered the website accessibility (Wijerathne, 2013). Gamage examined the library resources and services provided by libraries specializing in indigenous medicine in Sri Lanka based on their existing resources and services (Gamage, 2009). QAA - Quality Assurance & Accreditation Council of the University Grants Commission, Sri Lanka introduced the quality review process to the University libraries through five aspects; (i) Vision, Mission and Objectives, (ii) Management, (iii) Resources, (iv) Services, (v) Integration, (vi) Contribution to Academic Output, (vii) Networking and (viii) Evaluation (University of Peradeniya, 2007).

Based on the discussion above, it is noted that library evaluation takes place in every kind of aspects in the library context and it is counts as an essential part of the library service which can improve the performance while competing with others. Library resources, services provided and user satisfaction are counted as the most considerable aspects at evaluation. Reviewer observations, customers' perceptions via likert scales and given score methods have being vastly used to measure the actual level of performance. Evaluating these outcomes and based on them a graphical explanation (figure 1) is drawn to depict the proposed conceptual model.

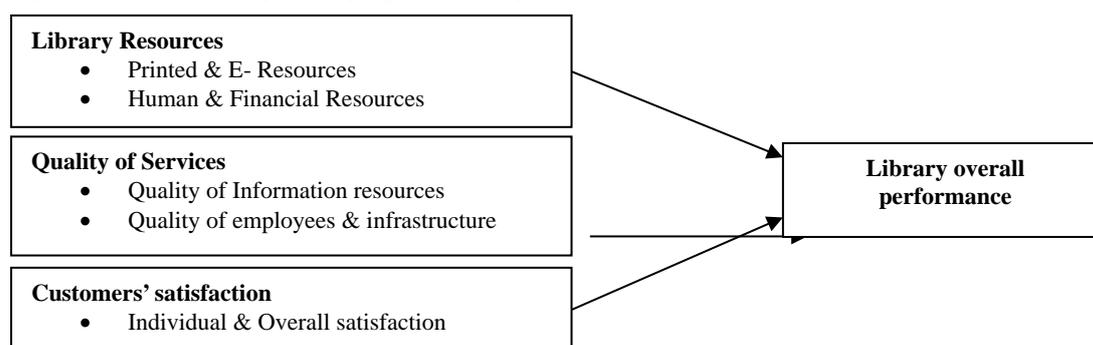

Figure 1 Proposed Conceptual Framework of the Study

³.<http://www.haplr-index.com/haplr100.htm>

⁴.<http://www.mohe.gov.lk/index.nhn/en/about-ministry/overview>

3 Methodology

Based on the above conceptual framework it is supposed to evaluate overall performance of the context libraries through their available resources, assured quality of the service and level of the customer satisfaction. To test the model, it is expected to conduct the overall performance evaluation survey using two types questionnaires which distributed to the sample find from Sri Lankan University libraries. After measure the individual library performance it is expected to give an overall performance indicator to the appropriate library.

Based on the proposed MCDA approach which combined with FUZZY logic and AHP – Analytic Hierarchical Process, and using above mentioned case wise performance indicators, it is expected to solve the following matrix.

After calculate above pairwise AHP matrix, it is expected to derive a list of most highly performed libraries accordingly.

Table 1 Pairwise Comparison Matrix for Library Ranking

	L_1	L_2	L_n
L_1	1	a_{12}	a_{1n}
L_2	$a_{21} = \frac{1}{a_{12}}$	1	a_{2n}
L_n	$a_{n1} = \frac{1}{a_{1n}}$	$a_{n2} = \frac{1}{a_{2n}}$	1

4 Conclusions

Libraries act as the disseminates of information. They are doing this systematically. If they have a picture about their current service level, it can be easily maintained their customers' perceptions and compatibility. Most of the ranking systems are catering on this manner and some of them are help to make the decisions in both ways; customer level and management level. Based on that it can be determined that ranking libraries are most significant on this information era. Today customers are highly expected quality service and recognition of the service among the similar organizations as well. Therefore, it can be predicted that proposed study based on library overall performance through the identified criteria will be the benchmark as well as innovative outcome of the LIS industry.

An Interdisciplinary Educational Approach for Dealing with Autist Students in Brazil

Eliana Rodrigues Boralli Mota, Ivani Catarina Arantes Fazenda, Arnaldo de Hoyos Guevara
Pontifical Catholic University São Paulo Brazil
(E-mails: jfazenda@uol.com.br, arnoldodehoyos@yahoo.com.br, cuidadoespecial2004@yahoo.com.br)

Abstract: This Paper shows a synthesis of the research project related to the Educational Vision /Approach used at AUMA – Association of the Friends of the Autist Child- a Non-Governmental Brazilian Organization founded in 1990 seeking to find out to what extent it may be possible to use an interdisciplinarity approach and the Jacques Delors UNESCO Education for 21st Century Report to deal with Brazilian National Educational Plan recommendations with the purpose to bring some contribution to any other Institutions which offer educational services to autistic children.

Key words: Autistic children; Education; Interdisciplinarity; Specialized care

1 Introduction

According to the Centers for Diseases Control and Prevention about 1 percent of the world population has autism spectrum disorder- ASD. (CDC, 2014); and in particular prevalence of autism in U.S. children increased by 119.4 percent from 2000 (1 in 150) to 2010 (1 in 68). Moreover almost half (about 44%) of children identified with ASD has average to above average intellectual ability. So there is growing interest in knowing the best way to deal with education for these children everywhere in the world.

AUMA Association of the Friends of the Autist Child is a Non-Governmental Brazilian Organization founded in 1990 based on an interdisciplinary approach in order to fill part of the gap in the Brazilian educational system, regarding specialized care for people with autism. The lack of vacancies, specificity, the existence of mistakes and inadequacies were very disturbing. In addition, to find out whether it was possible for educators to regard an autistic child with as a whole being, and what may be the framework for that purpose.

The learning process of autistic people has very peculiar characteristics and understanding the variations of these characteristics is very important to distinguish them, in order to better help each autistic child in the cognitive process. That will imply in the precise determination of the need of specificity, with direct consequences in practice. The purpose of the research concerns the vision and educational approach on work at AUMA, compared with the vision and principles of interdisciplinarity, to seek convergence. In particular, seeks to contribute to the development of the educator who works with autistic children, so that his/her vision and practice is not limited to transmission of knowledge and skills, but rather help develop the student as a person. In fact interdisciplinarity deals also with the way the Being is regarded: with infinite possibilities; and moreover the ontological aspects, praxeological and epistemic weave the methodology. As mentioned by SYRGIANNIS (2010): "In everything we do, there will be something that reflects our being."

Society benefits when it can enjoy a more humanistic view of work, especially when it refers to autistic children, different from the forms of intervention which tend to be adopted in Brazil and many other countries of the world, placing them in the position of mere objects receiving commands.

Pedagogical approaches in the Brazilian education are the expression of certain conceptions of man, the world and education, which derive from social development approaches translated into educational policies. They shape the organization of the school system and the school, with particular methods, choice of content, assessment and teacher-student relationship.

The periods in which each of the education trends marked education are close and, as explained by SAVIANI (1987), they do not constitute a homogeneous and stationary phases, but rather periods in which their characteristics prevailed or still prevail. The traditional humanistic pedagogical trend was prevailing in Brazil, from 1554 to 1920. The modern humanist trend marked the education, from that date until 1971, and thereafter the prevailing trend was the technicist. Each of these approaches depends on a particular conception of man and the world, influenced the organization of the school system and school in a particular way.

The approach selected, which is apparently made "a priori," the guiding categories, that is, the organization of the school system and school, the selection of content, the teaching-learning methods,

forms of assessment and the teacher-student relationship come from the recognition that they were present from Jesuit education, in the historical process of education in Brazil. SAVIANI (1987), explains that the periods of education do not constitute homogeneous and fixed factors.

BORALLI (1997) identifies the main feature in the work at AUMA as the way the autistic students are regarded, as integral beings: a view that is not based on passion, or the innocence or ignorance, but in careful and systematic observation of the daily life and the findings collected along the time.

Since 1943, when autism received its name by Dr. Leo Kanner, little has been shared on the subject in our society. Some people have heard about the issue, others never. It looks like a Tabu. No one knows for sure what the Disorder of the Autism Spectrum is. Even within the scientific community, the number of skilled professionals is scarce, to fulfill the demand affected by autism. But the limitations of actions in the field with predominantly behavioristic view where what matters is the doing disregarding the being and knowing, have led to the construction of educational processes that ignore the fact that autistic people are people before being autistic.

BORALLI (1997) started trusting in the ability of autistic children and, from this perspective, the entire educational process offered has been directing education to strengthen the capacity of thinking, concomitantly with the ability of doing of each student. Doing should not simply be a mechanic doing. Students' ability to think is encouraged in the educational process so that they develop more autonomous thinking. Concerning the type of education that actually drives the development of students, we could mention REGO (1994), based on the assumptions by Vygotsky, made by the Russian Davidov (1988, p.3):

“The school should not be restricted to the transmission of content, but mainly teach students to think, teach forms of access and appropriation of elaborated knowledge, so that the student can autonomously practice them throughout the life, besides the school time.”

So according to him, this is the main task of contemporary school facing the requirements of modern societies, which drives the view of this project.

According to FAZENDA (2015), interdisciplinarity is a course of action, seeking for inclusion, agreement, an attitude towards knowledge, to know more and better. There is a transition from a fragmented perception to a unitary conception of knowledge. Education only has meaning in the encounter and exchange of knowledge, emerging from an anonymous condition, through with dialogue, accepting the thinking of the other. What characterizes the interdisciplinary attitude is the boldness of research, the search: it is the transformation of lack of confidence in an exercise of thinking, a constant construction. Its principles are: humility, knowing how to listen and respecting other ideas, coherence, detachment and respect. The action can't be taught, but must be lived.

In Brazil it was recognized in 1998 by the Ministry of Education and Culture in Brazil, as a fundamental concept in contemporary education for Elementary and High School. However is still not yet fully reflected in practice as educators have to feel the meaning of the proposal, it allows the educator to become conscious of his/her own vision of the action, which is essential for those who intend to develop a conscious practice projected with the power of transformation for the receiver.

The Report to UNESCO for the International Commission on Education for the 21st Century by Jacques Delors in 1996 is a reference for the Project. In the report the education mission encompasses all the processes that raise people from childhood to the end of life, a dynamic knowledge of the world, the others and themselves, combining in a flexible way four fundamental learning processes: Learning to know, learning to do, learning together and learning to be. The report also mentions that the mission of education is to transmit knowledge about the diversity of the human kind and lead to the awareness of the similarities and interdependence among human beings on the planet. Education should help us discover ourselves. Only then can we truly put ourselves in the place of others and understand the meaning of their reactions

Some other authors contribute to the idea that the autistic person is regarded as an integral being. The whole being as described by authors such as Ken Wilber whose purpose is to integrate all areas of knowledge, Fritjof Capra, for whom the study of the parts does not allow to know the functioning of the whole, and Edgar Morin who says that it is necessary to overcome fragmentation of knowledge in restricted fields.

2 Development

AUMA - Association of the Friends of the Autist Child manages to get the approval from the Education Secretariat of São Paulo State to operate as the Elementary School - 1st to 5th grade, special

education mode, with the CEAACA - Educational Center of the Association of the Friends of the Autist Child 'Nathália Boralli', for the care of students with ASD - Autism Spectrum Disorder. This work and research may contribute with education, in that it will create an opportunity for teachers that work with people with autism and other interested professionals to approach this universe, with possibilities of theoretical / reflective direction. The production of specific knowledge ensures its usefulness to other academic and practical work for their cumulative contribution.

Goal 4 from the National Educational Plan in Brazil refers to inclusion stating that Education should be provided universally, for the population of 4 (four) to 17 (seventeen) years of age with disabilities, pervasive developmental disorders and high skills or giftedness, access to basic education and specialized education, preferably in the regular school system with the inclusive education system assurance, multi-functional resources, classes, schools or specialized services, public or licensed. Moreover in 4.4 item the goal intends to ensure specialized educational services in cross-functional resource rooms, classes, schools or specialized, public or licensed services, the complementary and supplementary forms to all students with disabilities, pervasive developmental disorders and high skills or giftedness, enrolled in public basic education, according to the need identified through assessment, and after the family and the student are heard.

In the 4.9 item the goal strengthens the importance of monitoring and monitoring of access to school, specialized educational services, as well as the permanence and school development of students with disabilities, pervasive developmental disorders and high skills or giftedness beneficiaries, together with income transfer programs, fighting situations of discrimination, prejudice and violence, with a view to establishing appropriate conditions for educational success, in collaboration with families and public agencies of social welfare, health and child protection, adolescence and youth; while in the 4:10 the direction is the fostering of research for the development of methodologies, teaching materials, equipment and assistive technology resources, with a view to promoting the teaching and learning as well as the accessibility conditions of students with disabilities, *pervasive developmental disorders* and high skills or giftedness; and moreover and most relevant at the 4:11 the goal is to promote the development of interdisciplinary research to support the development of intersectoral public policies that address the educational characteristics of students with disabilities, global development disorders and high skills or giftedness that require specialized care measures

Finally the 4.18 item focuses the promotion of partnerships with community, religious or philanthropic non-profit institutions which have agreements with the government, aiming to expand the supply of continuous education and the production of accessible educational materials, as well as accessibility services necessary for full access, participation and learning of students with disabilities, *global development disorders* and high skills or giftedness enrolled in the public school system; and in the 4.19 the goal focuses the promotion of partnerships with community institutions, religious or philanthropic nonprofit organizations contracted out by the government in order to encourage the participation of families and society in the construction of the inclusive education system.

3 Brazilian Educational Matrices

Concerning the possible influences of the historical educational development in Brazil follows some briefing about the Brazilian educational matrices.

3.1 Christian matrix

In the history of Brazilian education, the religious institutions and the educational process have always been in a steady relationship. Soon from the occupation of the country by the Portuguese, the education in Brazil was managed by the Jesuits.

The Jesuits were responsible for the first schools and universities in the Western world. Although they had intended to introduce the integral education of the student, regarding the humanist character, scientific, literary and philosophical inheritance of an ancient tradition, they turned, solely for the purpose of theological education, in which predominated the God-centered thinking, in order to direct the student to a unique and unquestionable way, belief in God.

The school functioned based on the normative logic of traditional thinking as a kind of categorical imperative that everyone should follow and not question, including all members of the school. In this sense, the school had as the supreme domain *Jesus Company*, who manipulated, dictated and directed the man of that time to the intellectual and social conformism, accepting that guidance as if their place in society had been appointed by God. Based on the imperative commandments of the *Ratio Studiorum* - set of norms designed to regulate education in the Jesuit Schools, the syllabus organized by the Jesuits,

the content that was taught by the traditional school resulted in the set of chosen subjects considered as upper and lower, which were taught from high school to further education in an attempt to prepare students for the practice of virtue and the recognition of divine power. The syllabus was formed by hierarchical disciplines according to the grades proposed, with the purpose to keep man under a theological belief in a supernatural order.

In the period of colonial Brazil, the colonial elite was educated in Christian moral values well within the logic of the Catholic Reformation of the sixteenth century. Thus, there was the same school but with very different objectives: to the elite, the moral and administrative instruction; for the natives the catechesis. The pedagogical structure of the *Studiorum Ratio* schools was identical to our schools of contemporary Brazil, as the students learn in classrooms, divided into levels and perform tests.

It would be around 1890 that the State took over with the reform by Benjamin Constant influenced by the positivist ideas.

3.2 Liberal matrix

The Liberal Mother left as greatest legacy to society of the late nineteenth and twentieth centuries, the search for a State of welfare, market economy, competitiveness and freedom, but has continued to be an unfair society, where production sources wealth remained in the hands of a small bourgeois group. To the proletariat the workforce was left, always paid below its real value. Within the liberal school proposal, the new school also encompassed Anísio Teixeira ideas in favor of an education to gratuity, universality and obligatory, which, happens to be a common good for all Brazilians, not just for the high privileged class of society. The liberal and capitalist model of education thought by Anísio Teixeira intended to integrate the population to the needs of the industrial society and that they were able to achieve a reasonable standard of quality of life, thus contributing to the country's growth.

Anísio Teixeira can be defined as one of the greatest thinkers and advocates of public education in Brazil. As an educator, philosopher and lawyer, he was one of the most important characters in the history of education, for besides being part of the movement for the new school pioneers he held several important positions from the 20s to the 60s. Teixeira was in favor to the idea that the school would have to prepare the new man to be introduced in the society of scientific work, liberal professions, such as medicine, law and engineering, so that from these conditions, the task of the nation would be directed to the construction of Brazil.

"That society would have to prepare ordinary workers, skilled workers and workers with expertise in technical abilities of all kinds. (TEIXEIRA, 1994, p. 54-45).

His criticism to the privileged or representatives of the Brazilian elite, the only ones who had access to secondary education and the university, was precisely because it was one of the reasons for the delay of Brazil, for the privileged, as well as the contents and methods the traditional school, contributed according to Teixeira to the archaic education system. For him, the school in the old model allowed for the Brazilian social dualism, as its curriculum was only for the privileged. It is in this sense that the common education would be a way of enabling the poor access education to join the elite.

"Education is not a privilege" (1994) is one of the most important books on Brazilian education produced in the last century because it shows the intention of consolidating the proposal of an education that had already been conceived from the beginning of the Republic, but that only came to effect in the second half of the twentieth century. Although the new education was directed to serve the capitalist economy, it meant the first opportunity of access of the poor to the public school system, which was free and had good quality.

3.3 Critical matrix

The critical school comes with the book by Alvaro Vieira Pinto (2002), Paschoal Lemme (1988) and Dermeval Saviani (2009), addressing the ways of education, distinguishing the concept of school based on two types of critical awareness. They argue that true education incites the subjects of the pedagogical act to transform their reality. That is why there is the need to awaken in the student that the social reality is structured through power relations reflected in the organization of social classes.

Paschal Lemme admits that the task of educators is to make people identify that illiteracy and the problem of education in general is a result of external and internal forces, and that it will only find solution, as the economic structure of the country is changed. Thus, the educational and health level of a people depends on the level of development of its economy. The author of *Memories* (1988) in the context of a turbulent time of political persecution, participated in the struggle for better living conditions for the Brazilian population, so it could be provided by public education, and thus continue to struggle for these ideals.

In the same perspective of social and educational change, it is necessary to establish a dialogue

with Álvaro Vieira Pinto in his book "Seven lessons on adult education" (2010). The author believed that the critical consciousness of the student would only be perceived when the school and the adults improved their understanding of the material conditions of existence of the population. However, for this change of man's situation and reality to take place, there had to be a dialogic education, in such a way that the role of the student-object became student-subject.

In general, the true criterion of education like that starts with the interest of the people. Therefore, living conditions may only be changed if the people understand and act on the social conditions of the country. Only then could the educational system provide change in the human condition. The critical educator interferes in the educational process contributing to the extinction of inequalities between educator and student, on the belief that one day a society can be built without social classes, and for that to happen consciousness of the self and the world are necessary.

Dermeval Saviani may be a reference of the Marxist critique of social reality to the field of education. In the book "School and Democracy" (2009), Saviani emphasizes the importance that society has in school education. For him, education should be directed to social practice as a transformation of the social structure. Being a critic of non-critical theories and critical-reproductivist, Saviani directs the pedagogical practice to a critical-revolutionary attitude; for him the school can't be thought of as being external and disconnected from the social historical context, nor be considered as compensatory of all social responsibilities. For thinking about education as a social equalizer instrument, as advocated by the traditional pedagogy, is too naïve to believe in the power of school as the only solution to social problems, while thinking the school also as a reproducer of inequalities is to believe that there can be no transformation in social structure and that the capitalist system is definitely consolidated with no prospect of social change, that is, class struggle. So the proposal of the author is to think beyond the two theories and point the way that education should follow, giving relevance to the transmission of knowledge, with the content starting in the social practice of students so that they understand the true reality. Only this way can they succeed in transforming society, in the sense that democracy and political participation are exercised.

However, while there is no respect for the rights of the people, school can't be expected to have political and democratic awareness, on the part of the teachers or students, as the school structure is organized like the social dynamics. So thinking beyond the pedagogies of essence and existence, to Saviani is emerging from the naïve consciousness to critical consciousness, fostering the pedagogical discussion in the political dimension in the broad and democratic sense. In short, work developed in schools should be articulated with the process of democratization of society. The author understands that to achieve the true sense of the pedagogical act it is important to consider that education is the passage from inequality to equality. For this to happen it is necessary to implement the processes needed to turn the possibility into reality (SAVIANI 2009, p. 70).

Finally, regarding most important Educational thinkers from Brazil, it's essential to mention "Paulo Freire" in this context. Antonio Novoa (1998), professor at the University of Lisbon, Portugal, author of several scientific works in the field of education writes:

Freire's life and work are inscribed on the pedagogic imaginary of the twentieth century constituting main reference for several generations of educators. [...] His proposals have been used by different groups, relocated in various social and political contexts. [...] From a particular educational concept that crosses the social theory, moral commitment and political participation, Paulo Freire is himself, an essential asset of pedagogical reflection. His work is like a kind of critical consciousness, which puts us on guard against the politicization of the educational thinking and pedagogical reflection. (P. 185).

The emergence of a new paradigm, which some call post-modernity, in the sense of overcoming the dominant paradigm, begins to show a strong influence in education, with a growing number of academic research and, in a special way, changing the concepts of the school curriculum (CAPRA, 2001; MORAES, 1997; Santos, 1997; 1999). It's in this context that the Paulo Freire's ideas could make a great contribution to this educational matrix which has been developed along the time and may have a decisive influence on educational policies that governments should adopt in the coming years and (who knows?) in the coming decades in particular regarding the way we deal with Educational Plan concerning Inclusion in Brazil, and in particular with Autism Spectrum Disorder Children.

4 Conclusions

To understand the educational problems in schools and the influence in the current social reality, it

is important to know that the true purposes built around school during the past centuries form the main factors for a coherent and critical analysis of school nowadays. It is possible to identify around the school structure the inheritance of both the positive and negative aspects, or even continuities and ruptures that the various kinds of thoughts left to the present context of the Brazilian education. It is possible to identify even in the project structure, the inheritance reverberated in many aspects of the various kinds of thoughts, if we analyze this structure from the idea of the social historical individual, collectively constructed in context

Moreover there is no doubt that we need to understand more deeply the local context or roots to build a work that strengthens the ability of thinking, creating literacy methods that may help students to become as autonomous as possible, identifying influences coming from the Christian and Critical Educational Matrixes; but in order to walk in the direction of a more human vision of autism it's important to consider the ideas coming from new inter and transdisciplinary thinkers like Ken Wilber, Fritjof Capra and Edgar Morin.

In this way and following Jacques Delors UNESCO Educational report one may be able to understand better the diversity of the human species and become aware of the similarities and interdependence among human beings on the planet. Education could help us become more aware of ourselves; and then one may be able to truly put ourselves in the place of others like the Autism Spectrum Disorder Children and understand better their feelings and the meaning of their reactions.

Significant of Lab Equipment Size and Location on Lab Design

Mohd Naim Abdul Halim, Akbariah Mohd Mahdzir
MOT Department, MJIT, UTM Kuala Lumpur, Kuala Lumpur, 54100
(E-mail: mnah87@gmail.com, arymahdzir@gmail.com)

Abstract: This paper discussed the significance of lab equipment size and location in determining the laboratory design. The reviewed article “Insight of Laboratory Design” have pointed out some view on lab design. In perspective of physical asset management, the size and location of lab equipment needs to be considered as well in determining how the lab design should look like. The criteria such as good airflows, daylights and smooth walking traffic are important in lab work-flows. Based on few literatures, several lessons recently discussed those factors has influenced on laboratory design greatly, while there are few gaps found need to be clear-cut upon the views on the article. As conclusion, the findings from some argument have elaborated the important keys in considering the lab design.

Key words: PAM; Lab design; Lab equipment

1 Introduction

De Palma, Angelo. “Insights on Laboratory Design.” *Lab Manager* Vol 1: No 7 Dec (2012): 4-19. The article, “Insights on Laboratory Design” was written by Angelo, De Palma (PhD) who is freelance writer living in Newton, NJ. In his article, there were three scopes discussed regarding the laboratory design. Starting up the design, he did mention a few elements which were related closely to the topic with begun by securing the fund until laboratory planning. Whereas, Green lab design also been discussed as one of the main element since the power source are the main components of a lab’s operating expenses. The third scope however mentioned about the criteria of lab expansion in lab design based on three case studies output which can be as a good guidelines and from the input of lab design experts, there were some advices to be considered as lab manager in deciding a good lab design. Without a doubt the author has good points in his article; however the significance of lab equipment size and location in lab design need to be discussed further.

2 Insights on Laboratory Design

Seven elements to be considered on starting-up the lab design, the first thing in designing the lab is project fund. It needs to be secured in order to maintain the enough momentum of the project while the safety element is considered as the core element when designing the workflows and also with no excuses do not exclude the human factors in design as for staff satisfactory. Meanwhile, it cannot be a preconception in determining the lab design because the concept should be constructed by looking into the client’s ‘science’ work description practiced. Understood that, it is necessary to looking into work-flow as well to confirm the design needs as lab workers are lacking on skills to define their own space and equipment size requirement. On top of that, flexibility in lab design has become trend and an important element in research lab area because the lab cannot be designed without the element of flexibility in order to fulfil the future needs of furniture, mechanical capabilities, systems, and cleaning modules while in the same time achieves the term of sustainability which drive toward austerity. In addition when it comes to lab design, the designer shouldn’t propose the other design to be implementing on another one because the lab design is dependable to theirs work-culture, listen to the client and convert the idea into design. Same goes to when deciding whether the design is best for renovation or build new, the idea was guided through good laboratory planning which involves three steps (due diligence, analysis, proposal) that provide the road map approach which is more cost effective.

Green lab nowadays is not the isolated issue in designing the lab, it is because the power and natural source consumption took more three-quarter from the cake of lab operating budget currently. One of the main reasons is the huge amount of air-changes per hour (ACH) which contribute to 24 hours power consumption whether the laboratory is occupied or not, in line with requirement of fume hood which are varies widely. One of the strategies is to occupy the Acuity to monitor air, providing relative measurements and to collect data which can use to maintain safe and comfortable environments. Whereas, the other strategy is using pyramid HVAC control hierarchy as shown by Figure 1 which started from the bottom by installing high-efficiency lighting to lower the cooling load, using low-flow fume hoods and lowering the air change rate. The next step is by using variable air volume (VAV)

systems that can lower exhaust and air change requirements. Another strategy is by installing low-pressure drop HVAC systems at early design stage. The last control measure is to involve reducing or eliminating reheats energy and/or adding some heat recovery (). Besides that, other utilities such as water and lighting also were in control measures in maximizing the 'green' goal in lab design.

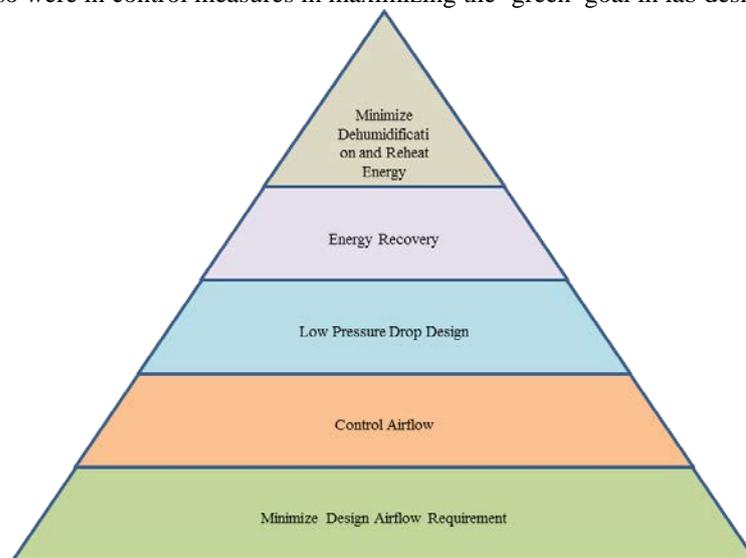

Figure 1 Air HVAC System

The scenario from three case studies on lab expansion given to the article supporting information and the same time added some value for determining the lab design. What can we learnt from first case-study, to do lab expansion it is necessary to hire an advisor early to identify any municipal, state, and federal compliance involved where those procedures also takes time to deal with. Meanwhile, from the second case-study it's very useful for those has problem with budget and urgency. Lab expansion can be done by someone who has experiences in constructing the lab before. By doing that, the cost for lab expansion can be reduce to almost 60% without ignoring the quality with provision, consult vendors and trades to help in deciding the specification and material. The third case study, the findings more or less support the points discussed on Green lab design. The project model of 'smart labs' which integrated features which are real-time air quality sensing, reduced fan, filtration, duct, stack discharge airspeeds, reduced internal heat load and reduced thermal inputs during setback periods can reduce until 50% of energy consumption.

At the bottom line of the article, the Q&A session held by the authors regarding the lab design had points out a few advises that should be followed by lab manager. In early stage is recommended to develop a good working team, get as much as information needed while communication is important so much so the isolated issue also could be uncovered. In the same time, the involvement of representative scientist is a good step for design 'artwork' at drafting session. Last but not least, the relationship with supplier also not less importance in order to make sure the project goes well in progress. (DePalma A.,2012)

It can be concluded that according to the author, to do a laboratory design there a few disciplines or parameters that should be followed as procedures. Where, it's involved about a few elements at starting stage which are fund, safety, human factors, concept, work-flow, flexibility, culture of the work, retrofit or build new and lab planning. In addition, without denial the concept of green lab also needs to be considered as the element is global issue nowadays. Furthermore, make the previous studies as the outlines and get some expert advices to guide on decision making.

3 Point of Review

The author has discussed the topic in proper manner, while the subsequent section paragraph has been arranged nicely in order to address the concept and idea how the lab design should being determined. Furthermore, the few case studies and Q&A session with experts has supported the arguments at almost above sections and in the same time conclude the author claim statement. Although the article has addressed all of the element to start the lab design, one of the element was lightly

discussed even though it's consider as prime consideration which is safety. The author only mentioned about emergency devices and how materials enter and leave the space. Where, the safety element in terms of protecting human health and life in line with protecting a facility from unauthorized access is also paramount in design (Daniel Watch, et al, 2012). Without any doubt sufficient circulation space is also a critical issue to maintain a safe working environment when the arrangement of fixed and loose furnishings needs to support the user freedom to go around the working area. (Innova,2014)

However, the element such as design according to human factors for staff satisfactory has clearly stated that the main design challenge is to create maximum comfort, and find elements that will make the working area attractive which Symrise Studio and Fragrance Laboratory, New York design has created today. (Wilk P.2016) The article also linked-well the element of flexibility with sustainability which makes the element at the top list of lab design trends. He says that flexibility should be built into casework design and layouts, to assume of electrical and heat loads and to speculate for air exchanges. It means that, flexibility which understands also as adaptability is the capability of the lab design to fulfil the necessity of both current and unforeseen future needs such as retrofits and modification which can save the cost effectively. (N. R. C.2000)

Meanwhile, the emphasis on green lab issue given a significantly impact on lab design nowadays which has been implemented by some of the lab such as Chemistry Biology building, University of Wisconsin-Stevens Point, Wisconsin where the building will assimilated green design by installing large window to enhance the daylighting instead of using lamp and also using mechanical and electrical systems which are highly efficient. (Ostafi J.,2016) While, the PACCAR Environmental Technology Building at Washington State University been constructed using renewable materials and technologies including wood composites, recycled concrete and pervious pavement. (J. Lannigan,2016)

The case study has revealed that it is important to familiar with local regulatory body in order to make the task ease, because across the nation the municipal state has their own requirements specifically on lab. It usually more stringent compare to another building because of the dangerous contained of volatile chemical and fumes. (Manley M.,2013) While to do the lab expansion as 'do it yourself' instead of experiences, sometimes it need to create a small group and maybe skunkworks model need to be used. But to success, its need to understand the model, because sometimes it needs distance to make space to explore, but also need to be close to the 'mothership' in order to stay relevant. (George Wainwright P., 2013)

4 Significance of Lab Equipment

On the sight of Physical Asset Management (PAM), lab equipment sizes and location also plays an important role to ensure the lab design still on the right track during the early stage. For instance of previous outline for size and area of fume hood in the lab makes the hood subjected to wind stream unsettling influence from close-by strolling activity, involving the premium area, blocking access to sunlight and making risky "deadlock" condition. By moving the hood independently from lab area, it will expanded wellbeing because of isolation of hazardous materials necessitating hoods, enhanced adaptability and condenses ventilation work associating the hood to fumes frameworks. (Roger N.Goldstein G. C. & Arjun H. mande, 2016)

Special condition needs if design is for laboratory that working on biological research. In term of equipment size, there must be a space between benches, cabinets and equipment for cleaning purpose accessibility. Whereas, the location of certain equipment also needs to be specified because some of the equipment for example electron microscopy or mass spectrometry required special utilities and environment control. (U. of S. Carolina,2010) so the lab design must not overlook this criterion before jump to real work because usually this element is irreversible.

The other thing to be considered is the equivalent linear feet (ELF) of work surface inside the laboratory. ELF is meant the required length of benchtop for equipment size to be placed and space for preparation work. While for the equipment which does not fit to benchtop, the ELF is the length of the floor required to place the equipment on. Usually, the ELF for fume hood also needs to be counted as it was always the requirement in any of lab design for personnel involves with hazardous chemicals. (N. R. C.,2011)

So, it is significant to discuss the particular of equipment size and location on planning the laboratory design. Yet it has certain influenced on lab workflows which cannot be denial where the elements are applicable and undeniable at any of labs and research facilities. Due to the seriousness of this parameter, most of research team now are towards resource sharing to reduce the quantity and cost

of lab equipment in the same time less space is needed which brings to low operational and maintenance expenses. (J. K. Blake Jackson, Stephen Palumbo,2015)

5 Conclusions

This article review has evaluated the article “Insights on Laboratory Design” by De Palma, Angelo. Most of points addressed in the article had shown the strong arguments in discussing about the element in determining the lab design. The output from the article has given a significant output to the people inside this area. Despite that, some of the point has lightly stressed such as safety which considered as a main element in designing the lab workflow. The section on Green Lab however has been described precisely with support of input from case study and also Q&A session with the expert. Nonetheless, the lab equipment size and location also has significant impact on deciding how the lab should be designed. The future study is hoped to discuss more thorough about this element.

Research on Chinese EFL Undergraduates' Personality Traits and Their Foreign Language Learning Styles

Li Li

International Office, Wuhan University of Technology, Wuhan, P. R. China, 430070
(E-mail: leeli@whut.edu.cn)

Abstract: The study is aimed to identify predominant personality types and learning styles, investigate the relationship between the participants' personality classifications and their learning styles. We look into how the participants' personality variables affect their foreign language learning style choice and find out whether different personality types may affect the way students establish their learning styles when learning English as a foreign language. The study enriches the content of domestic research on college EFL learners' learning styles. It may also offer the explanatory power of Bandura's Social Cognitive theory in analyzing the relationship between Chinese EFL students' personality traits and their learning styles. We hope this research can provide some references to other related studies in this field.

Key words: Chinese EFL Undergraduates; Personality Traits; Foreign Language Learning Styles

1 Introduction

In recent thirty years, the study on students' personality types and learning styles during their foreign language learning process has drawn scholars' wide concern. Studies abroad are dominantly guided by psychology and ethnology. Instrument used in these studies is mainly Myers-Briggs Type Indicator which is based on psychology. Teacher-centered methods are no longer considered as the key factor in determining the success or failure of teaching and learning English as a Foreign Language (EFL) (Richards & Rodgers, 2008). Learners shape their own learning process enormously. Nunan and Kathleen (2010) observed that good language learners find their own way. Foreign language teaching and research has returned to how to learn, that is, the student's learning strategies and learning styles, and its focus has also shifted to the student-oriented studying in students' learning process, cognitive process and psychological process. Considerable research deeply probes into the factors that influence students' academic achievements, one of which is the study of their learning styles (Ayersman & Minden, 1995; Chen Shao-hua & Zeng Yi, 2004; Reid, 2002; Zimmerman, et al, 2006; HE Xiaohong, 2005; LI Donggeng, 2005; LI Yan, 2009). Most domestic studies in this field focus on the relationship between learning styles and teaching strategies, the relationship between learning styles and students' achievements and the choice of learning styles and learning strategies. In the existing literature in China, there are few studies concerning the relationship between students' personality traits and their foreign language learning styles.

2 Data and Methodology

2.1 Subjects

Subjects of this study are 110 first-year undergraduate EFL learners from Wuhan University of Technology (WUT), among which 50 are majoring in science (45%), including Mechanism, Applied Physics and Software Engineering, and 60 are majoring in Arts (55%), including International Trade, Marketing and Financial Management. The participants are made up of 53 male students (48%) and 57 females (52%). (See Table 1)

Table 1 Subjects of the Study

		N	Percentage
Major	Art	60	55%
	Science	50	45%
Gender	Male	53	48%
	Female	57	52%

The participants, with one-year-long college English learning experience, have been taught and investigated by the author and one of his colleagues, Leilei, for one year in WUT. Among the subjects, sixty students majoring in Arts are taught by the author and fifty who major in science are taught by his female colleague.

2.2 Instruments

The instruments employed in the study were two complicated questionnaires. One of the questionnaires is the NEO-Five Factor Inventory (NEO-FFI) revised by Costa and McCrae (2004) with 60 randomly arranged items to elicit respondents' personality traits among five categories: neuroticism (N), extraversion (E), openness to experience (O), agreeableness (A) and conscientiousness (C). The other questionnaire is Reid's Perceptual Learning Styles Preference questionnaire (PLSP) (2002) which consists of 30 items to investigate EFL learners' learning style preferences among six categories: visual, auditory, kinesthetic, tactile, group, and individual.

Table 2 The Structure of NEO-FFI

Parts	Contents	Item No.
Parts1	Neuroticism	1,2,3,4,5,6,7,8,9,10,11,12
Parts2	Extraversion	13,14,15,16,17,18,19,20,21,22,23,24
Parts3	Openness	25,26,27,28,29,30,31,32,33,34,35,36
Parts4	Agreeableness	37,38,39,40,41,42,43,44,45,46,47,48
Parts5	Conscientiousness	49,50,51,52,53,54,55,56,57,58,59,60

2.3 Data collection and analysis

In an anonymous way, participants in the study completed the two questionnaires administered by the author in their classroom settings in the first semester of the year 2013. Before students were invited to answer the questionnaire, the author of the study briefly introduced and explained the purpose of the research. Students were informed that their participation was voluntary and their identity would be kept confidential. The response rate from the 110 sample participants was 100%.

The collected data were input in to the computer and processed by the Statistical Package for the Social Sciences (SPSS 19.0) to examine possible statistical significance and the correlation between subjects' dominating personality and their language learning styles.

3 Results and Discussion

3.1 Subjects' predominant personality traits

The data of NEO-FFI are input into the SPSS and then analyzed by means of Single Sample test. Table 3 shows the general types of the subjects' personality traits.

Table 3 Descriptive Statistics on NEO-FFI of All the Subjects Investigated

Sector	N	Mean	Std.Deviation	Std.Error Mean
Neuroticism	110	32.20	5.530	.527
Extraversion	110	42.21	5.597	.534
Openness	110	42.95	4.552	.434
Agreeableness	110	42.95	5.138	.490
Conscientiousness	110	40.24	5.102	.487

As is shown in Table 3, the first three personality traits of the subjects are Agreeableness (mean= 42.95), Extraversion (mean= 42.21) and Conscientiousness (mean= 40.24). These comparatively high figures indicate that the predominant types of the subjects' personality traits are agreeableness, extraversion and conscientiousness. The results generally mirror the findings of Ibrahimoglu and Unaldi, et al. (2013) who reported that the participants in their study reveal a high level of extraversion, agreeableness and conscientiousness. From the results in Table-3, it is shown that all the subjects have an optimistic view of human nature and appreciate getting along with others.

3.2 Subjects' dominating learning styles

The data of PLSP are input into the SPSS and then analyzed by means of Single Sample test. The general trend of the subjects' learning styles is shown in Table 4.

Table 4 Descriptive Statistics on PLSP of All the Subjects Investigated

Sector	N	Mean	Std.Deviation	Std.Error Mean
Visual	110	33.42	5.277	.503
Auditory	110	35.13	4.538	.433
Kinesthetic	110	37.00	5.636	.537
Tactile	110	35.58	5.696	.543
Group	110	35.07	6.276	.598
Individual	110	33.24	7.619	.726

The statistics in Table 4 simply all the subjects investigated predominantly prefer Kinesthetic learning style (mean= 37.00) and Tactile learning style (mean: 35.58), then the next two learning styles preferred by all the students are Auditory learning style (mean: 35.80) and Group learning style (mean: 35.07), while the least preferences of all the students are Visual learning style (mean: 33.42) and Individual learning style (mean= 33.24). We can see from the results in Table-4 that kinesthetic and tactile learning styles are two predominant preferences of Chinese college students. This finding suggests that Chinese EFL learners tend to apply kinesthetic and tactile learning styles to English learning, which also indicates that college students learn English effectively through concrete and complete body experience and touch.

3.3 Differences of personality traits and learning styles between students of science and technology and those majoring in arts

The data of NEO-FFI and PLSP are input into the SPSS and then analyzed by means of Independent Sample test. Personality of college students of arts and those majoring in science and technology is shown in Table 5.

Table 5 Descriptive Statistics on NEO-FFI of College Students of Science and Those Majoring in Arts

	Major	N	Mean	Std.Deviation	Std.Error Mean	t
Neuroticism	Art	60	32.78	5.752	.743	1.215
	Science	50	31.50	5.223	.739	1.225
Extraversion	Art	60	41.93	5.983	.772	-.564
	Science	50	42.54	5.136	.726	-.572
Openness	Art	60	38.62	4.723	.610	.499
	Science	50	38.18	4.374	.619	.503
Agreeableness	Art	60	43.00	5.421	.700	.121
	Science	50	42.88	4.830	.683	.123
Conscientiousness	Art	60	40.22	4.404	.569	-.044
	Science	50	40.26	5.879	.831	.043

According to the results in Table 5, college students of arts displayed the highest mean score of personality traits in Agreeableness (mean= 43.00) in which the students majoring in science and technology also got as the highest one (mean= 42.88). Then students of arts displayed the second and third highest mean scores of personality traits in Extraversion (mean= 41.93) and Conscientiousness (mean= 40.22) respectively, and, all the same, the students majoring in science and technology also did in Extraversion (mean= 42.54) and Conscientiousness (mean= 40.26) respectively.

This finding suggests that the predominant personality traits of college students majoring both in Arts and in Science are agreeableness, extraversion and conscientiousness, and there's no evident difference of personality traits between students of arts and those majoring in science and technology. In brief, all the college students investigated tend to be enthusiastic, responsible, cooperative and talkative.

3.4 Differences of personality traits and learning styles between male and female students

The data of NEO-FFI and PLSP are input into the SPSS and then analyzed by means of Independent Sample test. Table 6 shows personality traits of male and female students.

Table 6 Descriptive Statistics on NEO-FFI of Male and Female College Students

	Major	N	Mean	Std.Deviation	Std. Mean Error	t
Neuroticism	Male	53	31.68	4.914	.675	.952
	Female	57	32.68	6.051	.801	.959
Extraversion	Male	53	42.06	5.597	.769	.274
	Female	57	42.35	5.643	.747	.274
Openness	Male	53	38.49	4.535	.623	.160
	Female	57	38.35	4.608	.610	.160
Agreeableness	Male	53	42.02	4.664	.641	-1.844
	Female	57	43.81	5.443	.721	1.854
Conscientiousness	Male	53	39.87	5.424	.745	.729
	Female	57	40.58	4.807	.637	-.725

As is shown in Table 6, the mean value of the five personality types of the male and female college students investigated is fairly close to each other. The first two personality types with biggest mean value are Agreeableness with the value of male (mean= 42.02) and female (mean= 43.81), and

Extraversion with the value of male (mean= 42.06) and female (mean= 42.35). Then the next two main personality types are Conscientiousness with the value of male (mean= 39.87) and female (mean= 40.58) and Openness with the value of male (mean: 38.49) and female (mean= 38.35). Finally, Neuroticism with the value of male (mean= 31.68) and female (mean= 32.68) ranks the least personality type among the male and female college students. The results in Table-9 indicate that there is no clear difference of personality traits between male and female students whose predominant personality traits are agreeableness, extraversion and conscientiousness.

Table 7 Descriptive Statistics on PLSP of Male and Female College Students

	Gender	N	Mean	Std.Deviation	Std. Mean	Error	t
Visual	Male	53	34.75	4.965	.682		2.630
	Female	57	32.18	5.295	.701		2.637
Auditory	Male	53	34.34	4.719	.648		-1.773
	Female	57	35.86	4.274	.566		-1.766
Kinesthetic	Male	53	37.17	5.690	.782		.303
	Female	57	36.84	5.631	.746		.303
Tactile	Male	53	35.25	5.860	.805		-.596
	Female	57	35.89	5.573	.738		-.596
Group	Male	53	35.58	5.783	.794		.824
	Female	57	34.60	6.718	.890		.829
Individual	Male	53	36.19	7.330	1.007		4.208
	Female	57	30.49	6.869	.910		4.198

The results in Table 7 shows that the vast majority of the male and female college students investigated prefer kinesthetic learning style, which means that they tend to learn more effectively through concrete and complete body experience, for example, physical responses, participating, activities, role-playing. In addition, the second and third learning styles preferred by male students are individual and group learning styles, that is, male students tend to learn more effectively both through learning with others and alone. On the contrary, female students prefer tactile and auditory learning styles respectively.

3.5 Relationship between personality traits and learning style choices among low achievers and high achievers

The fifth question of this study to be dealt with is whether there is a meaningful relationship between personality traits and learning style choices among low achievers and high achievers.

Table 8 Correlation Between Personality Traits and Learning Style Choices among Low Achievers

		Visual	Auditory	Kinesthetic	Tactile	Group	Individual
Neuroticism	Pearson Correlation	-.181	.229	-.137	.521**	.017	-.393
	Sig.(2-tailed)	.376	.260	.503	.006	.933	.047
	N	27	27	27	27	27	27
Extraversion	Pearson Correlation	.188	.159	.426	.529**	.340	.063
	Sig.(2-tailed)	.358	.438	.030	.005	.089	.760
	N	27	27	27	27	27	27
Openness	Pearson Correlation	.213	.347	.290	.221	.127	.463*
	Sig.(2-tailed)	.297	.083	.150	.277	.537	.017
	N	27	27	27	27	27	27
Agreeableness	Pearson Correlation	-.329	.235	-.204	.098	-.018	-.236
	Sig.(2-tailed)	.100	.247	.317	.634	.932	.245
	N	27	27	27	27	27	27
Conscientiousness	Pearson Correlation	.158	.221	.511**	.227	.242	.062
	Sig.(2-tailed)	.440	.278	.008	.265	.233	.762
	N	27	27	27	27	27	27

*.Correlation is significant at the 0.05 level (2-tailed).

**..Correlation is significant at the 0.01 level (2-tailed).

According to Table 8, Neuroticism negatively correlates with Tactile learning style ($r = -.521$, $P < .01$) and Individual learning style ($r = -.393$, $P < .05$). Extraversion positively correlates with Kinesthetic learning style ($r = .426$, $P < .05$) and significantly with Tactile learning style ($r = .529$, $P < .01$). Openness positively correlates with Individual learning style ($r = .463$, $P < .05$). There is a strong correlation between Conscientiousness and Kinesthetic learning style ($r = .511$, $P < .01$). Interestingly, Agreeableness does not correlate with any of the six learning styles among low achievers.

Table 9 Relationship between Personality Traits and Learning Style Choices among High Achievers

		Visual	Auditory	Kinesthetic	Tactile	Group	Individual
Neuroticism	Pearson Correlation	.147	-.043	.090	-.067	-.289	-.196
	Sig.(2-tailed)	.464	.831	.655	.739	.143	.327
	N	28	28	28	28	28	28
Extraversion	Pearson Correlation	-.070	.123	.381*	.226	.518**	.304
	Sig.(2-tailed)	.728	.541	.048	.256	.006	.123
	N	28	28	28	28	28	28
Openness	Pearson Correlation	-.043	.072	.238	-.002	.178	.147
	Sig.(2-tailed)	.831	.721	.232	.993	.373	.465
	N	28	28	28	28	28	28
Agreeableness	Pearson Correlation	.267	.029	.008	.291	.145	.024
	Sig.(2-tailed)	.178	.887	.970	.141	.469	.905
	N	28	28	28	28	28	28
Conscientiousness	Pearson Correlation	.227	.301	.313	.498**	.496**	.096
	Sig.(2-tailed)	.254	.127	.111	.008	.009	.633
	N	28	28	28	28	28	28

*.Correlation is significant at the 0.05 level (2-tailed).

**Correlation is significant at the 0.01 level (2-tailed).

As is shown in Table 9, Extraversion positively correlates with Kinesthetic learning style ($r = .381$, $P < .05$) and significantly with Group learning style ($r = .518$, $P < .01$). Conscientiousness highly correlates with Tactile learning style ($r = .498$, $P < .01$) and there is a strong correlation between Conscientiousness and Group learning style ($r = .496$, $P < .01$). What is fairly interesting is that Neuroticism, Openness and Agreeableness correlate with none of the six learning styles among high achievers. According to the statistics in Table-11 and Table-12, we can easily obtain the information about the relationship between personality traits and learning style choices. Among low achievers and high achievers as follows. On the one hand, among low achievers, 1) the neurotic students favor tactile and individual learning styles, which shows that those students who experience negative emotions prefer learning alone through touch; 2) the extraverted students prefer kinesthetic and tactile learning styles, which suggests that those who are enthusiastic and talkative prefer learning through concrete and complete body experience and touch; 3) individual learning style is preferred by the open students, which means that those who are open, creative and curious prefer learning alone; 4) the conscientious students favor kinesthetic learning style, which indicates that those who show self-discipline, act dutifully, and aim for achievement prefer learning through concrete and complete body experience.

4 Conclusions

The predominant personality types of the subjects were agreeableness, extraversion and conscientiousness. The subjects' dominating learning styles were kinesthetic and tactile learning styles. There was no evident difference of personality traits and learning styles between the students majoring in arts and those of science and technology. There was no clear difference of personality traits between male and female students. As for learning style choices, the vast majority of the male and female college students investigated preferred kinesthetic learning style. Meanwhile, male students also preferred individual and group learning styles and female students also preferred tactile and auditory learning styles. There was a meaningful relationship between personality traits and learning style choices among low achievers and

high achievers. As for low achievers, the neurotic students favored tactile and individual learning styles; the extraverted students preferred kinesthetic and tactile learning styles; Individual learning style was preferred by the open students, and the conscientious students favored kinesthetic learning style. In terms of high achievers, the extraverted students preferred kinesthetic and group learning styles; and the conscientious students favored tactile and group learning styles. The main personality factors that may affect students' language learning styles were neuroticism, extraversion and conscientiousness.

In future study, abundant material should be collected to have full coverage of Chinese college students from as many majors as possible. Moreover, a study covering both questionnaires and interviews is worth future endeavors.

A Case Study of Innovative Application of CAT in Translation Project Management

Zhu Hanxiong, Wang Kaixuan

School of Foreign Languages, Wuhan University of Technology, Wuhan, P.R.China, 430070

(E-mail: wuthxzhu@qq.com, kaixuanwhut@qq.com)

Abstract: With the expedite process of economic globalization, the international language service industry has developed rapidly, which asks for more requirements on the translation talents and translation quality and efficiency. Computer-Aided Translation (CAT) technology has been applied in translation practice and translation project management as well as translation teaching to facilitate the innovation and revolution in translation teaching methods and translation project management methods. This paper engages a case study on Transn Translation Practice Base of Wuhan University of Technology to analyze innovative application of Computer-Aided Translation Technology in translation teaching and translation project management. And from the perspective of quality management, cost management, and time management, it analyzes some inspirations on translation teaching and translation project management, and provides some guidance for translation teaching and translation project management.

Key words: Computer-aided translation; Translation teaching; Translation project management; MTI practice base

1 Introduction

"With the development of information technology, artificial intelligence, and natural language processing technology, translation technology advances rapidly, the translation has shown professional features like informatization, diversification, processize, collaboration, professionalization and so on, challenging the traditional model of a pen, a piece of paper, and a dictionary" (Zhang Zheng, 2015). With the progress of Computer-Aided Translation (CAT) technology, which has been applied in translation practice and translation project management as well as translation teaching to facilitate the innovation and revolution in translation teaching methods and translation project management methods.

In China, the research concerning this area starts late, but with the development of network information technology in recent years and the setting of Chinese MTI programs, tremendous achievements have been achieved in the related research. Through researching from the website of National Knowledge Infrastructure (CNKI) on the Subject Headings of "Computer-Aided Translation" (June 25, 2016), a total of 964 relevant literatures have been found, among them there are 123 papers in 2015, which is almost the same amount with that of 2014(106 papers) and 2013(123 papers). And most of the papers are published in core journals of the related fields such as Chinese Translators Journal, Shanghai Journal of Translators, and Computer-assisted Foreign Language Education. From CNKI's academic attention data, concern about the relevant areas of "Computer-Aided Translation" is showing an overall increase year by year, the number of documents downloaded concerning this area is up to 5574 in May, 2016.

Research by Chinese scholars concerning this field can be found as: Introduction, history, and prospects of Computer-Aided Translation (Wang Huashu, 2015); Cui Qiliang (2014), from the concept of post-editing, analyzes the application and research status of post-editing, summarizes up the motive force of post-editing development, studies the types of topics suitable for post-editing, and proposes the practice code to improve post-editing quality and efficiency. Xu Bin, Guo Hongmei (2015), starting from analysis of the nature of the CAT, and with the help of actual publishing translation cases, illustrates that CAT can also be used for non-technical text translation; combined with high-quality machine translation (MT) and post-editing (PE), the adoption of "machine translation + computer-aided tools + post-editing" (MT + CAT + PE) mode has value for some non-technical text translation. Wang Huashu (2013), having comparatively analyzed the typical translation technology courses at home and abroad, points out the problems existed in computer-aided translation courses of the current MTI education, which is unable to meet the demand for modern language service and technical personnel; and thus he builds a MTI technical curriculum system faced with industry-oriented requirements. Xu Bin (2012), through analyzing tourist brochure translation projects, explores the translation project management issues involved in publishing translations, especially the translation process of books that value both diagrams and words, and describes the application of a variety of related technology of

computer-aided translation (CAT) in complex layout books translation.

With the development of science and technology and social economy, research on computer-aided translation technology and its applications is increasing year by year, and scholars' attention on related issues is also increasing, the research on related issues by domestic and foreign scholars is gradually deepening; The application of Computer Aided translation in translation teaching and the future trend of the development of the technology itself have become the focus of attention of scholars.

The rise of MTI in Chinese colleges and universities was rouse in 2007, and after years of development until so far, there are 206 Chinese universities having established MTI training bases enrolling MTI Masters, involving almost 10,000 people to be trained each year. And the vast majority of colleges and universities in China have set up computer-aided translation related courses. From 2012, the Translators Association of China and China National Committee for MTI Education add "translation and localization technology and project management, etc.," in training courses for translation major teachers of national colleges and universities, which highlights the importance of computer-aided translation technology in translation practice, translation teaching and translation project management.

2 Computer-Aided Translation Technologies and Applications

2.1 Computer-aided translation

"Computer-aided translation" (CAT) covers a wide variety of contents and its very complex structure is easy to be confused of. Although most scholars distinguish the concept of CAT in terms of the broad sense and the narrow sense, in view of individual differences in understanding, a broader concept of "technical translation" is adopted, that is the information technology used in the process of language communication, and cultural communication. If translation process is divided into three stages, say before translation, during translation, and after translation, then translation technologies refer to the information technology used in each stages, such as the pre- translation document encoding format conversion, the terminology extraction, bilingual alignment technology, repeating segments extraction technology, the machine pre-translation technology; the auxiliary spelling, auxiliary input, electronic dictionaries and parallel corpora inquiry and verification, translation memory matches, terminology recognition during translation; and Quality Assurance (QA) , translation format conversion, bilingual or multilingual typesetting, translation product function and language testing after translation. (Wang Huashu, 2015). Concluded from Wang Huashu's research (2015), the author of this paper summarizes and gives the following definition on CAT: Computer-aided translation refers to the information technology used in the process of translating to assist human translation, to improve translation efficiency and translation quality, before, during, and after translation. Its main function includes pre-translation document processing, machine translation during the translation process, quality control and other auxiliary functions after translation.

2.2 Major computer-aided translation tools

Broadly speaking, computer-aided translation tools include a large variety of CAT software, electronic dictionaries, online search engine, search tools, online searchable database, machine translation tools, word processing software, optical recognition software (OCR), format conversion software, content replacement tools, quality assurance (QA) tools, etc. In a narrow sense it refers to the translation tool directly used by translators in the translation practice to assist their translation performance. Such as SDL Trados (Translation, documentation and Software, also known as "TRADOS", is one of the world's most popular computer-aided translation (CAT) software in the world with more than 200,000 customers; statistics show that more than 90% of the Fortune Global 500 companies are using SDL Trados for everyday localization translation services. SDL Trados is headquartered in Maidenhead, UK. Yaxin (Yaxin CAT is a newly developed Chinese-English & English - Chinese translation platform by Beijing Dongfang Yaxin Software Company (www.yiba.com) , it is a specific software tool developed for organizations and individuals with translation tasks). Huajian (Huajian Group is a direct investment and holding high-tech enterprise of the Chinese Academy of Sciences; it mainly engages in technical research, and product development in the field of computer language information processing.) In terms of the market share of global CAT software, SDL Trados ranks the first, Logos Wordfast comes after it, while Star Transit, and Deja Vu rank the third and the fourth respectively. In which Transit mainly serves auto mechanics customers in German, and Deja Vu mainly serves French customers. And SDL's acquisition of Trados and other companies have let SDL itself to become the only giant in CAT markets. However Across and Alchemy are two of the companies that can compete with it. Wordfast used to present applications for Italian, but now is has been used by

companies who do not willing to let Trados to become the big company to monopolize the market.

2.3 Computer-aided translation technology and translation teaching

"Chinese translation education reform is imperative. That to include the translation technology and translation management education into the translation classroom is overwhelming." (Wang Huashu, 2015). "On one hand, the traditional translation ability is the foundation of translation technology ability. On the other hand, enhance the technological capabilities of translation can facilitate the progress of traditional translation capabilities"(Wang Huashu, 2015). Development of computer-aided translation technology has promoted the reform of translation teaching. With the rapid economic and technological development, the requirement of the professional quality on practitioners of language service industry has increased significantly, which does not only limit to the basic bilingual conversion capability, namely the traditional translation capabilities, but also requires practitioners of language services industry to master the most advanced information processing tools and machine translation software, and building of Corpus and other advanced professional skills, which raises new and higher requirements for the translation teaching in Colleges and Universities. In order to train senior translators that meet the social needs, colleges and universities translation teaching have begun a bold attempt to make progressive reforms on translation teaching. "In order to ecologically integrate the traditional translation ability with the training of translation technology ability, the cultivating of traditional translation capabilities and translation technology capabilities in actual translation teaching practice shall be balanced. Also, the teaching mode shall take the student as the subject, faculty as the guidance, and technology-driven mode shall be implemented; What's more, course content and teaching methods of translation technology ability shall be adjusted timely"(Wang Huashu, 2015).

2.4 Computer-aided translation technology and translation project management

Project management means that "the manager within a specific organization, within limited time and resources, scientifically use systematic theories and methods to implement a proactive and effective management for all the work involved in the project in order to achieve the ultimate goal of the project" (Wang Chuanying, 2011). Translation project management can be referred as that the organizer of a translation or the leader of a translation team, using of existing resources, scientifically manage the entire process of a translation practice to optimize the project's objectives. Wang Huashu (2015) pointed out that the core elements of a translation project management can be explained in the following three aspects: quality management, time management, and cost management; and it can be divided into five sub-capacity: project management knowledge; organization and coordination; communication; time control; cost calculation and control. Thus in the process of implementation of the translation project management, the project managers shall consider the importance of the "Three elements", and reasonably use the "Five sub-capabilities" at the same time to achieve optimal results of the translation project. Only when a translation project is quality guaranteed, timely, and within reasonable cost, should the project management be regarded as a successful one.

3 A Case Study

3.1 Establishment of translation project management model

When exploring graduate education reform, School of Foreign Languages of Wuhan University of Technology, combining the trend of the times and social latest requirements for translation professionals, makes bold innovation, reforms training methods, and tries to cooperate with enterprises. Then a pilot translation practice base for master students' education has been jointly established by WUT and Transn (Wuhan) Translation Company (Transn or Transn Company) which provides a rich professional practice platform for postgraduates, and enhances our school postgraduates' professional practice ability. Hereinafter, this paper will analyze the application of computer-aided translation technology in translation project management through quality management, time management and cost management.

3.1.1 Quality management

Quality is the core. As a college intern team, the translation project team has two tasks: teaching and translation; as the core of the project, the translation quality runs through the whole process; it has been one of the most important indicators to measure students' learning outcomes. Reasonable control of translation quality does not only enhance students' learning effect, but also can be a prerequisite for the smooth development of the project.

The first step is the quality control of pre-translation. The project manager will dispatch the translation work to best matched translators according to the actual project document type, the degree of difficulty, delivery time, areas of expertise involved, the specific requirements of customers, and the

translator’s abilities and preferences, and the original texts will be distributed to the translator together with the relevant requirements through TQ platform, where the translators' ability and the quality of the translation is expected to be ensured. At the same time after the translators receive the task; the text will be preprocessed in advance by ICAT terms, corpus, documentation and other tools to reduce the occurrence of errors.

Quality control during translation is the key of a successful translation project. With the help of ICAT software's corpus management, corpus synchronization, and built-in Google, Youdao and other search engine, as well other functions, the consistency of the translation can be ensured in a proper way, and the terminology can be standardized, and the translators could interact with each other directly. Through joining in translation team, translators can share corpus with each other; and the same task can be undertaken by many translators at the same time to achieve consistency of technical terms, thus the translation quality is ensured.

The main contents of quality control after translation shall be that: after the completion of the translation, the translation will be uploaded through TQ systems before quality tested and proofread by experienced quality inspector. After the translation quality control, corpus alignment, as well as artificial proofreading, quality control, and layout formation, the final version of the translation can be delivered to customers directly without any errors. After the completion of quality control, quality inspector will summarize various errors and unreasonable parts of the translation appeared, and feed back to part-time translators, and they are required to make a summarize each time, thereby enhancing the ability of translators and improve the translation corpus to improve the quality of future translations.

3.1.2 Time management

Time is guarantee, only when the project is completed on schedule should it be considered to be successful. Rational management of the time shall take every aspect into consideration including the degree of difficulty of the project, and the translators' ability, and the project delivery time will be decided according to those factors, and translators' progress will be followed up in a timely manner. Through Transn Company’s TQ software online dispatch and hand over of jobs, translators can accept the works and translation jobs anywhere at any time, which saves a lot of time and the auxiliary applications of ICAT corpus and machine translation, improve the translation efficiency, and effectively save the time for translation.

3.1.3 Cost management

Cost is the essence. Profit is the premise for the enterprise to survive and develop. Only when a translation project is completed within the range of costs should it be considered as a successful one. Therefore, costs shall be controlled in a reasonable range in the translation process. TQ and ICAT software do not only save transportation costs and practice cost of the translators, free software also reduces the cost of materials.

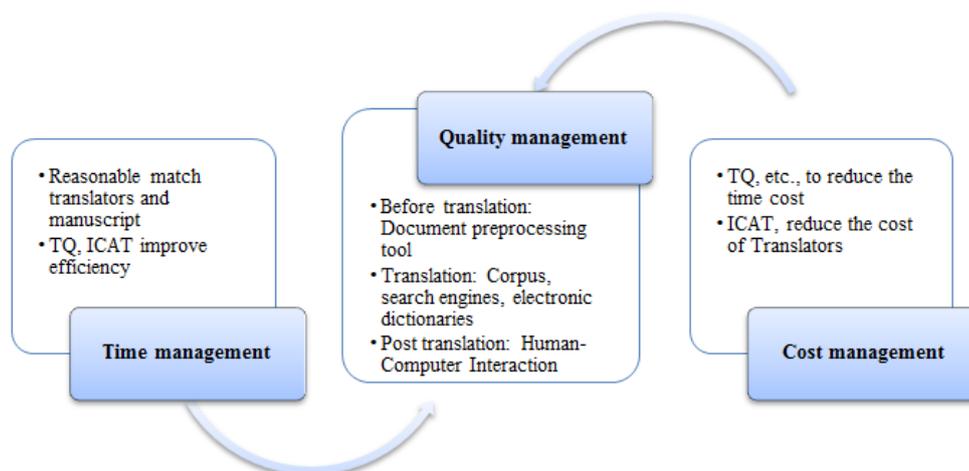

Figure 1 Flowchart of Translation Project Management

3.2 Application of translation project management model

Computer-aided translation project management has been introduced into the training of translation talents by Wuhan University of Technology, tutors include professors of School of Foreign Languages of WUT who have years of experience in translation theory and translation practice teaching and

experienced senior translators from Transn Company. School of Foreign Languages of WUT provide studio for MTI students with the necessary hardware and software facilities for teaching, including computers and a variety of necessary computer-aided translation software, which has provided a guarantee of personnel, finance, and material; and training on translators starts in accordance with project management mode of quality management, time management and cost management.

First, after a rigorous and detailed evaluation (assessment methods used are test papers from Transn Translation Company, and the test was read and appraised by experienced translators of Transn. And the test was taken in WUT classroom), fifteen students with the highest scores are selected from postgraduate students to join in the Transn translation project, and based on the project team, the practice base is constructed in the form of a pilot project. The project is in charged by the Finance and Legal Department of Transn (Wuhan) Company. An experienced translation expert is volunteered to be as instructors to help students with translation problems and team building. After team project manager dispatch a translation job to the translation team according to the specific circumstances, the team leader (team leader is one of the members of the 15 translators appointed by Transn company and WUT) will split it into several parts and assign them to each team members to be translated. The team shall finish the translation work on time and send the completed translation to the project manager, and after been quality tested by Transn, the translation will be sent directly to the customer. Feedback will also be delivered to every member of the team in order to help each member to make up the deficiencies and improve their translation ability.

An experienced outstanding young teachers is selected as instructor of this team; in addition to the daily tasks based on the amount of translation team can accept, Transn will conduct a 1.5-hour training for translation problems occurred during the translation practice and answering questions of the students as well as teaching the students with a variety of new translation experience and skills acquired in their constant practice. The whole project is done with the assistance of computer-aided translation software which have been independently researched and developed by Transn Company; TQ (integrated TPM translation management platform) is mainly used for messaging, order management, and dispatching and submitting of the translation manuscript; ICAT (Huoyunyike) Software aids translators through machine translation, terminology management, and post-editing.

In time management, the team leader takes the responsibility. The project manager dispatches the project to the team leader according to the difficulty of the task, the number of members of the group and translators' translation ability and other specific circumstances. The tasks are assigned to the team leader directly through TQ, as well as the reasonable submission deadline of the project. After receiving the project, the team leader will assign the task to members and work together with the team to complete the translation within the specified time. TQ and ICAT software developed by Transn Company allow timely communication among translators, where the team leader is able track of the real-time progress of the translation, urging the members to complete the translation task on time which ensure that the project can be completed on time. These online job dispatching and online translation have greatly improved the efficiency of document distribution, reduced the communication barriers between translators, and have improved the overall efficiency of the translation. Meanwhile, reasonable pre-editing and post-layout translation tools and other intelligent document processing application provided by ICAT allow the translators to quickly complete manuscript processing work, and greatly improve the efficiency of the project.

Quality management is responsible by the translators with the assistance of machine translation, ICAT Corpus, and terminology bank which ensure the consistency of terminology in the whole texts, while avoiding each kinds of low errors occurrence among. And also Transn instructor and college instructor collaboratively instruct the translators. When faced with difficult sentences, translators can real-time communicate with other team members through TQ anywhere at any time. If some specific works that cannot be solved after mutual discussion between members of the team, they can seek help from the instructors, thus greatly improve the translation quality. After being submitted to the Transn Company through TQ, the translation work will be quality inspected and proofread by a senior quality inspector which will largely ensure the quality of the translation submitted to the customer. When errors found, they will be feedback to the translator directly, and the tutors will explain the relevant translation errors in the training courses to be held regularly to avoid the same mistakes next time. Through comprehending by analogy, and analysis of translation practice experience, the translation quality of the team has been largely improved, and the practice capability of the translation team members has also been enhanced.

Because of the involvement of the project managers from Transn Company, the project cost

management has been following economic principles which pursue the maxim of profits. Rational use of TQ, ICAT software has significantly reduced the manuscript processing period, thus the time cost has been saved. Translators are postgraduate students, and they are required to finish the jobs anywhere they want including teaching equipment provided by the WUT, which has largely reduced the equipment costs. ICAT and TQ are software entirely and independently researched and developed by Transn Company, which greatly reduce the cost in purchasing additional computer-aided translation software.

In short, Transn practice base of Wuhan University of Technology is very successful in exploring MTI translation teaching and Transn Company translation project management. In virtue of computer-aided translation technology, the innovation and development of MTI translation teaching have been achieved, MTI students' translation practice ability has been improved, and new innovative ideas for translation project management of Transn Company are also highlighted.

4 Conclusions

The professional practice base has promoted the smooth development of translation teaching and translation practice of post graduate students of School of Foreign Languages, opening up a set of new translation of teaching and training methods. The translation team composed of postgraduate students, through self-management, and self-improvement in translation practice, not only improves their own translation ability, but also has a much more profound understanding of the translation operation and translation management in companies which lay a good foundation for their future translation practice, translation management, and translation teaching. In addition to promoting the development of translation teaching, Computer-aided translation technology also has a remarkable effect in translation project quality control, time control, and cost control. Universities shall properly add translation practice courses and computer-aided translation practice courses in Translation Teaching, and try to take the road of innovative cooperation with enterprises. Besides, in the process of exploring their own development, language services enterprises shall innovate actively. When providing high-quality language services for the society, they are also obliged to cultivate high-quality language services personnel. They shall actively cooperate with colleges and universities to give full play to their premium hardware and software facilities, as well as large numbers of potential young student translators, to save cost of enterprise and make contributions for university MTI education, so that a win-win situation can be achieved for all parties.

Application of Senior and Mentor Team in College Dormitory Culture Construction under the Credit System: An Empirical Study

Chen Zhenyu

Wuhan University of Technology, Wuhan, P.R.China, 430070

(E-mail: chenzy@whut.edu.cn)

Abstract: Based on literature analysis, this paper compiles a questionnaire about the effect of college dormitory culture construction on university life. Relative investigations and data analysis are conducted about the effect of dormitory culture construction, daily lifestyle, individual development and other aspects of university students under credit system. The survey shows that there is a close connection between the dormitory culture construction and dormitory members' study, lifestyle, psychological status and individual development, and the dormitory cohesiveness is the essential part of the culture construction. On the basis of survey data, according to problems reflected by students, this paper tries to deepen and refine the student management, and then build the management mode of senior and mentor team for dormitory, and focus on promoting the daily education management of college students by taking a dormitory as an unit. One dormitory corresponds to multi-category dormitory guides, and every senior student and mentor is individually responsible for one or more items of related works, implementing six kinds of quality-oriented education in scientific and technological, psychological health, academic guidance, career exploration, voluntary practice and cultural activities on campus, helping students understand the frontier of specialties, to make the development plan clear, to ease the psychological pressure and to adapt the college life as well as improving the comprehensive competitiveness by shaping great dormitory culture.

Key words: Credit system; Senior and mentor team; Student management; Dormitory culture

1 Introduction

In 1918, Peking University established the elective system, which becomes a symbol of establishing China's credit system. Then, Southeast University and Tsinghua University put forward credit systems with their own characteristics, according to the actual situation (HanHong, 2013). At present, credit systems implemented by most Chinese Colleges is equipped with Chinese characteristics, and the actual development is different among colleges.

Compared with the teaching plan for fixed academic year system, the credit system holds features like flexibility, mobility and personalization. The reform and implementation of the credit system, at the same time of breaking the academic year system as the inherent pattern in colleges, is also facing challenges from modes and means of management. Under the original model, we usually manage students according to executive classes, and the stationarity of executive classes is conducive to the unified arrangement and management by colleges. But the credit system weakens the management mode of executive classes, reduces collective activities and weakens the collective sense of honor. Under the implementing of the credit system reform and autonomous course selection system, students face various challenges of the diversity of the class time, places and instructors; meanwhile the examination-oriented education before the college entrance makes freshmen become unadapted in habits, study styles, human communication, psychological gap, missing study goals and many other aspects(Han Hong,2013;Yu Jinghua,2014).The school of automation combines the senior student system and the mentor system, and actively explores for building the student management mode adapting to the credit system.

2 The College Dormitory Culture Construction

As the basic unit of college, dormitory is an important place for students to study, live in and communicate, as well as a key position for college to educate, manage and serve. At present, the large number of dormitories in college brings large challenges to management and education.

The college dormitory culture construction is an important window of developing socialist culture and ethics in college as well as an indispensable part of students' lives and studies. As an important part of promoting academic atmosphere construction, the dormitory culture construction has obvious features which differ from disciplines construction, gaining more and more attention in schools and society. The healthy, progressive and harmonious dormitory culture not only relates the daily life order of each

student, but also influences students on learning situation, learning attitude, personal development and other aspects. In order to make clearer the function of dormitory culture construction in Study Style Construction, explore how to promote overall study style by elevating the level of dormitory culture construction and implement delicacy management for students; we particularly conduct this survey on this school's college students.

The survey employed anonymous questionnaire focusing on four aspects including dormitory relations as well as how students deal with dormitory affairs; assessment of effects brought by communists and student cadres on dormitory culture construction; assessment of what effects brought by dormitory culture construction on students' study; ways of improving dormitory culture construction. The survey was targeted at the undergraduate students of the school of automation. The amount of questionnaires sent out was 1400, and 1394 of them were retrieved. The amount of effective questionnaires was 1318, constituting 94.5% of the retrieved questionnaires. Basic information is as shown in Table 1.

Table 1 Survey Sample's Basic Features

Sample Gender Distribution	Male	80.2%
	Female	19.8%
Sample Grade Distribution	Freshman	30.5%
	Sophomore	25.2%
	Junior	27.5%
	Senior	13.4%
Sample Political Status	Communists	6.8%
	Non-communists	93.2%

According to the questionnaire, based on the analysis of data, it is founded that dormitory culture construction exerts obvious effects on students' study and daily life. To be specific, excellent dormitory culture provides good learning environment and driving force for roommates, and positive learning atmosphere will play an active role in promoting every roommate's performance in study, as well dormitory members living habits also have a greater impact on their academic performance. What's more, construction of dormitory cohesion is a key part of dormitory culture construction. If you live in a dormitory with good cohesion, dormitory members are more inclined to contribute a lot of energy to elevating level of dormitory culture construction and stimulate learning as well. As shown in Table 1, in dormitory which enjoys a high reputation in the areas of personalized decoration style in the same-grade dorms, the frequency of discussion about study every day reaches 50%, obviously higher than those dormitories with few decorations. As the input of dorm decoration gets lower, the frequency of discussion every day is reduced as well, while the frequency of little discussion and no discussion increased. Students, who stay in a dormitory where roommates object to the personalized decoration, will have least frequency of discussing study and have highest frequency of no discussion about study in their dorms.

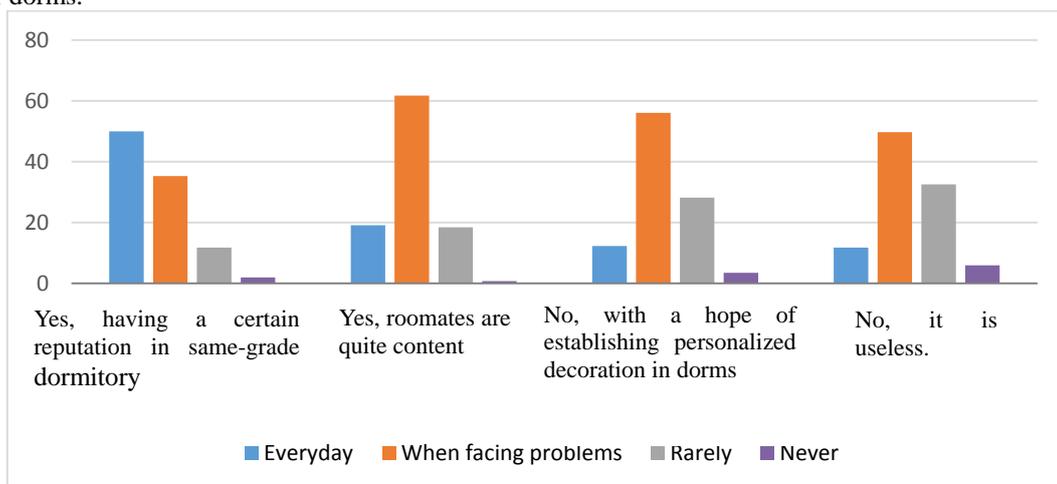

Figure 1 Do You Have Personalized Decorations in Your Own Dormitory? How Often You Discuss about Study in Dormitory?

In the aspect of exploring how many ways of improving dormitory culture construction, students are eager to have more chances to communicate with high-grade seniors. And great attention should be paid to daily management and culture construction of dormitory.

3 Senior and Mentor Team

3.1 Senior system

“Student Mentoring Scheme” (SNS for short) first appeared in 15th century England Eton. So far, seniors mentoring system has always remained popular in European and American Universities. In 1988, “Student Mentoring Scheme” started its trials from City University of Hong Kong (CUHK) and it was widely used by various colleges and universities later (Yu Jinghua, Xie Jing, 2014; Su Xudong, 2010).

Multilevel maladjustment were easily existed in freshmen after the beginning of term, and deeper understanding of learned majors is needed for students. Also, reasonable plan of their careers is of significance to them. Among high-grades students, we select and train a group of senior students who are having high-political quality, good at learning and experienced in practice to be served as dormitory seniors. The reason is that they are close to freshmen in the aspects of ages, life experiences, growth environment and so on, which makes moral education between both parties more attractive and acceptable during their process of communication. In the unit of dormitory, dormitory seniors use their own experience to guide low-grade students to adapt college’s life as soon as possible and overcome their interpersonal communication obstacles. Besides, they utilize what they learned to help low-grade students gain academic counseling; meanwhile it also has far-reaching influence on comprehensive development of seniors during communication between both sides.

On the basis of Senior System, Interpersonal circle is formed to break transverse student relationships, achieving the diversification of ways of communication between students and facilitating heritage of school culture. Under this mode, self-governance, self-education and self-service can be realized by students, which form a good and supportive atmosphere among students.

3.2 Mentor system

Mentor System is originated in Oxford and Cambridge. It is said that William Wickham Bishop of Winchester creates mentor system who founded “new college” in 14th century. A mentor is assigned by colleges to students after check-in. A mentor is the scholar who guides students choose subjects and responsible for students’ academic study and characters’ shaping. Face-to-face communication between mentor and student can be useful in assisting students make study plans and guiding students how to make improvements (Yu Jinghua, Xie Jing, 2014; Pang Ran, 2013; Liu Zhaoxia, 2005).

Students have greater rights in choosing and decision-making power under complete credit system, but owing to the lack of self-planning and self-design capability, no matter what study or life of students will be badly affected without the guidance of mentor. Therefore, it is necessary to carry out this system. Ideal mentors come from excellent teachers, management personnel and scientific researchers, who accomplish their jobs through guidance in students’ extra-curricular learning and research practices, assistance in solving problems in academics, thinking and life, reasonable careers planning and bringing subtle influence on students with mentors’ good morals and characters. In a word, the development and growth of students will be affected by mentor’s character, opinions, research ability and academic status anywhere, any time.

3.3 Construction of senior and mentor team

Construction of Senior and Mentor team is aimed at realizing integration of mentor system and senior system, forming educational power and bring better education effects (Wang Haiyan, 2012).

3.3.1 Selection

A group of excellent teachers and good high-grade students are purposefully selected to form a senior and mentor team in principle of independent-enrollment and merits chosen. And relative jobs are conducted by the leading of grade counselors. Every class is equipped with a head teacher, two postgraduates, seniors, juniors and sophomores respectively, among whom postgraduates are mainly in charge of affairs of scientific innovations and professional skills; seniors are mainly responsible for the affairs of further studies overseas and finding jobs or starting business; juniors are responsible for affairs of campus activities and daily life; and sophomores are mainly responsible for affairs of how to adapt college life and make reasonable time management.

3.3.2 Training

After establishment of this team, various targeted trainings are periodically organized in accordance with 3D training mode which is characterized by experts-training, teacher-exchanging and peer

counseling. The training content involves several parts such as the introduction of college history, academic development, interpersonal communication skills, lectures on psychology, majors introduction, social practice, campus life guide, dormitory safety lectures, academic development and counseling, a second classroom instruction, contest training about science and technology innovation, dormitory culture construction etc. The sharing meeting is carried out at regular intervals on which grade counselors and students representatives proceed deeper discussions.

3.3.3 Assessment

The establishment of the meeting, monitoring, assessment and other related systems can enhance the professional level of the team. The first thing is to standardize the responsibilities of "Famous teachers" Involving regulations should be strictly implemented to the performance of class directors. Outstanding directors should be invited to give speech and share their experience. The second thing is to create student leaders echelon. Senior students should be give training according to the requirements of the Rules for Student Cadres to carry out meeting monthly, summarize the work result and focus, analyze difficulties, explore and share experience together. Senior students should conduct student satisfaction evaluation, the test of students' basic situation, and check the team's familiarity with students.

4 Application of the Team of Student Mentors and Supervisors in the Management of University Students

4.1 Create "1+1" mode of dormitory daily service

A contact is required for every dormitory, which normally should be director teacher or senior students, responsible for dormitory daily management. Contact should regularly check sanitation and safety of the dormitory, get close to the thought and abnormal situation of students, and truly understand their needs, urgency, pleasure and troubles. Culture construction is the core of dormitory construction. The team is supposed to lead students to design, discuss, propaganda and consolidated their dormitory symbol. It's also team's responsibility to integrate school's spirit of "profound, authentic and cultivation" into dormitory's common dream and internalize it to the value that students pursue after.

4.2 Create "1+6" mode of dormitory culture construction

Under quality-oriented education, each senior student and mentor is respectively responsible for one or more transactions to meet six kinds of cultural needs of students in a dormitory which are science and technology innovation, mental health, academic guidance, career exploration, voluntary practice, and campus cultural activities, in order to help students know the professional front, clear development plan, alleviate psychological pressure, adapt to college life, and grew up in an all-round way.

4.3 Create multilevel education mode according to the difference of students' needs at each grade

In the unit of dormitory, education for academic career should be focused on freshmen; subject competition should be emphasized on sophomore; professional quality should be cultivated for junior; career guidance should be given to senior. Covering number of students will be adjusted from freshman year to senior year, and education will also convert gradually from general to personalized, so as to meet the needs of each grade.

5 Practical Effects

The management mode of senior and mentor team could bridge the gap between teacher and students, high-grade students and low-grade students in inheriting school culture. It not only performs education and conduction for low-grade students, but also make senior achieve self-identification. Students could satisfy their spirit of growing, and reposition themselves under the motivation of external honor, to complete a continuous and benign circulation of self-education, self-monitoring and self management.

The management mode of senior and mentor team can enable the daily management and quality-oriented education accessible for the widest range of students and their daily life. As an innovative education mode for dormitory management, it serves as a supplement of counselor's work, and respects students' individuality development as well, which is in favor of growth and success for students. The contact between students and school does not break after the seniors' leaving as it forms the resources of alumni and talents cultivation.

6 Conclusions

In order to renovate the education management of students in colleges and universities, The

management mode of senior and mentor team implemented by colleges and universities is an inevitable trend, which can not only meet the objective requirements of comprehensive development of college students, but also satisfy the real needs of enhancing effectiveness in the ideological and political education.

During the later period, great efforts should be made to improve the effective combination of tutorial system and student mentoring scheme, and to standardize and perfect the implementing regulations including four specific points: Firstly, based on grades or faculty, building up supporting senior mentoring teams and defining professional teachers who are responsible for relative jobs such as guiding, training and evaluation; Secondly, designing targeted and strong real-time training scheme of senior and mentor team, according to different needs of students in various regions, cultural backgrounds and subject majors; Thirdly, establishing more scientific and reasonable management system from the aspects of choosing, managing, testing and publicizing the senior and mentor; Finally, enriching the working contents and methods of senior and mentor team in time through feedbacks from the accepted audience.

A Study of Postgraduates Entrepreneurship Education Practice under the Popularization of Higher Education

Zhao Weifeng

Human Resources Office, Wuhan University of Technology, Wuhan, P. R. China, 430070
(E-mail: 515529518@qq.com)

Abstract. In the knowledge-based economy, innovation is the soul of a nation. Under this background, the postgraduate's entrepreneurship education practice has attracted more and more attention and has gained a lot of support. However, there exist many problems in these activities. This research aims to survey the current situation of postgraduate's entrepreneurship and analyze the problems encountered in order to improve the guidance efficiency. With the method of questionnaire and interviewing, the author brings forward comments and suggestions on the basis of the results.

Key words: Popularization of higher education; Postgraduates; Entrepreneurship; Survey

1 Introduction

The entrepreneurship practice of college students can date back to the 1980s, when the University of Texas at Austin in 1983 held the first university student entrepreneurship competition (Xu Xianping, 2001). Developed countries have accumulated rich experience in the theoretical research and the practice of entrepreneurship education (Fang Yufei, 2006). Moreover, they have succeeded in breeding a large number of talents with entrepreneurial innovation capability (Xu Juan, 2005), which promotes their economic development and social progress. Compared with developed countries, Chinese student's entrepreneurship education practice started relatively late (Li Chengxian, 2004). In May 1998, Tsinghua University "Business Plan Competition" set off a fever of entrepreneurship among college students (Li Yue, 2006). As postgraduates, how to better play to professional advantages and comprehensive abilities and to join the current of "public entrepreneurship and innovation," has become the purpose and significance of this research (Liu Chengbo, 2004).

2 Methodology and Discussion

Questionnaire, interview and literature methods are adopted in this research. The respondents are current postgraduates.

The main contents of the investigation are: (i)The status quotes of postgraduates entrepreneurship education practice under the popularization of higher education(Zhong Ronghui, 2008); (ii) Postgraduates' cognition to the policies and situation of postgraduates entrepreneurship; (iii)The internal and external factors that restrict the theoretical development and practice of postgraduate entrepreneurship; (iv)The necessity and feasibility analysis of postgraduates entrepreneurship education(Wang Shuang ,2015).

Table 1 The Statistical Description of Each Dimension Level

Level of factor	Grade			Gender		Profession		Home Address			
	1 st year	2 nd year	3 rd year	Male	Female	Humanities & social sciences	Engineering & agriculture a& medicine	Metropolis	Middle-sized and small cities	Cities & towns	Rural areas
Frequency	293	255	97	273	372	141	498	86	309	141	108

From the demographic variables, the number of valid questionnaires respectively on grade, gender, profession and home address were 763, 757, 741 and 754. To be specific, from the grade, the number of effective questionnaires is 763. Different grades of postgraduates are respectively 350, 295, 118, with each accounting for 44.4%, 37.4% and 15% of the total. From the gender, there are 757 valid questionnaires. Male and female respectively are 313 and 444, accounting for 39.7% and 56.3%. From the types of profession, there are 741 valid questionnaires, 178 of humanities and social sciences, 563 of engineering, agriculture and medicine, accounting for 22.5% and 71.4% respectively. From the home address, there are 754 valid questionnaires. Based on different size of cities, metropolis, middle-sized cities, towns and rural areas respectively are 100, 354, 161 and 139, accounting for 12.7%, 44.9%, 20.4% and 17.6%.

Table 2 The Correlation Analysis of Demographic Variables

		Grade	Gender	Profession	Home Address
Grade	Pearson simple correlation coefficient	1	.072*	.093*	-.075*
	P		.048	.012	.039
Gender	Pearson simple correlation coefficient	.072*	1	-.137**	.008
	P	.048		.000	.832
Profession	Pearson simple correlation coefficient	.093*	-.137**	1	.116**
	P	.012	.000		.002
Home Address	Pearson simple correlation coefficient	-.075*	.008	.116**	1
	P	.039	.832	.002	

*. Correlation is significant at the 0.05 level

** . Correlation is significant at the 0.01 level

By the use of Pearson product-moment correlation coefficient, the correlations among various demographic dimensions are obtained as is shown above.

Table 3 The Correlation Analysis of Each Dimension

		Family	Qualification	Cognition	School	Emotion	Society
Family	Pearson simple correlation coefficient	1	825**	837**	838**	836**	858**
	P		.000	.000	.000	.000	.000
Qualification	Pearson simple correlation coefficient	825**	1	846**	771**	857**	833**
	P	.000		.000	.000	.000	.000
Cognition	Pearson simple correlation coefficient	837**	846**	1	820**	843**	836**
	P	.000	.000		.000	.000	.000
School	Pearson simple correlation coefficient	838**	771**	820**	1	814**	852**
	P	.000	.000	.000		.000	.000
Emotion	Pearson simple correlation coefficient	836**	857**	843**	814**	1	844**
	P	.000	.000	.000	.000		.000
Society	Pearson simple correlation coefficient	858**	833**	836**	852**	844**	1
	P	.000	.000	.000	.000	.000	

** . Correlation is significant at the 0.01 level (2-tailed) .

It is observed that the six dimensions have reached a very significant level of correlation. In a sense, these six dimensions have closely related to postgraduates' entrepreneurship. Moreover, it can reflect the problems in the process of undertaking. In other words, these six aspects can be measured, and the results are both credible and effective.

The analysis of specific factors

Firstly, the family dimension is analyzed. The figure below shows respondents' views on how the enlightened level of family members impacts the postgraduate's entrepreneurship.

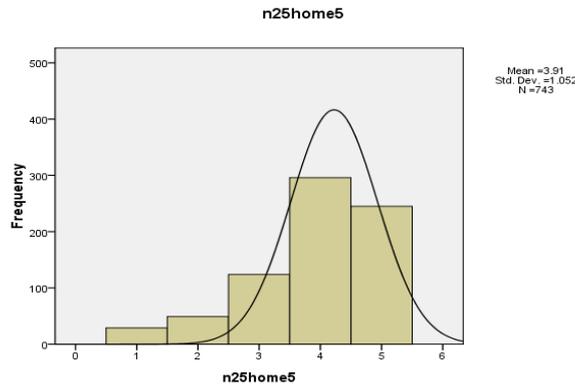

Figure 1 Family Dimension

From figure 1, it is observed that nearly 4% of the respondents believe that the enlightened level has nothing to do with students’ undertaking while 6.2% believe it effects to some degree, and approximately 70% of the respondents think that the enlightened level can influence one’s entrepreneurship. Among them, 31.1% of the respondents think it has a significant influence.

Secondly, the school dimension is analyzed. The figure below shows the respondents attitudes towards how entrepreneurship education in schools affects entrepreneurship.

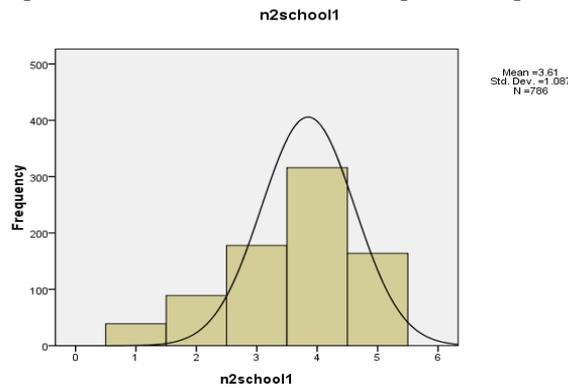

Figure 2 The Entrepreneurship Education System of School

Combined with the related data, it can be seen that around 20.9% of the respondents consider that the entrepreneurship education of school has a great impact on postgraduates’ entrepreneurship, 16.3% think that it has little influence, while 22.6% of the total hold the neutral opinion. There are 40.2% of the respondents think that school entrepreneurship education has an influence on entrepreneurship to a certain degree. To sum up, there are about 60% of people believe that the practice of entrepreneurship education of school can influence postgraduate entrepreneurship.

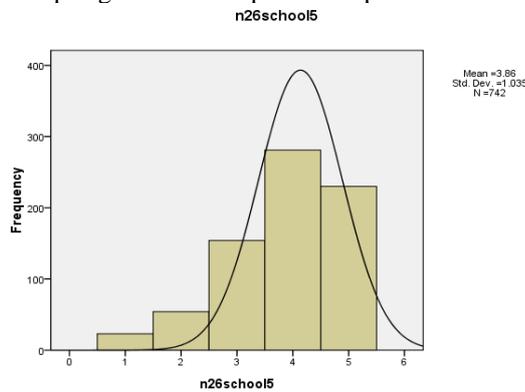

Figure 3 School’s Attitude to Entrepreneurship

However, in the above figure, there are 31% of the respondents hold the opinion that school's attitude has a great influence on postgraduate entrepreneurship. Compared with the school's educational practice, it has a larger proportion. This means that more students consider that school's attitude has a more significant impact on postgraduate entrepreneurship.

Thirdly, the Society dimension is analyzed. The figure below shows the respondents attitudes towards how the employment status of postgraduates and the financial support affect entrepreneurship.

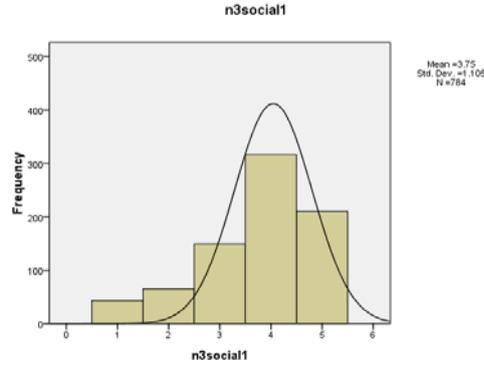

Figure 4 The Employment Status of Postgraduates to Entrepreneurship

In the figure above, only 26.8% of the respondents think that the risk safeguard mechanism has a great impact on postgraduate entrepreneurship. This is the smallest proportion among these five factors in society dimension. 5.5% think the mechanism has nothing to do with entrepreneurship, which is the largest of the five. In short, there are a large amount of people consider the risk safeguard mechanism has little impact on postgraduate entrepreneurship.

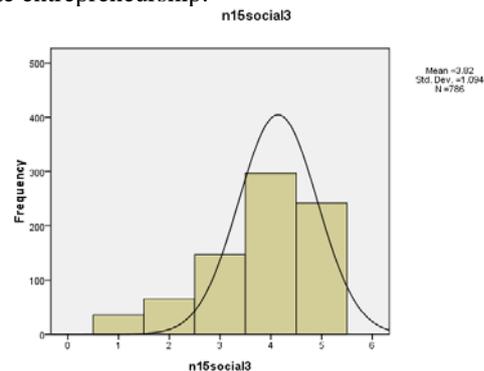

Figure 5 Financial Support to Entrepreneurship

Nevertheless, in figure 5, there are many people think financial support can affect postgraduate entrepreneurship. Merely 3.4% of the respondents think financial support has no influence on it.

Fourthly, the cognition dimension is analyzed. The figure below shows the respondents attitudes towards how the relevant policies and their understanding of their own profession affect entrepreneurship.

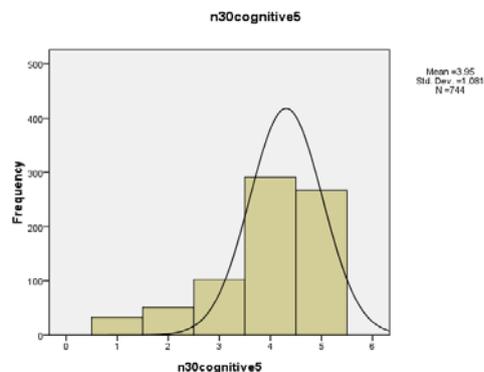

Figure 6 Postgraduates' Cognition to Relevant Policies

In the above figure, a large amount of people think that students' cognition to relevant policies can significantly affect entrepreneurship, which accounts for 75% of the total.

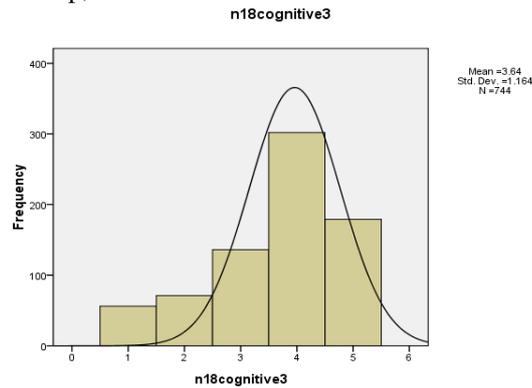

Figure 7 Postgraduates' understanding of their Own Profession

While in figure 7, both of the proportions are lower than the other four factors in society dimension, which accounting for 7.5% and 64% of the total.

Fifthly, The emotion dimension is analyzed. The figure below shows the respondents attitudes towards how the consciousness of innovation and interest to entrepreneurship affect entrepreneurship.

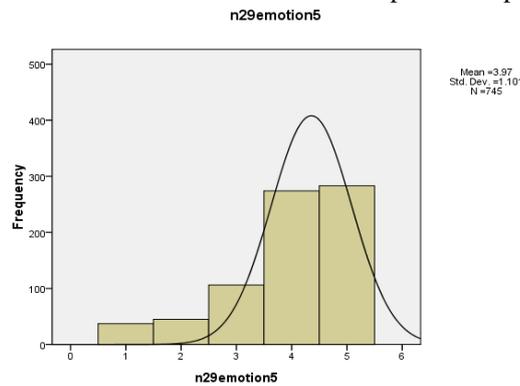

Figure 8 Consciousness of Innovation to Postgraduate Entrepreneurship

The figure above shows that there are 38% of the respondents believe that students' consciousness of innovation can significantly affect postgraduate entrepreneurship, and another 38.6% of people believe it affects to some degree. Therefore, it can be concluded that there are 76.6% of the people in total believe that students' innovation counts.

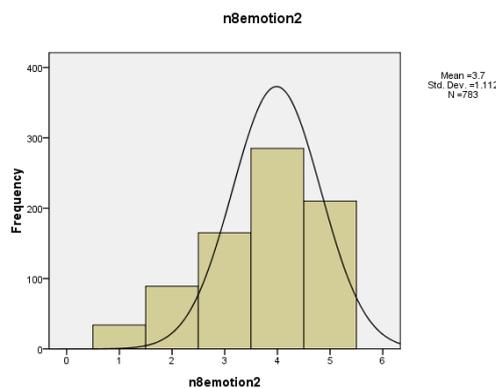

Figure 9 Interest to Entrepreneurship

In figure 9, there are merely 26.8% of the respondents believe that students' consciousness of innovation can significantly affect postgraduate entrepreneurship. This proportion is much lower than figure 8. To sum up, there are more students believe that the consciousness of innovation can more

significantly influence postgraduate entrepreneurship than interest does.

Six, the capacities and qualities dimension is analyzed. The figure below shows the respondents attitudes towards how qualities of students and knowledge and skills of students affect entrepreneurship.

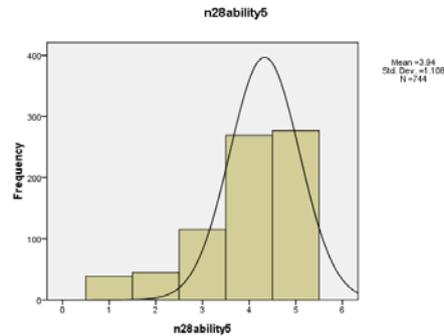

Figure 10 Faith to Postgraduate Entrepreneurship

In figure 10, there are 39.8% of the respondents believe that students' faith can significantly affect postgraduate entrepreneurship, and another 34.9% of people believe it affects to some degree. Therefore, it can be concluded that there are 74.9% of the people in total believe that students' faith counts.

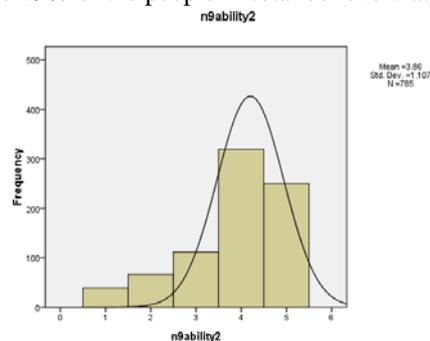

Figure 11 Knowledge and Skills to Postgraduate Entrepreneurship

However, in figure 11, there are 28.6% of the of the respondents believe that students' knowledge and skills can significantly affect postgraduate entrepreneurship, and another 38.8% of people believe it affects to some degree. Therefore, it can be concluded that there are 65.4% of the people in total believe that students' knowledge and skills counts.

3 Conclusions

To take these six dimensions above (including 30 factors) as a whole, the faith in entrepreneurship has the largest proportion, which is up to 39.8%. This indicates that more people think the faith is of great significance to postgraduate entrepreneurship. Even though all of these six dimensions have a relatively large impact on entrepreneurs in the respondent, the personal capacities and qualities have a larger impact. That is to say, people generally think highly of the capacities and qualities. Therefore, it is urgent enough for the government and the community to improve their risk protection mechanism for postgraduate entrepreneurship, so that the risks can be reduced, accepted and even transferred. As for the schools, the campus culture of innovation should be created and activities like entrepreneurship education should be carried out. As for postgraduates, they need to focus on their practical knowledge as well as practical abilities.

A Survey on Guidance on Dictionary Use as a Tool for Online Self-Correction in EFL Writing

Cai Ying

School of Foreign Languages, Wuhan University of Technology, Wuhan, P. R. China, 430070
(E-mail: cathycaiy@163.com)

Abstract: Recent years have witnessed the fast and steady growth in the research into dictionary use, especially the use of learner's dictionary. 62 students participated in an instructional experiment which was designed to explore whether dictionary use guidance could work well in helping users improve their performance on essay self-correction. A post-task survey was also carried out to investigate students' lookup behavior and in what ways dictionary affect self-correction in writing. Results of the study revealed guidance on dictionary use could play a great role in improving essay score and guide students into autonomous learning. It is suggested that EFL professionals incorporate dictionary use guidance into EFL writing pedagogical programs.

Key words: Dictionary use; Learner's dictionary; Online feedback; Self-correction; EFL writing

1 Introduction

An increasing number of empirical studies (e.g., Cowie, 1999; McCreary & Dolezal, 1999; Tono, 2001; Tarp, 2009; Welker, 2010) have been carried out worldwide to investigate dictionary users' reference needs and reference skills and examine the role of dictionary use in language pedagogy (Chen, Yuzhen, 2012). Meanwhile, Chinese scholars (Wu Jianping, 2001; Luo Siming, 2005; He Jianing, 2008; Wei Xiangqing, 2009; Xu Hai, 2009; Zhang Yihua, 2015) have proposed feasible suggestions to guide Chinese EFL learners to make the best use of dictionary, especially learner's dictionary. British lexicographers Hartmann and James (1998) defined learner's dictionary as "a pedagogical dictionary aimed primarily at non-native learners of a language. The degree to which dictionaries have been integrated into the learning process varies from culture to culture..." The core design features of learner's dictionary and the pedagogical assumptions which underlie it are demanded to be aligned with dictionary users' needs. However, the attempt to apply the research findings of dictionary use studies to EFL learning and teaching has been a compelling challenge. These exactly learner-targeted dictionaries haven't received attention from teachers and advanced EFL learners as much as lexicographers expected. (Wei Xiangqing, 2016) With focus on learner's dictionary use guidance, the present study endeavors to explore whether guidance on dictionary use can be regarded as one of the influential and effective strategies to motivate EFL learners to improve their writing through online autonomous self-correction. And if so, in what ways a learner's dictionary works in doing this?

2 Literature Review

Being an integral part of EFL teaching, feedback is generally recognized as an effective way to help students perform well in writing. Feedback is defined as an input from readers to writers, and the purpose of it is to give useful suggestions for correction. (Cai Jigang, 2011). The research on feedback started in 1950s and then foreign and Chinese scholars conducted a large number of systematic studies on peer review (Zamel, 1985; Keh, 1990; Mangelsdorf, 1992; Nelson, 1993; Jiang Yuhong, 2005; Yang Miao, 2006; Mo Junhua, 2007; Yu Shulin, 2013). They explored the different effects of teacher feedback and peer feedback on college students' writing, and investigated the reasons underlying those differences. The results indicated that peer feedback can be used as a useful supplement to teacher feedback in EFL writing classroom since teacher feedback is considered more authoritative while peer feedback is more effective in reducing students' anxiety and significantly improving their learning autonomy. Furthermore, some scholars (Xu Yueting & Liu Jun, 2010) conducted experiments to analyze peers' and teachers' specific differences in comment making and found that students could accept the feedback from their teacher and peers equally.

Thanks to the speedy development of information and modern educational technology, automated scoring systems in foreign countries have been developed, including PEG (Project Essay Grade), Intelligent Essay and Electronic Essay Rater (E-rater) (Liang Maocheng, 2007). With the powerful influence of the systems, Chinese technologists and educators have developed Chinese EFL learner-targeted automated scoring system: Juku Correcting Network created by Beijing word Network Technology Co., Ltd and

“i-write” developed by Foreign Language Teaching and Research Press. Soon an increasingly number of scholars (Cai Jigang, 2011; Wang Ying & Li Zhenyang, 2012; Zhou Yishu, 2013; Yang Xiaoqiong & Dai Yuncai, 2015; Wang Zhe & Zhang Yue, 2015) have shifted their attention to feedback based on automated essay scoring system. They compared online feedback with traditional types of feedback, investigated merits and demerits of the feedback given by the automated system, and especially explored the influence brought by the system on EFL writing. The results revealed that “Juku Correcting Network, the automated essay scoring system, can highlight appropriate expressions enlarge knowledge of synonyms and distinguish confusing words but it cannot accurately identify errors and provide good suggestions all the time”(Zhang Li & Sheng Yue, 2015). The results also demonstrated that the online automated feedback can effectively promote students’ autonomous learning and enhance their writing proficiency. It has been proved that “self-correction based on the system can significantly increase the final scores and quality of essays although there is no correlation between number of self-correction and increase of essay score” (Hu Xuewen, 2015). While the body of research has enriched our knowledge about automated feedback, little research has addressed the specific strategies EFL learners used after having received online feedback. The present research intends to explore whether guidance on dictionary use can be used as a strategy to improve the students’ performance on essay self-correction. It tries to integrate lexicographical results into EFL learning and teaching.

3 Research Methodology

3.1 Research questions

The experiment is designed to explore whether guidance on dictionary use can play a significant role in online essay self-correction. The specific research questions are as follows: 1) Can students having received instruction on dictionary use get higher score through self-correcting than those who have not? 2) Does the instruction make any differences in students’ improvement in writing? 3) If so, in what ways the instruction motivates students to make self-correction effectively?

3.2 Participants

The study is conducted in two EFL classes selected from a university of science and technology in central Hubei, China. Group A, consisting of 30 students, is the experiment group while group B, including 32 students, is the control group. All of them are first year science and engineering graduates and they are taught by the same English teacher. In addition, they have a similar language background: 1) Chinese is their mother tongue; 2) They have been learning English for 8-12 years, 70% of them have passed *College English Test Band 6*, a national English as a foreign language test in China.

3.3 Instruments

3.3.1 Juku correcting network

The entire experiment is based on Juku Correcting Network, an automated essay scoring System. The system is designed to improve users’ writing through online feedback: automated feedback, online teacher feedback and online peer feedback. The present study only adopts automated feedback. When users submit their first drafts to the system, the essays are graded immediately and suggestions for correction are given in four aspects, including task response, coherence and cohesion, vocabulary choice, and sentence building. Users get the feedback and evaluate those suggestions and decided whether they are helpful for essay improvement. Users are allowed to make correction as much as they need before the deadline. Each edit is saved in the system which is not only for users to observe their self-correcting process, but also for researchers to monitor users’ behaviors online. Researchers are able to compare different versions of an essay. Newly added words are highlighted in yellow and the deleted words are crossed out in grey.

3.3.2 Survey

A semi-open after-writing survey on learning strategy is carried out. 62 participants are required to fill out a questionnaire with 10 questions which emphasizes two aspects: 1) What do you choose to regard as an effective learning strategy when you are stuck with an encoding task? 2) Which parts in the learner’s dictionary work best for your essay self-correction?

3.4 Dictionary use guidance

The guidance targeted on how to obtain encoding information from dictionary. 30 students in group A (experiment class) have received instruction on dictionary use in two 45-minute regular classes. The researcher guided them to make appropriate dictionary choice to meet their own consultation needs and to understand what is the encoding information in learner’s dictionaries and how to use them in actual learning activities. In addition to those, examples of influential and authoritative learner’s dictionaries

on writing and collocations have been introduced. These subjects were expected to get familiar with reference skills through a series of carefully designed activities. Compared with group A (experiment class), group B (control class) has not received any instruction on dictionary use.

3.5 Data gathering

The participants have been required to complete four tasks, involving nice teachers or tough teachers, cosmetic surgery, environment and language purification. Each task took two weeks so that participants could complete the whole experimental cycle in approximately 8 weeks. Given the learners in group A (experiment class) may need longer time to practice dictionary reference skills through self-correcting, the data extracted from the last task was applied for the research. Students were asked to write an argumentative essay about the following topic: "Some Chinese scholars suggest that the Chinese language should be purified because it is being seriously contaminated. Do you agree or disagree?" They were supposed to write at least 200 words to give reasons and use relevant examples from their own knowledge or experience within 30 minutes. Within two weeks, all of the students in the two groups submitted their frequently self-corrected essays. Based on the statistics provided by the system, users' strategies for essay improvement could be examined by SPSS17.0.

4 Results and Discussion

4.1 Guidance on dictionary use and score increase

Table 1 Independent Samples -T test (First Score and Last Score)

Group	First Score					Last Score			
	N	Mean	Std. Deviation	t	Sig.	Mean	Std. Deviation	t	Sig.
A	30	79.5333	4.28094	1.565	0.123	86.4333	3.04770	-2.826	0.006
B	32	81.1563	3.88636			84.4375	2.50080		

Independent Samples- T test was conducted to compare the scores for the first editions of the essay submitted by group A (experiment group) and group B (control group). Table 1 shows that there was no statistical difference between the initial scores of the two classes ($P=0.123 > 0.05$), indicating two groups performed in the similar way before they made any self-correction on their essays.

Another Independent Samples- T test was performed to make a comparison between the last editions of the essay revised by group A and group B. As indicated in Table 1, the mean difference between the two groups reached the significance level ($P=0.006 < 0.05$). Obviously, group A outperformed significantly group B which could suggest instruction on dictionary use really worked in helping learners improve writing scores by a few points.

4.2 Guidance on dictionary use, times of correction and score increase scale

Table 2 Independent Samples -T test (Times of Correction and Increase Scale)

Group	Times of Correction					Increase Scale			
	N	Mean	Std. Deviation	t	Sig.	Mean	Std. Deviation	t	Sig.
A	30	19.1000	15.65215	-4.306	.000	6.8667	3.52070	-4.454	0.000
B	32	6.2813	4.71945			3.2813	2.79670		

Times of correction and score increase scale also went through Independent Samples- T test. As can be seen in Table 2, there was a significant difference between the two groups when it came to how many times they corrected and submitted the essays ($P=0.000 < 0.05$). This p value was not meaningful in the research field, but it was encouraging in pedagogy. In terms of score increase scale, group A fared better than group B. ($P=0.000 < 0.05$). It seems that group A attempted harder to revise their essays in various ways.

4.3 Learning strategy choice

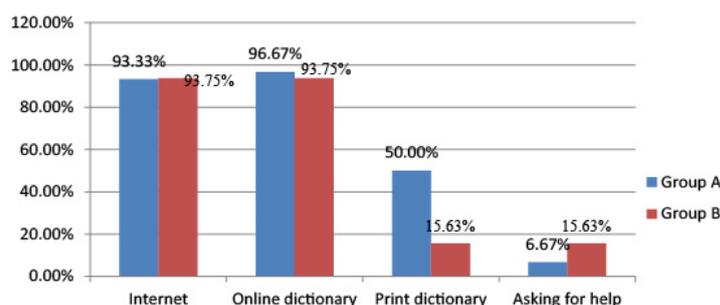

Figure 1 What You Turn to for Help in Essay Self-correction

Figure 1 shows different learning strategies group A (experiment group) and group B (control group) chose when they were struggling in seeking a better way to correct their essays. It is not surprising that both of the groups set internet and online dictionary as their priorities since they had quick and reliable access to them. Interestingly, compared with group B, half of group A chose print dictionary as a strategy. Asking for help was the last solution for them, but in light of their academic background, it is understandable that students who are more proficient in English are less likely to ask for suggestions from others.

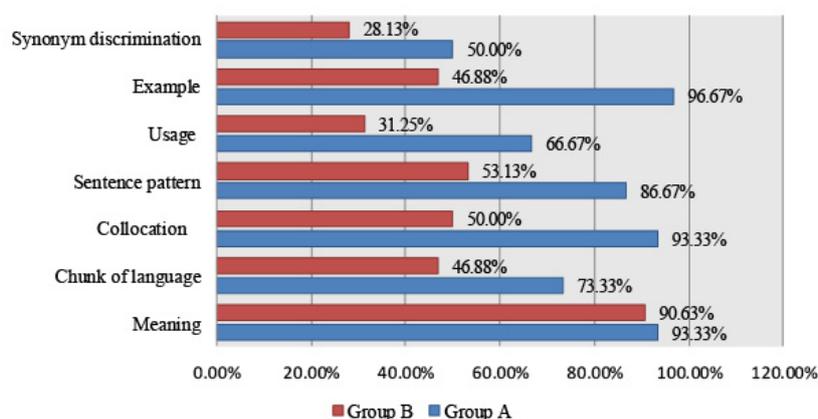

Figure 2 What Designs of Dictionary Work well for Your Essay Self-correction

As presented in Figure 2, the two groups reached an agreement on the vital and basic role of meaning in learner’s dictionary, with 93.33% and 90.63% respectively. Except meaning, it is startling to see that example, collocation and sentence patterns were considered the most useful information for both of the groups consistently. Synonym discrimination and usage attracted relatively less attention from the participants.

From figure 1 and figure 2, it can be seen obviously that the students of group A (experiment group) were influenced by the instructor and the guidance on dictionary use. Compared with group B, it appears that they start to view the microstructure and macrostructure of learner’s dictionary from a totally new perspective and endeavor to use the knowledge and reference skills gotten from the guidance to improve their essay self-correction.

5 Conclusions

The empirical research was designed to make clear the relationship between guidance on dictionary use and online essay self-correction. The statistical analysis of 62 online essays and questionnaires demonstrated that: 1) students who have received instruction on dictionary use could get higher score through self-correcting than those who have not; 2) the guidance also motivated students to consult dictionary more frequently and correct their essays more appropriately, thus improving their autonomous learning ability; 3) the guidance on dictionary use directed students’ lookup behavior, making them aware of those various ways in which they could possibly obtain useful information from dictionaries. In short, guidance on dictionary use can play a great role in self-correction improvement. Given the limited size of the subjects, there is still room for improvement in designing the whole

research. Furthermore, the instruction on dictionary use needs to be optimized in terms of content, method and time length. The present study has implications for integrating lexicographical achievements into EFL teaching and learning. And foreign language teachers are encouraged to think outside the box and develop creative solutions.

The Actuality and Countermeasure in the College Education Management under New Situation

Zhang Ganggang

Marxism College, Wuhan University of Technology, Wuhan, P.R. China, 430070

(E-mail: zhanggangg@whut.edu.cn)

Abstract: After the Ministry of Education introduce “Revitalizational Action plan facing 21 at century” in 1999. The tech and university began to increase the recruits. We have made great progress in high education, achieved great achievements in the development of education, but our college education management could hardly adjust to the new situation, and caused a series of problem. This Article starts with the present college education, synthesizes every kinds of factors, analyses the college education management problems, and come up with specific suggestions.

Key words: New situation; College education management; Countermeasure

1 Introduction

The Ministry of Education carried out the plan introduced “Revitalizational Action plan facing 21 st century”, which was a spring thunder in the history of college education, and began the transitions from elite education to the public education. With the plan carried out, the number of recruits keeps increasing year by year. According to the dates, the number of recruits was 1,080,000, the acceptance rate was 34%. Chen weixiu (2015) put forward that with the rapid development of society and improvement of the quality of education, China's higher education has entered the popular stage. The traditional management mode has been unable to adapt to the needs of high-quality personnel training. Under such a situation, it is necessary to carry on the reform and innovation of higher education management. This paper describes the main problems in the management of colleges and universities and puts forward the corresponding measures. After implementing college policy up to 2011, the number of recruits reaches to 6,850,000, the acceptance rate was 75%. This is the importance achievement of our country, achieving the leap of the higher education stages, playing a positive role in the national overall quality and the development of education. But as the enrollment expansion of colleges, the students in colleges increase faster, bring some new problems for the college education management. Facing to the new situation, college education management should be based on the practice, innovate the education management solution, solve the emerging problems in the work, improve the quality of high education study, and promote the normal development of college education.

2 University Education Management Problem Analysis under the New Situation

With the development of times, our college education situation changes continually. After entering 21 century, it faces more complex education situation. With the college entering new development period. Some education management problems emerge and become the first for college to deal with.

2.1 Lacking faculty and hardly meet the development of modern education needs

Because of the increasing enrollment. More faculty should be devoted for meeting the needs of education development. Before carrying out the plan, the ability to enroll students of school is strong, have big education space. At that time a teacher only instructs seven students, by 2012, the number of teachers has been increasing a lot, but couldn't accord with students on average, faculties' lack has blocked the development of college education (Wang Qun, 2005). Besides, With the development of science and technology, education method has been advancing and most of colleges have made advantages of modernized education method. The development also provides college education with modernized idea. As the concept of education practitioners, the teachers' personal qualities have an effect on teaching. Now many colleges lack good teacher assessment and incentive mechanism, many teachers follow tradition, keeping the old education and teaching method which can't adjust to the needs of modernized education development. That assign contradiction causes the lack of college faculty and hardly adjust to modernized education, becoming an important factor to restrict development of it.

2.2 Lacking scientific education management mechanism

Most of colleges keep following traditional management mechanism, the effect of traditional economical mechanism on school, only follow the nation's indicating to organize teaching, emerge serious administrative tendency, regard education management as to teacher and students' management, and old content and

management method. This management mechanism ignore the appearance of school ,not fully effecting teachers, professions and other educators, causing work lag and inefficiency .Otherwise, single management method, regardless of the specific circumstances, not combined with the concrete practice, lack system and flexibility which blocks the college management work(Wang Zhiqiang, 2009). Now, concentrating on systematic and standardized problems exist in our colleges education management, single management, old method and can't meet the needs of high education management.

Administration tendency of management cause mechanical management, lack communication, democracy management flexibility is insufficient, can't solve the complex problem facing now in the university education management and some specific situation. Secondly, education management lacks science. With the constant improvement of the school-running system, the functions of the management of college education is toward service and guidance, which requires colleges is equipped with a compact high education team, enhance the consciousness of the management, get out of the misunderstanding of management, and achieve the highest goal of "management is in order for not managing (Sheng Jian, 2013). However, one of the problem existing in the current university is a lack of scientific management, many management systems become a mere formality, not plying its proper role. There for, colleges in our country should learn advanced education management experiences from some foreign colleges, guided by the scientific outlook on the development, combined with the actual domestic and school and walking the road of scientific education management.

2.3 Undefined talents cultivation plan

College education should be based on talents cultivation, which is the final reflection for the college value. If not provided with the useful talents, college education could be defined failing education. Now, the problem still exists in college education. With the blind increasing in recruits, the number of people who are educated does increase. But the qualities of education don't accord with the growth. Because of the change of University management model, college education appears to be hit or miss in the freedom mechanism, confused about the talents cultivation. Many universities still follow 90 centuries' teaching subject, or the foreign, independent on undergraduate education, and not establish specific aim. Only paying attention to the students' practical applied ability. In other words, the inadequacy of cultivating students' talents. After entering the society, most of students hardly combine knowledge with work especially to resume learning. Colleges pay attention to cultivate learning talents so that they ignore to cultivate the actual ability after talents enter society. Under the new situation, university needs to concentrate on improving student's comprehensive quality, strengthening students' independent ability, and cultivating practical talents for society (Wang Yisheng, 2003).

2.4 Emerging problem of college graduates' employment.

With the improvement of the recruits and acceptance rate, the number of students increases rapidly which cause the college graduates face the severe problem .According to the dates the acceptance rate of graduates in 2009 is 35.6% , by2012,only 14%.The number of college graduates reaches up to several million annually. The phenomenon, graduates have difficulty looking for job, exist generally. The reason for it is that blind expansion on college education couldn't meet the needs of talents which is another problem that require to be solved in the higher education management work. A lot of Universities open new professions in order to attract new recruits, but these professions don't take market demands into consideration, especially some unpopular professions don't consider the market demands, blind expansion, upon coupled with not updating course content techniques, etc, leading to graduates being unemployed before employed. On the other hand, the number of graduates doesn't accord with job vacancy (JiaEna, 2009). The reason for the contradiction is numerous talents. Nevertheless, demands actually. Otherwise undergraduates expect too much of their employments and aren't willing to work on some physical labor, many company express, which also cause graduates' difficulty in employment (Yang Deguang ,2001) (as showed in Figure 1).

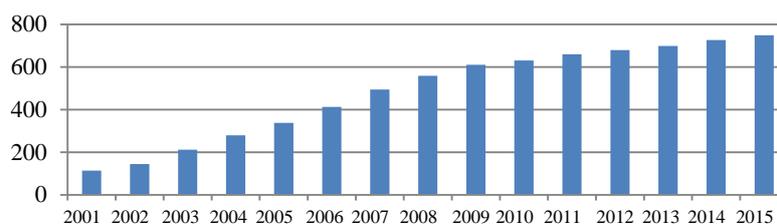

Figure 1 2015 - 2001 National College Graduates(ten thousand people)

3 Education in Our Colleges Management Countermeasure Analysis

To comprehensively promote the reform of higher education, provide high quality for the society, the education management mode needs to be changed radically and campaign real reform to the education management. In order to cultivate high quality talents, we should adapt to new situation, innovate the education management continually, and fully play a role in education management.

3.1 Transform education management idea

To deal with new present problem in higher education management, the college education management should be required to transform idea constantly, innovate management idea, put forward idea that will adapt to social changes. And ,the college education in our country needs to learn advanced education experiences and idea in a broad platform, combine with the concrete practice, have creative thinking and implement innovation education in order to be in line with international standards and achieve internal education; The managers of college education should transform education management concepts , which means understanding the present situation, of which the most important thing is to have the service idea and consciousness. Serving people is the ultimate source of college management education and people has a positive position. Managers should set out from the era demand, give top priority to human factors, set up service concepts and consciousness, transform state controls and restrict on students to thinking actively about how to manage guide students and create conditions for students to realize their value. Otherwise with internationalization of the college education, the managers also build company awareness. In the modern economic society, the development of college education and talents cultivation should be based on market-oriented, college education must according to the social demand for talents cultivation, master the demand change and according to the demand to adjust to the direction of personal training, to meet the social meets. On the other hand, the development of colleges can't be without adequate financial support. In the market economy environment, the investment subject will also develop from single to diversity. The development of colleges gets rid of the pattern where s single rely on state founding in the past, taking the marketability path. To establish a perfect found chain, from a variety of channels to raise funds and combine the development of colleges with market and society, facing to market for survival and future for development. So managers in colleges are not only educators, but also entrepreneurs having a strong sense of market and a keen vision and drive playing a key role in commanding the overall situation so as to make the colleges play a bigger role. This aspect has reflected in many colleges, such as many colleges to set up business schools now.

Facing to successful people, EMBA programmers attracting a large number of successful business people to study has obtained the good economic benefits of which the most famous is the Yangtze River business school (GuoWujun, 2007).

3.2 Promote the reform in teaching management institution

Promoting the reform in teaching management institution is the necessary choose for managers and college leader to complete education management work under the new situation. For a long time, our college education management has been restrained by old system and idea, not keeping pace with the reform of university. Although colleges enroll recruits continually and loose the admission age constraint, there is no marked improvement and innovation in education management work directly causing the wrong foot in it and full of contradiction. It must conform to the trend of The Times and constantly promote reform in teaching management institution in order to make a great progress on college education under the new situation. First, strongly carrying out credit system and creating the environment that is benefit for the improvement of students' study. School formulates course credits for students, student can select course that they like according to credit, in addition also can be according to their interest, habits and personal will, taking their professional course. This can not only improve the students' passion, give students independent development, also can save the students' learning time and costs Two, Promoting reform in the quality of education assessment system. Original education can hardly adjust to the needs of college education teaching management. Only paying attention to the performance of teachers' teaching plan, ignoring role among students, causing the quality of college teachers' teaching evaluation unreasonable, and some teachers' teaching achievement being ignored. So all-round education quality evaluation system should be established. It includes the education development level evaluation, supervision and evaluation management assessment. Promoting reform in education quality system and setting up comprehensive target system is helpful to form a comprehensive management, teaching and Incentive study mechanism.

3.3 Establish the status of students

College education aims to provide society with talents, comprehensively promote the level of

people educated and the quality. Because students are the subject status to accept education, college education ought to focus on students. But the severe administration phenomenon still exists in many colleges, they give priority to their own interests, not considering student' interests, making college education put the incident before the fundamental, hardly achieving favorable effects. To fundamentally change the situation .it requires to give priority to students. Schools' work ought to focus on solving students' present problem among learning and life, giving priority to education management. Setting up the status of students, basically is that colleges establish the concept of people-oriented, fully playing the positive role of human in the education teaching management. Giving priority to students is the necessary people-oriented outlook of scientific development, is helpful for colleges to solve students' present problem in the education work, promoting teaching quality, strengthen teaching achievement and promote the all-round development of all aspects of school work. On the other hand, giving the priority to students, or cultivating students' self-management awareness, improving students' self-discipline and self-management, cultivating students' responsibility consciousness, which is the necessary choice for students to develop roundly.

4 Conclusions

Problems existing in current university education management and specific measures are definitely not limited to it. With the development of The Times and the changes of education concept, varieties of new problems emerge in the college education management. In order to solve the present problems and the problems that will appear, administrator and college leaders need to adjust to The Times continually, combining with practical situation and absorb advanced management experiences, exploring a way to accord with the actual management of colleges. Only in this way, the progress and development of college education will be better promoted.

A Research on the Development Mode of Campus Culture in Colleges on the Basis of Synergetic Theory

Yu Dongjiang, Liu Changping

Foreign Language School, Wuhan University of Technology, Wuhan, P.R. China, 430070

(E-mail: yudongj@whut.edu, 99652361@qq.com)

Abstract: Cultural inheritance and innovation serves as an important function of colleges in the new era. However, incoordination remains in the development of campus culture in colleges. By utilizing the viewpoint of synergetic theory, the paper reveals the feasibility of introducing the development of campus culture in colleges, forms internal mechanism of synergy from such aspects as key elements, layer of structure, evolutionary process of self-organization and framework of mode, and discovers order parameter, evolutionary impetus as well as phenomena of competition and synergy that facilitate the evolution of systematic, so as to promote the contact motion between subjects and objects in the system for development of campus culture in colleges, form synergetic effect, and help achieve the maximization of effect of development of campus culture in colleges.

Key words: Development of campus culture; System; Synergetic theory; Mode

1 Introduction

Culture is something through which one can pursue and enjoy the spiritual freedom by developing one's own "survival will" and "freedom will" to the largest extent (He Mingsheng, 2014). The history of social development indicates that culture is the achievement of civilization produced by mankind's implementation of practices of social activities and the integrated manifestation of human survival. With uniqueness and innovativeness, campus culture in colleges presents as the peculiar achievement of civilization produced by the college teachers and students in the process of talents cultivation. Along with the reform of cultural system, it becomes an important question of cultural reform and innovation for colleges, the carrier of inheritance of fine culture and the important source of ideological and cultural innovation, how to assume the functions of cultural inheritance and innovation in the new era. The synergetic theory has revealed how the open system in imbalance, under the circumstance of exchanging material or energy with the outside world, presents its orderly temporal, spatial and functional structure in a spontaneous way by its own internal synergy. Therefore, from the perspective of synergetic theory, the paper, in accordance with the views of systematic thought in the development of campus culture in colleges, dissects the problems existing in the development of campus culture in colleges, reveals the mechanism of self-organization evolution in the system of development of campus culture in colleges, and attempts to build the development mode of campus culture in colleges from the perspective of synergetic theory, in order to explore the internal relation between the subjects of the development of campus culture in colleges and enhance the efficiency of the development of campus culture in colleges.

2 The Status Quo of Development of Campus Culture in Colleges from the Perspective of Synergetic Theory

For the past few years, as the function of student-cultivation of higher education institutions has been strengthening, increasing colleges and universities began to realize the importance of synergetic innovation in the new situation. It has become an urgent issue for many higher education institutions to address how they assemble their own resources and abilities to achieve the function of talent cultivation and society-oriented service. Campus culture influences the all-round development, including morality, intelligence and physique, of the students in colleges in an imperceptible way. However, from the perspective of synergy, disorder exists in the system of development of campus culture in colleges, the subjects of participation are failed to give play to synergetic effect, and the in coordination remains.

1) The development of internet culture has greatly impacted on the development of traditional culture. The development of campus culture in colleges is based on the teaching and managing activities of schools and is born in higher education institutions, a specific growing circumstance. From the perspective of synergy, on the one hand, spatially, the campus culture of colleges develops by focusing on the space of "higher education institution". On the other hand, temporally, the campus culture of colleges is unique values developed by a college through a certain historical period and a series of historical incidents. From the perspective of self-organization evolution, the campus culture of colleges

continuously produces the driving force and resistance which help accelerate the evolution of system in the process of evolution, so that enable the system of campus culture to exchange its energy with its counterpart in the outside world and to selectively absorb or repel the impacts from the culture of the outside world, which helps the campus culture in colleges to form a relatively closed system of development in a traditional pattern. Meanwhile, the development of internet technology influences the development of campus culture in technology and methods. Such platforms as mobile phone, micro-blog, Wechat, QQ group and website forum have become the platforms to transmit the campus culture in colleges. Without the traditional restrictions of space and time, college students obtain an access to know dynamic situation of cultural development by using the internet, implement activities of internet culture and club activities for the purposes of meeting the demands of self-worth and society, all of which exerts a great impact on the progress of traditional system for cultural development. These transformations illustrate that it is a big challenge for campus culture of colleges how to realize the synergy, in the system for the development of campus culture of colleges, an open system for cultural development which constantly exchanges information with the outside world, between the “offline” traditional culture and the “online” internet culture in campus.

2) The coexistence of diversified forms of culture results in the decline of educational function of the system. Currently, along with the development of globalization, different cultures and nationalities are fused in a highly intensive way. Various cultures can be seen in the system for development of campus culture in colleges in the same space time, which enables diversified cultures to be transmitted among colleges, which embodies in the coexistence of traditional Chinese culture and western culture, in the company of mainstream culture and sub-culture, and in the coexistence of mass culture and elite culture. The fusion and competition of diversified cultures promote the formation of particularly cultural atmosphere in colleges, which exerts great influence on the view of life and values of the teachers and students in colleges. It is easy for some students to harbor extreme emotions and thoughts due to the unclear understanding of reality, and to be devoid of cultural identity in the process of their realization of individual value by means of so various accesses as clubs and internet after they get rid of traditional restraints of time space, so that they may fall into the confusion of morality and values, which is detrimental to the sound development of college students. At the same time, the socialist culture with Chinese characteristics guided by the Marxism remains the dominant role in campus culture. It is a significant test for current development of campus culture how to uphold the dominant role of socialist culture with Chinese characteristics guided by the Marxism and enhance the educational function of the system for development of campus culture in colleges in the situation of coexistence of diversified cultures

3) The self-organization evolution of the system for development of campus culture in colleges is facing with various challenges.

The evolution and development of self-organization of the system for development of campus culture in colleges rely on the synthetic effect produced by the subjects in the system. Owing to different philosophies of schooling and courses of development, diversified sediment was formed in the system for development of campus culture in colleges. Such disparities as value guidance of campus culture, distribution of research resources, division of disciplines, characteristics of talent cultivation, practices of specialties and students' activities among universities and colleges make it possible that disparities exist among the subsystems for cultural development of colleges. Hence, resistance exists in the internal coordination of the system for development of campus culture. In the meanwhile, under the influences of “diversified cultures” and “internet culture”, problems including out-of-control of behavior, moral disorder and crisis of psychological health emerge among the young students in campus due to the introduction of part of unhealthy culture and thoughts, which stores the potential conflicts in the system for development of campus culture. The production of various conflicts is bound to push forward the mutual “competition” or “synergy” among the subjects in the system for campus culture and the incessant evolution of self-organization in the system for campus culture in colleges. It becomes a major challenge for the development of campus culture in colleges how to maintain the orderly and steady development for the system of self-organization evolution and to enable the self-organization evolution of the system for campus culture in colleges to hold the predominating direction of advanced socialist culture guided by the Marxism.

3 The Internal Mechanism of Development Mode of Campus Culture in Colleges on the Basis of Synergetic Theory

3.1 The key elements of synergy of development of campus culture in colleges

From the perspective of synergetic theory, the development mode of campus culture in colleges is essentially a cross-systematic management system for development of campus culture, whose elements of management constitute the framework of development mode of campus culture in colleges, and whose operating mechanism is the interactively operating process of management elements within the framework of development mode of campus culture in colleges. From the perspective of knowledge management, culture is the new blocks of knowledge formed by a mass of knowledge blocks through gathering and innovation. The elements of synergy can be divided into four categories, namely, subject, object, process and circumstance (Zhang Xifeng, 2012). The subjects of development of campus culture are educators and educational organizations. The objects are objects of management in the process of development of campus culture, such as educatees, experimental facilities, capitals, knowledge and other resources. The synergetic process of development of campus culture is the interactive process among the participants of development of campus culture in system, resources and actions. And the circumstances of development of campus culture include internal and external situations in which the organizations of development of campus culture exist.

3.2 The synergetic structure of development of campus culture in colleges

From the perspective of synergetic theory, the synergetic structure of development mode of campus culture in colleges lays more emphasis on the interactive relations between different subjects and objects. The development of high technology, whose carrier is the information communication technology, facilitates the birth of network organizations which, as a new organization pattern to suit knowledge-oriented society, information economy and organizational innovation, makes it possible to realize the synergetic development among key elements. The development mode of campus culture on the basis of synergetic theory attaches importance to the building of strategic relation of network organization, interactive relation of activities and actions, and relation of resources sharing between different subjects. Hence, the corresponding operating mechanism needs to be formed between each layer of relations to promote the integral development of system for development of campus culture. Therefore, having built the framework of synergetic structure for the development mode of campus culture in colleges from such three layers as strategy, business and implementation, the paper realizes the synergy of “human-human” and “human-mechanism” in the process of campus culture of colleges by taking network organization as the major form of structure, so as to obtain the synergetic structure of development of campus culture in colleges as shown in the Figure 1.

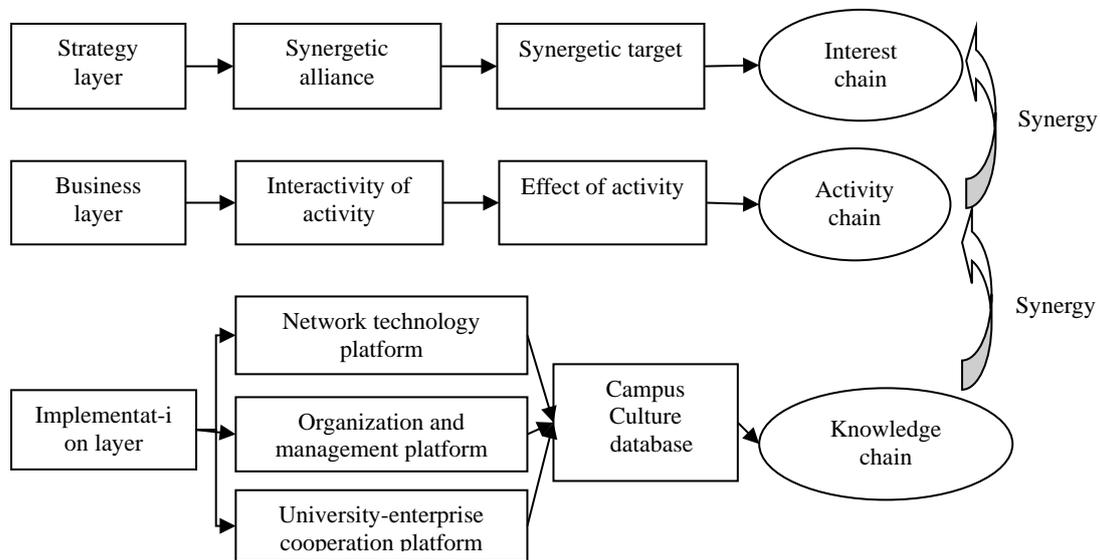

Figure 1 The Layers of Synergetic Structure of Campus Culture Development in College

As illustrated in the Figure 1, the framework of development of campus culture in colleges is a universally hierarchical structure. The synergetic structure of development of campus culture in colleges includes three layers of synergy, namely, strategy synergy, business synergy and implementation synergy. The subjects of development of campus culture in colleges ally with each other as an alliance of

development of campus culture in colleges in the interest of common good, and then set specific target and itinerary of development of campus culture in accordance with overall strategic objective. Since knowledge is able to drive forward the practice of cultural activities, the knowledge innovation of culture pool of colleges is equipped with the capability to promote the activities of cultural development to achieve effect so as to realize synergetic target. At the macro level, the culture pool, performing as the expansion or extension of knowledge chain, advances the production of activity chain of campus culture and, progressively, facilitates the development of interest chain of involved subjects, and finally promotes the development of network organizations for development of campus culture in colleges.

3.3 The process of self-organization evolution of development of campus culture in colleges

The system for development of campus culture in colleges consists of such subsystems as system of campus material culture, system of campus regulatory culture and system of campus spiritual culture. The movement of self-organization in the development of campus culture mainly exists in the integration of various resources in the system for development of campus culture in colleges. It involves in the system for movement of self-organization through order parameters including university spirit and philosophy of education, activates the flow of interior information in the development of campus culture by using media vehicles such as resources sharing, education transmission, innovation practice and cultural experience. By multi-layer communicative coordination, it creates the impetus for self-organization evolution of system and overcomes the resistance of self-organization evolution in order to enable the system of development of campus culture to give full play to its synergetic effect.

4 The Development Mode of Campus Culture in Colleges on the Basis of Synergetic Theory

Based on the above, the paper, under the guidance of the synergetic theory as well as the training program and target of innovation-oriented talent cultivation for higher education institutions, sums up the highly theoretical and abstract system for development of campus culture in colleges, which can be seen in Figure 2. The subjects and objects of synergetic development of campus culture are various kinds of "people" in campus culture. The content of synergy is the system of media dissemination which consists of four factors as a whole including resources sharing, education transmission, innovation practice and cultural experience. The process of synergetic is the process constituted by three elements as a whole including resources, system and actions. Through the self-organization evolution of the system for development of campus culture, the synergetic effect of system for development of campus culture in colleges is released in order to guide college students' in such respects as behavior, concept, norms and values in a correct way, strengthen students' capability of combining theory with practice, facilitate the matching between talents cultivation and social demands, promote cultural innovation and inheritance in colleges, advance the implementation of student-cultivation program of colleges, enhance the ability of students in innovation practice, facilitate the matching between talents cultivation and social demands, and fulfill the target of talent cultivation of colleges.

As it is shown in Figure 2, in order to further optimize the development mode of campus culture in colleges, strategy has been formulated under the guidance of training objective and program for innovation-oriented talents in colleges as well as synergetic theory as follows:

1) We need to carry out the synergetic philosophy of development of campus culture and strengthen the impetus of system for development of campus culture in colleges.

In accordance with the force condition of self-organization movement of the system for development of campus culture in colleges, in order to promote the exchange between the system and the outside world in material, information and energy, we need to, in the process of development of campus culture in colleges, insist on implementing synergetic philosophy, break up primitive equilibrium state, incessantly create the platforms for implementing resource sharing, information exchange and interactive communication with the outside world, diminish the frictions in the development of campus culture in colleges, strengthen the systematic impetus which is needed by the evolution of the system for development of campus culture in colleges. First, the activities of resources sharing should be implemented. We need to advance associated activity of talent cultivation on the aspects including curriculum and courseware, online teaching resources, resources of teaching staff, university-enterprise joint cultivation, and international exchange and cooperation, promote resources sharing both at home and abroad as well as at school and outside school, strengthen the coordination in resource sharing between the subjects and objects in the system for development of campus culture in colleges. Second, communicative platform of campus culture should be built. We need to, by organizing

activities of scientific and technological innovation, activities of cultural experience, and lectures of culture, explore common factors of cultural values, strengthen the cohesion of dominant values, reduce the friction produced by island effect, and facilitate the general driving force of development of campus culture in colleges.

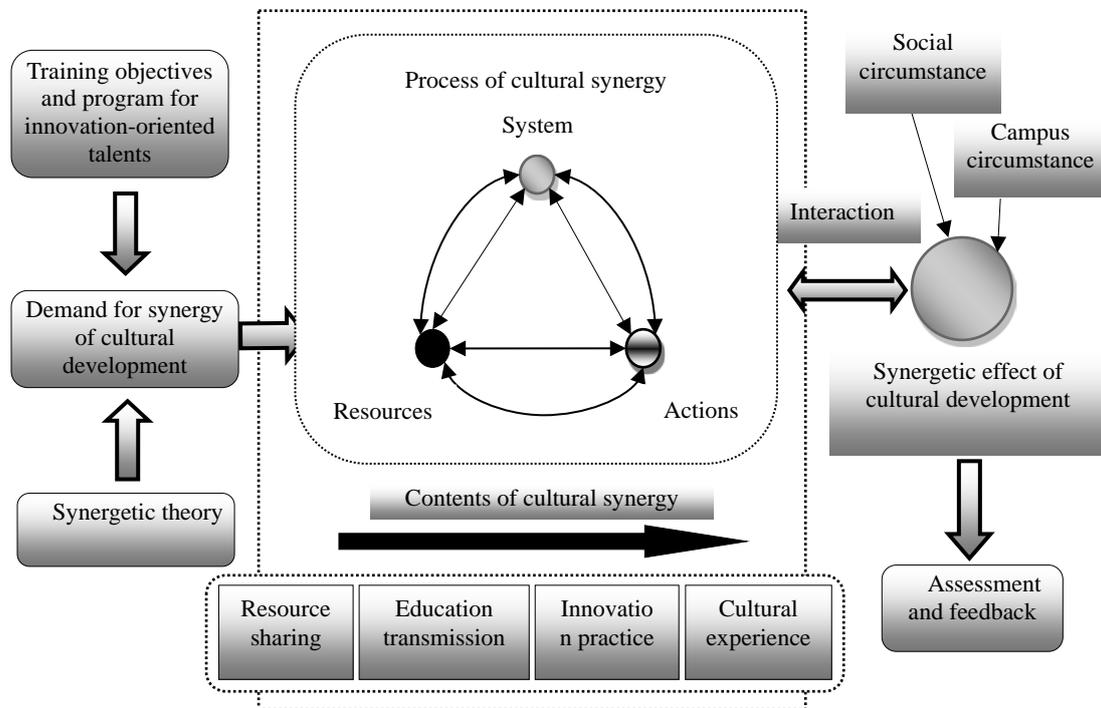

Figure 2 The Framework of Development Mode of Automobile Culture in College Campus on the Basis of Synergetic Theory

2) We need to make full advantage of the phenomena of competition and synergy in the synergetic so as to facilitate the self-organization evolution of the system for development of campus culture. In line with the result of self-organization movement of development of campus culture in colleges, the final state of self-organization evolution system presents as two phenomena, namely, competition and synergy. Competition makes the evolution of system tend to be imbalanced, while synergy among subsystems helps enhance their momentum and hold advantage. Therefore, in the process of development of campus culture in colleges, competition and synergy should be take full advantage. First, we need to encourage the relevant departments in the system of development of campus culture in colleges and the various kinds of students to implement benign competitions, reform the systems of quality assurance and assessment for talents cultivation in colleges, adopt the incentive mechanism and the measure of management by objectives to mobilize the subjective initiative of subjects and objects participating in the development of campus culture. Second, we need to advance the synergetic innovation on the aspects of resources, system and actions. The synergetic innovation of resources requires the relevant departments in colleges to break up the boundary between them and students, strengthen the integration of resources of teaching and practice, intensify the coordination of resources both at schools and outside schools, reinforce the exchange and cooperation in resources between China and other country, and provide resource pool for the development of campus culture. The synergetic innovation of system demands of the building of system of synergetic innovation for education and culture transmission, the formulation of measures and detailed rules of implementation, the advance of implementation of talent cultivation policies as well as relevant policies targeting education and culture transmission. The synergetic innovation of actions requests to bring into full play the characteristics and advantages of colleges to jointly build the base of social practice and scientific research, achieve the practice of university-enterprise interaction, and cultivate students' healthy value orientation.

3) We need to release the order parameters of development of campus culture and drive the operation of development mode of campus culture in colleges.

In the development mode of campus culture in colleges, order parameters play a core role in the system of cultural development. The system of socialist core value, with high degree of stability, is the most essential state of development of campus culture in Chinese colleges. Therefore, in the practice of development of campus culture in colleges, we need to use the system of socialist core value as guidance to direct the activities of development of campus culture, optimize the top-level design of development of campus culture, pay attention to the guidance of public opinion, strengthen the radiant and driving roles of club activities, and cultivate students' awareness of innovation and concept of collectivism. All these will help drive the self-organization evolution of development mode of campus culture in colleges.

5 Conclusions

The building of development mode of campus culture in colleges on the basis of synergetic theory, as a complex system project, implements the philosophy of development of campus culture by using synergetic theory. It also releases the order parameters of development of campus culture by taking full advantage of coexistence phenomenon of "competition" and "synergy" in the system for development of campus culture, which can effectively promote the interactive synergy among such aspects as information and resources sharing, education and culture transmission, technological innovation and practice, and cultural experience, so as to build a brand-new development mode of campus culture in colleges.

Abstract: This paper, by investigating into the condition of 4210 graduating students taking postgraduate entrance exams and acquiring exam-free admissions in a MOE-administered university, analyzes the intention of the graduating students to select a college or university for postgraduate study. Optimal-scale model is applied to the study and the paper analyzes the influence consisting of the soft power, the hard power and self-evaluation on selecting a college or university for students. The paper finds that while selecting a college or university for postgraduate study, the students attach importance to the strength of major, qualification of faculty, influence of a university at home, chances of going abroad for exchange, etc. Based on the findings, the paper proposes that colleges and universities attract quality student sources by fortifying condition construction, reforming postgraduate training pattern and improving awarding and subsidizing systems, etc.

Key words: Selecting a college or university for postgraduate study; Intention; Influencing factor

1 Introduction

In order to adapt to the new normal of internal development of postgraduate education, General Office of the Ministry of Education dispatched a series of documents to reform the postgraduate admission system, especially the exam-free admission system, among which “Notice on Further Reinforcing the Work of Recommending Excellent Undergraduate Student for Postgraduate Exam-Free Admission” and “Notice on Further Improving the Work of Postgraduate Exam-Free Admission for Graduating Students” exerted a significant influence on college and university selection for graduating students. Scholars at home and abroad made analyses on the influencing factors of college and university selection from various perspectives. Some studies point out that students’ intention of selecting a college or university is affected by its social cognition (Zhang Xindan, 2012), the degree of its social recognition (Li Yuqiong, Cheng Ying, 2015), the extension of its social relations, the degree of its internationalization, and ranking (Ding Lan, Li Haizheng, 2010), etc. Some studies abroad find that the instruction for innovation (Hartzell, 2014) and salary expectations have a greater impact on students as they are choosing colleges or universities for postgraduate study.

This study, by selecting 4210 students from the university as objects for investigation, aims to analyze the factors such as the soft power, the hard power of the university, etc. that react upon the undergraduate students in school selection.

2 Research Design and Measurement Model

2.1 Research design

In questionnaire design, the graduating students took into account the soft power, the hard power of a college, and self-evaluation while selecting a college for postgraduate study. In terms of the soft power the major influencing factors comprise the treatment of postgraduates, the influence at home, chances of going abroad for exchange, school-enterprise cooperation mechanism, alumni resources, academic resources and social resources, etc. The influencing factors about the hard power include the level of platform (whether or not the college or university is a member of Project 985 or 211), strength of discipline, qualification of faculty, condition of laboratory, infrastructure (e.g. teaching building and accommodations), employment rate, etc. The students’ self-evaluation is demonstrated from the aspects consisting of supervisor’s academic influence, sense of belonging, preference to certain cities, learning environment and connection with assistive personnel (head teacher, counselor, etc.) The above three aspects contain both horizontal and vertical comparison, thus completely reflecting the influencing factors for students’ selecting school.

2.2 Validity of measuring index system

The measuring index system for the graduating students is composed of level I, II, and III. Level I is the objects of measurement – the influencing factors of selecting a college for the fresh graduates; Level II includes the soft power, the hard power and self-evaluation; Level III is the specific measuring index decomposed from level II. The paper accumulated the total score of each measuring level in order to reflect the validity of measuring levels and specific index. The correlation test between the objects of measurement of Level I and each of the factors of Level II (soft power, hard power and self-evaluation) passed the test of significance, and the value of correlation intensity is higher than 0.80 (the results are 0.87, 0.91 and 0.82 respectively). The paper also verified the correlation between Level I and Level II, and the value of the test of significance is lower than 0.001, the correlation intensity higher than 0.70.

2.3 Collection of questionnaire data and evaluation of sample

The study distributed 4210 questionnaires in total and retrieved them all, among which 3601 questionnaires were completely finished. The statistical result was calculated by statistics analysis software Stata 12.0. In order to confirm the validity of the sample, the paper compared the actual data of the number of students taking postgraduate entrance exams and getting exam-free admission provided by School of Graduate of the university. Among 3601 copies of valid questionnaires, the number of students taking postgraduate entrance exams is 2449, and the number of those having acquired exam-free recommendation is 1152. The number of students who applied for their own university is 1338, and the number of those who applied for other colleges and universities is 1111. The number of students having acquired exam-free recommendation from their own university is 600, and the number of those having acquired exam-free recommendation from other colleges and universities is 552. The data is shown in Table 1.

Table 1 Data of Students Taking Postgraduate Entrance Exams and Getting Exam-Free Admissions

College Selection	Taking Postgraduate Entrance Exams			Getting Exam-Free Admissions		
	Selecting Their Own University	Selecting Other Colleges and Universities	Total	Other Colleges and Universities	Total	
Sample Percentage	54.63%	45.37%	100%	52.08%	47.92%	100%
Actual Percentage	55.24%	44.76%	100%	50.38%	49.62%	100%

It is known from Table 1 that the percentage of the number of the students in the sample is basically in conformity with the actual data with the maximum deviation of 3.4%. The result is credible as the deviation is within a reasonable range.

3 Research Findings

3.1 Distribution of graduating students' intention of selecting a college or university

The data shows that in this university the number of students taking postgraduate entrance exam is 3027, and the number of those getting exam-free recommendation is 1183. The ratio of the former to the latter is 2.56:1. The number of students who applied their own university is 1672, and the number of those who applied for other colleges and universities is 1355. The ratio of the former to the latter is 1.23:1. The number of students acquiring exam-free admission from their own university is 596 and from other colleges and universities 587, and the ratio is 1.02:1. Table 2 shows the specific data.

Table 2 The Actual Data of the Number of Students Taking Postgraduate Entrance Exams and Getting Exam-Free Admission

	Taking Postgraduate Entrance Exams	Getting Exam-Free Admission	Total	Percentage
Students Who Chose Their Own University	1672	596	2268	53.87%
Students Who Chose Other Colleges and Universities	1355	587	1942	46.13%
Total	3027	1183	4210	100%
Percentage	71.90%	28.10%	100%	

Based on the data of the students applying for a college or university as their first choice, the percentages of students applying for colleges and universities of Project 985, Project 211 and other research institutes are 35.05%, 61.51% and 3.44% respectively. For the students of exam-free admission, the percentages are: 41.76%, 54.61% and 3.63%, as is shown in Table 3.

Table 3 Data of Colleges and Universities Which Students Applied for and Were Admitted

Levels	Colleges and Universities of Project 985	Colleges and Universities of Project 211	Others	Colleges and Universities of Project 985	Colleges and Universities of Project 211	Others
Number of Students	1061	1862	104	494	646	43
Percentage	35.05%	61.51%	3.44%	41.76%	54.61%	3.63%

Table 2 and Table 3 have shown that students inclined to move to colleges or universities of higher levels.

3.2 Analysis of influencing factor

3.2.1 Comparative analysis of the soft power, the hard power and self-evaluation

As is demonstrated by the result of the optimal scale model, the scores of three influencing factors, namely the hard power, the soft power and self-evaluation in terms of selecting other colleges and universities are: 78.6, 71.6 and 66.1. Therefore, the hard power of other colleges and universities is the most crucial factor for students to choose them and self-evaluation is nevertheless less influential.

The scores of three influencing factors, namely the hard power, the soft power and self-evaluation for students who selected their own university are: 69.6, 67.5 and 66.4. Therefore, the hard power is still the key factor but self-evaluation ranks the second.

By conducting a comparative analysis, it can be concluded that the students, while selecting a college or university for their postgraduate study, lay more emphasis on the strength of a college or university. The difference is made on the factor of self-evaluation, which exerts a great influence on the students who selected their own university for their postgraduate study.

3.2.2 Influential condition of university's hard power

Through adopting the optimal scaling model, this paper measures and calculates influences of concrete indexes of university's hard power on students faced with the fact that they have to choose to pursue their graduate study in their own universities where they finish undergraduate study or start their graduate study in other universities. Concrete statistics are shown in Table 4.

Table 4 Hard Power Indexes' Influences on Students' Intention of Choosing Universities

Influence of Hard Power on Students' Intention of Choosing other Universities to Start Graduate Study							
Specific Indexes	Very Little	Little	Normal	Large	Very Large	Mean Value	Influencing Factors Score
Strong Competence of Majors	0.91%	2.49%	17.15%	42.70%	36.74%	4.119	82.38
Faculty with Excellent Profession	1.09%	2.19%	18.55%	45.44%	32.73%	4.065	81.30
High-level Platform	3%	2.75%	16.16%	42.84%	35.25%	4.046	80.92
Better-equipped Laboratories	1.78%	4.11%	24.85%	41.84%	27.42%	3.890	77.80
High Employment Rate	2.01%	4.21%	24.94%	41.83%	27.01%	3.876	77.52
Fully Functional Infrastructure	4.28%	8.13%	33.76%	33.21%	20.61%	3.577	71.54
Influence of Hard Power on Students' Will of Choosing Their own Universities to Start Graduate Study							
Specific Indexes	Very Little	Little	Normal	Large	Very Large	Mean Value	Influencing Factors Score
High Employment Rate	2.69%	4.95%	31.24%	41.36%	19.76%	3.705	74.10
Faculty with Excellent Profession	2.32%	5.75%	36.11%	43.02%	12.81%	3.582	71.64
Strong Competence of Majors	4%	5.53%	36.46%	39.41%	14.59%	3.551	71.02
Better-equipped Laboratories	4.38%	9.08%	43.43%	33.77%	9.34%	3.346	66.92
Fully Functional Infrastructure	6.79%	10.8%	43.65%	30.44%	8.32%	3.227	64.54

As is shown in the result, among all the factors within hard power on students' will of choosing other universities, the following three factors ranks Top Three: Competence of majors, faculty with excellent profession and the platform level of the universities that students choose. Their scores are 82.38, 81.30 and 80.92 respectively. The next two factors following the top three are laboratory conditions and employment rate. The index of infrastructure scores relatively low at 71.54. Among all the factors within hard power on students' will of choosing their own universities, employment rate, faculty with excellent profession and competence of majors rank Top Three. Their scores are 74.1, 71.64 and 71.02. Comparatively speaking, laboratory conditions and infrastructure score lower at 66.92 and 64.54. In comparison, the paper finds out that students attach more importance on competence of majors, faculty with excellent profession and the platform level of the universities when they choose to start their graduate study in other universities. Meanwhile, students attach more importance on employment rate, faculty with excellent profession and competence of majors.

3.2.3 Influential condition of university's soft power

Through adopting the optimal scaling model, this paper measures and calculates influences of concrete indexes of university's soft power on students faced with the fact that they have to choose to pursue their graduate study in their own universities where they finish undergraduate study or start their graduate study in other universities. Concrete statistics are shown in Table 5.

Table 5 Soft Power Indexes' Influences on Students' Intention of Choosing Universities

Influence of Soft Power on Students' Intention of Choosing other Universities to Start Graduate Study							
Specific Indexes	Very Little	Little	Normal	Large	Very Large	Mean Value	Influencing Factors Score
Relatively Large Domestic Influence	1.16%	3.16%	18.13%	48.36%	29.20%	4.013	80.26
Abundant Alumni Resource	2.14%	4.09%	27.98%	42.15%	23.64%	3.811	76.22
Fairly More Exchange Programs with Foreign Universities	4.21%	6.11%	32.48%	36.32%	20.88%	3.636	72.72
Fully Functional University-Enterprise Cooperation Mechanism	2.94%	6.00%	35.91%	37.13%	18.01%	3.613	72.26
Better Allowance and Treatment for Graduate Students	6.04%	5.92%	44.72%	30.45%	12.87%	3.382	67.64
Successive Postgraduate-Doctoral Program of Specific Majors	15.02%	13.92%	39.61%	20.85%	10.61%	2.981	59.62
Influence of Soft Power on Students' Intention of Choosing Their own Universities to Start Graduate Study							
Specific Indexes	Very Little	Little	Normal	Large	Very Large	Mean Value	Influencing Factors Score
Academic and Social Resource	2.93%	6.66%	39.14%	40.89%	10.38%	3.491	69.82
Abundant Alumni Resource	3.09%	6.97%	39.28%	40.07%	10.59%	3.481	69.62
Relatively Large Domestic Influence	3.62%	9.21%	45.79%	33.12%	8.25%	3.331	66.62
Fully Functional University-Enterprise Cooperation Mechanism	3.95%	8.96%	45.84%	34.53%	6.72%	3.311	66.22
Better Allowance and Treatment for Graduate Students	4.9%	10.81%	46.27%	30.4%	7.61%	3.250	65.00
Fairly More Exchange Programs with Foreign Universities	7.25%	14.99%	51.52%	20.59%	5.65%	3.024	60.48

As is shown in the statistical result, among all the factors within soft power on students' will of choosing other universities, the index of other universities' domestic influences ranks the first with the score of 80.26. The next three following factors are exchange programs with foreign universities, alumni resource and university- enterprise cooperation. As for those students choosing their own university to start their graduate study, they attach more importance on academic and social resource and fully functional university- enterprise cooperation mechanism.

3.2.4 Influential condition of self-evaluation factor

Through adopting the optimal scaling model, this paper measures and calculates influences of self-evaluation index on students faced with the fact that they have to choose to pursue their graduate study in their own universities where they finish undergraduate study or start their graduate study in other universities. Concrete statistics are shown in Table 6.

Table 6 Self-Evaluation Indexes' Influences on Students' Intention of Choosing Universities

Influence of Self- Evaluation on Students' Intention of Choosing other Universities to Start Graduate Study							
Specific Indexes	Very Little	Little	Normal	Large	Very Large	Mean Value	Influencing Factors Score
Supervisors' Academic Influence	2.32%	3.66%	25.89%	44.20%	23.93%	3.837	76.74
Personal Favor towards the City that the University Locates	4.43%	6.55%	26.64%	35.25%	27.12%	3.741	74.82
Unsatisfactory Academic Atmosphere of their own University	14.14%	16.98%	42.05%	18.75%	8.08%	2.896	57.92
Weak Sense of Belonging to Their own University	18.41%	17.13%	40.67%	15.60%	8.20%	2.780	55.60
Influence of Self- Evaluation on Students' Will of Choosing Their own Universities to Start Graduate Study							
Specific Indexes	Very Little	Little	Normal	Large	Very Large	Mean Value	Influencing Factors Score
Weak Sense of Belonging to Their own University	2.08%	6.92%	29.48%	45.93%	15.59%	3.660	73.20
Supervisors' Academic Influence	4.36%	9.99%	40.94%	34.08%	10.63%	3.366	67.32
Unsatisfactory Academic Atmosphere of their own University	4.29%	9.45%	43.91%	33.66%	8.7%	3.330	66.60
Personal Favor towards the City that the University Locates	6.93%	12.57%	34.74%	32.18%	13.59%	3.329	66.58
Influences from Instructors and Faculty Within Their own University	6.06%	13.03%	45.11%	27.87%	7.93%	2.707	54.14

As is shown in the statistical result, among influences of all the factors within self-evaluation indexes on students' will of choosing other universities, the index of supervisors' academic influences and the city where the university locates rank top two with the score of 76.74 and 74.82 respectively. As for the self-evaluation indexes influences on students' will of choosing their other universities, sense of belonging to the university, supervisors' influence of students' own universities, the city where the university locates and academic and scientific research atmosphere get high scores.

4 Conclusions

Recently, a university directly under the administration of the Ministry of Education has developed in high speed and cultivated its own feature. From the survey and analysis on the university comes the findings which have typical significance on the inclination and influential factors of the university selection for undergraduates who want to pursue a master's degree. Based on the results of the research, the author holds the opinion that in order to attract more excellent students in the background in which the postgraduate enrollment mechanism has been reformed, the decision maker of postgraduate education in universities should make some adjustments from the following aspects:

1) To promote the hardware and software conditions in university so that the postgraduates can be provided a benign fundamental guarantee for academic research. As is shown in the result, the two influential factors with highest scores are the competence of majors in hard power and domestic impact in soft power. Thus famous universities and well-known supervisors are not the only factors taken into considerations when undergraduates select university to pursue a master's degree. Based on the publicity of university and supervisor, undergraduates pay more attention to the discipline competence and whole faculty. Additionally, indexes such as teaching quality, study depth of majors and course design get relatively low scores, which indicates that the teaching mechanism reform should be deepen and the teaching system should be improved in order to promote the education level. With the purpose of solving the problems reflected in the survey, the academic research atmosphere in universities should be cultivated and the laboratory conditions and fundamental facilitates should be improved. In this way postgraduates can be provided a better environment for academic research.

2) To adjust the cultivation mode and provide multiple cultivating patterns and vocational guarantee for postgraduates. From the research comes the finding that not only the discipline competence and the platform level of universities are taken into consideration when undergraduates select a university for master's degree. The major employment rate and schoolmate resources also attracted much attention. Thus the selection of university is relevant to the career planning of undergraduates. Hence, the postgraduates cultivating mode should be reformed: on the one hand, aiming at the international academic frontier, university should broaden the channel for international exchange and cooperation and propel the international cooperated cultivation to nurture a multitude of academic talents. On the other hand, universities shall establish University- Enterprise Cooperation Mechanism and enhance the cultivation of applied talents in order to adjust to the urgent demand of the transformation of economic mode and adjustment of industrial structure. Universities shall start the postgraduate cultivation mode reform by grade and sort and improve the quality the cultivation of postgraduates in order to provide conditional guarantee for postgraduates' career plan and attract more excellent students with universities quality advantages.

3) Enlarge the publicity when recruiting new graduates and improve the Scholarship and Aid System with the purpose of providing life guarantees for graduate during their study. With the reform of Graduate Education Investment Mechanism in China, universities will charge fees from graduates within National Graduate Enrollment Plan since the autumn semester in 2014. This reform has directed students to pay attention to the Scholarship and Aid System when they choose the university to start their graduate study. Therefore, universities shall design attractive Scholarship and Aid System and formulate Scholarship and Aid Mechanism with own characteristics of the universities. The survey also finds out that many students are not likely to choose one university given the condition that they do not well understand the Scholarship and Aid System and Policy or they lack interest in Scholarship and Aid System of the university. Therefore, universities shall take various measures in the same time and enhance the publicity particularly on prominent advantages of discipline and Scholarship and Aid System so that students can make rational decisions after fully understanding them.

Analysis of Health Status of University Teachers: Based on Physical Examination Data

Li Yifei

Public Health Division, Wuhan University of Technology Hospital, Wuhan, P. R. China, 430070
(E-mail: 1987804939@qq.com)

Abstract: To understand the disease characteristics and establish family health records of the highly-educated and senior cadre in Wuhan University of Technology. In 2012 and 2013, the highly-educated and senior cadre in Wuhan University of Technology received medical examination in internal medicine, surgery, gynaecology, ophthalmology, otorhinolaryngology, stomatology and radiology as well as electrocardiography, B-ultrasound, blood pressure test, liver and kidney function tests, blood tests and so on. Disease distribution and tendency were analyzed in detail. According to the physical examination results, we found that chronic pharyngitis, fatty liver and hypertension were the top three diseases in 2012. In 2013, the top three diseases were hyperlipaemia, hypertension and fatty liver. With the college enrollment expanding, the staff members are over-burdened, and many of them keep bad habits, which leads to increased incidence of various diseases among the staff members. So relieving their stress and offering health education would be the priorities in the future. At the same time, the self-protecting and health care consciousness should be elevated.

Key words: Staff members; Medical examination; Health care

1 Introduction

Along with the rapid economic development and the changing of China's population constitution, the incidence and mortality of cardiovascular disease (CVD) have been rising constantly (Murray, 1996). Although the current medical technology is more and more mature, but the number of patients died of cardiovascular disease is up to 15 million each year (Gao, 2014). Cardiovascular disease has become the leading cause of death in the world (Yao, 2013). At present, the number of cardiovascular disease patients in our country is as high as 300 million, and 3 million people died of cardiovascular disease every year, which accounted for 51% of the total causes of death (Ma, 2012). According to this calculation, 1 people were killed by heart disease in every 10 seconds. Hypertension is a common chronic disease, which is characterized by sustained increase of arterial blood pressure "cardiovascular syndrome", it is the most important risk factors of cardiovascular disease, and is a major cause of death of cardiovascular disease in China (Revision committee of the Chinese hypertension management guidelines, 2014) For either the western or Asian population, hypertension is considered one of the most important but also preventable causes of CVD and renal disease(Klag, 1996; Collaborative, 1998). In the past decades, the prevalence and total number of patients suffering from hypertension have been increasing. The number of Chinese adults with hypertension grew from 30 million 1960 to 59 million in 1980, and it further rose to 94 million in 1991(Gu, 2003). In recent years, the prevalence rate of hypertension increased rapidly, according to the previous adult hypertension prevalence rate of 3% average annual growth projections, the 2012 hypertension prevalence rate was 24% (Yang, 2014). According to the growth rate projections, 2016 hypertension prevalence rate will up to 36%. Highly-educated and senior cadre of Wuhan University of Technology is the backbone of the research and teaching activities. To understand the health status and to build the family health records of highly-educated and senior cadre, medical examination was administered in 2012 and 2013. On this basis, the preventive health care strategies can be formulated to promote the general health level of the staff members of our university.

2 Subjects and Method

2.1 Basic characteristics

A total of 933 staff members in the three campuses received medical examination (252, 426 and 253 staff members from east campus, west campus and other campus, respectively). The data of 897 staff members were complete, while the data of 36 staff members were incomplete. The composition of participants with complete medical records is shown in Table 1. The total number of staff members expected to receive medical examination in 2013 was 1261 and 984 of them received the medical examination. Thus the participation rate was 78.03%, as shown in Table 2.

2.2 Items of medical examination

The medical examination was thoroughly planned and the equipments and materials needed were purchased according to the plan. The medical examination form was redesigned for the convenience of building family health records. The newly added information included ID number, residence, contact number, previous medical history and life style. Therefore, the medical staff can timely inform the participants of the medical examination results. Moreover, the test report number was identical with the medical examination form number in order to avoid potential errors. Health education prescription was attached to the medical examination form so that the staff members could take appropriate countermeasures based on the medical examination result. The items of medical examination were as follows: general items, examinations in internal medicine, surgery, dermatology, neurology, gynaecology, ophthalmology, otorhinolaryngology, and stomatology. The tests taken included digital radiography, anteroposterior chest radiography, 12-lead electrocardiography, B-ultrasound of liver, gallbladder, pancreas, kidney and spleen, routine blood test, blood lipid test (4 items), liver function test (2 items), urine acid (UA), kidney function test (2 items, UREA, Cr), glucose test (Glu), hepatitis B virus test, alfa feta protein (AFP) rapid test and routine urine test (10 items).

Table 1 Basic Information of Staff Members Receiving Medical Examination in 2012

	Retired with honors	Retired	On the job	Total
Number of participants	107	374	416	897
Female	28	55	78	161
Gender ratio (male/female)	2.82/1	5.80/1	4.33/1	4.57/1
Average age (years)	80.0	69.8	48.0	60.9

Table 2 Distribution of Staff Members Receiving Medical Examination in 2013

	Number of retired staff members expected to receive medical examination	Number of in-service staff members expected to receive medical examination	Total		Participation rate
			Total number of staff members expected to receive medical examination	Total number of staff members having received medical examination	
East campus	185	164	349	256	73.35
West campus	242	332	574	471	82.05
Yujiatou	236	102	338	257	76.03
Total	663	598	1261	984	78.03

3 Result and Analysis

Table 3 and Table 4 show the result of medical examination among highly-educated and senior cadre of Wuhan University of Technology in 2012 and 2013.

3.1 Expenses

The total expense of medical examination was 311087.9 yuan in 2012. The charge for basic items was 260yuan per person, and the total was 242580 yuan. The charge for additional items was 68507.9 yuan and the charge per person was 333.43 yuan. The charge for additional items per person was 73.43 yuan. The charge for additional items per person among staff members retired with honor was 282.5yuan and that for ordinary retired staff members was 72.33 yuan. The charge for additional items per person among in-service staff members was 44.54 yuan. The expense was the highest for staff members retired with honor and the younger the age, the lower the expense was. This is because the health conditions usually deteriorate with age and the risk of various diseases increases (as seen from the result of medical examination).

3.2 Disease distribution

As shown in Table 3, hypertension had the highest prevalence among 6 major chronic diseases. The prevalence reached 51.40% among staff members retired with honor. The prevalence of malignant tumors was not calculated and that of chronic obstructive pulmonary disease was not calculated either due to very low incidence. The prevalence of hypertension, diabetes, coronary heart disease and cerebrovascular disease increased with age (participants retired with honor, ordinary retired participants and in-service participants were considered as three age groups). This is obviously seen from the

difference of statistical significance in disease distribution and the charge per person among the three groups. Fatty liver (43.75%) and chronic pharyngitis (51.20%) were the most prevalent diseases among in-service participants and the prevalence increased significantly at younger age. About 20% of the participants had hyperuricemia and the prevalence of all six major chronic diseases increased with age, as was generally expected. The high prevalence of chronic pharyngitis among in-service staff members can be explained by the nature of the teaching occupation, and this indicates the need for a more proper schedule of teaching time. The high prevalence of fatty liver and hyperlipidemia (19.95%) among in-service staff members was associated with occupation, life style and dietary habits. To prevent and control the major chronic diseases, it is crucial to strengthen physical exercises, control body weight and refrain from eating too much or food high in animal fat and sugar. Fresh vegetables and fruits are highly recommended and smoking and excessive drinking should be stopped. As seen from the medical examination result in 2013 in Table 4, chronic diseases were also prevalent, especially metabolic disorders including hyperlipidemia, hyperuricemia and fatty liver. All of these chronic diseases are associated with bad habits and poor prognosis of cardiovascular and cerebrovascular diseases. However, hypertension, diabetes, coronary heart disease and cardiovascular events can be prevented and controlled. To promote overall health, health education is needed to reiterate the importance of reasonable diet (food low in sugar, salt and fat) and routine aerobic exercises. As to the prevalence of malignant tumors, 5 participants were suspected of cancers in 2013, 2 participants were scheduled for selective surgery followed by pathological confirmation, and 3 participants were not yet contacted.

Table 3 Result of Medical Examination Among Highly-educated and Senior Cadre of Wuhan University of Technology in 2012

Disease	Retired with honor		Retired		On the job		Total	
	Number of cases	Prevalence (%)	Number of cases	Prevalence (%)	Number of cases	Prevalence (%)	Number of cases	Prevalence (%)
Hypertension	55	51.40	140	37.43	50	12.02	245	27.31
Diabetes	19	17.76	33	8.82	14	3.37	66	7.36
Coronary heart disease	16	14.95	17	4.55	0	0.00	33	3.68
Chronic obstructive pulmonary disease	1	0.93	1	0.27	1	0.24	3	0.33
Cerebrovascular disease	10	9.35	11	2.94	3	0.72	24	2.68

Kidney function deterioration	Cr	57	39	31	127	17.28
	UREA	22	8	13	43	

3.3 Comparison of prevalence of chronic diseases in 2012 and 2013

Fig. 1 shows the comparison of prevalence of chronic diseases in 2012 and 2013. The proportion of staff members having hypertension and fatty liver declined in 2013, especially fatty liver, but the prevalence of hyperlipidemia increased slightly. Excess calorie intake, insufficient physical exercise, high sodium chloride intake and excess drinking are the major causes of hypertension (Wan, 2000). Patients with alcoholic fatty liver should stop drinking and those with dystrophic fatty liver should increase the intake of proteins, amino acids and choline. Supplementation of polyene lecithin is effective against fatty liver, while patients with drug-induced fatty liver should stop medication immediately. In recent years, the prevalence of hyperlipidemia has been rising in China (Li, 1996) because of high-fat, high-cholesterol and high-sugar diet and lack of physical exercise (Liu, 1997). Chen adopted non-drug interventions combined with knowledge-attitude-behavior therapy for hyperlipidemia patients so as to fundamentally change the life style (reasonable diet, proper physical exercise and losing weight) (Chen, 2002) and thus to reduce the blood lipid level.

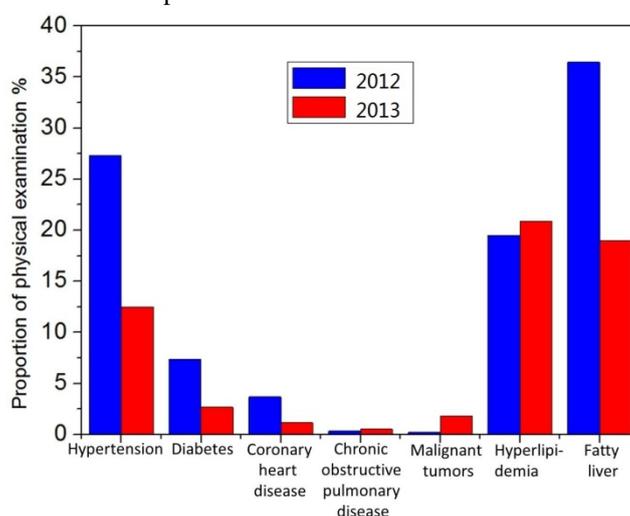

Figure 1 Comparison of Prevalence of Various Diseases in 2012 and 2013

4 Conclusions

Through medical examination, we have gained a comprehensive understanding of the health conditions of highly-educated senior cadre of our university. The family health records are built and the health education program is also underway. Except the increasing prevalence of hyperlipidemia, chronic obstructive pulmonary disease and malignant tumors compared with 2012, the prevalence of all other diseases declined in 2013. This indicates effectiveness of the health-promoting countermeasures implemented at school. But some defects still exist. For example, the propaganda before medical examination is not enough, the equipments for medical examination are outdated and the participants have to go to different places for different examination items. So more investments in equipments and more medical staff are needed and the rules and regulations of medical examination should be perfected.

The participants should receive medical examination at the university hospital according to the time notified. Finally, health education program should be enhanced to raise the awareness of control and prevention of six major chronic diseases.

The Relationship Between Second Cultural Acquisition and College English Teaching for Non-English Majors

Ma Qian, Fu Zhuheng, Zhou Xiang

School of Foreign Languages, Wuhan University of Technology, Wuhan, P.R.China, 430070

(E-mail: 454805006@qq.com, 510753750@qq.com, 6149206@qq.com)

Abstract: Language and culture are inseparable, and they can influence each other. Learners always learn language and culture of the target language on the basis of understanding their native language and culture. This paper discusses the importance of cultural acquisition for language acquisition and analyze the relationship between the first and the second cultures of English learners, to drive language acquisition by cultural acquisition and to put forward some suggestions to promote the level of college English teaching for non-English majors.

Key words: First culture; Second culture; Non-English majors; English teaching

1 Introduction

The process of language acquisition is inevitably accompanied by the process of cultural acquisition. Acquiring a foreign language means the acquisition of the culture carried by it. On the other hand, cultural acquisition also affects the level of language acquisition. Sapir-Whorf theory believes that speaking a foreign language means a transformation of cultural perspective (Carroll, J.B, 1956). Learners' second cultural acquisition is always on the basis of their first culture, so improving English learners' abilities to understand and use the target language and culture in the native language environment is the key to English culture teaching.

The second culture acquisition is an emerging discipline. In the west, Hamers & Blanc (1989) put forward the success of second language acquisition is bound to be accompanied by second culture acquisition. Acculturation model created by J.Schuman is one of the main theories of modern foreign language learning. In China, "cultural studies" began in the 1980s, triggering a discussion in the field of language and culture teaching. At present, second language cultural acquisition has still been leading to the attention of researchers. Cao Luman (2011) analyzed the influence of the deep cultural migration on second language learners' pragmatic competence. Meng Ruoyu (2013) combed the development of second language acquisition research in the west. Gao Yuanyuan (2013) put forward the combination of cultural acquisition and the teaching goal. Tan Huiming (2014) emphasized the necessity of the cross-cultural foreign language teaching, and emphatically discussed the teaching goal, content and method of the cross-cultural foreign language teaching.

2 Language Acquisition and Cultural Acquisition

Current research on the relationship between language and culture is divided into two main categories: linguistic determinism and cultural relativism. Linguistic determinism holds that language and culture are relatively independent and different cultural societies use language in their unique ways, while cultural relativism believes that the ways people perceive the world are so similar that the communication between cultures and races is well-reasoned. Although there is a divergence between those categories, they both admit the inseparable relationship between language and culture. Every language carries corresponding cultural connotation and every culture conceives a unique language. Language is flexible because of culture. Meanwhile, culture is real because of language.

Language acquisition and cultural acquisition make each other possible. They are mutual development. Language acquisition must be accompanied by the corresponding cultural acquisition in the process. If it adapts the culture, language acquisition will be promoted. If not, language acquisition will be impeded. Cultural factors in language can affect the process and result of language acquisition. The appropriateness of language use is also inseparable from the social cultural knowledge.

Under normal circumstances, foreign language learners have already had a complete set of the first cultural system before they begin to know the second culture. Because of the cultural concept based on the first cultural system, social distance and psychological distance towards the second culture will become the key factors that influence the second language acquisition. Therefore, the cultural acquisition plays an important role in language acquisition. The differences between learners' native language culture and the target language culture and learners' intercultural communicative competence

will directly influence the second language acquisition. Language acquisition is a process of communication with another culture. Only abstract and blunt language knowledge is not enough. Cultural awareness in language acquisition (cultural acquisition) is the main content of cultural studies in recent years (Fiske, John, 1989).

3 The First Culture and the Second Cultural Acquisition

The first culture refers to cultural information in native language while the second culture refers to that in the target language. Under normal circumstances, the learners can acquire native language culture in the process of the first language acquisition. The process of second cultural acquisition is different from the first cultural acquisition. Learners have had a complete system of the first culture before they acquire the second culture. However, every culture system contains two types of cultural orientation, "central culture" and "marginal culture". Central culture refers to the formation of world outlook, values and outlook on life in the specific cultural background for a long time. Generally speaking, it is difficult to change; marginal culture usually refers to a person's daily living habits and behaviors which are easily affected by the outside world. Therefore, the process of second cultural acquisition is mainly embodied in the learners' transformation and extension towards the first culture system, especially the marginal culture in it. If learners' first culture and second culture are similar or learners are familiar with the second culture, their abilities of second cultural acquisition will be stronger.

According to the relationship between the first and second cultures, stages of the second cultural acquisition generally include cognition, conflict, selection and fusion:

- 1) Cognition. Contact with the second culture with curiosity and absorb some of it.
- 2) Conflict. Understand the second culture deeply and find personal conflicts between two cultures to show anxiety and depression in process of adapting to the new culture.
- 3) Selection. Make choices from the cultural conflicts.
- 4) Fusion. Blend two kinds of cultural concepts; accept the second culture without giving up the first culture and apply different cultural concepts in different cultural environment.

To study the four stages of the second cultural acquisition, 50 English learners are interviewed and analyzed to show the process of learning and understanding the foreign culture. We obtain a general result from the survey in which emotion and time are the two main parameters.

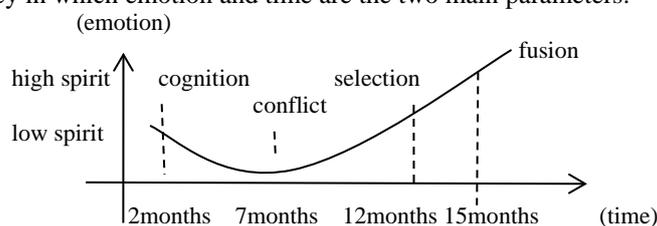

Figure 1 Stages of The Second Cultural Acquisition

As Figure 1 shows, students in contact with the second culture around two months will enter the first stage, in which with preliminary acquaintance with the new culture, they feel very curious about everything, and want to know more about the new culture with a high spirit. Seven months later, they gradually encounter a number of conflicts between their native culture and the new culture. In this stage, students can't adapt to some of the new culture and show depression and anxiety about it. Then after a period of depression, they must learn to choose between the two cultures in order to avoid those conflicts. Generally speaking, about fifteen months later, a few students will finally adapt to the new culture, and enjoy high spirit of learning.

There is a certain degree of similarity and individuality in both cultures. Similarity and individuality between different languages and cultures may become the motivation of learning foreign language for learners. At the same time, it also can be the obstacles of learning. In terms of cultivation of cross-cultural ability, the exclusiveness of culture, namely "psychological rejection of the native culture (especially spiritual cultural part) towards a foreign culture different in certain degree" (Gu Jiazuo, 2000), can be either the interference factors for foreign language learners or the favorable opportunity to cultivate the students' cross-cultural awareness and sensibility to the cultural differences. In the process of learning and using the second language, learners always try to replace corresponding concepts in two languages. Because of lack of cultural equivalence as well as ingrained habits and influence in the native language, it is not easy. Therefore, on the basis of knowing similarities and differences between the first

and second cultures, taking examples by the first cultural acquisition, foreign language teaching is consciously cultivating the second cultural acquisition ability and cross-culture ability.

4 The Current Situation of College English Teaching for Non-English majors and Some Recommendations

With the deep research about the relationship between language and culture, and the combination of language and culture in foreign language teaching, more and more people have realized the importance of culture teaching in foreign language teaching. This paper attempts to combine culture and language, and puts forward some suggestions for English teaching based on the analysis of the present situation of college English teaching for non-English majors.

4.1 Improving the traditional teaching method and combining language teaching and culture teaching

Basic English has always been the target in college English teaching in China, resulting in mechanical teaching of teachers, and passive learning of students. Under such condition, English teaching takes enormous effort but produces low effect. In recent years, the embarrassing situation of "high scores and low abilities" in English teaching is obvious. Although colleges have made a series of reforms, the major teaching mode still takes "listening, speaking, reading, writing and translating" as the main teaching content. In the process of second language acquisition, one will inevitably experience "cultural conflict" or "culture shock", if he only pays attention to the semantic equivalence, but ignores the cultural characteristics of language domain (Du Xueze, 1999).

In English teaching, educators should pay attention to the cultivation and improvement of learners' second cultural acquisition, and add culture communication function to the traditional teaching method in language skill training. Educators should design classroom teaching in different ways according to learners' professional interests. Meanwhile, they should make students feel the charm of culture in the osmosis by combining cultural teaching and language teaching in class. At the same time, educators should guide students to see different languages and cultures in an equal way, and adjust the conflict between the target language and native language culture to cultivate students' cross-cultural awareness, improve learners' cultural adaptability, and promote their second language learning.

4.2 Transferring the thinking mode and setting up correct learning concept

Because of the influence of school education, social environment, personal values and other aspects, the concept of "language is a tool" is still prevailing. Especially in college English teaching for non-English majors, most learners, even the educators see English only as a communication tool, a means to make money or obtain employment. Learners always learn English passively. Most of them only pay attention to the language knowledge which is useful to the test, but ignore the knowledge related to culture.

In vision of current globalization, along with foreign language teaching reform developing into a deeper level, foreign language researchers have a more profound understanding about foreign language teaching: a foreign language is not just a "tool" of communication, but a carrier of culture; foreign language teaching should not be narrowly limited as a "tool", and we should hold "foreign language professional view" and "foreign language education view" (Hu Zhuanglin, 2002).

Educators and learners should abandon the concept that "language is a tool", and establish a correct concept of foreign language teaching. We must pay more attention to the culture related to language, when we learn basic language knowledge and skills. Foreign language learning is not merely a tool to obtain a specific "earnings", but a process of understanding the target language culture, expanding the way of thinking, and improving our overall quality.

4.3 Dealing with the relationship between the two cultures correctly and creating an atmosphere of "Inter-lingual Culture"

Today, academia advocates cultural teaching, and emphasizes the contact between learners and the target language culture. But there must be some differences between two cultures. Sometimes excessive emphasis on the culture of the target language seems to force learners to make a choice between the two cultures, and even force them to abandon their native language culture. It will increase the learners' psychological stress and emotional obstacles of foreign language learning. All cultures are equal. When faced with the conflicts between the first and second cultures, we need not to make a choice between them. The best effect of culture teaching is achieving an effective interaction between two cultures by using different cultural values in different communication environments.

Thus, in the process of culture teaching, educators should guide the learners to strengthen their

cultural sensitivity, and maintain an objective attitude towards the two cultures, rather than push learners to identify or criticize any culture. Culture teaching is to cultivate students' cross-cultural awareness instead of a simple interpretation of cultural knowledge. Acton puts forward the theory of perceived social distance in the process of learners' second language cultural adaptation. He believes that there is an optimal timing of perceived social distance during the period of the second language learning in a second culture. Despite distance between learners and native language culture or between learners and target language culture is either too close or too far, which is not conducive to learning. Keeping a certain distance is helpful to second language learning (Bi Jiwan, 2009).

"Inter-lingual culture" is the integration of first and second culture. In this cultural atmosphere, it requires learners not only to acquire second culture, but also to keep up the first culture. When faced with cultural conflicts, learners should see the similarities and differences between the two cultures with a tolerant attitude and an expanded thinking, not as a simple trade-off. In classroom, educators build an atmosphere of "inter-lingual culture", which can not only help learners to get rid of the "stereotype", but also avoid "cultural conflicts" and "culture shock". Providing good psychological and emotional premise for learners makes sure a further improvement of their language abilities.

5 Conclusions

The research of second cultural acquisition has been the most important aspect in the second language acquisition and teaching. It is very necessary for the healthy development of foreign language teaching to identify the relationship between language acquisition and cultural acquisition and to emphasize the importance of cultural acquisition in foreign language teaching. On the other hand, from the perspective of the relationship between the first culture and second culture, studies of the second culture must start from the first culture in order to achieve dynamic balance between the two cultures. In the end, promoting language acquisition by cultural acquisition further improves the level of college English teaching in China.

Reflections and Countermeasures for the Guiding Role on University Graduate Employment

Li Xuwei, Tian Shi, Song Shaokun, Shen Guofang

School of Materials Science and Engineering, Wuhan University of Technology, Wuhan, P.R. China, 430070

(E-mail: 11922502@qq.com, 1125048641@qq.com, 493483093@qq.com, 1325049580@qq.com)

Abstract: Difficult employment for university students has become a prominent social problem in recent years, which is inadequate to blame on the university expansion or employment structure defects. The employment of university students is greatly influenced by the changed conception of university students employment. This thesis briefly makes analyses of the current employment situations and issues on employment conception of Chinese college students. The underlying reasons are analyzed from the perspective of college students and higher institutions, countermeasures are put forward from the perspective of college students, college counselors and higher institutions. All of these are based on the current tough employment status of college students and the features of market economy under the new situation.

Key words: Chinese college students; Employment; Employment status

1 Introduction

The issue on the difficulty of university students employment comes with the university expansion, which was not so prominent to draw the attention of the public before. It was not until 1999 that this issue gradually become the focus of societies and public opinion and eventually become a prominent social problem. The development of China's economy inevitably contributes to the demand for talents, economic restructure will facilitate adjustment in personnel structure accordingly. The increasing number of college students and unreasonable talented person system, etc. College counselor, the guider of students in ideology and behavior, is an important bridge between students and the society. Faced with the tough job market, college counselors should play an active role and carry out employment guidance work better. It's of great significance and necessity to help foster in university students the correct outlook on careers, values, life and even the world, which is the most important mission when carrying out the guidance work of university students employment.

After searching in China National Knowledge Infrastructure, university students employment as the keywords, we find four typical theses that have great significance in guiding university students employment, whose time span is between 2007 and 2011.

Dong Shijie (2007) adopts the method of empirical investigation and document analysis aiming at the situations and development tendency of the decreased university students' successful employment in his article<University Students' Successful Employment Research>, which analyzes the reasons for university students' failed employment in terms of the changing conceptions in employment, methods of employment guidance, specialized establishment in universities and the situations of job markets.

Zhao Mingjun (2010) puts forward an idea that the situations of university students employment are resulted from four factors including society, school, family and students themselves in <Analyses the Current Situation Analysis of University Students' Employment and Education Countermeasures>.

In <Analysis of University Students Employment and Countermeasures Research>, Wu yi (2011) says that in order to further implement the combination of micro employment guidance and macro employment guidance, we should Improve the pertinence and effectiveness of employment guidance work and make counselors play their fundamental roles.

Wu bing, Duan Jinyun and Luo Shoujian(2010) draw some conclusions in<Literature Review of University Graduates Abroad Employment: Traditional Factor Analysis>⁴by summarizing the documents of Saks, Ashforth(1999), B.E.Saks(2006) and so on. It points out that foreign countries focus most on the characteristics of graduates themselves and analyzes the factors that influences college graduates' employment from the perspective of psychology, pedagogy, economics, sociology and management science.

2 Current Employment Status of College Students

As the increasing of university enrollments, the number of college graduates is constantly rising.

However, the society has not yet ready for the employment of college graduates when the number of college graduates is increasing rapidly.

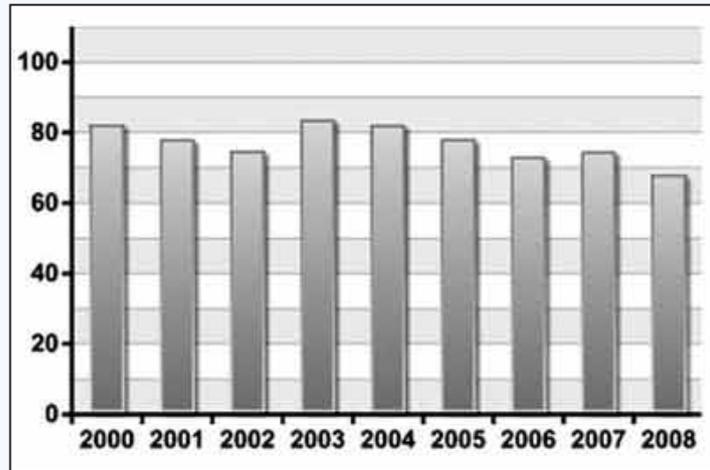

Figure 1 The Employment Trend of Colleges and Universities in Wuhan

To put it in a more simple way, the supply is far below the demand. At the same time, unreasonable employment structure also leads to the increasing difficulty to obtain a job for college students. According to statistics, the number of college students across the nation is estimated to reach 7.5 million in the year of 2015, which are called “the hardest year for job-hunting” by the net group. Data in 2013 shows that the number of employed college student accounts for 43.5% of the total of graduates, while the number of unemployed college students is 23.4%. Above data intuitively indicate that the current employment status of Chinese college students is getting more and more severe. Some scholars refer to the difficulty of university students employment as structural unemployment, they hold the view that university students are reluctant to go somewhere like small and medium-sized cities, county and especially western districts where the disparity of wages, working environment and welfare is relatively large between the real labor market and what they require. Therefore, to resolve the problems of university students employment, we need to find out the primary contradiction existing in the process of their obtaining employment.

Table 1 Employment Status of Students in the School of Materials Science and Engineering of Wuhan University of Technology in 2010 to 2015 ^②

	2010	2011	2012	2013	2014	2015
Employment Rate	91.72%	94.95%	96.75%	94.80%	93.15%	94.79%
Acceptance Rate of Postgraduates	35.06%	34.04%	46.16%	44.80%	48.07%	52.7%
Rate of Flexible Employment	2.20%	4.65%	4.03%	3.60%	2.74%	Not Available

--Data From White Paper on the Employment Status of Graduates in Wuhan University of Technology

The School of Materials Science and Engineering has been the key development department in Wuhan University of Technology. Majors like Material Chemistry, Material Engineering and Material Physics in the School of Materials Science and Engineering have cultivated urgently-needed talents for the society. The table below shows the employment status of undergraduates in the School of Materials Science and Engineering in the last five years. The percentage of employed undergraduates is obviously higher than that of the unemployed. All of these are closely related to the professional training of students in the School of Materials Science and Engineering, which offers majors confronting to the urgent need in the society. It is obvious that the employment status of college students in the School of

Materials Science and Engineering of Wuhan University of Technology has been better than the average of Chinese college graduates. However, when we guide students of Materials Science and Engineering School in Wuhan University of Technology employment, we find that it's not the decreasing employment positions but the deviation between students' expectations of obtaining jobs and realistic demand—Their employment conception can not keep pace with the fast-changing market that basically cause the difficulty of university students employment. The students should be guided to form a correct view of obtaining employment by universities, or a series of problems will do harm to the development of these students in the aftermath.

Overall, the phenomenon of the difficulty for graduates to get jobs will lead to idle resources of human talents, which is a kind of waste and a loss to the society. Difficult to find a job will be extremely traumatic to the students, along with a series of mental issues. In this severe employment situation, college counselors should guide college students to apply for a job reasonably and take a correct attitude towards employment.

3 Reasons for the Austere Employment Status

3.1 Deficiencies of the plan and model of talent cultivation in higher institutions

3.1.1 Lagging adjustment in specialty structure

The specialty structure arrangement seriously disconnects with the structure of talents demanded, which is highlighted by structural unemployment among college graduates. On the one hand, relatively insufficient graduates of practical majors can not meet social demand. On the other hand, graduates of theoretical majors are relatively surplus. Due to the unreasonable education structure, there is a mismatch between the structure of talent cultivated by universities and the structure of talents demanded. As a result, structural surplus arises and a part of college students find it difficult to get employed.

3.1.2 Low proportion of practical teaching

What employers value traditionally was book knowledge rather than abilities? However, today the employers' focus has shifted to the combination of ability and knowledge. Chinese colleges basically follow the objective of personnel cultivation which puts emphases on imparting knowledge, and the students can not apply what they have learned into practice in this traditional class.

3.1.3 Inadequate employment guidance

Colleges servers for the graduates, mainly in areas like providing employment information, helping them go through procedures for employment, interpreting employment policies. However, what college graduates really need in job hunting are scarce, such as basic training of professional skills, cultivation of qualities required in workplace, career planning for college students and courses of professional etiquette. Especially how to provide the students with effective and high-quality employment guidance and information services and help them to establish a correct attitude in job hunting, which is what university students exactly needed.

3.2 College students themselves influencing employment

3.2.1 View of choosing and obtaining employment being out of line with the society

College students' view of choosing and obtaining employment is seriously out of line with the reality. There is a tendency in college students to follow the general trend, and division of distinction or distinction in labor inwardly. When they choose jobs, it's a general phenomenon that they would choose the positions of civil servant, public institution and overseas-funded enterprises in coastal developed areas and big cities like Beijing, Shanghai, and Guangzhou rather than choose the entry-level position like a village official in western districts that provide enough employment positions.

3.2.2 The lack of capacities and qualities in college graduates

Different levels of requirement are made by employers in ideological and ethical standards, professional quality, team spirit, interpersonal skills and practical ability to college graduates. What college students have learned in school is basically purely theoretical knowledge, and they are lack of the opportunity to apply the theories into practice. Exercises of capacities in adapting to new social environment and interpersonal communication are scarce in college graduates. As a result, college graduates fresh from the school are worse in practical capacities and qualities than those who entered workplaces earlier, which increases the training cost of enterprise.

4 Suggestions on Guiding Reasonable Employment for College Students

4.1 Guiding reasonable employment from the perspective of higher institutions

4.1.1 Reforming traditional education model and improving education system

“We need to comprehensively advance quality education, follow the law of education and the law of students’ physical and mental development, adhere to the principle of moral education first and capacity as the most important, so as to promote students to develop morally, intellectually, physically and aesthetically in an all-round way.” Higher institutions should speed up the transformation of the model of traditional exam-oriented education, and put emphasis on promoting the transformation towards quality education model. Higher institutions should innovate talents training system, teaching management system and school-running system. Reforms should be made in teaching content, teaching method, quality evaluation and college enrollment system. Comprehensive quality of students should be given a greater percentage, so as to evoke attention to self-quality among students. Higher institutions should not only value academic scores of students, but pay equal attention to improvements in academic scores and qualities, aiming at cultivating modern talents having revolutionary ideals, sound morals, good education and a strong sense of discipline.

4.1.2 Putting emphasis on education in practice, and combining theories with practice

We should vigorously develop vocational education, which combines theories and practice together. Thus vocational education students can apply their knowledge into practice. Investments in the education of graduates should be enlarged, better conditions and environment should be created and constructed. In this way, graduates could master a wider range of skills through study and exercise, such as technical skills, interpersonal skills and problem-solving skills. These skills can help graduates better prepared for employment. Free opportunities for studying in a given time enable college graduates develop comprehensive skills for effectively adapting to constantly changing market demand. Higher institutions should improve the quality of teachers. Major courses should be reasonably arranged, which combine professional theories and practice closely. Education in practical link should be strengthened to improve the practical capacity of students. In the course of teaching, emphasis should be put in cultivating the flexibility and adaptability of college students, and fostering high-quality applied, technical and compound talents suitable for social need.

4.2 Guiding reasonable employment from the perspective of college counselors

4.2.1 Improving their professional skills

College counselors, who play an important role in students’ college period, guide students all the time in both study and life. And college counselors need to perform their important duty to guide college students to obtain employment reasonably. As the development of society, job demand of the society for college students has become more and more strict. As a result, college counselors should help students to fully understand their career planning when guiding them to obtain employment reasonably. College counselors should help college students pinpoint the way of employment by using their rich experience. And, college counselors should have a professional and further development.

4.2.2 Helping the education of career planning and guiding students to establish a correct attitude towards employment

First, occupational assessment should be carried out to make the career orientation clear. Through doing occupational assessment, students can better understand his or her occupational interest and personality. Then when choosing a job, students can consider factors like interests, capacity, and knowledge storage. Thus, an optimum matching between the employee and the job can be achieved. Second, demand standards from the employers should be made clear by involving students themselves in employment. Low-grade students should be arranged to attend careers fairs to improve their sense of participation. Data sources: Wuhan polytechnic university graduates employment situation, the white paper in employment. In careers fairs, the students can communicate directly with the employers and get to know standards and requirements of professional demand, thus adjusting their career planning. Third, professional career designs should be carried out to make out career routes. Professional career designs should be carried out, aiming at equipping every student with his or her own career planning. Professional career designs should be planned, prepared and completed early. Hence, college students could be fully and mentally prepared before hunting a job, so as to achieve rational employment.

4.2.3 Tracking the follow-up services after the graduates take up occupations

Work on the employment of graduates does not come to an end even after the students take up occupations. Follow-up survey and feedback about the graduates should be collected by college counselors, who need to have a master of the working situation of the graduates in time. Gathering advice from the employers and graduates is of great importance in the work of college graduate employment. As a result, college counselors should do well in collecting follow-up survey and feedback, which is not only an inspection of the preliminary work, but also basis for future work.

4.3 Guiding reasonable employment from the perspective of college students

4.3.1 To establish a correct view of choosing and obtaining employment

College students should establish a correct view of choosing and obtaining employment, which claims choosing a job before being employed first. College students should take a right attitude towards employment, endeavoring to broaden employment channel and employment area. A long-term development, instead of a better platform should be attached more importance by college graduates, who need to plan for their future from a higher viewpoint. When choosing a job, college students should decide a reasonable expectation about employment based on their personal conditions. What's more, they should decide their professional orientations in stages and step by step. And, the deviation between expectation about employment and realistic job opportunities should be narrowed down constantly. College students should take an initiative to create job opportunities, bear the concept of entrepreneurship in mind, and have the dedication and courage to start business.

4.3.2 To strive to improve capacity and self-quality and offer to participate in social practice activities

College students should attach importance to foster job-hunting ability and comprehensive quality. To be a qualified builder and successor in the new century, college students should enhance scientific and cultural qualities and professional skills in an all-round way. At the same time, college students should try to adapt to the rapid development in science and technology and profound adjustment in industrial structure in contemporary China. Apart from fully mastering professional knowledge in class, the participation in class and school activities should not be ignored. College students, enthusiastic in these activities and public benefit activities, can get their teamwork spirit cultivated and exercise the abilities to organize, coordinate and associate. The possibility of obtaining employment successfully will be greater after the improvement of practice ability and comprehensive quality of college students in every aspect. On school days, college students can take part-time jobs in their spare time to accumulate social work experience. While hunting for a job, full preparation should be made to increase the chance of getting a job. Advantages should be made full use of and disadvantages should be avoided in job-hunting.

5 Conclusions

Employment of college students can not be solved in a short period. As a result, faced with increasing severe employment status, college students are supposed to treat problems in employment positively, endeavor to improve self-quality and adjust their attitudes towards employment. In order to make the knowledge structure of students educated match with the requirement of societies as well as possible and ease employment tension, universities should guarantee the education teaching qualities and better serve college students by adjusting information concerned timely according to social development needed, they also should establish students' employment information system rapidly and actively and work hard on offering equal and adequate employment information and guidance services that can help students make career decisions. Meanwhile, Counselors ought to strengthen the employment education and guidance of graduates and undergraduates, help foster students' scientific and reasonable employment conception, set up a sense of "get a job first, and then choose", change the conception of employment and position themselves correctly and don't aim too high.

Abstract: By analyzing current China's situations in informatization construction, major problems of informatization construction of China's colleges are analyzed: "focus on hardware upgrades, ignore software development", "focus on equipment assembly, ignore talent cultivation", "focus on sector development, ignored overall architecture". Three solutions are put forward to solve these problems in this paper: "clearly define overall plan, unify the standards", "build up professional teams, strengthen talent construction", "share data centers, standardize systems development", in order to play a guiding role in future informatization construction of China's colleges.

Key words: Campus informatization; Campus digitization; Data center; Data share

1 Introduction

Campus informatization is an important part of China's national informatization and social informatization, as well as the technical support for reform and development of higher education institutions. Campus informatization refers to advanced information technologies such as computer technology, network technology, multimedia technology and etc, which are introduced from all areas of university teaching, management, scientific research, service life and etc. The use of these technologies will assist in teaching, research and management activities, achieve efficient scientific and standardized management, assist with school management objectives, enhance the teaching, research, management level and work efficiency.

The colleges informational construction in our country has made breakthrough progress in recent years. Competent departments and colleges attach great importance to the informational construction, they have invested a lot of time, energy and financial resources. According to statistics from ministry of science and technology development center, 92.7% of university has built their own campus network, and thousands of universities are in the construction. Among the universities which have their own campus network, 98.4% has realized office automation and scientific research network. In addition, 90.5% of the classroom has connected to the network, 74.3% of the students' dormitory implements the networking. Thus, the colleges informational construction in our country has begun to take shape, the way and details in informational construction are increasingly rich.

In the last century 90s, China is striving to build information colleges. The network information technique is reforming the management thought and manner in tertiary institutions in a revolutionary way. At present, the information technology in China has been widely applied in college education, management, scientific research. The main research contents for colleges informational construction in our country are "Campus One-Card-Through System", "Virtual Campus", "Digital school" and so on. On the whole, colleges informational construction in China has completed the hardware infrastructure research stage, entered into a new stage of comprehensive application resources research. Compared with the colleges informational construction in our country, foreign more earlier, and they have a stable, large-scale technical team. Such as Sweden, Britain, the United States focus on the investment of colleges informational construction, especially for the United States, the campus informatization development in the developed countries abroad headed by the United States, started earlier, planned farther, invested more and led our country by near a decade. In general, pay attention to share and manage network teaching resources, develop and use remote teaching system, share education resources by means of information technology is the main research way for colleges informational construction in foreign countries (Ji Hongfang, 2015).

2 The College Informatization Status

In recent years, China's universities have a relatively rapid development in informatization infrastructure construction. The construction of Chinese Education and Research Network has connected

more than 2,000 colleges nationwide. Modern distant education network has been built, which is providing services to more than 100 colleges.

Currently, all colleges have access to the Internet, the vast majority of colleges have set up their own campus network, whose speed of backbone network has reached 100Mbps even 100Gigabit. China's campus informatization system has begun to take shape. The relevant authorities and universities attach great importance to their own informatization construction. The input of all aspects such as manpower, financial capacity and material resources are great. The long-term planning has been developed and the content of informatization technology gradually become rich.

3 The Main Problems Existing in the Construction of Campus Informatization

After years of infrastructure construction, China's campus informatization has indeed made great progress. The speed of informatization is accelerating and the momentum is also very rapid. But there are some problems as seen in Figure 1 in the informatization construction process of Chinese colleges and a lot of hidden dangers are exposed, which hinders the development of campus informatization to a deeper level (Zhang Guanghui, 2005).

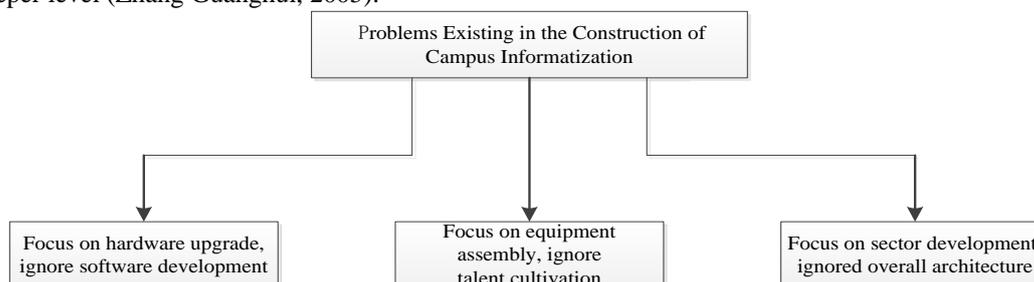

Figure 1 Main Problems Existing in the Construction of Campus Informatization

3.1 Focus on hardware upgrades, ignore software development

First, "focus on hardware upgrades, ignore software development" is a common problem in the informatization construction of higher education institutions. Pay attention to the purchase of equipment and upgrade hardware, contempt and ignore the investment of software development, which has been a very obvious trend in the informatization construction of present campus. The utilization of network resources is low and many sources such as teachers, students, administration and etc are not timely to be integrated, which makes the intensity of the informatization service is too large.

Second, the school invests heavily in the construction of the underlying hardware infrastructure but ignores the system maintenance and updating, and the processing depth is not far from enough. There is no further research and secondary development of system potential and another system is re-started, which puts a lot of funds, manpower. But because the costs of maintenance, updating and development are not in place, the device or system is not able to fully play the investment benefit, thus indirectly caused the failure of investment.

Moreover, many colleges ignore the construction of the campus informatization norms and institutions. The relevant norms and institutions are not perfect. The lack of information exchange standards and information exchange regulations further restrict the development of informatization.

3.2 Focus on equipment assembly, ignore talent cultivation

The second main problem that restricts the construction of campus informatization is that the colleges only focus on the construction and equipment assembly, but ignore the construction of the information group and the cultivation of the information quality of the teaching staff (Yu Feng, 2008). Foremost equipment need a team for professional management and maintenance, which has been overlooked by the current colleges in construction. There is a lack of a specialized technical team, especially the quantity, quality and technical ability of the management and maintenance personnel, who can not meet the needs of the informatization construction in colleges.

In the process of the informatization construction in colleges, along with the continuous development and innovation of technology, information platform gradually increased, and information facilities are also constantly in upgrading and replacement, so for college teaching and administrative staff especially older workers, requirements in information quality become more and more rigid. Many colleges ignore training and upgrading of the informatization quality in college staff after the construction of information environment, making the campus informatization environment become a

decoration.

Therefore, talent cultivation is the most important in the informatization construction. Only leaders at all levels attach importance to informatization construction, pay attention to the introduction of professional talent, training and improving the staff related ability, management and maintenance of the informatization hardware and software facilities, the construction of development team, can the investment benefit of informatization construction to be ensured.

3.3 Focus on sector development, ignored overall architecture

At present, the third problem existing in the process of campus informatization construction is lack of consideration of the overall architecture. Attentions are only paid to the department development, but the unified planning and resource sharing are ignored, resulting in the disunity of standards, poor overall coordination ability, waste of resources and inefficiency. Due to the various demand of every department for the system and other factors, the development of various sectors of information is not balanced, and each sector is relatively independent of the development of their respective independent application system. The data linkage between systems is very poor and the resource sharing is restricted.

The existence of "information isolated island", the disunity of standards of resource construction and the lack of the overall framework restrict the further development of the campus informatization. Software and data structure of the system was inconsistent between the school and the college in the university, between colleges in the university, between the colleges with the functions of the department and between departments. Disability to share information resources makes some of the information resources become the "information isolated island". Departments of the school have poor coordination and lack of an overall development direction. And there are many problems in information resource sharing. All the reasons make low efficiency of management and office work, and greatly reduction of the benefits of informatization investment.

4 Solutions to the Problem of Campus Informatization

Campus informatization is a systematic project which is long-term, great and complex (Zhang Jin, 2011). Here are some solutions to the problems existing in the present construction as seen in Figure 2.

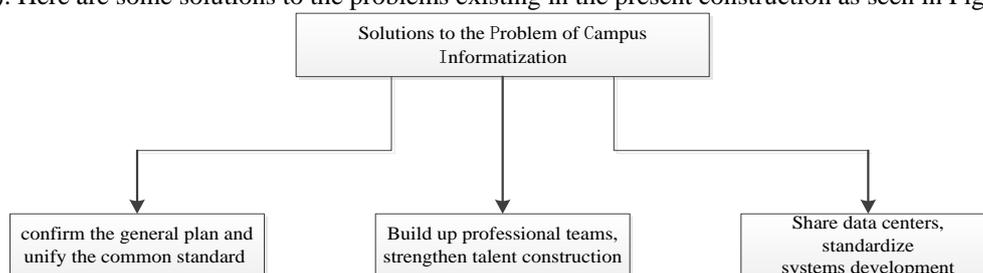

Figure 2 Solutions to the Problem of Campus Informatization

4.1 Confirm the general plan and unify the common standard

A good overall plan is indispensably needed in informatization construction. The colleges should build a united standards and norms, complete relevant system according to the characteristics of running a school and dominant subjects of each college. The build of standards and norms is propitious to unified leadership in informatization construction and it can make sure there is a united standard during the information collecting, handling, switching and transmitting. Besides, it can maximize the share of information resource and promote the collaborative development of college information system (Jiang Dongxing, 2011).

The global awareness about management informatization of departments needs further improvement. With the united guide and requirement of college, the system construction of various departments needs to be planned rationally and relevant database needs to be built to establish the foundation of data sharing and data interconnection barriers breaking. Apartments should put forward the requirements of data excavation and analysis according to actual requirement as early as possible. Meantime, the network center should enhance the technology guidance to each apartment about the actual application of information technology such as data excavation.

4.2 Build up professional teams, strengthen talent construction

Although the construction of campus informatization has a certain foundation, many colleges lack a professional group majoring in informatization technology and the training towards staff about informatization technology is far from enough. A group in which people are clarified, professional and

strong in technology power is necessary for campus informatization. In addition, the development and improvement of staffs informatization quality must be upgraded.

The construction of informatization is in an urgent desire of relevant talent. To improve the group construction of campus informatization talent, the “human-oriented” concept should be set up and the development and improvement of informatization professional talent group need to be valued by the leadership in colleges. In addition, it’s important to improve the informatization ability of all builder, especially the leader and manager in colleges. The colleges should organize some training for all staffs to build their informatization concept and service consciousness, strengthen the training, teaching and management towards people who engaged in the informatization system in each department. The relevant people’s ability about collecting, screening and managing the information should be upgraded and a united and healthy system maintenance and operation norm for each department should be completed as soon as possible. Thus, the work efficiency and service quality will be improved and it will lead to a high speed development of campus informatization construction.

4.3 Share data centers, standardize systems development

The data is core and key in campus informatization construction. Many colleges end up with redundant data, waste of information and repeat of effort for the reason of lacking of an united standard and data center (Wang Zirong, 2005).

The colleges can build large scale server and enterprise class database system to make up the basis of the whole informatization platform. This database basis may consist of students database, teacher database, file database, teaching resource database and manage resource database. There is a strong relevance between different databases. A specialized apartment is in charge of the maintain of the core data to confirm the normative and integrity of the data. Other apartments who need the relevant data should apply for the right of maintenance and use.

All apartments should follow a united standard engage in system development on the basis of an united data center to ensure that the system should fulfill the requirements as below: the unique identity of users; the unity of database development tools and development environment; the define of common interface for data sharing; the overall wholeness in application system construction and etc. Thus, the extend quality of the system will be improved.

5 Conclusions

All in all, there are some misunderstandings and problems in China’s campus informatization construction at present. To solve these problems, the leaders in colleges should ascertain the overall plan about campus informatization construction according to the need and characteristics of the college. To coordinate, introduce professional talent, unify the standard and make the overall advancement of campus informatization and digitization construction, the management should be done by an authoritative organization.

Abstract: As a result of a high population density in university student dormitories, it is susceptible to accidents that threaten personal and property safety of the students, which poses great challenges for security management in universities. It is an important initiative to introduce grid-based management for innovation of campus security management. By analyzing the current university students' characteristics and problems found in safety Management of college dormitories, this paper has put forward student safety grid-based management concepts and patterns with dormitories as base units according to the work reality and explored concrete grid-based management methods and measures to deal with all kinds of campus crisis and ensure student safety.

Key words: Grid-based management; Dormitory safety; University students; Safety management

1 Introduction

With the progress of China's modernization in higher education and expansion of the education scale, the traditional way to manage the school and provide a service to students is unable to meet the new demands (Wu Y, 2015). As there are some weaknesses in student education, service and management, in addition, ideological and political work in schools and school safety and stability management are confronted by more difficulties and challenges, these problems have to be solved by advancing education information using modern communication technology (Hao V Q, 2013).

At present, the university students' safety management, mainly including the crime, food poisoning, fire and other aspects of the management issues were researched by scholars from different angles (Yan X U, 2014). In foreign countries, many college students' dormitory security management can be used for reference to our country, especially Britain and the United States and other developed countries. Their national higher education develops relatively early. It is an important reference for the safety management of our college students' dormitory that they have a relatively perfect student dormitory safety management system and rich experience.

In recent years, our research on College Students' dormitory safety management, has become a multi subject auxiliary, qualitative and quantitative phase, the government began to pay attention to the safety of college dormitory management, but due to a late start, there are still many problems (Yang J J, 2014).

Grid-based management is a modern management thought based on division of the managed objects into a number of grid units according to certain standard to enable grid units to communicate information effectively between each other and share organizational resources transparently by using the modern information technology and coordination mechanism between the grid units, so as to integrate organizational resources, improve management efficiency (Fang L J, 2013). The concept of grid-based management was early applied in the city management, where grid administrators went on a tour of inspection within certain grids, they would report the detected problems if any and checked the solved problems with result feedback. With prompt feedback by grid-based management and targeted solution can be made to such problems, which is helpful for the college dormitory management. To explore grid-based student dormitory management in universities helps fully acquire information about students in universities, manage student service in a more timely, targeted and scientific way, which is an effective way to realize modernization of university management systems and abilities.

2 Existing Problems in Current Dormitory Safety Management Pattern

Since college-system management model was introduced, all colleges have been exploring new methods for safety management and they have built a safety management system with student work forces and student cadres at the core (Zhen-Jiang, 2016). However, there are still many problems in

safety management such as heavy workload and delayed information feedback, which are mainly caused by the following points:

2.1 No safety responsibility extending to students

At present, safety responsibility in universities is mainly taken by school, then down to college and instructor or teacher in charge of a class. However, students have no pressure of safety responsibility, so when they meet safety problems they fail to pay deep consideration, take heed of safety risks and have no self-responsibility consciousness for safety accidents.

2.2 Lack of staffs in charge of safety education, supervision and feedback

The safety work now mainly relies on school staffs responsible for logistics, security and student affairs, instead of giving full play to the role of the students. As staffs responsible for safety management have to take care of a lot of other work, they often cannot go deep among students to learn about safety situation of the students. Since students know well about each other, to give full play to the role of students in safety responsibility will not only lessen workload of the school staffs but improve accuracy and timeliness of the information.

2.3 Limitation with student safety guards

At present, student safety Management is mainly based on class as the smallest unit. Because of limited knowledge about the whole class, the monitor gives the class safety education and feedback in a small scale as before with gaps.

2.4 Low initiative of student safety guards

At present, due to lack of effective drive mechanism in the safety Management, student safety guards generally have low initiative, for example, there is a case where a serious safety accident was caused as a result of failure to report a small safety risk (Chen Z F, 2014).

3 Exploration of Applying Grid-Based Student Dormitory Safety Management Model in Universities

3.1 Construction of basic platform for grid-based management

3.1.1 Building grids

One or more adjacent dormitories are brought into a grid according to division based on student dormitories. Dormitories are taken as the first layer of grids, which are also basic grids, and heads of the dormitories are appointed as persons-in-charge of grid safety, namely grid members, responsible for the safety education and feedback of their own dormitories.

Classes are brought into the second layer of grids and class monitors are appointed as persons-in-charge, responsible for feedback of safety information of the whole class. Safety information of the class can be obtained from feedback made by heads of dormitories or from personal visits by monitors.

As persons-in-charge of grids, instructors are responsible for receiving, giving feedback of and dealing with safety information of their own grades of students. College secretaries in charge of student affairs are brought into the fourth layer of grids, responsible for receiving and dealing with significant safety information.

3.1.2 Setting up teams of grid members

Set up grid member team systems with involvement of dormitory administrators, student instructors and teachers in charge of a class based on a mix of full-time and part-time work. A dormitory head is appointed for each grid to serve as a full-time grid member. Basic requirement of a grid member is that he must be politically reliable, have strong sense of responsibility, love student management work, and have computer experience; his main responsibility is to collect and analyze different types of relevant information, and implement superior service management of students in the grid.

3.1.3 Building information networks

Build internet-working, interconnecting and inter-operating information networks based on campus networks and by using VLAN technology.

3.1.4 Building an integrated information system

An integrated data base was build base on fully acquire information about students and grid-based management. Student information includes information of ID cards, household registration, student status, family, physical and mental health and actual performance in school as well as other basic information and application information of students. And then build an integrated information system for grid service management of university students in accordance with the design requirements for "institutionalization, modulation and integration".

3.1.5 Building operation mechanism

Develop working system and operation procedures related to grid-based management of university students.

3.2 Goals of application of grid-based dormitory management

3.2.1 Acquiring information

Give play to the role of grid members, university and college leadership, staffs in charge of student affairs, staffs in charge of teaching affairs, and security officers to comprehensively and accurately collect student information in a timely manner. The system of grid-based management of student dormitories is a closed working link, which is a scientific problem solving system, as shown in Figure 1.

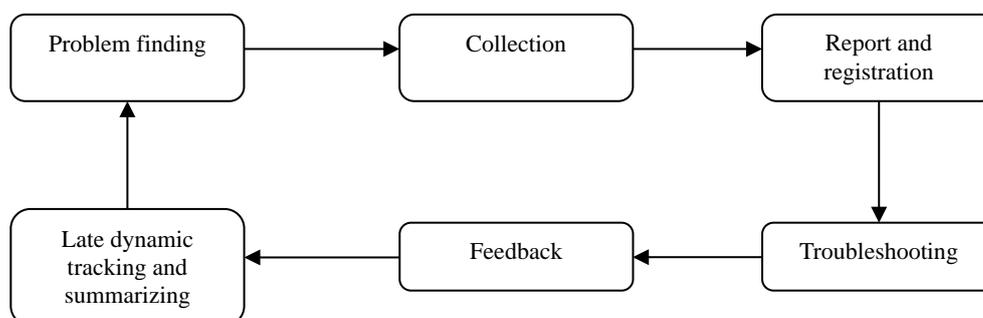

Figure 1 The System of Grid-Based Management of Student Dormitories

3.2.2 Management implementation

Fully use grid-based management tools to improve and strengthen daily management of students, so as to ensure their safety. Try to find and resolve disputes, give a timely report and take effective measures for management through analysis and comparison of related information.

3.2.3 Providing service

Include studies, life, health and safety, career guidance, subsidization and other service items of students in the service management platform, realizing “one-platform management, one-stop service and all-in-one transaction”.

3.3 Grid-based dormitory management ideas and methods

Reasonably classify responsibility grids according to the number of class leaders and the quantity of student dormitories to establish management systems at the level of department, class and dormitory. Grid-based management is based on division of grids, which is in accordance with the principle of “full coverage, clear definition, no blank, no overlapping”, requiring that grid division should be conducive to responsibility assignment and facilitate investigation into students and reasonable solution of the problems efficiently. Colleges and departments appropriately allocate figures within grids to establish high quality management service teams with good traits. Members of each team have to pay regular to visit to dormitories of the students within the grid for talks to collect and deal with questions and comments presented by students. Grid-based dormitory management system runs mainly by relying on the following mechanisms:

3.3.1 Information collection mechanism

Heads of dormitories of each class should collect dynamic information in time about students within the grids by conversation, observation, etc., and keep in contact with teacher in charge of the class and institution by email, QQ, We-chat, short message and call, to make the channel of information feedback unblocked.

3.3.2 Regulating handling mechanism

In accordance with the principle that “persons-in-charge of students gather collected information, college or department dormitory managers coordinately solve problems”, appoint specialized staffs for dormitory management within the department and record received information in time, to ensure that the problems can be effectively handled in a timely manner.

3.3.3 Supervision and feedback mechanism

Recorded incidents are subject to a supervision system, and the solved problems should be marked in the register book; as for any problems that fail to be solved in time a result of objective condition restriction, dormitory managers should make timely coordination and report to leadership in a timely manner, so that the problems reported by students can be settled and answered.

4 Significance of Grid-based Dormitory Management Model on Management of University Students

4.1 Having realized transformation of student management from extensive style to refine style

As the students born after 1990 enter universities, campus life is becoming richer as those students have strong curiosity and a wide range of knowledge with excellent ability of learning, critical thinking and expression, but they are lack of sense of social responsibility and times mission. Besides desiring to learn knowledge at school, they have increasingly diverse and personalized demands, so management of students is required to change from extensive style to refine style. The grid-based student dormitory management system with advanced foreign grid-based management concepts, based on segments of responsibility grids to carry out meticulous management of students in dormitories, has greatly enhanced effectiveness of management and contentedness of service.

4.2 Having realized transformation of student management resources from “strip-strip” based style to “strip-block” based style

For a long time, there have been limited resources for student management as it is the most grass-root work for the resources are not organically integrated at the lowest level. By introduction of grid-based management to integrate resources to the grass-root level, the transformation from solely relying on department student managers to integrating all forces including student cadres across the department, maximizing the Party’s organizational advantage and improving the efficiency of student management work.

4.3 Having realized transformation of student management from experience based style to democracy and science based style in decision making process

As there are more secrets, interests and other issues of students are involved in dormitory management, how to fully respect students and take into account of interests of students in all aspects in decision making process is a quite practical problem. Although opinions of students were emphasized in decision making process before, there were some problems such as insufficiency and incompleteness of their opinions and acquired information resulting in flawed decisions and execution block. Introduction of grid-based management system of student dormitories requires student cadres to go deep among students to listen to opinions face to face, so as to make decisions on the basis of opinions and wisdom of a wide range of people, to promote democratic and scientific decision-making process.

4.4 Having realized transformation of student management patterns from relatively closed style to more open style

Grid-based student dormitory management system further promotes openness of the college in student management patterns. The ideas of taking students as the core and doing practical and good things for students are followed to integrate resources and innovate student management mechanism, so as to maintain stability and safety on campus. Through this model, efforts are made to establish a full-coverage and full-service dynamic management mechanism in the work of managing students, to enhance the vitality of student cadres in student management and further improve the mechanism of management of students.

5 Conclusions and Expectation

Compared with the traditional management thought, problems arising from management activities can be detected in a timely manner with prompt feedback by grid-based management, and targeted solution can be made to such problems, which is helpful to overall and comprehensive management of the organizational resources.

Grid-based dormitory safety management is implemented to establish a grid-based management mechanism “horizontal to side, longitudinal to bottom, crisis-cross, fully covering, grading managed, responsibility well defined, layer based responsibly performing with responsibility assigned to individual”, where each performs its own functions, interacts with each other, and performs comprehensive supervision; establish and perfect all management systems, strengthen supervision systems, realize transformation of student dormitory management from working by a few to working together, from extensive style to refine style, from periodic movement to normalization; develop a long-term mechanism of institutionalized, standardized and normalized student dormitory management, so as to continuously improve safety management of universities and realize the goal of establishing a safe and harmonious campus.

In the near future, with the combination of artificial prevention and technical prevention, the Grid-based dormitory safety management system will be established to optimize the process

management constantly, and improve the scientific level of college dormitory management.

Soft Power in Wuhan: Results of A Survey of Building the World City and Attracting Overseas Talents

Lan Lan

Institute of Education and Psychology, Hubei Engineering University, Xiaogan, P.R.China, 432000
(E-mail: 870829610@qq.com)

Abstract: This paper investigates the soft power in Wuhan from building the world city and attracting the overseas talents. It based on a sample of urban construction in Wuhan for recently years. The findings show that there are some unbeneficial factors for Wuhan to become the world city like weak innovation ability, undeveloped international capabilities, severe ecological environment and low quality of human resource and other issues. And the conclusion is drawn that Wuhan should learn from international practices, establish international talent resource, improve the multicultural capacity of personnel structure, and attract overseas talent through multiple approaches in order to achieve an international talent market allocation.

Key words: Wuhan; World city; Soft power; Overseas talent

1 Introduction

In 1990, Joseph, a professor at the Kennedy School of government at Harvard University, published the article “power soft” in the famous American magazine “foreign policy”, which declared the birth of the concept of “soft power”. He argued that soft power was the ability of a country to build a state of affairs, with the aid of this situation, which enables other nations to develop their own tendencies in a manner consistent accordance to their own tendencies and interests. Joseph Nye proposed the concept of soft power, in the international competition pioneered the new field, in a certain extent, long-term latent in the international relations thought, culture, value outlook and political system of fighting clear open and the formation of the theory, so as to promote this series of disputes by ideological differences to the evolution of the cultural field (Joseph S. Nye Jr., 1990). In this sense, soft power is an important performance of the national comprehensive competitiveness.

The concept of urban soft power is mainly used in the academic circles, and it is mainly used to explain the resources or elements of soft power. Ma Qingguo scholars put forward: “in the city competition, through the construction elements of non-material culture, government management, citizen quality, constantly enhance the culture of influence, the political attraction, public cohesion and city image of affinity, thereby enhancing the overall urban competitiveness.” (Ma Qingguo, 2007). the city's soft power is defined as “the city with its culture and philosophy as the essence of the cultural soft power, social soft power and the soft power of the environment” (Chen Zhi, Yang Lake, 2008). The above scholars incline to explain urban soft power from the elements, but the soft strength emphasis on inner city soft power, for the globalization of today, how to help the city into the global urban network in the external soft power is also very important, and this external city soft power manifestation is the international communication. Therefore, Zhuang Delin scholars proposed “international metropolis of soft power should be both a city soft power of common features and the international metropolis of personality characteristics. There are 6 main sources of soft power in international metropolis: urban culture, public management, human capital, urban innovation, quality of life and international communication.” (Zhang Delin, Chen Xinkang, 2009)

2 The Basic Features of the World City

As we all know, the world city is the high-end form of international metropolis, in the global political, economic and cultural aspects, all show its tremendous influence. From the world recognized world cities, such as New York, London, Paris and Tokyo, can be summed up the basic features of the world's cities: the strong economic strength. The specific performance is that the economy is large, the per capita GDP is high with high degree of aggregation of international headquarters, and the economic structure is the core of the modern industrial system. The second, the international high-end resources flow and trading is huge. Because the world city as the international metropolis of high-end form, itself is a resources sufficient liquidity, efficient allocation of state and space, mainly in the convergence of top talent, high levels of information, strong international competitiveness, and the three-dimensional traffic system with high speed. Third is a huge global influence. As the external performance of the city's

soft power, the influence of the world city shows the cultural and public opinion, and reflects the organization and system of binding (Zhuang Delin, Yang Ying, 2010).

3 Analysis on the Soft Power of Wuhan's Construction of the World City

3.1 Profound cultural heritage

Cultural atmosphere of the city is a city of psychological formation and plays a role in the process, as long as people enter the city, you will feel and enjoy a "cultural city", it is infectious, virtually pervaded the city space society "climate" (Lian Yuming, 2010). Wuhan historical and cultural heritage are too numerous to enumerate, such as the Yellow Crane Tower which is called "the first floor in the world", and the Qingchuan of China Pavilion which is famous in Hubei. They are all the true portrayal that Wuhan is China's famous historical and cultural city. Wuhan has the Hubei Province Museum, Wuhan Museum, Panlong of China city museum and other famous museums, including Panlong of China city museum was discovered for the first time in the middle reaches of the Yangtze River region of China which the city site was the early Shang Dynasty (Wang Xingchang, 2006). City cultural atmosphere is so, and it is the result of a number of things to play a role beyond these specific matters and as an "impression" left in people's minds.

3.2 Superior geographical position and rich resources

The city's cultural soft power is built on the basis of the hard power, which is the economic foundation of the city, and the premise of economic development and city's cultural soft power is convenient transportation, Wuhan has obvious advantages in this aspect¹. Because of Wuhan since ancient times enjoy the title of "thoroughfare of nine provinces". This is due to its geographical location within the city richly endowed by nature, from rivers, lakes and mountains together, land and air traffic is very convenient. In 2009, Wuhan has become the country's first comprehensive transportation hub of the pilot city. In addition, as a core element of the construction of city soft power, the development of science technology and education, especially the cultivation of innovation is essential talents. Wuhan has abundant educational resources according to incomplete statistics, and up to 2014 there were 98 colleges and more than 1.0726 million graduate students in Wuhan, which was the number one in the world big cities. See the table 1: list table of patent applications in Wuhan (2014)².

Table 1 List of Patent Applications in Wuhan (2014)

Category of patent application	number	compared to 2013	Percentage
Invention patent application	11871	21.9%	42.7%
Utility model patent application	13783	-1.9%	49.6%
Design patent application	2148	13.2%	7.7%

3.3 Underdeveloped function of internationalization

The development of non-governmental organizations is imbalance, and the lack of international influence is the weakness of Wuhan City, intergovernmental organization and the international meeting industry development is relatively backward, which great limits the Wuhan City soft power promotion. For example, to attract the world's top 500 settled in the measure, the gap is obvious compared with some domestic city. Up to now, the world's top 500 enterprises reached 228 which settled in Wuhan, but lower than Chengdu (283) and other cities; at the same time, there were only 2 regional headquarters overseas top 500 and 6 foreign bank branches or offices in Wuhan, and there were large gaps compared with Beijing (the regional headquarters of a Multi-National Corporation were 82) and Shanghai (which were 347) (Zhang Zhen, 2013).

3.4 Inconspicuous talent advantage

According to the number of the sixth national population census summary, the number of college students was 25191 that the educational level of the resident population per 10 million people in Wuhan ranked third in the country, the educated population was 3.8 times the national average, which was Tianjin's 1.4 times and Shanghai's 1.1 times. But there was still a big gap compared with the developed countries. The proportion of college graduates in the United States was 60%, equivalent to 4.3 times

¹ Li Mo. 2049 Wuhan to Build the World City will Present the "1+4" Layout [EB/OL], <http://news.cnhubei.com/xw/wuhan/201311/t2770807.shtml>

² Wuhan Municipal Bureau of Statistics. 2013 Wuhan national economic and social development statistics bulletin [R], <http://www.stats-hb.gov.cn/wzlm/tjgb/ndtjgb/whs/whs/108937.htm>

higher than that of Wuhan; Japan and South Korea both was 30%, equivalent to 2.1 times that of Wuhan.

However, there are some problems about talent structure in Wuhan, some talented people who are specialized personnel in different fields are too many to waste, and some talent shortage can not meet the social needs. At present, the advantage in the world city is very obvious among high-tech industries, the financial industry and the cultural and creative industries. For example, there are 50%~55% employees staff were concentrated in these three industries in New York, London and Tokyo, Wuhan accounted for only 1.25% in the financial industry and cultural creative industry personnel, especially in the financial industry, while New York and London were more than 10%. Such a disparity gap proved strongly that talent industry distribution was not reasonable in Wuhan, especially in the macro industry and key personnel the industrial distribution.

3.5 Lack of scientific and technological innovation ability

R&D funds account for the proportion of GDP; R&D intensity is an important indicator of a country's level of investment in science and technology. In 2013, the high-tech industrial output values were more than 56.0447 billions ¥ which increased 23% in Wuhan, and the value of high-tech industries increased 17.019 billions ¥ which increased 25.6%. In the first quarter of 2014, the high-tech industry output value of the implementation was 2.55 billions ¥ which increased 22.35% in the first quarter in Wuhan. The funds for research and development invested were a substantial promotion, and research and development expenses expenditure were 255 billion ¥ which accounted for the proportion of the city's GDP reached 2.74% in 2013, although the total progress of R&D was larger, R&D investment in structural was obviously insufficient in Wuhan, because according to the international accepted standards, enterprises would be strong competitiveness if only corporate R&D funds accounted for operating income were more than 5%. But in 2013, there were only four enterprises that the proportion was more than 5%, and 33 Enterprises that R&D cost less than 1%, even 32 Enterprises that R&D was "zero investment" phenomenon. There was still a big gap between the world 500 strong enterprises in 5% to 10% level and Wuhan.

3.6 Worrying habitat environment

The greatest feature of Wuhan city is lakes and rivers crisscross, dotted. Existing total surface area is 2117.6km², accounting about 25.0% of Wuhan city land area. But its lake pollution situation is very serious, the specific data see table 2. Secondly, in the emissions of pollutants and waste gas, the total emission of industrial waste gas to 5873.2 billion standard cubic meters, and this increased 4.27% than in 2013. Motor vehicle emissions were 5.14 million tons, and this increased 2.8% than in 2013. Smoke (powder) dust emissions reached 2.75 million tons and this increased 7% than in 2013; the industrial smoke (powder) dust emissions 2.16 million tons, and this increased 9.1% compared to last year¹.

Table 2 Wuhan City Lake Status Monitoring List (2014)

Comply with the standard of grade II	Comply with the standard of gradeIII	Comply with the standard of gradeIV	Comply with the standard of grade V	Below the standard of Grade V	total
3	3	44	22	15	87
3.4%	3.4%	50.6%	25.3%	17.3%	100%

4 Results

4.1 Establish the international talent Heights to attract overseas talent return

Wuhan government should establish the open concept of talent in line with the international rules, think the problem of talents in the global open environment, and attract overseas talent to return to work, change the past "rigid management" into "flexible flow" to talent as the goal, make full use of global resources through the "flexible flow", and really construct the open international highland of talents in Wuhan. At the same time, the government should accelerate the establishment of the socialist market economic system to adapt to the talent, innovation and personnel system from the "policy" to "institutional innovation". One is to really form the employment standard with "paying more attention to capable and performance", and improve the selection and appointment of personnel. On the other hand, in order to Firstly, the government should study the internal distribution equalitarianism of entrepreneurs for innovation the distribution system to effectively stimulate. Second, we should actively explore the implementation of technology shares, intellectual capital and other elements of the incentive to

¹ Environmental Protection Bureau of Wuhan City, Wuhan City, City, the State of the Environment Bulletin.2014, http://cjrj.cjn.cn/html/2015-03/20/content_5426931.htm

participate in the distribution of the form for the scientific and technological innovation talents.

4.2 Focus on the integration of Eastern and Western culture

With the acceleration of the trend of economic globalization intensifies and international talent flow, the leap of global culture and Western culture fusion is inevitable. First of all, in the talent management culture, we must overcome the past concept that Education equals talent, advocate “performance culture”, and establish a scientific, objective and fair performance appraisal system (Wang Weiyi, Wan Xiaolan, 2005). Secondly, we should establish “using talents culture overseas”. In the introduction of talent, we should be tolerant to the culture identity difference on some overseas talent, truly tolerant people and retain people; in the selection of personnel, we should pay attention to the elite stage of elite talent and insist on promotion for merit rather than for seniority. Finally, we should the implement a “win-win” talent management culture and carry out cooperation and exchanges with the international talents in accordance with the principle of mutual benefit and common development.

4.3 Set up the international talent market

In the international talent market, we should establish the Wuhan international talent agencies in New York, London, Paris, Tokyo and other international metropolis, participating in the competition for talents in the world with a positive attitude and spirit. We should speed up the selection of high level talent and “international intelligence”, and introduce the world-class masters. Therefore, Wuhan should first develop and build an international level advantage and potential of the park and the industry, and provide excellent working environment and high-end platform to attract the world's highest level of experts and personnel; secondly, Wuhan should establish and improve the information base overseas senior talents, which included overseas senior experts database, senior experts overseas project library, overseas cooperative venture capital enterprise database, and so on, understand and master the international Talent dynamics in time. At the same time, we should set up a number of highly flexible head hunting company, as well as open and transparent bidding mechanism, and format the talent selection mechanism in line with the world trend, introducing the world-class master (Xu Wanqiang, Lan Lan, 2014).

4.4 Learn from international practice in attracting overseas talent

The developed countries are inclined to attract overseas talent who are in urgent need in the immigration policy of their talents. One is the high salary system, let science and technology people can realize their own value; Wuhan government should allocate special funds to improve scientific and technological personnel wages, especially to ensure the outstanding talents a good salary level. The other is to give the promotion opportunity, let employees feel attractive, such as foreign experts in Singapore now can participate in the administrative and business management from the past to undertake consulting work, and some even have served in the government department or bureau level cadres, served as president of the important duties in colleges and universities. Wuhan should innovate boldly on the nationality issue, only to see whether it is suitable for the post before the election, also should emphasize the performance in the promotion regardless of nationality; the third is to provide a good social welfare, Such as the Canadian government want to strengthen the “Silicon Valley of the north” high-tech industry in Ottawa, and build specialized kindergarten for the “Silicon Valley of the north” young workers which let high-tech talent to systemic heart into work (Li Xiangqian, Xiang Hong, 2005). The fourth is to create a good environment and opportunity. Such as the Singapore government to vigorously carry out job training and foreigners in Singapore the financial sector can attend funded by the government of domestic and foreign training, and so on.

5 Conclusions

As an ancient city with deep historical and cultural traditions, Wuhan must be built up from the traditional culture of Confucianism to the integration of the cultural construction of the western culture, to achieve a qualitative leap in the world city. In a word, in order to build a world city for Wuhan, we must take positive measures to attract overseas talent to return, avoiding the permanent loss of talent, and making it become the ultimate destination of talent.

Abstract: Based on Parsons AGIL model, this paper analyzes the current situation and problems of the development of social organizations of persons with disabilities in China. We argue that an AGIL model which dynamically takes four parts “adaptation”, “goal achievement”, “integration” and “mode latency” as a coherent whole is an important tool to analyze the development of social organizations of persons with disabilities in China. First, we analyze the current environment of these organizations and the problems, and define the development goal of them, then we bring up solutions according to the goals, that is, integrating resources based on the existing community grid management system, with the cultivation of professional social workers, establishing micro societies of persons with disabilities and social support networks with persons with disabilities as the principal part, so as to solve the problems of social capital shortage of persons with disabilities, and their lack of care after disintegration of unit system and the government withdrawal from specific social services, thus to empower persons with disabilities and social organizations of them. In this paper, a development framework of social organizations of persons with disabilities is constructed, and a development model of social organizations of persons with disabilities was brought up in a dynamic analysis way. Findings show that, the analysis based on AGIL and its application is conducive to the development of social organizations of persons with disabilities.

Key words: AGIL model; Social organizations; Persons with disabilities

1 Introduction

The cause of persons with disabilities in China has made remarkable achievements ever since the reform and opening up. The state has promulgated laws for protection of persons with disabilities, government of all levels have established a range of institutions involved in work of persons with disabilities, and formulated and implemented work plans for developing the cause of persons with disabilities; under such circumstances, persons with disabilities have been improving their quality constantly, and their living conditions have also been significantly improved; in the meantime, a good social custom of supporting and helping persons with disabilities has further formed. Development of social organizations of persons with disabilities has made certain progress in China.

Studies have shown that current development of the cause of persons with disabilities is still facing a severe situation. According to statistics, in 2010, China's per capita disposable income of families of persons with disabilities is merely equivalent to 59% of the national average level; Engel coefficient of families of persons with disabilities is 8.1% higher; unemployment rate of urban persons with disabilities is twice higher; the proportion of well-off people among persons with disabilities is 20% lower; 28.6 percent of school-age children with disabilities do not receive compulsory education; 38% of urban and 70% of rural persons with disabilities rely on family support. To ensure the long term development of the cause of persons with disabilities in China in this ever changing new era, social organizations of persons with disabilities will play an increasingly important role. Under the background of the government relaxing control over social organizations and issuing encouraging and supporting policies, introduction and popularization of the concept of “big society, small government”, and improvement of citizenship consciousness of the masses, the number of new style social organizations of persons with disabilities (mainly in the form of non-profit and non-government organizations) different from traditional ones will increase, and they will also develop in both vertical and horizontal dimensions. The impact of social organizations of persons with disabilities on the development and welfare of persons with disabilities will be increasing. Therefore, it appears more and more important to conduct researches on social organizations of persons with disabilities.

Based on system theory and “quartering” of behavior system, sociologist Parsons established the famous “AGIL” functional analysis framework. The domestic academic circles have made a lot of achievements on AGIL Model and application research of it on analysis of social organizations so far.

AGIL Model analysis and application research on social organizations mainly focus on enterprises, economic and educational organizations in rural areas and areas inhabited by the minority nationalities. Research on social organizations of persons with disabilities has started, and has made a small amount of achievements. Yet, now research on social organizations of persons with disabilities with AGIL Model analysis and application research is still blank. Therefore, this research is conducive to fill the blank of research on social organizations of persons with disabilities from different aspects, is quite innovative; and extends the application research of AGIL Model to some extent.

2 Relevant Concepts and Reconstruction of AGIL Paradigm

2.1 Several relevant concepts

2.1.1 Social organizations of persons with disabilities

Foreign scholar David Popenoe gives the definition of organization from group in his works *Sociology*. He holds that “A group is a collection of two or more persons having a common identity and a sense of solidarity, members within a group interact and influence with each other, and share specific goals and expectations (David Popenoe, 2011).” Thus it is deduced that “in human society, people have united into groups for a certain goal, and those groups with certain goals are organizations. (David Popenoe, 2011)”. While Chinese scholar Zheng Hangsheng divides organizations to two types, “Generally there are two kinds of understanding for social organizations, one is social organization in a broad way, which covers all groups for common human activities; and the other is organization in a narrow way, which means secondary group organization form in respect to primary group, and it can also be called formal social organizations. Such organizations are referred to as groups that people form by coordinating and connecting their actions to realize a certain common goal.”

In this research, for the limit of time and data, the definition of social organizations we adopt is the narrow one. Here, social organizations of persons with disabilities only refer to those public and non-profit organizations related to services provided to persons with disabilities, and relevant organizations established by persons with disabilities voluntarily, but not include business organizations that employ persons with disabilities or other organizations.

2.1.2 Empowerment

“Empowerment” is a word used in social welfare, which means to make people feel greater and more sense of responsibility, and have the ability to do what one should do. The use of “empowerment” can date back to 1970s, when Solomon, a scholar of Columbia University of the United States, suggests empowering discriminated African-American black people, thus introduces the concept of “empower” into social work research. Even in the agenda of community work, this concept is often brought up. And it has become one important value concept and work mode promoted in social work and the practice. “Empowerment” is a process in which an individual gain more confidence and control ability over the life space in the active interaction with others and the environment, and promotes the use of opportunities and environment resources, so that more individuals could get help to gain more “power”.

In the research, we will propose to empower persons with disabilities through analysis and route of AGIL Model, to make them improve their “all power”, and survive and live better in society.

2.2 Application of reconstruction of AGIL model into the research

2.2.1 AGIL analytical model and its application

AGIL model is an analysis model which is the exploration result of Parsons when he studies on and describes the social system. It is widely applied into analysis and study on organizations. Parsons’ theory of action systems holds that the “action system” is divided into “behavior organic system”, “personality system”, “social system” and “culture system” four subsystems. In social system theory, the social system is the focus of Parsons’ analysis. He defines “social system” as: the social system is constituted of many interconnected individual actors, and it exists in at least one natural or social environment. Actors in the social system take “happiness maximization” as their behavior orientation, and they are closely connected to the surroundings (including other actors). Symbols exist inside the social system, which are constructed by culture and have won universal recognition of the members, and they define and coordinate the relationship between behavior orientation of actors and the surroundings. (Parson, 2008)

The author thinks that, a dynamic relationship exists among the four basic elements: A (adaptation) means adaptation to surroundings, within a certain period of time, social organizations and surroundings involving persons with disabilities are adaptable to each other to some extent, since surroundings are changing constantly, to respond to new challenges and opportunities brought about by change of

environment, organizations of persons with disabilities must make corresponding changes to achieve development. Therefore, it is quite necessary to make analysis on surroundings. Based on such analysis, social organizations of persons with disabilities need to determine new G (goal) for development, that is to say, we may determine the development goal of social organizations of persons with disabilities through analysis. Then, with the idea of I (integration), put forward development mode of organizations of persons with disabilities based on grid community management, and the mode will impact cultural and legislative institutions, that is L (latency). Such latency will form a new culture, new surrounding (A). Social organizations of persons with disabilities will develop in this dynamic loop.

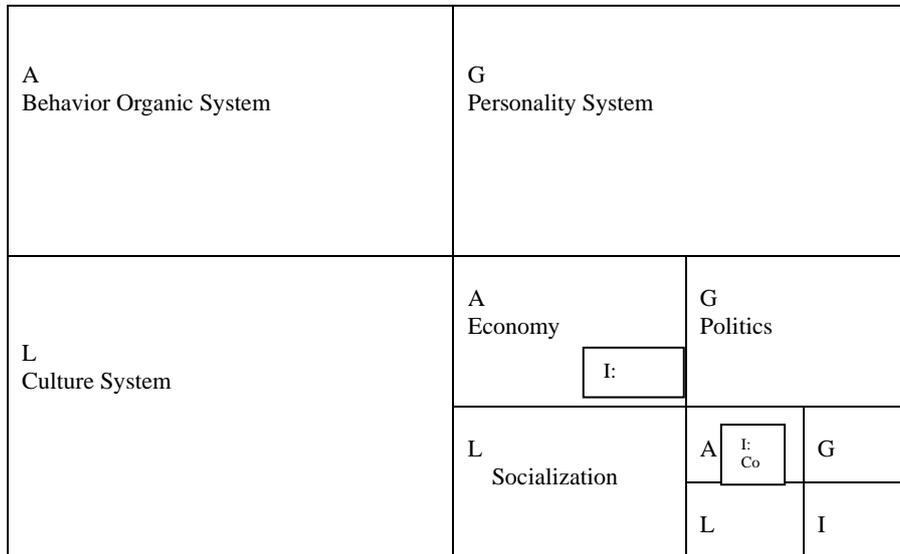

Figure 1 AGIL Functional Analysis Model

A-Adaptation, acquiring sufficient resources

G-Goal Attainment, settling and implementing goals

I-Integration, maintaining solidarity or coordination among the subunits of the system

L-Latency, creating, preserving, and transmitting the system's distinctive culture and values

Source of data: Hou Junsheng: Western Sociological Theory Course, Nankai University Press, 2001

Table 1 Four Basic Elements

A adaptation	G goal attainment
Present surroundings of organizations	Goals organizations need to achieve
Impact of goal attainment to culture and institutions	Ways for goal attainment of organizations—establishment of social organizations of persons with disabilities based on grid
L latency of mode	I integration

Here, A means the develop surroundings of social organizations of persons with disabilities; G means the development goal of social organizations of persons with disabilities; I means construction of social organizations of persons with disabilities based on grid; L means mode latency and the impact on surroundings. (Table 2)

3 Development of Social Organizations of Persons with Disabilities in AGIL Model

3.1 Development environment of social organizations of persons with disabilities

3.1.1 The roles of government, law etc. in construction of social organizations of persons with disabilities

In construction of social organizations of persons with disabilities, the government is one of the key factors in fulfilling the responsibilities of providing public services; it rests on the protective level of setting the demands of service objects, or persons with disabilities, making a comprehensive consideration in the supply capacity of fulfilling the demands in realistic level, and protection to the rational interests of service producers; it takes various factors into comprehensive consideration and

formulate reasonable laws and regulations and policies. Since 1991, at the level of laws, special stipulations on services for persons with disabilities in China mainly concentrate in Law of the People's Republic of China on the Protection of Disabled Persons (as of effective in 1991). In addition to that, 36 laws have stipulations on services for persons with disabilities including the Marriage Law of the People's Republic of China, the Law of the People's Republic of China on the Guarantee of the Rights and Interests of Women, Labor Law of the People's Republic of China etc. At the level of administrative regulations, there are Regulation on the Education of the Disabled, Regulation on the Employment of the Disabled (May 2007), Deductions and Exemptions of Taxes for the Disabled etc. formulated by the State Council. Moreover, some rules and regulations issued by relevant departments and rules and regulatory documents issued by local governments of all levels have made specific requirements on services for persons with disabilities in accordance with local conditions; and institutions of all levels of the central government and local governments have formulated proportional policy for the disabled, preferential policy for the disabled, and stipulations of barrier-free for persons with disabilities etc. (Liu Qionglian, 2011)

Besides, the disabled persons' federations of all levels, as an actual part of the government, have played an extremely important role in the development of the cause of persons with disabilities in China.

3.1.2 Primary social organizations of persons with disabilities

Currently, social organizations of persons with disabilities in China consist of two parts mainly: disabled persons' federations widely spread all over China and other associations for persons with disabilities.

Inosculating representative function, service function and management function as a whole, China Disabled Persons' Federation is national institutional group of persons with disabilities approved by the Chinese government, a comprehensive social group of "semi-government-semi-private" nature. Meanwhile, in order to better represent, reflect the actual problems of different categories of persons with disabilities, China Disabled Persons' Federation has set special associations inside, such as China Association of the Blind, China Association of the Deaf, China Association of Persons with Physical Disability and China Association of Persons with Psychiatric Disability and their Relatives etc., routine work of these associations are handled by standing body of China Disabled Persons' Federation. China Disabled Persons' Federation also sets branches and sub-branches in all provinces, cities and counties, to publicize policies for persons with disabilities, protect their rights and interests and serve the groups. Grassroots mass organization of persons with disabilities will be established at sub-districts, township, and enterprises and institutions dense with persons with disabilities. (Zhou Pei, 2012)

Also, there are nongovernmental organizations of persons with disabilities. Some of them are established voluntarily by persons with disabilities, such as friendly society of persons with disabilities; some are established by charity persons, such as Puki in Shanghai; others are affiliated to government with relatively independent operation.

3.1.3 Problems faced by development of social organizations of persons with disabilities

1) The government actually assumes the role of social organizations of persons with disabilities
Disabled Persons' Federation should be the most important provider of services persons with disabilities in China, which holds the political and economic resources. But under the situation of various conflicts getting prominent at the transition period of society in recent years, policies and actions of the government have taken on new changes; measures for "maintenance of stability" which pay much attention to social stability are getting more. On the one hand, the government provides services for persons with disabilities through the Disabled Persons' Federation; on the other hand, it conducts management of persons with disabilities through it. Actually the Disabled Persons' Federation assumes management function of this special group of people, persons with disabilities. And the function is enhanced at the present time of prominent social conflicts. Economically and politically, Disabled Persons' Federation are affiliated to the government, the resources for service provision also come from the government. So the services provided to persons with disabilities by Disabled Persons' Federation is actually provided by the government. In this process, the government actually assumes the role of social organization.

2) Impact of social atomization

The urban society management system in transition period in China is facing unprecedented challenges. On the surface, it is shown in frequent occurrence of various social conflicts; while take a deeper look, we will find that the disorder of basic order of urban society management caused by social atomization has reinforced the crisis to a large extent.

With the deepening of reform and opening up of late 1970s, the single form of social organizations

in China “unit system” disintegrated; at the same time, people gradually got individualized, and get out of connection with the society and the groups they used to be in. In this context, along with the disintegration of the unit system, persons with disabilities lost a stable support organization, and lost connection with society. Selfishness and indifference of people caused by social atomization makes impossible of persons with disabilities getting help from surrounding crowds, which results in poverty of the group of persons with disabilities, and their lack of emotional support.

3) Social capital shortage of persons with disabilities and social organizations of them

Persons with disabilities are both the object and the subject of social management of persons with disabilities; both the beneficiaries and promoters of development of the cause of persons with disabilities. While actually, for the limitation of disabilities and impact of mentality, barriers in social environment and lack of social support, numerous persons with disabilities are excluded from mainstream society, lack of the ability of gaining social capital as normal persons; also, since most persons with disabilities are in poor living conditions, there is shortage of social capital for persons with disabilities. Plus the impact of social atomization nowadays, the insufficient social capital is getting more inadequate.

3.2 Development goal of social organizations of persons with disabilities

3.2.1 Needs analysis of the group of persons with disabilities

First, need for poverty relief and support. The need for poverty relief and social support is still the top need among social needs of persons with disabilities. Dim employment situation and limited income etc. result in the strained circumstances of persons with disabilities and their families. According to Maslow’s hierarchy of needs, the need for survival is the most fundamental need, and only on this basis, can pursuing for needs of higher hierarchy become possible.

Second, need for employment. Employment is one prerequisite to ensure a stable and permanent income for persons with disabilities. Psychologically, improvement of education level and vocational skills can bring to persons with disabilities more satisfaction and happiness. Low education level limits the possibilities of persons with disabilities improving their life by themselves, and hinders the overall development of the cause of them in macroscopic view. Therefore, it is of vital significance to provide support for employment as well as vocational trainings.

Third, need for rehabilitation and life services. Need of persons with disabilities for medical assistance and rehabilitation training services will be on steady increase, especially with the prominence of China entering the aging society, elderly persons with disabilities are on the increase, the need for medical assistance and rehabilitation training services will also increase together with need for daily care services such as life care.

Fourth, need for cultural and educational services. Most persons with disabilities have cultural competence and cultural needs. Yet for social discrimination, inadequate educational facilities for them etc., persons with disabilities are always constrained in attaining education. In addition, to meet the needs of persons with disabilities for cultural life is related not only to education, but also to other cultural life services in various forms, while cultural facilities specially targeted for the special physiological conditions of persons with disabilities are rare.

3.2.2 The development goal of social organizations of persons with disabilities: to realize public services

Due to changes in social situation, improvement in consciousness of citizenship, and the current difficulties they are in, including social atomization and the government taking steps to exit the field of social services, etc., social organizations of persons with disabilities should take achieving real public services as the goal. To do this, persons with disabilities must get empowerment, to improve their own abilities. From the perspective of social organizations of persons with disabilities, they should be fully aware of the numerous problems they are facing, realize needs of persons with disabilities, and seek for a proper way suitable to the development of organizations based on their needs.

3.3 Integration: construction of social organization of persons with disabilities

3.3.1 Introduction of the concept “grid management”

Community grid management is an innovation based on new technology. Relying on a unified urban management and digital platform, it classifies all communities in a city into unit grids according to certain criteria. By strengthening inspections on components and events in the unit grids, a mode is established with disposal and supervision separated from each other. For the government, the main advantage of this approach is that the government can take the initiative to discover problems, handle them in time, strengthen its capacity on urban management and issues processing speed, and solve the problems before residents make complaints. In this way the previous mode of passive response to issues changes to the new mode of actively discovering and solving problems; second, it adopts digitalized

management tool, which is mainly manifested in the digitization of management objects, processes, and evaluation, by doing this agility, accuracy and efficiency of management can get ensured; third, it is a closed scientific management mechanism, with not only a set of standardized and unified management standards and procedures, but also a closed loop formed by four steps: discovering, filing, dispatching and closing a case, which very effectively enhances the capability and level of management. Because of these features, the traditional, passive, qualitative and decentralized management in the past can turn into the present modern, active, quantitative and systematic management.

3.3.2 Construction of social organizations of persons with disabilities based on grid community management

1) Micro societies in communities based on grid management and its significance

Simply speaking, Community Grid Management is to draw many grids in the community in accordance with the specific circumstances, and then assign community staff to different grids, and the staff will be responsible for residents in the grid he/she belongs to, thus plays the role of management and control. Based on the grid administrator's knowledge on the actual situation and the social relationship he/she has established with persons with disabilities in the grid, the administrator may assist persons with disabilities in establishing social networks, so as to build "micro societies" in the grid. Then these micro societies can be connected on the social network of all grid administrators. For the volunteer nature and moderate autonomy among these micro societies, organizational rigidity and social support network whose services are not up to the needs of persons with disabilities caused by huge organization can be avoided. Such social support network just plays the role of enhancing the social capital of persons with disabilities and social organizations of them, thus achieves the purpose of empowering persons with disabilities.

2) Social workers cultivate micro societies

Social workers are professional workers who follow the value of helping people to help themselves, use professional methods such as case work, group work, community work and administrative work etc. to help organizations and individuals to exert their potential, coordinate social relations, solve and prevent social problems, and promote social justice. In the process of establishment of the micro societies, social workers will play a big part. Due to physical conditions, persons with disabilities may have some problems in terms of social contact, and social workers will play the role of link in it. They use professional work skills, gain resources through various channels, solve problems, and promote the establishment of micro societies of persons with disabilities in the grid. In this process, social workers are "companion" of organization building, "connector" of various resources, "coordinator" of stakeholders, and "facilitator" for exchanges and actions of persons with disabilities.

3) The relationship between social workers and grid administrators

In societies building, the relationship between grid administrators and social workers is an unavoidable issue. Grid administrators have the background of community staff, mainly responsible for the management of population information. Social workers as a third party to intervene between the government and persons with disabilities, are direct providers of services for persons with disabilities. Different from grid administrators, at work, social workers are spokesmen of the interests of persons with disabilities, and facilitators for establishment of micro societies from bottom to top.

However, with the development and popularization of social work career, a lot of people who work in the community become social workers through learning and passing the qualification exam. Therefore, in some communities where conditions are not ready to hire professional social workers, grid administrators are actually playing the role of social workers.

4) The role of persons with disabilities

Persons with disabilities are the service objects as well as principal part of micro societies, which have been established with the assistance of social workers and grid administrators (sometimes they may be the same persons). Persons with disabilities may take initiative in the process of establishment of micro societies, when possible, micro societies can be handed over to them for self-management.

3.4 Model latency and the impact to environment

With the establishment of micro societies and the support networks, power of persons with disabilities is enhanced, social organizations of them have developed and social capital is enriched. Difficulty of persons with disabilities can be solved, their needs can be satisfied. Opportunities for persons with disabilities to voice in the society will increase, persons with disabilities will have more impact on society, and people will pay more attention to persons with disabilities and care for them more. This will have an impact to formal and informal social systems.

In the formal institutional level, with the increase of this impact, it will get fixed through some

clear form in organizations and in the country, and supervised by the organizations of the actor and ensured its implementation through coercive power, thus formal institutions will be affected. Laws, rules, policies, regulations and agreements etc. related to social organizations of persons with disabilities will be established and updated. For example, restrictions of laws and policies on construction of social organizations of persons with disabilities may reduce, social organizations of persons with disabilities and corresponding association organizations may establish their own norms and regulations, so as to make social organizations of persons with disabilities develop in unformal institutional level from formal institutional level, and relevant values of concepts, ethics, morals, customs and ideologies will also be affected. Interpersonal indifference and the sense of alienation from society of individuals caused by social atomization will also get eased.

With the formation of the new environment, which is conducive to latency of the model, social organizations of persons with disabilities will make development in a relatively stable and continuous environment. In the meantime, according to the logic of the previously described AGIL model, when new problems arise, we can repeat this process, so as to achieve new development for social organizations of persons with disabilities. In this “spiraling”, the cause of the persons with disabilities will gain sustainable development.

4 Conclusions

Based on Parsons AGIL model, the research explores one method to make interpretations on social organizations of persons with disabilities, which is to dynamically see the four parts of AGIL as a whole in link. When analyzing and solving the development problems of social organizations of persons with disabilities, first make analysis on the current environment of such organization and the problems in it, define the development goal of the organizations, and then put forward resolutions according to the goal, in other words, integrate resources based on the present community grid management mode, with cultivation of professional social workers, establish micro societies of persons with disabilities and corresponding social support networks with persons with disabilities as principal part, so as to solve the problems of social capital shortage and care loss of persons with disabilities which they face after disintegration of unit system and the government withdrawal from specific social services, and thus to empower them and social organizations of them. Then a social custom of supporting for persons with disabilities will form, and it can also promote policy and legislation of the government and NPC, so that a new environment that conforms to the development of the cause of persons with disabilities is created to maintain the mode. When it comes to new challenges, we can also make adjustment according to the model, and finally promote the development of the cause of persons with disabilities.

It is sure that for the time limit and constraint of the author’s experiences and knowledge, there are still many problems regarding the research, such as, the specific methods and means for establishment of micro societies; the adaptability of this dynamic AGIL analysis model; whether there are better models to make analysis and give solutions to the problems etc. The author will proceed with answers to these questions with colleagues and scholars who have read this article.

Abstract: Academic speeches are typical multimodal discourses, in which all kinds of modes are mutually dependent and cooperative to realize the academic speeches. Meanwhile, they construct and transmit the discourse meanings of the speakers. This paper adopts two academic speeches as samples to explore the differences in Chinese and foreign academic speeches. Based on Norris' multimodal interaction theories, this study adopts ELAN software as the mode annotation device. Three perspectives will be explored and analyzed comparatively, namely, mode relations, the dynamic construction of multimodal contexts, and multimodal construction and transmission of meanings. It is expected to provide a new angle for multimodal discourse analysis.

Key words: Multimodal interaction; Academic speeches; Meaning construction

1 Introduction

With the development of all kinds of media, the ways of information transmission have become more diversified. Discourse analyses are no longer pure linguistic ones, and more non-linguistic factors will be embodied in them. Derived from Halliday's systemic metafunctions in Functional Grammar, Kress & van Leeuwen (1996) made systematic studies on the meanings of images and inquired into how the different modes integrate and construct the overall meanings in social interactions. They noted that the meanings of discourses in social interactions were not merely realized by a single modality, but realized by an integrated use of multiple modes. Then in 2001, they put forward the framework of multimodal discourse analysis. They believed the same meaning can be expressed by different modes in a particular cultural context (Kress & van Leeuwen, 2001). Multimodal theory has been widely applied in analyzing discourses in social interactions currently.

At present, the analyses in China or abroad either focus on technological analyses, or focus on the application study on teaching. In China, the representative studies are conducted by Zhang Delu, Hu Zhuanglin and Zhu Yongsheng. Zhang Delu(2009) explores the synthetic theoretical framework for multimodal discourse analysis of different modes in multimodal discourse and their realization in foreign language teaching; Hu Zhuanglin (2007) studies construction of multimodal English classroom for the cultivating of multimodalization; Zhu Yongsheng (2007) examines discourse meanings, whether the same type of discourse can realize different ideologies, and how the relationship between discourse and ideology should be analyzed. These researches enrich and deepen the understanding of multimode in linguistic field, and promote its application in teaching and linguistic studies.

Academic speech is a kind of prepared and extemporaneous discourse. It is an important type of academic communication. Through academic speeches, the scholars from all fields publicize their research results and exchange ideas and new viewpoints with their peers. In this way, they can not only put forward new theories or ideas, but promote their own fame. Academic speeches are typical multimodal discourses, which include the usage of languages and many diversified modes. This type of discourse has raised academic attention, and relevant studies have been carried out. Hyland (2010) analyzed tone and mood, and discovered that although different speakers presented

Different speech characteristics because of varied personal experience and academic background, but they shared some common points, such as the use of affirmative modal verbs, a great amount of use of tone modifiers, the frequent use of declarative sentences, the use of present tenses and active mood, etc.

Based on the previous studies, this paper will further explore how the kinds of modes are mutually dependent and cooperative to realize the academic speeches, and how they construct and transmit the discourse meanings of the speakers.

2 Research Methodology

2.1 Research questions

In this study, the following questions will be explored and analyzed: (1) In Chinese and foreign academic speeches, whether there are differences in the selection of different modes by the speakers? (2) What are the relations among the selected modes? (3) Whether the modes play the same functions in constructing and conveying meanings? If the answer is “No”, then, what are the differences? (4) In what ways do the different modes interact to realize the construction of meanings in academic speeches?

2.2 Corpus selection and research framework

This paper adopts two sample speeches to make comparative analyses: Sample One is a TED academic speech from Eli Pariser and Sample Two, an academic speech from Zhang Weiwei, discussing “Viewing China Model in Global Comparison” in 2014. Eli Pariser, a Pioneering online organizer, gave a speech on “Beware Online Filter Bubbles” in 2011 to present the new idea about how personalized search might be narrowing our worldview. Zhang Weiwei, a distinguished professor of Fudan University, focuses his studies on China Model. The two sample speeches are academic speeches which bear the typical characteristics of Chinese speeches and foreign speeches.

This study adopts ELAN software as the Mode Annotation Device. ELAN software can transcribe video and audio texts, which is very convenient in establishing different transcription levels for different speakers.

This study adopts Sigrid Norris’ (2004) Multimodal Interaction Analysis as the framework to explore the differences in Chinese and foreign academic speeches. The framework includes the unit of analysis in multimodal discourse analysis, different communicative modes and features of different modes in human interaction. According to Norris (2004), a communicative mode is a “heuristic unit that can be defined in various ways and has no clear boundaries”. She proposed nine modes in her framework: spoken language, proxemics, posture, gesture, head movement, gaze, music, print, and layout.

This paper will adopt Norris’ mode clarification, but cancel the mode of music since in academic speeches, music is rarely used. In coding scheme, hand movement is adopted in analyses. The modes of print and layout are mainly presented in PPT designing.

Three perspectives will be explored and analyzed comparatively, namely, mode relations, the dynamic construction of multimodal contexts, and multimodal construction and transfer of meanings. It is expected to provide a new angle for multimodal discourse analysis.

3 Dynamic Analysis of Differences in Constructing Discourse Meanings

With the gradual expansion of network information and the wide application of modern media technologies, non-verbal modes tend to play more and more significant roles in meaning construction. The multimodal discourses are composed of multiple modes, and they mutually interact to construct and transmit the whole meanings of the discourses. Therefore, in the process of analyzing the construction and transmit of discourse meanings, other modes besides languages should be explored together in order to get a comprehensive view of the communications.

3.1 Mode selection and differences

There is a close relationship between mode selection and the language user. Different speakers may use quite different modes in their speeches, which represent their own differentiating selection systems.

According to Halliday’s Social Semiotic Theory (Halliday, 1978), the selection system is a meaning system, a meaning potentiality. The multiple modes of communication, including language, head movement, facial expressions, etc, are components of the meaning system (Kress & vanLeeuwen, 2001; Norris, 2004).

In the following, the researcher will present annotation output results of the two samples to illustrate the speaker’s preference of certain modes and how the duration of time affects the meaning construction.

Table 1 Sample One Annotation Output Results

	A	B	C	D
1	Eli Pariser	Begin Time	End Time	Duration
2	spoken language	0:02:23	0:05:11	0:02:88
3	posture	0:05:67	0:06:78	0:01:11
4	gesture	0:05:03	0:07:11	0:02:08
5	head movement	0:05:09	0:05:66	0:00:57
6	gaze	0:05:07	0:05:09	0:00:02
7	hand movement	0:05:07	0:09:45	0:04:38

Table 2 Sample Two Annotation Output Results

	A	B	C	D
1	Zhang Weiwei	Begin Time	End Time	Duration
2	spoken language	0:03:42	0:05:11	0:01:69
3	posture	0:02:12	0:03:09	0:00:97
4	gesture	0:10:03	0:11:50	0:01:47
5	head movement	0:03:09	0:04:91	0:01:82
6	gaze	0:10:07	0:10:15	0:00:08
7	hand movement	0:07:41	0:10:30	0:02:79

In Sample One, the speaker tends to use “hand movement” to help to construct and strengthen the meanings he expects to transmit. The duration is longer compared with Chinese speaker in Sample Two (0:04:38 VS 0:02:79). The speaker in Sample Two adopts “head movement” such as head nodding more frequently (0:01:82 VS 0:00:57) to help to transmit his meaning and tries to show modesty, which is one of virtues in Chinese culture. Head nodding can also be interpreted by Chinese people as a way to affirm others’ ideas and to facilitate interpersonal communication. In Sample One, the duration of “spoken language” lasts longer at the beginning of the speech compared with Sample Two(0:02:88 VS 0:01:69) which implies that in foreign speakers’ eyes, in the process of constructing meanings, language modes play a more important in academic speeches compared with the non-verbal modes. Whereas, in Chinese speakers’ minds, non-verbal modes are more important in establishing harmonious communication atmosphere for the audience, which function as the prelude factors before the speech. Therefore, the Chinese speakers pay more attention to the non-verbal modes such as posture and facial expressions before deliver speeches.

3.2 Modalities interaction and meaning construction

In speech communications, how do the multiple modes interact on each other to construct the whole meanings? Zhang Delu (2009) classifies the relations among the modes into complementary relationship and non-complementary relationship. In order to realize the expected speech effect, the speaker must know how to coordinate the modes to construct the meanings, in which all of the modes should be in complementary relations. That is to say, one mode works to provider new experience or contents for the other modes, or one mode is used to strengthen the meaning of another mode. Both of the two kinds of communication modes are indispensable, and mutually complementary. The successful transmission of the different modes’ information relies on the other modes.

Different modes bear different modal supply features, that is, they have their unique ideographic potentiality respectively. For instance, the language expressions are used to explain the profound concepts and theories; colors of the images are better in expressing humans’ feelings and attitudes; graphic structures can be used to promote expressing directions.

The following table will present clearly the mutual interaction among non-verbal modes and how the meaning are constructed in the process of speeches.

Table 3 Interaction among Non-verbal Modes and Meaning Construction

Non-verbal Modes		Facial Expression	Posture	Hand Movement	Gaze	proxemics
Characteristics	Eli Pariser	earnest; smile; attentive	Right posture/home position/left-to-right posture	metaphoric Hand movement (MHM)	Gaze at PPT Presentation (GP)	closer distance
	Zhang Weiwei	smile; attentive; relaxed	Home position/left-to-right posture/right-to-left posture	deictic hand movement(D)	Gaze at the audience (GA)	Distance from the audience
Meaning Level	Eli Pariser	1)interpersonal meaning; 2)discourse meaning;	1)interpersonal meaning; 2)conceptual meaning;	1)interpersonal meaning; 2)discourse meaning;	interpersonal meaning	interpersonal meaning
	Zhang Weiwei	1)interpersonal meaning; 2)discourse meaning;	1)conceptual meaning; 2)interpersonal meaning;	1)conceptual meaning; 2)interpersonal meaning;	interpersonal meaning	interpersonal meaning
Roles in Meaning Construction	Eli Pariser	To strengthen meanings(SM)	To construct the meanings(CM)	SM & CM	CM	SM
	Zhang Weiwei	SM	SM & CM	Iconic hand movement(IHM) showing profession	SM & CM	Social distance implying social status

Through comparatively analyzing Sample One and Sample Two, we find Eli Pariser adopts “hand movement” as one of the major modes in constructing the meanings in the speech. Chinese scholar Zhang Weiwei mainly relies on the modes of “gaze” and “posture” to construct and transmit meanings in his speech. On the mode of “facial expressions”, Chinese scholar paid more attention to use them to establish and strengthen his professional status. In order to narrow the audience’s psychological distance with the speakers, both of the speakers “smile” frequently to the audience.

In Sample One, in designing the PPT, the speaker fully utilizes the diversified modes to express and transmit the meanings. He applies properly the elements such as sound, image and videos to provide information, interpret and deepen the speech contents. PPT presentations and verbal expressions are complementary to meaning expressions. Video materials integrate video and audio modes presentations together, which include images, sound, words and so on. They coordinate harmoniously to present stereoscopic sensory stimulation, which can promote the audience’s perception, understanding and storage of the received information.

In the whole academic speech, obviously, the multiple modes coordinate together to implement the construction of meanings. But in this corpus, the main modes are the combination of the speaker’s speech, and the words, images and video modes in the PPT. By virtue of the modes presented in the PPT presentations, the contents of the speech, supplemented by the speaker’s gestures, hand movement, postures, facial expressions, and other modes such as tones and audio, are transmitted efficiently in the whole speech discourse. Other modes work as very important assistant ways to yield the expected speech effects, which will directly affect the audience’s and understanding of the contents, degree of recognition, and ultimately, their psychological feelings.

3.3 Comparative analyses of constructing dynamic multimodal contexts

Since academic speeches belong to a kind of extemporaneous speech, in analyzing, the functions of contexts in the speeches should be explored. In order to grasp the essence of the interactions, we segment the whole speech into four critical segments, namely, the beginning, ideas elaboration, exemplification, the conclusion. Each segment relies on “mediate actions” as devices to mediate the relationship among the modes. The “mediate actions” include the speaker’s gestures, hand movement, postures, facial expressions, tone and pitch, geographic position, spatial layout, video and audio, layout, etc. After analyzing the modes adopted in each segment, we find that in Sample One and Sample Two, both of the speaker utilize fully the diversified channels and measures to create the authentic communicative contexts for the audience. He puts on various facial expressions to be in accordance with his speech contents. He holds proper postures and consciously takes advantage of his own images (such as postures, gestures, tones, eye contact, facial expressions, and so on). The speaker uses rhythmic voice, natural and passionate words to ensure the successful proceeding of the communication and interactions.

It is widely acknowledged humans’ verbal and non-verbal expressions or actions usually comply with the recognized cultural traditions, values and social practices. Contexts should form an interface between macroscopic cultural contexts and microscopic speech contexts. They integrate together to affect the speaker’s selection of languages forms and multimodal modes in speech communication.

4 Conclusions

The study takes the non-verbal modes as an integral part to construct and transmit meanings in speech communication. Through the comparative analyses of Chinese and foreign academic speeches within the framework of Multimodal Interaction Analysis, it provides a new angle for the multimodal discourse analysis.

Since the academic speeches belong to a part of extemporaneous speeches, its characteristics of extemporaneousness implies that there are many uncertain factors that may affect the speech communication, which makes the usage of the modes and the relations among the modes become more complicated. Therefore, we should conduct more speech corpus analyses so as to reveal and describe the interaction and complementary mechanism in the discourses.

An Analysis of Synergistic Effect of University Campus Culture Construction: Take the Campus Automobile Culture in Wuhan University of Technology for Example

Yu Dongjiang, Liu Changping

Foreign Language School, Wuhan University of Technology, Wuhan, P.R. China, 430070

(E-mail: yudongj@whut.edu, 99652361@qq.com)

Abstract: A synergistic effect is produced during interactions among the subsystems of university campus culture construction. This paper provides five paths, namely, sharing of university spirit, sharing of resources, synergy of culture construction mechanism, synergy of subject behavior, integration of implicit and explicit education means to be adopted to maximize the release of synergistic effect, so as to obtain better synergistic effect in the construction of university campus culture. This paper then studies the construction of automobile culture in the campus of Wuhan University of Technology as a case which comprehensively analyzed and evaluated its synergistic effect, in order to provide an approach for scientific analysis and judgment of this effect on university campus culture construction and realize the dynamic monitoring on it.

Key words: Campus culture construction; Synergistic effect; Path; Fuzzy comprehensive evaluation

1 Introduction

In the new era, universities are endowed with functions of culture inheritance and innovation. The development of culture inside the university campus enters into an age of multicultural coexistence that every culture flourishes vigorously and every opinion is embraced freely. In the context that the education reform is being deepened in an all-round way and the education resources are being integrated and optimized, collision and communication of multiple cultures lead to cultural conflicts and differences. According to the practical experiences of several universities, the core spirit of cultural construction and core cultural values have been overwhelmed during the multicultural development in the campus which only lingers at the superficial and narrow-minded multicultural competition level that is only about senses such as matches, games, cultures, sports and entertainment. And some people deems that university campus culture construction is no more than an appendage of running a school, and it costs unnecessary expenses. These narrow-minded and short-sighted concepts have twisted the connotation of university campus culture, made the management and regulations in disorder. In addition, they have made the university campus culture lack of real core spirit and value norms, erased the realistic value and true connotation the culture has for inheritance of university spirit, regulation of teachers and students' behaviors and boost of university development (Wu Juan, Lin Zhijun ,2010; Yang Yang ,2012). This paper analyzes the university campus culture construction system from the view of synergy in order to find the accessible paths for synergistic effect, solve the multicultural conflict issue and promote the innovation of university campus culture construction.

2 Connotation of Synergistic Effect of University Campus Culture Construction System

Research on synergy of campus originates from the systematic scientific research, and soon afterwards is popularized in the application of management and economics. Ansoff (1957) stated that synergy is enterprise's overall performance generated by the sum of every independent component, in an expression of $2+2=5$, i.e. the whole value of an organization is greater than the mere sum of the parts. Porter (1985) further studied synergy from the perspective of value chain, explaining that the activity that an organization shares resources between business units (Michael Porter, 1997) finally creates a competitive advantage by gaining more marginal income than marginal cost through synergy. As a branch of social culture, campus culture is an important approach to strengthening and improving college student's ideological and political education. Kroeber (1952) believed that culture, especially the cultural system of values, is the product of human activities. From the view of Marxism, the formation of culture is a sum of formation processes of values system that human subjects use and change objective world. Campus culture originates from the inner heart and behaviors of college teachers and students and reflects their cultural concepts, thinking features and behavior patterns. Effective campus culture construction can become a vital carrier for ideological and political education of college students

to, through the intra-system function, release the sharing outcomes between cultural construction and moral, intellectual construction, make the classroom teaching and extra-curricular activities complementary to each other, and realize a synchronous pace between the campus culture development and college student's healthy growth, so as to exert synergistic effect to indeed enhance the ideological and political education level of college student.

However, few studies on synergistic effect of university campus culture construction are published and no ultimate solution to the cultural conflict issue existed in the campus cultural construction in reality can be proposed. In combination with synergy theory and related studies, the author of this paper believes that the synergistic effect of university campus culture construction indicates that the subjects inside the system carry out cultural sharing through related approaches and build a bridge between the university spirit, values and the healthy growth of college students to facilitate the shaping of student's inner personality and quality by university's school-running essence and concept and social spiritual civilization, by which a common psychological contract between the students and the university will be created, and sharing, synchronous and complementary effects between the university cultural construction and promotion of teachers and students' behaviors and qualities will be achieved.

3 Access Paths for Synergistic Effect of University Campus Culture Construction System

Seeing from the operation and development of universities, the release of synergistic effect of campus culture construction contributes to the success of integration of campus cultural education resources. The university campus culture construction not only requires the interaction among the subjects outside the university to realize synergy between the inside and the outside, but also requires the coordination among the subjects inside the university to gain internal synergy. This paper focuses on the internal synergistic effect of campus culture construction in order to reveal the black box of synergistic effect release of the university campus culture construction system.

1) Sharing of university spirit₁ brings synergistic effect, and highlights the leading position of socialist core values. University spirit is a high concentration of university's behaviors, concepts, beliefs and customs in a long-term process. The sharing of university spirit helps all the teachers and students stay at the same level regarding core concepts like values and helps share the university campus culture construction resources between each other to deliver healthy, positive and active values, and consequently make the university culture construction keep in line with university talents cultivation and social services. The access paths for university spirit in the university culture construction are as follows: 1) all the teachers and students set up socialist core values and place it in the dominant position; 2) explicitly put patriotism in the leading position and nationalism at the center to help students accept mainstream culture from the cognitive view; 3) let the student associations and organizations with the Communist Youth League taking the lead play their guiding role to aid young students unify their personality, psychology and exterior culture automatically, and to generate good university environment and academic atmosphere; 4) use innovative online working methods and take active advantage of new media platform to strengthen the communication between students and the university so as to let the students accept the leading of mainstream culture from daily life.

2) Sharing of resources₂ brings synergistic effect. Several scholars deem that sharing of software and hardware resources can reduce the operation cost for diversified organizations. Hence the access paths for sharing of resources of university campus culture construction system are as follows: 1) sharing of intangible resources, represented as sharing of inner knowledge. The knowledge sharing among the subjects of campus culture construction helps the subsystems of campus culture construction system acquire innovative operation methods, which on the one hand is conducive to the accumulation of university campus culture construction resources, and on the other hand drives the circulation of professional knowledge accumulated by the university, thus reflecting the upgrade of overall value of the university campus culture construction from the perspective of value creation; 2) sharing of tangible resources, embodied as sharing of hardware resources, and coordination and harmony of the geographic location of campus, building style, greening, dormitory, offices, experiment center, teaching facilities, etc., which contributes to the sharing effect of campus culture construction; 3) cross sharing of intangible and tangible resources make the explicit university environment and implicit profound inner cultural knowledge in harmony, creating unique university cultural landscape and mark of time, which results in synchronization with talents cultivation.

3) Synergy of cultural mechanism construction b_3 brings synergistic effect. Mechanism

construction is the core of university campus culture construction which restricts and also orients teaching, scientific research, talents cultivation and social service, etc. of university. Sound mechanism is able to stimulate teachers and students to raise their self-management awareness and perfect their behaviors which will be internalized as self-restriction and regulation. The synergy between university campus culture construction mechanism and the procedures, contents and running mechanism of university's basic behavior norms is beneficial for campus culture construction system operating in an orderly way so as to realize the synergy of university campus culture construction.

4) Synergy of subject behavior₄ brings synergistic effect. According to Porter's value chain theory, the operation flow of sharing of culture construction chain can facilitate the system to gain scale effect and competitive edge. How the subject of campus culture construction can get this synergistic effect depends on which links of value chain are the easiest ones to generate scale effect and competitive edge in the university campus culture construction chain, and depends on how important every link is in the previous mentioned chain. In this chain, the interaction between the behaviors related to culture construction practices and ones related to talents cultivation, scientific research, career services and ideological education is a process of coordination and harmonization. Teachers and students as subjects use the knowledge learned from practicing the cultural activity system, and automatically perfect their abilities and qualities during campus culture construction.

5) Integration of explicit and implicit education means b_5 brings synergistic effect. As an implicit carrier, university campus culture construction complements the explicit education of class teaching. In order to reinforce the synergistic effect of university campus culture construction, every implicit and explicit means that is beneficial to this construction must be integrated, for example, to set up an explicit working mechanism in favor of this construction from multiple aspects such as teaching, management, services. At the same time, attention shall be paid to implicit education means to create good atmosphere for the construction. The factors released by the synergistic effect of campus culture construction should be integrated to every link of campus education and life to activate the extra-curricular activities to the extreme extent, so as to improve the synchronization of this construction with student work, ideological and political education and talents cultivation to eventually create synergistic effect of university campus culture construction.

Based on the above analysis, this paper analyzed the synergistic effect of automobile culture construction system of Wuhan University of Technology (WUT) as a case study that further analyzed the status quo of the synergistic effect of automobile culture construction in the campus of WUT by adopting the fuzzy mathematic evaluation method and combining the previous analysis of access paths for the synergistic effect of university campus culture construction in accordance with the scientific and feasible principle, oriented and subjective principle, systematic and targeted principle, adaptive and dynamic principle, in an attempt to find an approach to improving the release of synergistic effect of automobile culture construction in the university campus.

4 Evaluation on the Synergistic Effect Value of Automobile Culture Construction in the Campus of WUT

By referring to associated data and experiences, this paper stood from the view of expert evaluator and included undergraduates, postgraduates and doctoral students as well as teaching and administrative staff of School of Automobile Engineering of WUT as respondents. Questionnaires were distributed to the respondents in a random way. And stratified sampling was adopted to conduct the sample survey. A total of 432 questionnaires were sent out during this survey and 280 questionnaires were collected. After removing the invalid questionnaires and ones whose format were non-conforming, finally 272 valid questionnaires were obtained with a validity rate of 63%. For the design of question items in the questionnaire, the index system was designed according to the above access paths for synergistic effect of university campus culture construction. The consistency of questionnaire was tested with the corrected item-total correlation (CITC) and Cronbach's α . According to the test results, the questionnaire was revised in order to make the index description of questionnaire understood by more respondents. Then a revised formal questionnaire was formulated, whose CITC was above the test criterion of 0.5 and Cronbach's α reached 0.732 which conformed to the test criteria of questionnaire, meaning that further distribution was permitted. Likert scale was mainly used during the survey. Investigators gave a score ranging from 1-4. In the meantime, according to the semantic differential scale, measurement levels were designated as Very Good, Good, Fair, Poor. See Table 1 below for details.

Table 1 Criteria for Quantitative Evaluation Grading

Value	Comment	Level
	Very Good	E1
	Good	E2
	Fair	E3
	Poor	E4

4.1 Determination of index weight

Evaluation object set P = value of synergistic effect of automobile culture construction in the campus of WUT. Evaluation factor was determined as (university spirit synergy, sharing of resources, synergy of cultural mechanism construction, behavior synergy, synergy of implicit and explicit education means), and then the analytic hierarchy process was used to work out the largest characteristic root of the automobile culture construction system in the campus of WUT, which was $\lambda_{max} = 6.00237$. In order to determine whether the judgment matrix of the automobile culture construction system in the campus of WUT passed the consistency test, the consistency index was calculated:

$$CI = \frac{\lambda_{max} - n}{n - 1} = \frac{6.00237 - 6}{6 - 1} = 0.000474$$

The average random consistency index was $RI = 1.24$. Therefore, the random consistency rate was:

$$CR = \frac{CI}{RI} = \frac{0.000474}{1.24} = 0.00038 < 0.10$$

The above result showed that, the ranking result of analytic hierarchy of the automobile culture construction system in the campus of WUT was satisfactory with appropriate allocation of weight. The result of normalization of its corresponding characteristic vector was:

$$W = (0.298 \ 0.229 \ 0.179 \ 0.175 \ 0.127)$$

In a similar way, we still used the analytic hierarchy process to build a judgment matrix for the secondary indexes of the automobile culture construction system in the campus of WUT respectively, and worked out the weight by using software to calculate the largest characteristic root of judgment matrix and conducting a consistency check. After normalization, the weight values of each secondary index were:

$$\omega_1 = (0.342 \ 0.324 \ 0.226 \ 0.108), \omega_2 = (0.386 \ 0.275 \ 0.339 \),$$

$$\omega_3 = (0.276 \ 0.232 \ 0.392 \), \omega_4 = (0.101 \ 0.237 \ 0.221 \ 0.235 \ 0.095 \ 0.111)$$

$$\omega_5 = (0.346 \ 0.432 \ 0.222 \)$$

4.2 Multi-level fuzzy comprehensive evaluation

This paper adopted the fuzzy comprehensive method using weight average model to generate operator, calculate vector and synthesize scores. The equation was as follows:

$$b_i = \min \left(\sum_{i=1}^p (\omega_i \cdot r_{ij}) \right) \quad j = 1,2,3 \dots, m$$

Among which b_i , ω_i , r_{ij} respectively represented the membership grade that belongs to level \bar{i} , the weight of number i evaluation index and the membership grade of number \bar{i} evaluation index belonging to level \bar{j} .

Calculate the vector result of multi-level fuzzy comprehensive evaluation: the statistical data of the automobile culture construction system in the campus of WUT from the sample survey were taken into the established model to calculate the vector of fuzzy comprehensive evaluation at every level. The results were:

$$B = \begin{pmatrix} b_1 \\ b_2 \\ b_3 \\ b_4 \\ b_5 \end{pmatrix} = \omega \cdot R = \begin{pmatrix} 0.288 & 0.151 & 0.464 & 0.097 \\ 0.304 & 0.321 & 0.320 & 0.055 \\ 0.344 & 0.261 & 0.335 & 0.059 \\ 0.239 & 0.319 & 0.304 & 0.138 \\ 0.410 & 0.348 & 0.162 & 0.079 \end{pmatrix}$$

Therefore, the comprehensive evaluation vector of synergistic effect of the automobile culture construction system in the campus of WUT was:

$$A = B * W = (0.308 \ 0.262 \ 0.343 \ 0.085)$$

With the evaluation vector of every index, the comprehensive grade value was thereof worked out. Therefore the comprehensive score of university spirit synergy was: $(0.288 \ 0.151 \ 0.464 \ 0.097) * (4 \ 3 \ 2 \ 1)^T = 2.63$, with evaluation result of “good”; the comprehensive score of sharing of resources was: $(0.304 \ 0.321 \ 0.320 \ 0.055) * (4 \ 3 \ 2 \ 1)^T = 2.87$, with evaluation result of “good”; the comprehensive score of the synergy of cultural construction mechanism was: $(0.344 \ 0.261 \ 0.335 \ 0.059) * (4 \ 3 \ 2 \ 1)^T = 2.89$, with evaluation result of “good”; the comprehensive score of synergy of subject behavior was: $(0.239 \ 0.319 \ 0.304 \ 0.138) * (4 \ 3 \ 2 \ 1)^T = 2.63$, with evaluation result of “good”; the comprehensive score of synergy of implicit and explicit education means was: $(0.410 \ 0.348 \ 0.162 \ 0.079) * (4 \ 3 \ 2 \ 1)^T = 3.09$, with evaluation result of “good”. The comprehensive score of value of synergistic effect of automobile culture construction in the campus of WUT was $(0.308 \ 0.262 \ 0.343 \ 0.085) * (4 \ 3 \ 2 \ 1)^T = 2.79$, demonstrating that the overall value of synergistic effect of automobile culture construction in the campus of WUT was “good”.

4.3 Analysis of results

The result of fuzzy mathematical comprehensive evaluation of synergistic effect of automobile culture construction in the campus showed that, the overall value of synergistic effect of automobile culture construction in the campus of WUT was “good”, demonstrating that the paths of automobile culture construction in the campus of WUT had exerted synergistic effect, achieved preliminary success and expected for further development. The level evaluation result of synergistic effect factors of automobile culture construction in the campus showed that this construction currently runs well in the aspects of sharing of university spirit, sharing of resources, synergy of culture mechanism construction, synergy of behavior, integration of implicit and explicit education means, demonstrating that the School of Automobile Engineering of WUT is able to integrate teaching, scientific research, enterprises and various tangible and intangible resources at home and abroad under the guide of university spirit synergy led by the socialist core values, make a lot of coordination and interaction actions that promotes the enhancement of synergistic effect of automobile culture construction in the campus by focusing on the automobile culture construction mechanism, and able to utilize implicit and explicit education means to boost the healthy development of the automobile culture construction in the campus. According to the scores, we can know that further improvement needs to be made regarding the university spirit synergy and subject behavior synergy of the automobile culture construction in the campus for that of WUT. The university spirit, which should be held as the soul of campus culture construction, shall be refined and accumulated under the guide of socialist core values, to navigate the cultural construction. Close track of teaching, scientific researches, services and managing behaviors shall be paid attention to so as to upgrade the connotation of culture construction from these behaviors and improve the psychological quality and professional proficiency of teachers and students as subjects.

5 Conclusions

Based on the above analysis, this paper tried to summarize the connotation of synergistic effect of university campus culture construction and its generation path and to provide a basic theoretical frame for it so as to assist the university culture construction department to keep track of the running of campus culture construction system which helps the university to hold the overall direction of campus culture construction, integrate current cultural and educational resources as well as implicit and explicit education means, coordinate the frame and implementation of university campus culture mechanism and also coordinate the interaction between the cultural construction and university’s education, management and service actions. This frame can also help realize the dynamic monitoring of synergistic effect paths for university campus culture construction for the smooth operation of campus culture construction system. Therefore, it has good application prospect and a value for promotion.

Construction of a High-Level Martial Arts Team Management Pattern Based on the Three-Dimensional Methodology WSR

Yi Peng

Physical Education Department, Wuhan University of Technology, Wuhan, P.R.China, 430070
(E-mail: 13476188559@163.com)

Abstract: By adopting the WSR, interviewing professionals, searching relative documents, inspecting on the spot, designing questionnaire and reasoning logically, this paper intends to analyze the module of a high-level martial art team management. The results indicate that the traditional pattern, relying too much on the coaches' experience or simply restricted to the management regulations, therefore cannot give full play to the subjective initiative or in the process of control and prediction achieving the comprehensive effects of the management. WSR, a three-dimensional system consisting of W- facilities maintenance, S-rules and regulations, and R-human resources, emphasizing a comprehensive management combining all the three perspectives and the effects of whole control, which lays an important theoretical foundation of both the organization and management of high-level martial art teams in Chinese universities and forming a cognitive system of the three-dimensional mechanism.

Key words: Martial art team; Management system; WSR methodology

1 Introduction

The traditional pattern, being affiliated, independent, or cooperative, has a remarkable influence at the primary stage. However, with the rapid development of social science and technology, continuous expansion of the education functions, and the change of management conception in the new century, there is a higher demand for the management work. Meanwhile, traditional management disadvantages gradually increasing, it is urgently needed of a management pattern characterized as being more scientific, regulated, comprehensive, logical and humanized. WSR three-dimensional system management for high level sports team in Chinese colleges comes from practices. It also will accept the examination of pretties (Ma wenjing, 2007). "WSR three-dimensional management mode" consists of the three dimensions of w(wuli) S(Shili) and R(Renli). From the macroscopic theory the three-dimensional system management mode emphasizes on management of "three into one" of facility safeguards, regulation and emphasizes on the realization of integrity of management effects. (Wang Yan Deng, 2011). This provides important theory base for the organization and management of high level sports team in colleges forming the cognitive system of "WSR three-dimensional system management mode" (Qiaojian, 1995). Therefore, the author of this essay, based on system methodology, tries to reasonably construct the WSR pattern, guided by oriental philosophy, and combining the features of systematic science.

2 Basic Theory of WSR System Methodology

In the middle of the 1980s, people always ignored the humanity factors in solving practical problems, which seriously discouraged the solution to them. As far as Xi Zezong concerned, consideration should be given to the importance attached and the relative factors between stuffs and humans in a systematic program. Professor Gu Jifa, put forward the oriental system methodology Wuli-Shili-Renli by referring to both Chinese thoughts in philosophy and western system methodology, shorted for WSR. He pointed out that we should know the stuff use the opportunities and learn humans. Although the three branches stand for different meanings in this methodology, there is a closed link between them. The core of the system is the overall consideration for all the three branches when confronted with complex circumstances; W: the rules and objective existence of materials movement; S: the ways to solve problems, that is how to arrange or make use of stuffs; R: all understandings and solutions to matters are completed under the assistance of human beings and so does the judgment of both matters and things (Bo Chen, 2001).

Table 1 Contents of the WSR

Sector	Object and content	focus	principles	Supporting theory
Wuli	Rules and regulations in material world	What Analysis on functions	Honesty Truth	Natural science
Shili	Reasons of Organization and systematic management	How Analysis on logic	Cooperation See for efficiency	Management science System science
Renli	Reasons of dealing with individuals and groups	A good job Analysis on humanity	humanity, harmony, and efficiency	Humanistic Knowledge Behavioral knowledge

3 Establishment of the Three-Dimension Management Pattern of Martial Arts Teams

3.1 Frame of a high-level martial arts teams management pattern

The three dimensional management systems are made up of three parts: W stands for the assurance of materials needed for the high-level martial arts teams in colleges; S stands for various rules and regulations promoted by high-level martial arts teams in colleges; R stands for HR of high-level martial arts in colleges. The three branches can be stretched out without limits according to different situations in universities and obtain full openness, close to each other and fully interacted. The three branches systems, together with their own derivations, are all open to and communicate with the outside world, including the exchange of materials. There is a connection among all branches systems, which makes it possible for each one to shift and change to another one or the environment. Some branches, even sometimes can be part of the system under some condition while they can also be totally out of the system under some other condition to penetrate into the environment to fulfill its function. The short-term departure and long-term convergence can be completed by the emergence of departments or the personnel mobilization (Zhong Wei, 2011). Therefore, there is a possibility for the adjustment of orders of high-level martial arts teams in colleges in China.

3.2 Three dimensional pattern of high-level martial arts teams management

3.2.1 Design of Wuli system structure

Wuli refers to mechanism involving motion of matter and usually hold the application of natural science. It mainly responses to the questions like what is matter and what it needs are reality and object existence of the study and the aggregate principles of motion of matter. Traditional pattern of high-level martial arts in colleges, roughly classifying the equipment as facilities, rarely gives a thought to its elements and hardly manifest the integrity of materials as a complete system. With Wuli system, the poor management of traditional pattern can be improved by sorting various information in an organized and systematic way. Major factors affecting the Wuli system are: 1 training facilities and fundamental equipment are basic supports for athletes' training and matches; 2 3 information web fundamental facilities, web guides in! 4 sports equipment means clothes and facilities for athletes. For Wuli system, the facilities of a sports team play an important role in its development, for on one hand, it acts as the material basis of the training, and on the other hand, helps to save athletes' energy in matches and training. Currently, to reasonably arrange the facilities, it is normally equipped with spots, facilities and workers working on internet information management in colleges in China (Sun Dongchuan, 2001). However, if more measures can be taken except for the above mentioned, for example, setting up a professional assessing group consisting of experts, further expanding financial ways, and improving the management of concerning facilities, material factor would be able to have a more efficient influence on the system. Besides, adopting much more advanced facilities involving information searching and sorting in time will greatly facilitate its development.

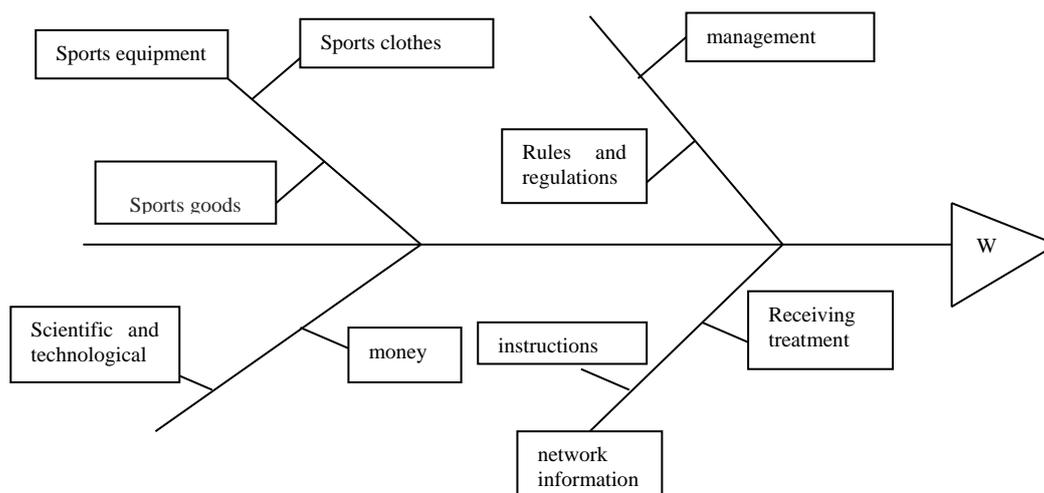

Figure 1 Fish-Bone Chart Analysis on the Wuli Facilities

3.2.2 Design of the structure of Shili system structure

Shili, reasons of solutions to problems, are mainly used to solve how to arrange. It can be generally

interpreted a mechanism used or concerned during the process of creating and changing of the world, indicating a boundary between humans and matters/stuffs. In the essential phrase of the making of rules and regulations of traditional sports team management, there is no good results and no complete mechanism to follow due to a lack of integrity conception, no key points and no levels. Major factors affecting the Shili system are: 1 the rationality of training. It is the key point in a game for the athletes to fulfill their advantages and judge the situation clearly and adopt reasonable strategies; 2 the rationality of training schedules. The schedule should be made not only based on the specific physical strengths but also related to the literacy lessons, at which point schedules should be made after full communications between trainers and trainees. 3 the rationality of literacy classes. High-level athletes are not only equipped with professional sports skills but also need relative literacy classes to upgrade literacy qualities and professional skills, which lays a foundation for the athletes who won't work as athletes any more. 4 the rationality of praises and punishment. The mechanism of praises and punishment is designed to restrict both couches and athletes, which at a degree mobilizes the enthusiasm and initiative.

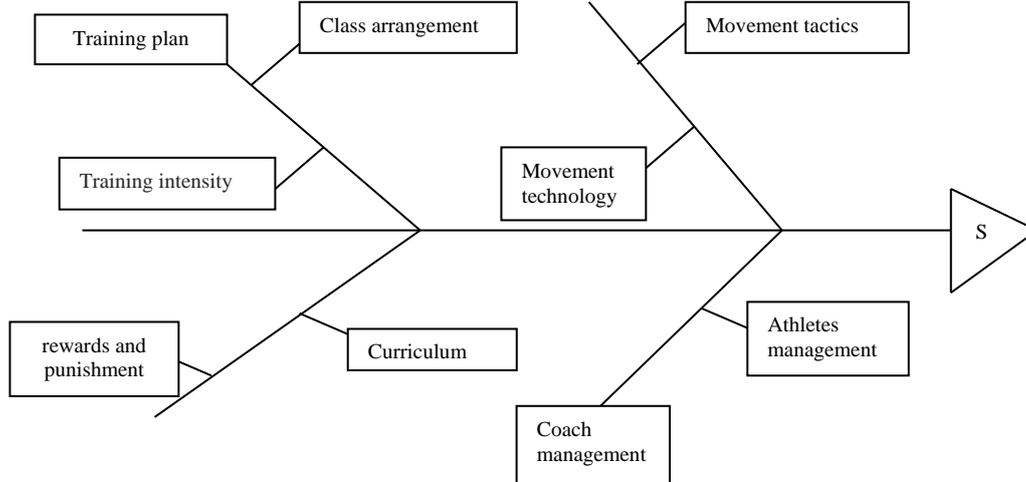

Figure 2 Fish-Bone Picture Analysis on the Shili Regulation System

3.2.3 Design of structure of Renli system structure

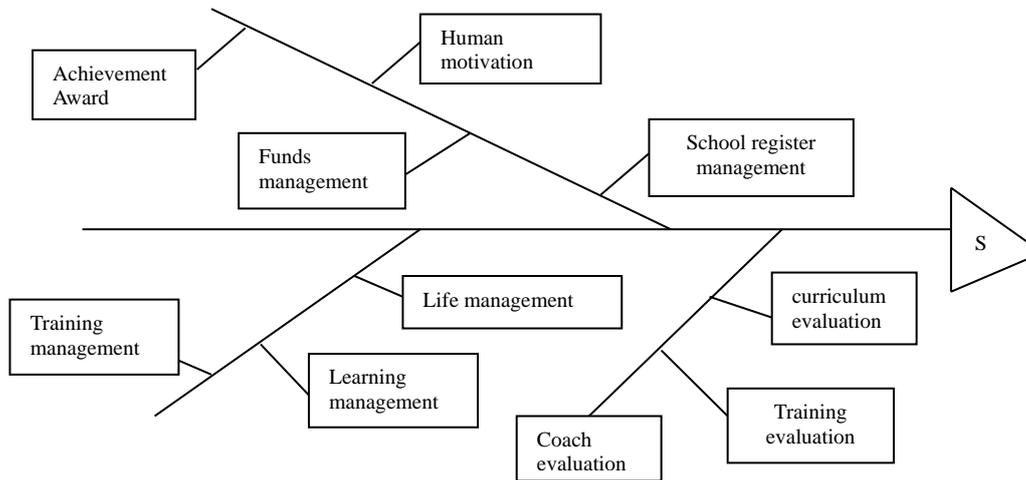

Figure 3 Fish-Bone Picture Analysis on the Renli HR System

Renli, the secrets of living as a human. In life, things and problems can't live without humans, for humans are who are responsible for corresponding assessing standards to deal with questions like 'how should we do' and 'what's the best can we do?' to solve targeted aims under the assistance of the knowledge about humanity and social science. In traditional module, there is nothing in humanity or flexibility but rules and regulations (Li Haoyi, 2008). Thus, it was able to fully display the significance of harmonious interpersonal relationships. Major factors affecting the Shili system are: firstly, HR

assessment system. Coaches are responsible for the organization of competition training, while athletes carry out specific steps under the instruction of their trainers; secondly, systematic management of the enrollment, learning, student status, training, life and employment, the procedure of which should combine both the academic learning and professional sports training and take the duality of identity into consideration. Finally, the key to a high-level sports team is to establish a reasonable mechanism about the organization and motivation of the team. Except for the mechanism, we should also set up a series of regulations on the scientific teaching, curriculum setting, team management and so forth and then be strict about athletes to settle the contradiction between the two aspects.

4 Conclusions

In traditional pattern, there is no flexibility in the system of organization and operation, and the relationship between the orders and obeying is in a mess, so this limits the development of the team of athletes, both internal and external. WSR pattern is scientific and reasonable in theory and successful and feasible in practice, greatly improved the level of the team of athletes in colleges by specifically classifying WSR into three different branches, Wuli materials infrastructure, Shili rules and regulations and Renli HR resources, which also clearly sort out the thoughts and is of great science during the management. Meanwhile, the WSR system still remains to be further improved and implemented, it is strongly advised that we should constantly bring in new ideas and methods about the management and continuously fulfill the pattern on the grounds of practical conditions.

Research on Countermeasures on the Construction of Curriculum Resources Sharing in Application-Oriented Colleges

Tan Xiangping

Logistics Support Office, Wuhan University of Technology, Wuhan, P. R. China, 430070

(E-mail: 342319929@qq.com)

Abstracts: This paper adopts the methods of questionnaire and individual study, taking Wuhan University of Technology as an example, puts forward suggestions and countermeasures on the construction of curriculum resources sharing in the application-oriented universities in Hubei province. Based on the data analysis of 50 copies of questionnaire survey, this paper has empirical research on the current situation of curriculum resources sharing in Wuhan University of Technology from three aspects, which contains curriculum setting, teacher resources allocation and student needs, aiming to explore the mode of curriculum resources sharing in application-oriented universities.

Key words: Application-oriented universities in Hubei province; Curriculum resources; Sharing; Wuhan University of Technology

1 Introduction

In Wuhan University of Technology, there are 87 existing undergraduate majors, which covers literature, science, engineering, arts and other disciplines. Considering the amount of courses, most of the public courses have realized a better situation of resource sharing (Huyen J, 2006), such as "College English", politics, computer, etc. Basically, every major set up and put classified teaching in practice (Xiaolong Li, Jinxiang Yang, 2014), so we should observe and study the current situation of sharing of curriculum resources from every aspect of each school (Frederick Rudolph, 1996). Due to the restrictions of different majors, the possibility of sharing curriculum resources is relatively small for several quite different majors, such as the School of electronic and Information Engineering and School of music. However, there exists relatively large possibility of sharing curriculum resources (Che Yu, 2006) between School of electronic and Information Engineering and School of mathematics. As a result, this paper will have a research between related schools. In this paper, the current situation of curriculum resources sharing in WUT (Wuhan University of Technology) will be elaborated from three aspects, which contains curriculum setting, teacher resources allocation and the student needs. Besides, the setting of curriculum is the most basic and important part (Stanley E, 2011) of teaching planning. From analyzing the existing situation of curriculum setting, the rationality of teaching planning and the maximum possibility of curriculum resources sharing could be revealed (Liu Dongxing, Hua Jinlong, 2014).

2 Research Method and Research Tool

2.1 Analyze on the current situation of curriculum resources sharing in different majors in the same school.

In Wuhan University of Technology, department of computer science and technology is one of the relatively large and strong departments. This department includes three undergraduate majors: network engineering, embedded application software and computer software. In the same school, the curriculum of different majors could be obviously repeated. Hence, it is necessary to share the curriculum resources. According to the teaching planning of department of computer science and technology in 2010, repeated key courses of three undergraduate majors can be showed in the following table:

Table 1 Three Common Courses of Department of Computer Science and Technology in WUT

departments items	Network engineering	Embedded application software	Computer software	Overlapping courses
Amount of key courses	15	14	16	10
Overlapping courses/total courses	66.7%	71.4%	62.5%	—

Statistics in Table 1 shows that in actual teaching, part of common courses are taught in normal class, such as the course "discrete mathematics" and so on, these courses are taught respectively by

different teachers in different classroom. In this way, the curriculum resources don't not realize better resource sharing (Shuangrong Song, 2014). Besides, part of the courses is taught in large class, which follow the way that same teachers spend same time to teach more students, such as the course "data structure". In this way, the curriculum resources sharing between different majors could be more and more reasonable.

2.2 Analyze on the current situation of curriculum resources sharing in different schools.

In the previous chapters, the school of computer science and technology, department of mathematics and the school of electronics and information engineering have something in common in terms of the nature of the subject. Besides, covered courses between these three schools also have close relationship, so curriculum resources sharing could be possible. According to undergraduate teaching program of Wuhan University of science and technology in 2014, curriculum setting of three schools are obtained, and it can be clarified through Table 2.

Table 2 Curriculum Setting of Three Schools

schools items	computer science and technology	mathematics	electronics and information engineering
Overlapping with school of computer science and technology	—	Advanced mathematics; College Physics; Discrete mathematics; C language	Advanced mathematics; Linear algebra
Overlapping with school of mathematics	Advanced mathematics; College Physics; Discrete mathematics; C language	—	Advanced mathematics
Overlapping with electronics and information engineering	Advanced mathematics; Linear algebra	Advanced mathematics	—

Statistics in Table 2 shows that it can be found from the table that there exists certain repeat of curriculum setting in these three schools. Except for these completely same obligatory courses, there are some similar or overlapping courses among these three schools, such as Basis of Computer, Application Design, Electronic Technology Base, Probability theory. All these courses are related to mathematics, computer and electronic information engineering. In conclusion, this type of above-mentioned courses is easy to realize curriculum resources sharing.

3 Results and Analysis

3.1 The research on the curriculum resources sharing from the perspective of allocation of teachers

In Wuhan University of Science and Technology, there is a high level team of teachers. This school has 5393 teaching staff now, including 3069 full-time teachers (793 of them are professors, 1396 of them are associate professors). High-quality and excellent teachers are mostly concentrated in school of economics and management, school of electronic information engineering and the department of mathematics. Now, this following chapter will study the current situation of teachers sharing inside the school and between schools. From my survey and research, it can be found that the phenomenon of teachers sharing is very common among different majors in one school, which means the sharing rate is very high. In the school of economics and management, school of electronic information engineering and the department of mathematics, the sharing of teachers resources is only limited to the same professional courses. In terms of inspected results of technology management department, electrical engineering department and mathematics Department, teachers' allocation of these schools is relatively reasonable. There are different degrees of teacher resources sharing between schools, between departments, between professionals. But this kind of sharing needs to be further elevated in depth and breadth.

3.2 The research on the curriculum resources sharing from the perspective of from the perspective of students

A questionnaire survey was conducted towards students from eight undergraduate schools in Wuhan University of Technology. Rationality and utilization rate of curriculum resources and teacher resources allocation are studied from the perspective of the needs of students. In this way, we can get further understanding of students' internal demand for learning and curriculum resources. Plus,

sufficient practice evidence could be provided for the feasibility and necessity of university curriculum resources sharing.

3.3 Analyze the undergraduate curriculum resources survey in WUT

The questionnaire examines students' evaluation of the present situation of curriculum resources from three aspects: 1) Professional satisfaction degree. 2) The evaluation of school curriculum .3) The needs of curriculum resource sharing. Students from eight schools participated in this questionnaire survey, they are students from school of economics and management, school of liberal arts, school of teacher education, school of foreign language, school of life science, school of computer science and technology, school of electronic and information engineering and school of mathematics (50 copies of effective questionnaire).Statistical analysis results are as follows.

Firstly, professional satisfaction degree

From the results of the survey, 18% of the students is very satisfied with their own professional, and they wish to continue their studies, 6 people are not satisfied with their professional, which accounted for 12% of the total number. But it is worth noting, 22% chose “It’s OK, I will choose another job when I graduate.” And this percentage is worthy to catch our attention. The specified result could be showed in table 3.

Table 3 Undergraduates’ Professional Satisfaction Degree in WUT

items	Very satisfied, want to study further	Satisfied, want to choose other majors	It’s Kobuk I will choose another job when I graduate	Not satisfied, always want to change my major	No idea	total
people	9	22	11	6	2	50
percentage	18	44	22	12	4	100

Generally, most students are very satisfied with their professional. According to the table 3, 62% choose “satisfied” and “very satisfied”, from this we can see that the inner learning motivation of students is very healthy, and it provide good circumstance for the advance of curriculum sharing.

Secondly, satisfaction degree of curriculum setting and teaching planning

Students’ satisfaction degree of their own professional mostly depends on their own interests, cognitive thinking mode and the influence of family environment. However, whether the professional, that students study for four years, could satisfy students’ original learning motivation, depends on the rationality of curriculum setting and teaching planning.

According to Figure 1, 89% show that teaching planning partly satisfied or basically satisfied their own leaning needs. However, 13 people express that they are completely not satisfied with their professional, and they can only learn by themselves. And we need focus and reflect on ourselves.

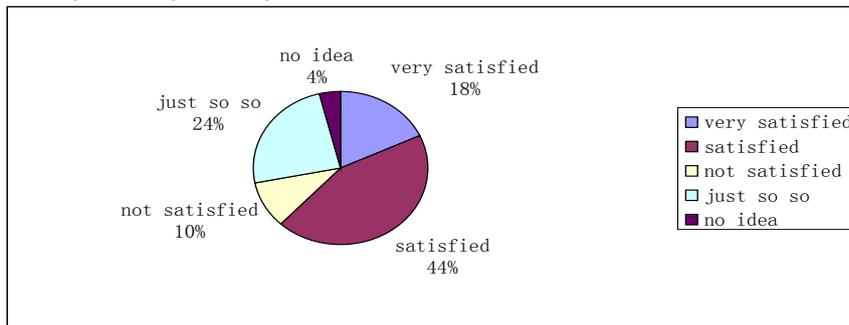

Figure 1 Undergraduates’ Satisfaction Degree Towards Curriculum Setting and Teaching Planning

Thirdly, satisfaction degree towards the teaching of teacher

In Figure 2, Comparing with curriculum setting and teaching planning, students’ satisfaction degree towards teachers’ teaching is very high. 60% express their high satisfaction, 11 people give medium evaluation, only 4% show their complete dissatisfaction and 8 people have unclear idea. The specified results can be showed in the following table.

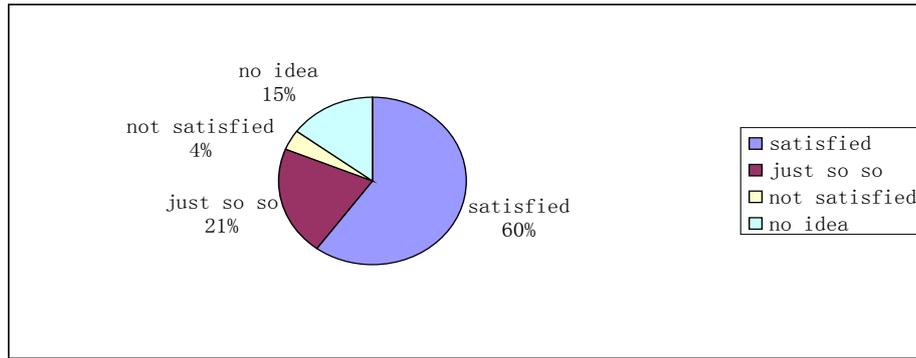

Figure 2 Undergraduates' Satisfaction Degree towards Their Teachers' Teaching in WUT

Fourthly, analysis of students' satisfaction degree towards quantity and quality of courses

According to the survey, it can be showed that most students are relatively satisfied with the quantity of existing courses and the arrangement. And they are very satisfied with the setting of their own major courses. However, students from these eight schools have different attitude towards the amount of public courses and professional courses.

Students from different schools have different opinions about the arrangement of existing curriculum. Most of science and engineering students think that the professional courses are too few, such as the course statistics of school of mathematics only has nine, but the public courses are relatively more. Student from school of economic management think that their professional courses are too many, the optional courses and public courses are relatively less, which could impact their expansion of knowledge.

From all the survey results, over 90% students think that the optional courses are too few, 80% think that the offered optional courses has little to do with their own professional courses, and they are not able to choose the optional courses they want. These may be the two reasons why students think the optional courses are relatively few.

3.4 Research on the practical need for resources sharing

After the comprehensive understanding of students' satisfaction degree about their own major, course setting, teaching planning, the necessity of curriculum resources sharing and the specific need are further studied in this research.

From the perspective of teaching arrangement in universities, the need of sharing curriculum resources has been a common view, but is it necessary from the perspective of students?

According to this questionnaire survey and some random interview of individual students, we can see that the results are very obvious; almost all the students show their urgent need of sharing of quality courses. Most students show great interest about courses on Internet, such as open courses of Yale University on the Internet

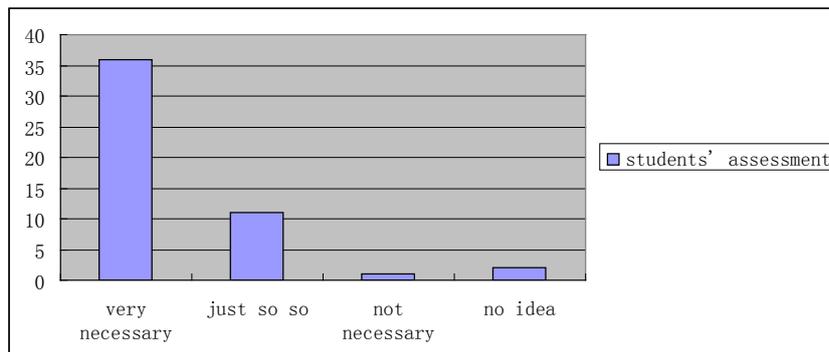

Figure 3 Undergraduates' Need of Sharing Curriculum Resources Sharing in WUT

Just as the Figure 3, students have very clear judge about the necessity of sharing curriculum resources. In this 50 copies of questionnaire, 36 people choose "very necessary", 11 people choose "necessary", and these people accounts for 94% of the total number. Plus, only 1 person thinks it is "unnecessary".

The above-mentioned part has clarified “optional courses”. And the further study of optional courses could derive the possibility of optional courses in cross-major class. According to the survey results, it can be showed that 30% of the students chose “not interested another professional”, 60% of the students said they were interested. Through random interview of students, part of the physical and engineering students expressed that their professional course is too many, their experiments are too many, their learning work is also very heavy. They have no time and energy to have elective courses, such as students from school of electronics and information engineering and students from school of life sciences. The specified results could be showed in the following table:

Table 5 Undergraduates' Willingness of Cross-major Learning in WUT

genre schools	history and Philosophy	Foreign language	Economics, management, law	Science and Engineering	computer	arts
Economy and management	16	24	22	4	14	14
Liberal arts	18	33	17	9	13	9
Teachers' teaching	11	33	28	8	29	9
Foreign language	10	31	31	11	19	5
Life science	9	29	36	16	18	6
Computer science and technology	13	35	37	13	19	5
Electronic information and engineering	12	32	39	15	27	10
mathematics	14	31	37	17	31	13

Through table 5, we can see that on the one hand, foreign language and computer courses are generally welcomed; on the other hand, students of science and Engineering, such as students from school of computer science and technology and school of electronic information engineering, show great interest in courses outside of their own majors, such as economics, management, law and foreign language courses.

Through the analysis of questionnaire survey and statistic, we find that students' need of sharing curriculum courses generally exists, they show certain interest in cross-major and cross-subject high quality courses. Although students from different schools show different willingness about sharing curriculum resources, but in general, almost all the students think sharing curriculum resources have more advantages than disadvantages. Some problems are also found in the process of doing questionnaire survey and individual interview, for example, students are not completely satisfied with the setting of curriculum, quantity and quality of courses. Because of the unreasonable arrangement of optional courses, some students don't have energy and time to learn other courses though they want to choose optional courses; but other students think that their professional courses are few, at the same time they don't have suitable optional courses to choose so as to waste too much spare time. To solve these problems, scientific consciousness and methods needs to be raised, we should find students' inner learning need, make reasonable arrangement of curriculum and teacher resources. In this way, we can meet the needs of different levels of students and treat students as the core.

4 Conclusions

The goal of curriculum resources sharing in application-oriented undergraduate colleges and universities of Hubei Province is to optimize the allocation of resources for higher education, improve educational efficiency and competitiveness. Through the integration and utilization of colleges and universities resources, let's make new teaching plan and teaching mode for fostering applied undergraduate talents This kind of talent training mode must have dynamic, systematic and sustainable utilization of the available resources, and constantly update and summarize the mode in the combination of theory and practice, which can be applied into the demands of application-oriented undergraduate education.

Abstract: The main question of this paper is whether the Balanced Scorecard, when applied as performance measurement system hinders innovation at hospitals under study. An in depth literature review is done on the on the scope of performance measurement system and the use of Balanced Scorecard from the context of organizations in general, health care industry, and different types of hospitals. Findings show that no mention of the above found in hospitals applying Balanced Scorecard that measure innovation specifically. It can be concluded that, with innovation being inculcated in the vision and mission statements of the hospital, Balanced Scorecard may not hinder the innovation.

Key words: Balanced scorecard; Performance measurement system; Health care; Hospital; Innovation

1 Introduction

The service sector has increased at a fast rate and becoming a competitive sector of the economy (Injazz, 1994; Akter, 2008). This phenomena is also affecting the health care industry which is consisted of several sectors ranging from medical devices manufacturing, nursing, pharmacies to hospitals play an important role in the world economy (Mahmud, 2007). To explain further, there are two main stakeholders in the industry named as healthcare providers and consumers. Additionally, there is a range of internal and external stakeholders. The former involves health care specialists providing professional knowledge and service, such as physicians, psychiatrists, dentists, nurses, babysitters, etc. The latter receive healthcare service and therefore care about the quality of health care services Akter (2008) further discussed on the difference characteristics of the healthcare sectors with an added sector of emerging fields within.

From another perspective, Smeltzer and Ramanathan (Smeltzer, 2002) explained that in health care delivery processes, many key actors playing multiple parts resulted in role ambiguity during the service processes and product variations. From the macro environment perspectives of the health care, the changing variables such as rapid transformation of technology in general, demographic factor and change in lifestyles resulted in unstable environment that affects both private and public healthcare organizations (Koumpourous, 2013). Even with the advancements in scientific and technology fail to address with patients' satisfactions and service inefficiency that have been plaguing the industry (Mohammadkarim, 2011).

These events have turned the global health care organizations to balance between managing increasing health costs and providing high quality services to consumers at lower costs (Deloitte, 2014).

Thus, the role of innovation to help solve or lessen the problems mentioned above in order to increase their competitiveness, effectiveness and sustainability.

2 The Role of Innovation to the Healthcare Organization in the Competitive Market

There are several types of innovations used to solve or minimize global competition and emerging crisis faced by organizations (Bessant, 2006; Brzóška, 2014; Szmál, 2015; Baran, 2015; Dasgupta, 2009). As discussed earlier, it is important for health care organizations have to understand the need of innovation to improve performance apart from regulations imposed (Plsek, 2014) Innovations provide a possibility to create a new customer value (new products and methods of customer service) as well as new value for a business.

Organizations need to innovate to increase and defend competitive advantage, either by managing their environment or by reacting to organizational dynamic and environmental demands (Baregheh, 2009; Bessant, 2005; Damanpour, 1991; Zain, 2002). While hospitals are embracing an innovation orientation, translating it into improved performance has proven challenging (Plsek, 2014). McCreight (2013) provides an insight to this challenge, "One of the striking differences between hospitals and other

organizations is that so many more groups play important.

As such, the need to measure innovation in the organization has become important to ensure the business survival of the organization.

3 The Need to Measure Performance of Organizations

In general, to manage better in these trying times, most of the successful organizations within the market-based economy use performance measurement systems because they are required by the stakeholders' interest. This is necessary, in order to produce information to indicate performance levels achieved, or to embrace a particular system to generate continuous customer-based market driven improvements

As with other industries, the healthcare industry needs performance measurement system due to the advent of transparency in healthcare quality. This system will become more prominent by using indicators (ishoek, 2001).

4 The Evolution of Performance Measurement System

Literatures mentioned on the need to measure organizational performance are being inspired by either the Balanced Scorecard (Kaplan, 1993) or by the work of Neely (Neely, 1998).

Initially in measuring organization performance, only one stakeholders' perspective is covered (22, 23,24) or one category within a single stakeholder (Laschinger, 2001; Sluijs, 2003). For example, financial measures such as return on investment, internal rate of return, net present value and payback period which have been demonstrated to be inadequate (Ma, 2013).

Until recently, many scholars have been concerned with the bias that that could be generated using this process. For example, Counte and Meurer (Salge, 2009) recognized the high potential for a single respondents' bias, since they observed that very little information is gathered across types of employees in order to avoid bias.

Given the inherent limitations of financial measures (they reflect historical performance, are highly aggregated, and may lead to a short term bias), many companies have sought to supplement financial measures with nonfinancial measures (Kaplan, 2001).

As a result, the more comprehensive nonfinancial measures are designed to capture the operating effects of managerial decisions that will, eventually, influence financial results (Westbrook, 1998).

The combination of financial and non-financial measures have been agreed by Neely (Neely, 2007) who stated that organizational performance measurement must covers three specific fields of organization results: financial performance (profits, return on assets, return on investment, etc.); market performance (sales, market share, etc.); and shareholder return (total shareholder return, economic value added, etc.)

This is being supported by the fact that the assessment of performance in an organization is critically important in order to achieve its goals. It is essential for an organization to be consciously aware of its surrounding situation and quality of performance, especially in complex and dynamic contexts (Nikjoo, 1993; Raeisi, 2013).

As discussed above, all the performance measurement models developed after the mid-1980s are more balanced. They embraced different perspectives of analysis and manage them in equally. However, scholars take various ways to balance performance measurement (Daniel, 1989; Neely, 2005; Brignall, 1991).

Turning now to the health care industry, studies stressed on the importance of performance management systems in health care organizations.

5 The Need of a Comprehensive Performance Measurement System to be Applied at Healthcare Organizations

The need for a comprehensive performance measurement system is more prevalent, since the health care industry faces medical errors, patient safety issues, and increasing medical costs (Olden, 2007; Stock, 2007). The increasing medical costs are due to the use of technology and modern medical tests when compared many other industries (Boon, 2004).

As examined by Aguinis (Aguinis, 2011) who asserted that performance measurement system can make several important contributions to organization such as increasing the motivation to perform, achieving organizational goals, improving employees' competency and clarifying the definitions of the job.

6 The Current Knowledge on the Current Performance Measurement System in Healthcare Organizations

Stewart and Locamy (Stewart, 2001) admitted that health care performance measurement systems must do more than measuring administrative functions and its focus on financial perspectives for the purposes of coordination and control. Niven (Niven, 2008) further explained that the main limitation in performance measurement systems at health care organization serves a narrow regulatory, clinical, or diagnostic function. There are not constructed to tell the story of an organizations' strategy and guide its implementation.

So, the need to include wider areas apart from the medical or technical measurements is becoming more important.

7 The Involvement of Stakeholders in Performance Measurement System

Porter (2010) started the argument by saying that an enhanced organization performance depends on the existence of a common goal for different stakeholders. The same understanding has been applied with the concept of quality in health care, which have been developed from a purely technical approach to a multi-faceted issue (Donabedian, 1987). The multi-faceted issue in healthcare, which tries to satisfy the needs, interests and demands of three principal interest groups (Øvretveit, 1992) which can be listed as those who provide the service (i.e. the health care professions), those who manage it, and those who use it (i.e. patients). Additionally, Morgan and Everett (Morgan, 1990) suggested a fourth interested party, namely those who commission the service, the purchasers, resource allocators and policy makers. Each group has its own specific and different interests and opinions on the definition, measurement and improvement of hospital service quality.

It can be deduced that the health care organizations are dependent on their stakeholders. And this, can be done by measuring performance of different stakeholders' perspectives. Evidently, one of the more often mentioned performance measurement system in measuring health care organizations performance is the Kaplan and Norton's Balanced Scorecard.

8 Balanced Scorecard as a Performance Measurement System

Kaplan and Norton (Kaplan, 1996; Kaplan, 2001) introduced the use of Balanced Scorecard as a tool for performance measurement and strategic management to business organizations for more than a decade. In addition, Modell (Modell, 2012) explained that Balanced Scorecard is a strategic planning and management system being applied extensively in business and industry, government, and nonprofit organizations worldwide to align business activities to the vision and strategy of the organization, improve internal and external communications and monitor organization performance against strategic goal.

Supporters of Balanced Scorecard explained that other types of performance measurement systems do not offer timeliness and forward- looking indicators of Balanced Scorecard. The cause and effect linkages of the Balanced Scorecard capture the complexity and relationships of the strategy, facilitating explicit tradeoffs among cost, quality and access. Many of the other measurement systems complement the Balanced Scorecard by guiding operational and process improvement.

It has been reported that approximately 53% of the global companies and 60% of large US companies applied the Balanced Scorecard as formal process of measurement (Rigby, 2009). From the global perspective, the Balanced Scorecard is one of six most generally used management tools with its high ratings in terms of satisfaction (Rigby, 2010). A Cranfield University research report addressed that out of 75% of the companies that applied a formal process of performance measurement, 46% embraced the Balanced Scorecard as their main method (cited in Balanced Scorecard Collaborative Training Material, 2006).

Although the Balanced Scorecard has attracted commendable interest as a performance measurement innovation (Ittner, 1998; Ittner, 2003), the pessimist view is that it is management fad and a product of management consultants (Zimmerman, 2001). Many are concerned about the variable success of the Balanced Scorecard in its implementation (Malina, 2001) questions about its logical validity (Norreklit, 2000), its many uses (Wiersma, 2009) and its rhetorical basis (Norreklit, 2003; Busco, 2015).

On the bigger perspectives, others have doubts on Balanced Scorecard universal appeal (Bourguignon, 2004) while mentioning that the Balanced Scorecard needs to adapt differences in communication, reward structures, strategies, and information displays and characteristics (Otley, 1999;

Banker, 2004).

Interestingly, when Balanced Scorecard are applied at healthcare organizations, they measure diverse spectrum due to plurality of organizational settings in terms of both focus (for example acute care, ambulatory care, long-term care, insurance and managed care, consulting) and mission (e.g., for profit, religious, government owned)(Shewchuk, 2005).

Within the health care organizations, hospitals are important sectors serving important services. They absorb big percentage of resources. The developing and developed countries experienced about 40 and 80% of resources being distributed to hospitals, respectively Since hospitals affect the health care capability, resulting in the importance of measurement of hospitals performance. (Mohammadkarim, 2011)

Focusing on the hospitals sector alone, Koumpouros (2013) and Christesen (2008) suggested that Balanced Scorecard have expanded their overall customer dimension by reducing patients' complaint. This has led to the understanding that patients are satisfied with the health care services and treatments. It resulted in the improved patient retention rates along with their loyalty towards the hospitals. Consequently, apart from the positive results such as an increment in their revenues (Karra, 2005; Urrutia, 2005), reduce costs (Gurd, 2008) increase hospitals profitability (Kairu, 2013) and evidently improve their financial performance (Davis, 2004)

9 Does Balanced Scorecard Kill Innovation at Hospitals?

Literatures highlighted that the Balanced Scorecard may result in negative result to the organization. This is supported by Voelpel, Leibold, and Eckhoff (Voelpel, 2006) who explained that it may become an obstacle for the organization to become innovative and creative due to its notions on strong inherent organizational control. However, Kaplan and Norton have responded strongly to the arguments made earlier (Kaplan, 2006).

Table 1 Using Balanced Scorecard as Performance Measurement System at Different Hospitals and the Benefits Derived from Different Perspectives.

Name of hospitals/(department of hospital) studied	Benefits and improvements gained
Duke Children's Hospital & Health Center, Durham, North Carolina, U.S.A (Melions, et al., 2000) Description of hospital – not mentioned in literatures	<ul style="list-style-type: none"> • Costs reductions • Revenue enhancements • Better patients care
St. Martin De Porres Hospital, (Emergency department) Chia Yi City, Taiwan, Republic of China (Huang, et al., 2004) Description of hospital – not mentioned in literatures	<ul style="list-style-type: none"> • Performance of the emergency department significantly improved after implementing the balanced scorecard including hours of continuing education attended by the staff • Staff job satisfaction, the rate of incomplete laboratory tests within 30 minutes • The average monthly inappropriate return rate, and hospital profit.
Peel Memorial Hospital, Ontario Canada (Harber, 1998) Description- acute care hospital	<ul style="list-style-type: none"> • Patient satisfaction level increased from 89% to 95% • Staff satisfaction survey participation level rose from 33% to 75%. • Better understanding on where to invest time and money in learning where objectives has been achieved • Achieve ability to relate vision and mission statements to business performance measurement
MacKay Memorial Hospital, Taipei, Taiwan, Republic of China (Wencheng Chang, et al., 2008) Description – a private Christian hospital	<ul style="list-style-type: none"> • From 2003 to 2005, the revenue from services not covered by the National Health Insurance (NHI) increased from NT\$1407 million (US\$1 = NT\$32.9; €1 = NT\$39.0) to NT\$17,894 million. • Inpatient satisfaction rose from 89.07% to 91.9%. • The number of visits by disadvantaged patients (those with economic, social or physical disabilities) increased from 82,350 to 97,658 visits. • The number of research projects also increased from 46 to 61 projects. • The percentage of patients admitted to an intensive care unit in less than 3 hours from arrival in the emergency department increased from 47.8% in 2004 to 82.5% in 2005

Source: this paper

With reference to the Norwegian banking sector, Antonsen (Antonsen, 2014) found that Balanced

Scorecard may inhibit information sharing, cooperation and organizational learning. But, the question that can be forwarded to those in the hospital sector in particular, is “Does Balanced Scorecard kill innovation at hospitals?”

To answer the question, an analysis on the several hospitals that applied Balanced Scorecard as performance measurement system and have successfully gained benefits were made.

Table 1 listed the benefits obtained by the different types of hospitals located in different countries in applying Balanced Scorecard.

From the table 1 above, it can be derived from the literatures that the hospitals analysed have been using Balanced Scorecard in many guises that conform to each organizations’ objective. In achieving different positive results in many perspectives especially in the financial performance and patients’ satisfaction. Unfortunately, they are no mention of measurement recorded from the perspective of innovation.

This may be due to the nonexistence of the innovation indicators in the Balanced Scorecard used in each of the four different hospitals under study.

10 Conclusions

It can be concluded that hospitals have to include in its vision and mission the need to innovate. This will show in the perspectives when designing the Balanced Scorecard. This is to support the argument made by that Kaplan and Norton (2006), that Balanced Scorecard will not hinder innovation at the organization that apply it as performance measurement system.

In other word, Balanced Scorecard will not kill innovation at the hospital when it is a part of the indicators of the performance measurement.

Abstract: The scope of this Paper is to clarify the unfolding of Complex Thinking concerning the role of management, as a result of a research carried out in some Brazilian public schools, where the dialogical movements were understood in the whole context in which the linear and systemic aspects coexisted. The studies of the theory of Complexity are the bases of the reflections on the management activities, enabling articulation toward the self-organization of the group. It is observed by many researchers that the action of the manager usually encompasses the role of a planner of the work, with rational use of the resources and articulation of the means to reach the targets of the institution, in addition to the role of coordination and control of people's work. That has shown not to be enough to meet the challenges of the world nowadays. The processes of management may get different meanings: under a more technical view where management is often centralized, decisions come from the top without participation of the other levels; under a more democratic conception, the process is more participative, and decision is collective. In this view, the manager is expected to promote collective work, encourage the participation of the different subjects of the team and institution community, establish co-responsibility and assure the construction and implementation of a proposal – a set of intentions – a collective agreement. To be able to do so, the manager should be prepared to perceive the team as a living system, able of self-organization, as well as the linear and systemic aspects in permanent balance.

Key words: Complex thinking; Management; Self-organization; Sustainability

1 Introduction

The strengthening of democratization represents a change in the net of power relations at the institution. The vertical flow of centralized command is replaced by horizontal relations which are more flexible. Power is not crystalized in hierarchical levels, but it is distributed among the teams of work which take responsibility for thinking and doing. Decision and action becomes complementary in the live dynamics of the balance of polarities – not opposites as in the hierarchical pyramid. The dichotomy between planning and executing does not exist as mutually excluded. Instead, participation of those who share the same ideals for change increases, and they agree in taking a common task defined by negotiations of objectives. Success or failure of results are not attributed to a leader of command, but are the result of collective work. Control is much more related to follow up and evaluation of the process aiming at helping the subjects in their construction of responsible action. Plans of work are not imposed top/down neither outside/inside, but rather built, implemented and evaluated by the teams. Models make no sense, as the solutions come from the context, resources and degree of need and effort on the part of the people involved. This view of management actions expands as we reflect with the help of Complex Thinking by Morin preparing managers to take decisions for sustainable development.

2 From Administration to Management

In the last two decades, the expression 'school management' was introduced in the Brazilian educational context, replacing 'school administration', with the aim of encompassing new skills of the school principal, in the process of democratization of public schools. In this sense, school management is understood today, at least legally, as a collective and participatory process, which governs the way the school works, involving decision-making, planning, implementation, monitoring and evaluation of an educational policy.

In this context, the school principal is in charge of the implementation of the collective decisions of school boards, as well as the coordination of the operations of the school unit. The manager is expected to encourage the participation of the members of the team and the school community, define responsibilities and ensure the construction and implementation of a pedagogical proposal, ie a body of intentions, a collective pact. The democratic management concepts are closely interwoven with the

principles of citizenship, autonomy and emancipation, being a way to develop people for sustainability.

Democratic management in school, in essence, is not a practice that can simply be instituted because it is a self-organizing process, coordinated by the manager, through participatory experience. This process is not mechanical, as social reality is extremely complex, the educational field is not neutral and the human being cannot be regarded as an instrument of production, distant from the natural world. Thus, the discussion on school management will be expanded below from the perspective of the complex thinking by Morin (2005a, 2005b, 2005c), covering the dialogical movement between linear thinking and systemic thinking.

3 Linear Thinking in Management: Hierarchical Control and Bureaucracy

Linear thinking, a hallmark of our times, tends to simplify reality, fragmenting it so it may be understood and controlled. It is appropriate for the treatment of mechanical and functional problems, but ineffective when dealing with issues that require a systemic view. Reason is overused, through rationalization, which perceives only the immediate answer, simplifying and reducing everything to simple linear causality.

The traditional model of school management, which expresses the linear, Cartesian and mechanistic logic, has its recent origins in the Classical Theory of Administration, whose leading exponents according to Chiavenato (2000) are: the American Frederick Winslow Taylor and his studies on Scientific Management; the European Henry Fayol and the Classical Theory; the German Max Weber and the Theory of Bureaucracy.

One of the criticisms of the administrative models of Taylor, Fayol and Weber is the logical and deterministic approach of the organization, in which fragmentation and the mechanistic division of labor prevail. Critical theorists of the twentieth century, guided by the Marxist conceptions, played an important role in denouncing the alienation in production processes and social relations of such administrative models. As a result of this alienation, human beings were pervasively prevented from understanding the nature and product of their work, as well as perceive themselves as human beings, part of a systemic nature where they are encompassed. The human dimension in its entirety was eclipsed by the excessive importance given to a fragment of a human being's capability: just labor force.

The model and practice of school management, based on the classical management theory, served the purpose of the mass formation of a skilled labor for mechanical work. The structural model of the industry was reproduced in school by maintaining organizational efficiency, centralization of power and instrumental use of communication at the service of control of the production machine.

The ideals of discipline and obedience, plausible in the context of productivity optimization, became the linear communication standards, desirable in the school environment in which subjectivities are hidden and unrecognized. The education process was mechanized and schools became factories. To some extent at least education was robotized and robotizing.

Even nowadays, schools are characterized by pyramidal power structure and the fragmentation of school work. In what concerns school organization, the division of labor in technical-administrative and pedagogical tasks is due to the value of specialization at work. The roles and responsibilities are defined through regulations, to maximize efficiency and to assure hierarchical control.

4 Systemic Thinking in Management: A Living Organization

While the linear thinking is effective for the analysis of the parts of a whole, systemic thinking is important for the understanding of the interdependence and interaction of parts as an open system.

Systemic thinking may be represented by the web of life, as this is its very essence. It is a contextual thinking in the concept of Capra (1997, p. 46): "systemic science shows that living systems can't be understood by analysis. The properties of the parts are not intrinsic properties but may only be understood within the context of the larger whole."

A system is a set of components that are related to each other. It keeps an organization and a structure. The organization defines the system's identity and expresses its configuration through the essential features of its parts. The structure is defined by how the parts are related. The structure of the system changes during its existence, in permanent exchange of energy with the environment. It is an autopoietic system in continuous regeneration.

In the systemic thinking, the labor organizations are conceived as dynamic, not linear networks, as the mechanistic paradigm is not enough to explain them. For Capra (2002), human organizations resemble living systems. They can't be controlled like machines, through instructions, because they are

alive and react to the impositions.

Regarding the organization as a living being, there is awareness that the system is able to get self-organized, to learn, to change and evolve naturally, because its intrinsic feature is self-production. It is in constant circular retroactive movement, of own creation, seeking for sustainability in the balance of two paradoxical forces: autonomy and dependence.

The notion of human autonomy is complex and is directly related to the idea of dependence. According to Morin (2001), the subject depends on the environment in which he or she lives, learning a language to communicate, in order to acquire knowledge and generate new knowledge. These are fundamental perceptions to build an attitude towards sustainability

A sustainable management of a democratic school should be based on the experience of the dialogic principle of autonomy / dependence, through the strategic coordination of actions and mediation of interpersonal relations. The living organization, in this case, is a self-eco-organizing system with relative autonomy, which constantly interacts with exterior, and is able to create its own determinations and purposes.

Systemic thinking is necessary for the manager, as it allows him to view school life beyond the bureaucratic routine and formal / functional relations. School dynamics can understand as a living being, a culture in permanent construction.

Democratic management can fit in this conception, for autonomy and dependence, in dialogical movement, are complementary polarities that characterize the emancipatory process.

An articulation action could be unveiled by the manager when understanding that the own power may be used to stimulate shared decision-making, in which he takes the coordinator position. Thus, he / she can create opportunities for him / her and his / her team to experience new relations and for the educator's isolation scenario to assume new more organic settings.

Systemic thinking is opposed to linear thinking, but both are embraced by complex thinking, so that reality may be better understood.

5 Complex Thinking in Management: Dialogic Relationship between Linear Thinking and Systemic Thinking

Morin (2005a, p.151) explains that all organizational relationship produces antagonism with complementarity, ie, "[...] the complementarities that are organized between the parties secrete antagonism, virtual or otherwise; dual and complementary identities coexisting in each part is itself virtually antagonistic ". As in the TAO, a figure of complexity, the female principle yin contains within it the yang masculine principle, antagonistic and dormant; in opposite relationship, the male yang principle contains latency in the female principle yin. When a polarity reaches its peak, it reveals within it the seed of its opposite.

Linear thinking which is expressed in the bureaucratic matrix and systemic thinking characterized by the vision of the whole oppose dialogically, are complementary opposites, according to the interpretation of complex thinking (Morin, 2005a, 2005b, 2005c). The linear thinking and systemic thinking are always present in the same reality. The prevalence of one over the other may represent a simplistic attitude in the interpretation of reality, if they exceed, for example, in the particularization or generalization. Mariotti (2007, p 82) explains: "The holistic view is as reductionist as the Cartesian. One reduces aggregation, while the other reduces by fragmentation."

The school organization reflects in its domain all the social complexity as it is a part of this. It is a cell of the social hologram, therefore it reflects inside the dynamics of the whole of which it is part. As society, it is also a living organism that is able to get self-organized. Metabolically (Moraes, 2004) it is in permanent reorganization or regeneration, in response to all processes of disintegration. Inside, the relations are ambiguous, appearing as complementary and antagonistic. Beside the movements of change, there are conservative forces; collaboration and resistance are forces which coexist, as well as order and disorder. A force is always in operation in response to the simplifying character of the opposite force. The system is open and caordic.

With the vision of complexity on the school organization, it is possible to deal with the paradoxes that are perceived in everyday reality, which is predictable and at the same time unstable and uncertain. The school culture is ambiguous and has a contradictory character, because it has elements that stimulate innovation, as well as elements which contribute for conservation. Routine and emergent situations alternate; formal and informal relationships flow in parallel; ambiguities are natural in the game of convergence and divergence. It's actually the game of all living systems like we can see in nature.

Understanding reality from the perspective of complexity is to realize that there is a creative tension between the polarities depending on contradictions. The opposites are fed by this contradiction and the dialogic relationship is maintained, while new properties emerge that feed, as a recursive ring, the balance game of polarities.

The school is a place of conflict, of dialogic encounters that generate creativity. The subjects have different interests and values from each other that can be negotiated through dialogue. The dialectic can be helpful in finding a consensus whenever possible. A dialogics is necessary in situations where tensions remain, and also in what concerns respecting diversity. The words by Mariotti (2007, p. 154) complement the idea: "Being able to distinguish when employing dialectics and dialogics is a highly strategic skill."

Conflicting situations are not only found in schools, but are part of the social fabric. They are the result of confrontation of ideas, in all social issues, especially of political nature. In fact, they are reflected in the school. An example of this is the paradox in which managers are in the task of mobilizing educators for participatory and co-responsible building of a political-pedagogical project.

Thus, the management action faces a conflicting reality, explicated by De Rossi (2006), whose interests and values emanate from two distinct and contradictory forms of reasoning: the regulatory one and the emancipatory one. The linear reasoning of regulations is at the service of public policies that are governed by the market economy and are extremely concerned with quick results, while the emancipatory reasoning regards the socio-political citizenship construction as a process.

A major challenge for the school manager is to encompass the coordination of bureaucratic and educational activities in such a way that they may express a relationship of interdependence. In practice, there is a division of activities due to the technicist culture still prevailing particularly in the public schools. The educational activities tend to be under the supervision and full responsibility of the coordinators, while bureaucratic activities monopolize all the time of the school manager. This split is due to a fragmented and reductionist vision of school teams who base their actions only in the list of regulations drawn up by school assignments. They lack a vision of the whole, a perception of the systemic reality.

Educational and bureaucratic doings are imbricated in the democratic and complex dimension. The bureaucratic tasks, called 'the means', are necessary to give support to the school routine, to the maintenance of the infrastructure, the implementation of the projects, in short, to give life to the intentionality of the formative educational process. Otherwise, if they are valued as 'core activities' they will assume a linear and instrumental character. On the other hand, the educational activities are made viable through the bureaucratic structure and legal boundaries that need to be followed and kept under control.

Bureaucracy is also ambivalent. It has an operational and rational characteristic, as it encompasses working methods and applies impersonal rules to ensure the good work of the organization. However, this same bureaucracy can be manipulated by rationalization, running the risk of becoming an administrative blockage, to the extent that the real purpose is distorted.

Besides the bureaucratic and routine activities, there are planned actions. The former are predictable and resemble rigidity, the latter are focused on uncertainty and emerging elements. Planning is a more strategic action, as it works in the field of unpredictability and flexibility, in opposition to the program through which everything is done more automatically (MORIN, 2000, 2001).

In addition, planning, in the complex and democratic dimension, is an activity resulting from collaborative movements inherent to participatory spaces and dynamics. They emerge and are consolidated as leaders and their teams do not arise as mutually exclusive opposites. In this case, management is not exercised by authoritarianism, but gains recognition and legitimacy when there is respect and value of individuality and diversity. The balance between the polarities is maintained because the focus of the changes remains on the interests and meanings. Significant disturbances act naturally in organizations, perceived as self-organizing systems, without having to undertake a mechanical effort to put them in motion.

These impulses may trigger structural, unforeseen changes. Under these conditions, intuition, according to Motta (2001) shall be valued in the action of an officer, beside the analytical rationality, as it produces the global vision required to cope with ambiguities and uncertainties which are present in the emerging situations at work. What is desired is a balance between order and chaos, logical and illogical elements, rational and intuitive ones.

In modern organizations, communication of inter-subjective nature emerges at the heart of management practices, concomitant with the reduction of both, relations of subordination and use of communication only to transmit orders and guidelines.

In contemporary management, the concept of authentic communication arises in professional activity. According to Zarifian (2001, p. 165), it is "a process by which reciprocal understanding is established which leads to a shared meaning, resulting in further understanding of the actions that those involved take together or in a convergent manner." This meaning is transformed in the course of this communication according to the viewpoint exchanges and turning more explicit the common needs. From the reflective dimension of meaning, that is, the subjective and practical redesign, the subject directs his / her thoughts and actions, undertakes the own change in face of the events or problems that have made a pre-existing situation lose stability. The expression of that individual dimension is the mark of freedom of the subject, an attribute of civility in modern society.

However, authentic communication is related to expressiveness, that is, in the right to freely express the personal meaning that is contained in the thinking and action, in relation to the partners of communication, as well as the power to express this sense in the initiatives concerning ideas and the doing with autonomous responsibility. Thus, the individual assumes the causality of the own actions.

In line with this, there is a dialogical relationship in the management action, that is: to assert an idea or action in terms of the management skills to direct and control, and at the same time, use authentic communication as a source of reflection on the challenges of the company and the subjective engagement of the individuals who compose it.

Thus, the interpersonal relationship based on the authoritarian model of obedience, and control gains a new meaning by the collaborative model, which values friendship, cooperation, fellowship and consensus. While the first model exemplifies the patriarchal culture and is based on distrust and desire for domain, the second is related to the matristic culture, recognize trust as the principle of interpersonal relationships.

Mariotti (2000) summarizes the essence of these two matrixes according to their characteristics. The patriarchal culture is described as an expression of linear thinking, which, in turn, is guided by the need to control nature, to encourage competitiveness, to use deterministic discourses of exclusion, based on immediacy and dichotomies such as good / bad, friend / enemy, and others. The matristic culture, representative of complex thinking, is distinguished by understanding the human being in tune with nature, by the participation, solidarity, inclusion, as well as acceptance of reflection on paradoxes and differences.

6 Conclusions

Manager's role alignments are a complex undertaking, but not complicated, and deals with key ideas like: democratic management, participation, autonomy, emancipation, and others of the kind. The change is systemic, but it requires the manager's attention to the context and at the same time, the value of educators and needs to look at the whole and the parts as an open dynamic system, without losing sight of the intersubjective plot. So in other to take care of the school organizational climate is crucial for the members of the team work in charge to find pleasure and meaning in their role on a self-sustaining creative living movement, helping students to develop more participatory activities and attitudes related to a sustainable world as is now happening in more educationally advance countries like Finland.

Abstract: In this paper, the radar chart approach was applied to monitor provincial degrees. The paper defined and quantized indicators such as teaching staff, scientific research, talents cultivation, base construction, academic exchange, and social services. National minimum standards, the average and the maximum value of the degrees among the same-level and same-type ones were used to determine the radii of the three concentric circles. The paper constructed the early warning model of doctor's and master's degrees in China. An applied research was presented using this method.

Key words: Radar chart; Doctor's and master's degrees; Early warning

1 Introduction

Following the law of development, the risk early warning theory, as an important research object in the field of management, uses advanced techniques and methods to make accurate judgements of current situations, based on which the evaluation, prediction, warning of the operation quality and consequence of part of or entire social systems related can be achieved (John L. D., Ted R.G, 1998). Considerable research has applied the risk early warning theory to humanities and social sciences research fields namely business administration and public administration, whereas only a few research applied the risk early warning theory to the field of education. Focusing on the construction of emergency early warning institutions on campus, Yi Zhaodi (2016) suggested that social groups such as governments, community, schools, and family should be incorporated in the construction of safety campus, and special attention should be paid to the significant influence of community in safety campus construction. Chen Guang (2011) emphasizes the importance of establishing the work responsibility mechanism with well-defined and law-abiding duties and responsibilities, the people-oriented and student-friendly safety education mechanism, and the prevention-oriented trouble shooting mechanism with comprehensive coverage. By studying the construction of early warning system of specialties in vocational colleges, Li Haizong (2014) maintains that the indicator system should include 10 second-level indicators such as demand for talents, source of students, employment status, teaching staff etc., and 38 third-level indicators. In order to study the standard construction of compulsory education schools, Yang Shuyi (2012) constructed 15 second-level indicators such as school-aged population enrollment ratio, annual consolidation rate, ratio of music teachers, PE teachers, and art teachers, etc. to represent the risk evaluation indicator system of the standard construction of compulsory education schools. Research on early warning model of doctor's and master's degrees in local and provincial education departments remains a blank.

The local or provincial graduate education departments carry out early-warning evaluation on doctor's and master's degrees within their jurisdiction, in order to provide information and lay the foundation of dynamic regulation of doctor's and master's degrees for graduate students training units. For the reason that the number of degrees authorized is large and the process of evaluating those degrees is intensive and time-consuming, the early-warning evaluation posts a challenge to the local and provincial graduate education departments. This paper states that the key to meet the challenge is to establish scientific supervision methods and modernized supervision techniques, therefore the local and provincial graduate education departments can have efficient supervision on doctor's and master's degrees within their jurisdiction, thus eventually improving the provincial and local authorized degrees early-warning mechanism.

2 The General Structure of Early Warning Mechanism of Doctor's and Master's Degrees Based on Radar Chart Approach

First invented and applied in the field of corporate financial management by Japanese businesses, the radar chart method is mainly used as a comprehensive evaluation technique to assess corporate financial conditions. As the shape of financial composite chart resembles radar, the chart is known as the

radar chart. The radar chart is a direct and graphic comprehensive technique to analyze and evaluate corporate financial status and business conditions from the perspective of production, safety, revenue, growth, and mobility (Fu Zan, Fang Deying, 2007). Using the radar chart, a lateral comparison is achieved by comparing a corporation's financial indicators, which represents the financial status of the corporation, with the lowest, the average and the highest financial conditions among similar corporations. Therefore, the corporate's financial conditions can be revealed. Local or provincial government has the similar demands to supervise the degrees offered by the graduate students training units, hence the radar chart approach can be used in the early warning supervision on the doctor's and master's degrees.

In order to use the radar chart to early-warningly monitor the degrees, this paper firstly frames the general structure to solve the following problems:

2.1 Demand analysis of the provincial graduate education departments

The demands of the provincial governments to early-warningly evaluate the authorized degrees is twofold:

One is to provide information for graduate students training units. By developing corresponding information system, graduate students training units are able to get a full picture of whether their doctor's and master's degrees meet the national basic standards, how the degrees have developed over a time span, and the lateral comparison between similar disciplines among the same-type degrees within provinces.

The other one is to provide decision-making references for provincial or local governments to carry out dynamic regulation on authorized degrees. In 2015, the State Council Academic Degree Committee issued < Notice on Carrying Forward Dynamic Adjustment of Doctor's and Master's Academic Degrees and Professional Degrees >, stating that the Academic Degree Committee of provincial and local Council should take the responsibility of the dynamic adjustment of graduate students training units within their jurisdiction, to constantly adjust and improve the structure of disciplines and specialties, to eliminate the degrees which have inefficient demands, inadequate conditions to cultivate graduate students, and poor cultivation quality, and to replace them with those with urgent needs and well conditions.

2.2 Component analysis of authorized degrees

Nowadays, there are different perspectives of how degrees are composed of. This paper holds that the degrees are composed of 7 indicators, namely research orientation, teaching staff, scientific research, base construction, talents training, academic exchange, and social services. Teaching staff includes the number, the structure and the competence of teaching staff; Scientific research includes research projects and scientific achievements; Base construction includes the number of national, ministerial, and provincial bases; Talents training includes the size and quality of students cultivated; Academic exchange examines international conferences and international projects; Social services examine the transformation of scientific achievements. These indicators are used to determine the specific contents and indicators when monitoring authorized degrees using the radar chart method.

2.3 Determining the radii of the concentric circles in radar chart

There are three key elements to determine the radii of the concentric circles and provide comparison.

The first element is to determine the radius of the exterior circle, which shows the highest level within certain limits. More specifically, it reflects the maximum value of all related disciplines at the same level (doctor's degree or master's degree) or the same type (academic degree or professional degree).

The second one is to determine the radius of the middle circle, which shows the intermediate level within certain limits. More specifically, it reflects the average of all related disciplines at the same level or type.

The third element is to determine the radius of the inner circle. Inner circle reflects a government's basic requirements or minimum standards for an authorized degree, the lowest threshold to be more precise.

A radar chart of doctor's and master's degrees consists of the three elements which can be used to evaluate degrees. For instance, if all indicators of a degree fall beyond the inner circle, the degree is qualified. If some indicators fall within the inner circle, the degree is considered disqualified. Moreover, provincial and local graduate training departments should consider the demands of dynamic adjustment, to bring the degrees which rank last among the same level and same type degrees into supervision. The degrees under supervision are potentially to be eliminated during the dynamic adjustment.

3 Matters Need Further Attention

The above chapter introduces the framework of using the radar chart to early-warningly monitor the doctor's and master's degrees of provincial graduate students training units. A few matters need to be clarified for application reasons.

3.1 The selection and definition of the indicators

Using the radar chart approach to monitor degrees of provincial graduate students training units requires a clarification of the specific indicators. This paper holds that the construction of a degree is composed of 7 factors: research orientation, teaching staff, scientific research, base construction, talents training, academic exchange, and social services. Research orientation mainly tells that the degree has stable, characteristic, and advantageous orientations, which is difficult to be quantified. Meanwhile, the factors like teaching staff, scientific research, and the talents training can reflect the features and advantages of orientations. For the reasons above, the research orientation is not included. Therefore, 6 indicators used to monitor the doctor's and master's degrees of provincial graduate students training units are teaching staff, scientific research, base construction, talents training, academic exchange, and social services.

These indicators should be defined. First of all, the indicators used should meet the national essential requirements for authorized degrees that are expecting to come forth. At present, the Academic Degree Commission of the State Council is organizing the Discipline Appraisal Group of the State Council and Professional Degree Advisory Committee to formulate essential standards for doctor's and master's degrees, and bring forward basic requirements for the Audit and Qualified Assessment of authorized degrees, for academic degrees and professional degrees respectively. For the standards are still under consideration, this paper follows the basic standards that came forward at the 11th Degree Authorization and Audit in 2011. The basic standards have two requirements for Teaching Staff: the number of teaching staff who are professors, and the number of teaching staff who have doctor's degrees. There are three requirements for scientific research: the amounts of scientific research funds, the amounts of public and government-sponsored research funds, and scientific research awards. One requirement for talents cultivation is the number of degrees granted.

Secondly, the indicators used should meet the needs of systematic assessment to authorized degrees. The national requirements only propose some key factors which are far from comprehensive, so further improvements are required. For Teaching Staff, academic leaders should take into consideration. Hence, academicians, "the Thousand Talents Plan", Yangtze Rive Scholars, and the National Science Fund for Distinguished Young Scholars are included to reflect the quality of teaching staff. Besides the research funds and provincial and ministerial-level research awards, the number of papers which can be indexed by SCI, EI, and ISTP and the number of patents are also included to systematically assess the innovation capacity of the discipline. As for base construction, the number of national research bases and provincial research bases are included. Besides the size of talents cultivated, indicators reflecting the quality of talents cultivation such as the number of National Excellent Doctoral Dissertation (nomination included), Provincial Excellent Doctoral Dissertation, and Provincial Excellent Master's Dissertation are included. For academic exchange, the number of international academic conferences and the amounts of international research funds are considered. For social services, the transformation of scientific achievements into productivity is included.

3.2 The determination of the radii of three concentric circles

The Radar Chart consists of three concentric circles. The radius of the inner circle reflects the national lowest threshold or basic requirements. Besides the indicator required by the national government, as national requirements are still being discussed, the radius of the inner circle is defined as the minimum value of the degree among the same-type and same-level degrees in a province. The radius of the middle circle is defined as the average value of the degree among the same-type and same-level degrees in a province. The radius of the outer circle is defined as the maximum value of the degree among the same-type and same-level degrees in a province.

3.3 Improvements of the database and the data

In order to monitor the construction of doctor's and master's degrees using the radar chart, an information management system should be developed to collect and handle the massive data using existing network platform. As has been discussed above, the data processing is not complicated, nor is the development of the information management system. The key lies in the acquirement of data. In order to collect mass data needed, importance should be attached to the construction of basic database and the improvement of related data. The more records related to doctor's and master's degrees are

collected, the more comprehensive the data are, and more thorough the analysis of the construction and development of doctor’s and master’s degrees can be achieved. Currently, several provincial and local Academic Degree Commission have established fundamental information database of graduate students training units within their jurisdiction, which provides basic information of the doctor’s and master’s degrees. Nevertheless, the information database is incomprehensive, incomplete, and dated. Furthermore, the regular report system is yet to be established. Further improvements are expected to create the conditions for early warning supervision on doctor’s and master’s degrees.

4 The Application of Radar Chart to Early Warning Supervision on Doctor’s and Master’s Degrees

For research convenience, the early warning supervision on a Doctor’s degrees of Chemical Engineering and Technology in a designated province is taken as an example for applied analysis.

4.1 Data collection and data processing

4.1.1 Data Collection and Handling

This paper takes data on degrees of Chemical Engineering and Technology in 2015 as an example. Details are depicted in Table 1.

4.1.2 Data Processing

The indicators are non-dimensionalized. The equation reads:

$$k_i = \frac{x_i - \min x_i}{\max x_i - \min x_i}, (i=1, 2, 3, \dots, n) \tag{1}$$

In the equation, k_i represents the standard value of x_i , whose range is 0 to 1. $\min x_i$ represents the minimum value of x_i , while $\max x_i$ represents the maximum value of x_i .

Table 1 Descriptive Statistics of Academic Doctoral Degree of Chemical Engineering and Technology in a Designated Province

Units for graduate training	Teaching Staff			Scientific Research					Base Construction		Talents Cultivation					Academic exchange		Social Services
	The number of professors	The Number Of Teaching Staff have Doctor’s degree	academicians, “the Thousand Talents Plan”, Yangtse Rive Scholars, the National Science Fund for Distinguished Young Scholars	Annual Research funds (10 thousand)	Annual Gov. Sponsored Research Funds (10 Thousand)	Number Of Provincial Or above Sci. Awards	Number Of Papers Indexed By SCI EI ISTP	Annual Number of patents	Number Of National bases	Number Of Provincial bases	Number Of Doctor Degree granted	Number Of Master Degree granted	Annual number of National Excellent Doctoral Dissertation (including nomination)	Annual number of provincial Excellent Doctoral Dissertation	Annual number of provincial Excellent Master’s Dissertation	Number of Inter. Conference	Annual funds of inter. research projects	Annual Profits Of research transformation
Univ. 1	25	46	1	1460	890	1.8	65	15	0	2	6	111	0	0.6	2.2	0.8	60	360

Univ. 5	14	29	0	710	480	0.4	45	10	0	2	9	75	0	0.4	2	1	120	600

Table 2 Normalized Data

	X1	X2	X3	X4	X5	X6	X7	X8	X9	X10	X11	X12	X13	X14	X15	X16	X17	X18
Univ. 1	0.630	0.750	0.333	0.625	0.628	0.500	0.158	0.304	0	0	0.147	0.274	0	0.300	0.200	0.214	0	0
Univ. 2	1.000	1.000	1.000	1.000	1.000	1.000	1.000	1.000	1.000	0	1.000	1.000	1.000	1.000	1.000	1.000	0.333	1.000
Univ. 3	0.444	0.375	0	0.839	0.845	0.357	0.496	0.130	0	1.000	0.294	0.073	0.500	0.500	1.000	0.357	0.167	0.143
Univ. 4	0.519	0.708	0	-0.016	0.033	0.571	0	0	0	0	0.500	0	0	0	0	0	0.833	0.214
Univ. 5	0.222	0.396	0	0.234	0.289	0	0.014	0.087	0	0	0.235	0.055	0	0.200	0	0.286	1.000	0.571

For research convenience, the 18 indicators representing the contents of authorized degrees are denoted as x1 to x18, varying from the number of professors to annual profit of research transformation. When determining the radii of the three concentric circles, the outer circle reveals the highest level among the same-level and same-type degrees, the radius of which is denoted as 1 according to equation (1). The middle circle represents the average value among the same-level and same-type degrees, the

radius of which is denoted as 0.5 according to equation (1). Similarly, the radius of the inner circle which represents the lowest level is denoted as 0. Therefore, the radii of the three concentric circles are 1, 0.5, and 0 respectively. For observation convenience, the center of the circles is denoted as -0.5. The indicators are non-dimensionalized and presented in Table 2.

4.2 Drawing the radar chart

In 2010, during the Degree Authorization and Audit by the Academic Degree Committee of State Council, several requirements are proposed for Doctoral degree candidates: the number of professors should be no less than 8, the number of teaching staff who have doctoral degrees no less than 10, the annual research funds no less than 260 000 yuan, the annual government-sponsored research funds no less than 130 000 yuan, the annual scientific awards at provincial or above levels no less than 0.4, the annual doctoral degree granted no less than 1. These data form the lowest level of an authorized degree, which can be seen as the radius of the inner circle. After determining the radii of the three concentric circles and normalizing the statistics, the values of all the indicators can be determined. Using softwares such as EXCEL, the radar chart can be drawn.

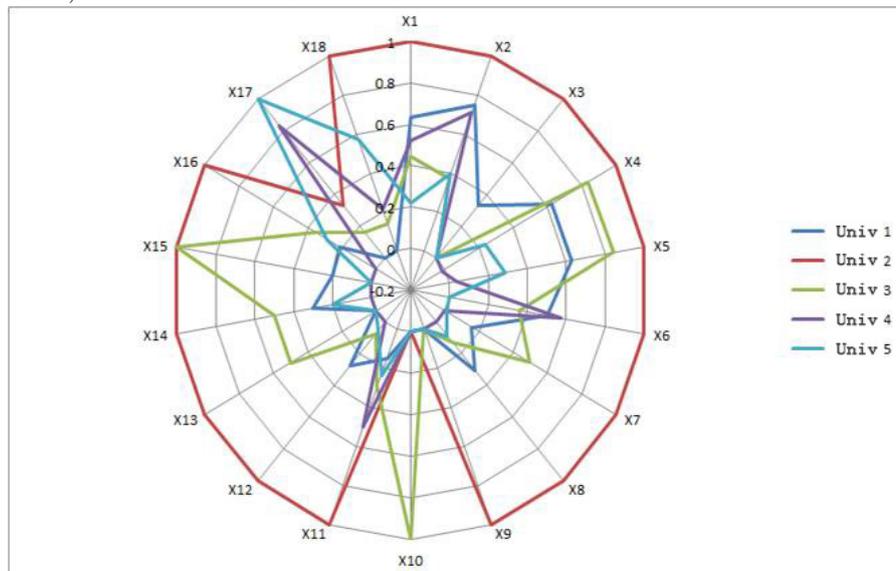

Figure 1 The Radar Chart of Degrees of Chemical Engineering and Technology of Several Universities

4.3 Analyzing the construction of authorized degrees using the radar chart

As can be seen in the radar chart, University No.2's degree of Chemical Engineering and Technology has the most strength and advantages, 16 indicators of which are at the highest levels, especially for indicators X10 and X17. The strength of University No. 3 is also strong, indicators X4, X5, X10, X13, X14, and X15 of which are above the average. University No.1 ranks in the middle, indicators X1, X2, X4, X5, and X6 of which are above the average. While University No.4 ranks relatively low, indicators X1, X2, X6, and X11 of which are above the average, but indicator X14 is below the average. University No. 5 ranks last, only indicators X17 and X18 of which are above the average.

5 Conclusions

As can be seen in the radar chart which depicts the supervision on the degrees of Chemical Engineering and Technology within a designated province, the University 4 fails to reach the national basic threshold. Therefore, the provincial educational departments should warn the University 4 to reinforce scientific research, research funds to be specific. Meanwhile, the radar chart reveals that the overall strength of university 4 and 5 are relatively weak, hence university 4 and 5's degrees of Chemical Engineering and Technology should be included in the provincial dynamic adjustment. The radar chart serves as decision support for local or provincial government to dynamically adjust degrees.

This paper only discusses and analyzes the radar chart method. In order to apply this method to early warning supervision on doctor's and master's degrees, several adjustments are required.

5.1 Longitudinal comparison should be included

Firstly, this paper only made a lateral comparison between doctor's degrees offered by several

graduate students training units in a designated province. Longitudinal comparison should also be included. Because the longitudinal data is quite difficult to collect, this research did not include longitudinal comparison. But if ample longitudinal data are provided, further research can study the development of a degree through a period of 3 or 5 years to analyze the construction and development of degrees and the indicators that constitute the degrees in a given period. Consequently, administrators, especially the ones governing university Graduate Schools, are able to fully understand the overall situation and the construction and development of indicators that constitute the degrees, and to make accurate judgments relying on the information provided.

5.2 The scale of the data should be expanded

Secondly, this research should expand the scale of data. Ideally, the early warning supervision on degrees should be undertaken in a relatively large scale horizontally and longitudinally. As the data collected are rather small, the highest value, the average and the lowest value of the degrees of various levels and types cannot objectively represent the values of degrees. As a consequence, the objective evaluation of the construction and development of a degree is compromised. Thus, future research should establish a nationwide database based on basic data collected across the nation, which will play an important role in determining the radii of the three concentric circles. The larger data will contribute to the increase in the reliability of basic values of the three layers.

5.3 Several indicators need further adjustments

In this paper, the indicator system includes 6 first-class indicators and 18 second-class indicators. All the first-class indicators and second-class indicators are given the same importance when conducting correlation analysis. While from the perspective of system theory, the importance of the elements that constitute doctor's and master's degrees indeed vary. For instance, external elements such as scientific research, talents cultivation, academic exchange, and social services should overweight the internal elements such as teaching staff and base construction. Additionally, provincial and local graduate education administrators as well as university graduate education administrators vary in work hierarchies, work contents, and focuses, therefore the indicator system should adjust accordingly to meet various needs.

Study on a Model of Creative Thinking

Tian He

School of Civil Engineering and Architecture, Wuhan University of Technology, Wuhan, P. R. China,
430070

(E-mail: 674161673@qq.com)

Abstract: Transformative thinking model is based on the theorem of contradiction & identity. Its integration in studying, working and researching will enforce the interpretation in concept of diverse thinking, even more to enforce the understanding and finding in scientific theory. This model will be the one of the latest models the computer stimulate human intelligence. Applying the formal model into study, work and scientific study, which will play a guiding role, will deepen the understanding of thought and concept of the law of the unity of opposites and mutual transformation, so as to deepen the understanding of and discovery of interdisciplinary theory.

Key words: Contradiction; Identity; Transformation; Thinking model

1 Introduction

Artificial intelligence is a young discipline formed by the three directions of natural science, social science and technology science. In 1956, in the Dartmouth conference, scientists investigated machine to simulate human intelligence, and first proposed the terminology "artificial intelligence". Since then, the AI (Artificial Intelligence) research has been recognized and its name and mission were determined, the earlier achievements and the first group of researchers also appeared.

The aim of the study of artificial intelligence is to create a machine that can simulate human intelligence (Lu Ruling, 1987). The two main schools of artificial intelligence research are: "bionics" and "heuristic". Bionics is to simulate the human nervous system, it adopts the neural network simulation with computer or physical components while the heuristic genre is to imitate human cognitive ability or use a similar approach (E·Popov, 1985).

This paper presents an artificial thinking model, which is a model of human thinking, is established according to the method of dialectical thinking. It is a kind of new model of computer simulation of human intelligence, which is the form of dialectical thinking. There are at least two approaches to this new model that we need to explore, that is, the transformation method and different reasoning, the two are interrelated and complement to each other. It is worth noting that the transformation of thinking mode is only a simulation of the law of the unity of opposites. As for how unity is decomposed into two opposite thinking models, the author has been basically solved. Different reasoning is a thinking method based on the law of the unity of two opposites. Mao Zedong states in *on contradictions* that "when the movement of the things in the second state, as the number of changes the first state reaches a maximum point, causing the decomposition of the unity, the nature of the changes, so a significant change appears". If we want to find out the unknown object \bar{a} according to the object which currently known, it is reasonable for us to regard a and \bar{a} as a unified body with some kind of identity of opposites, they constitute the two aspects of a contradiction, so that the other side of the contradiction, the object \bar{a} can be sought from the object a . Whereas the question about how to find out the other side \bar{a} when regarding a as one side of the contradiction in a unified body is the core of different reasoning. Due to the length limitations, this article does not include a detail discussion on this question.

2 All Opposites Exist Similarities

2.1 On the law of the unity of opposites

Mao Zedong's exposition of the unity of opposites: the law of things, which is the law of the unity of opposites, is the fundamental law of nature and society, and it is also the fundamental law of thinking. Contradiction exists in all objective things and subjective thinking process and conflicts throughout all the process from the beginning to the end, it is called the universality and absoluteness of contradictions. Meanwhile, each aspects of contradictions differs, it is called the specifieness and relativity. Contradictory things share indentity according to certain conditions, therefore they can co-exist in a continuum, and can convert each other to the opposite side, and it is the particularity and relativity of contradiction.

Bbu Vogman's exposition of the unity of opposites: everything is always and ever and ever moving

slowly. Things change, they change into another state, and become the other things, and hence, the opposition emerges from the constant movement and change. Similarly, in the unified opposition formed by movement and changes, the universal connection principle has been clearly visible and can be recognized.

We can easily recognize some opposites, while others are very difficult or impossible to understand. We are familiar with the opposition, in the physical fields; there are hot and cold, long and short, quiet and noisy, solid and liquid, quality and energy, mountains and valleys, land and sea, day and night, movement and stationary, the past and the future. In the world of organic, there are human beings and animals, land animals and aquatic animals, predators and herbivorous animals, plants and animals. There are soft and hard, sweet bitter in sensations. In human emotions, there are happiness and sadness. In social aspects, there are social individuals, young man, labors and weak people, urban and rural areas, industrial and developing countries, market fluctuation, free man and slave, labor and capital, economic and ecological, war and peace. In the field of thinking, there are thinking, material and spiritual, the inner world and the outside world, the inevitable accidental atheism and the theism, the spirit of science and the natural science, good and evil, as well as other countless opposition.

What is the unity of opposites? When we study the opposite, we can find the common character of opposites. It is the identity of things "identity, unity, consistency, mutual penetration, mutual penetration, mutual dependence, mutual connection, mutual cooperation. These different nouns are of one meaning, they refer to the following two kinds of circumstances: first, the two aspects in the process of the development of every kind of contradiction exist each with its opposition to the premise of their existence, the two sides are in a unified body. Second, the contradiction of both sides, according to certain conditions, they transform towards its opposite. These are the so-called identity. The original contradiction cannot exist in isolation and if there is no contradiction with it, it will lose its own conditions. Because of the presence of each other, they are opposite to each other, and coupling with each other, they share mutual penetration, mutual penetration and depend on each other, this is the first meaning of identity. The mutual transformation of the contradiction between the things is more important. The two aspects of contradictory things, because of a certain condition and the direction of their own, they transform to the opposite direction toward their opposite sides, which is the second meaning of identity (Mao Zedong, 1958).

2.2 The identity of opposites is the basis of thought form.

When discussing the law of the unity of opposites thinking, we should first refer to a sentence, that is "we shall never believe we can use these dialectical principle as we can use the formal logic, formal logic has become a science, mathematical science, dialectics is a system that can't be axiomatic and have no reason to become a special science." (Bbu Vogman, 2001) But the same work pointed out that: "in the scientific community, the most profound one in a large number of examples is Einstein's discovery: quality (material) and motion (energy), people had thought the opposite objects are the same because the movement is free and the matter is condensed. That is to say, there are two kinds of material and form. This identity can be calculated with the famous formula." It shows that there exists some kind of identity of the interconversion between two opposite things, when we find the same may establish the conversion relation between them to make it formal. Precisely when competing transformation relations, the writer finds out the common characteristics of all sorts of mutual transformation between the opposites and to give a formal research to the thinking law of the unity of opposites, so as to set up their common-followed reforming process of thinking model.

3 The Transformative Thinking Model

3.1 The meaning of transformation

The unity of opposites thinking form is through the transformation of the method, the transformation method is to turn one thing into the other, and the other is the way of the two things that are opposite to each other. It's a thinking model formed according to the unity, the oneness and the unity of the things and the reflection of the law of the unity of opposites in the theory of knowledge. There are many ways to investigate the identity of things, and many ways to transform one thing into another such as model, imitation, simulation, bionic, equivalent, transformation, mapping, correspondence, duality, isomorphism and transformation, etc. They find out the laws of things by comparing the similarities between one thing and the other. The essence of this kind of method is to seek the identity between two things (that is, seeking common); the key lies in the correctness of the conversion process.

3.2 The law of the unity of opposites thinking, the transformative thinking model

1) Convention: a represents a class of thing while \bar{a} is another class of thing that share identity with a .

2) Currently known: In $\bar{a} \xrightarrow{\bar{B}} \bar{A}$, \bar{B} represents certain kinds of thought, method and solution while \bar{A} is the law of \bar{a} . The formula shows that the law \bar{A} applied to the object \bar{a} is acquired by using method \bar{B} to study the object \bar{a} .

3) Inquiry: In $\bar{a} \xrightarrow{\bar{B}} \bar{A}$, \bar{A} is the law that apply to the object a , the formula shows that the law \bar{A} applied to the object a is acquired by using method \bar{B} to study the object \bar{a} .

4) Transformation: In $a \xrightarrow{T} a^T = \bar{a}$, a^T is equivalent to a , or that it is a a transformation. T indicates the condition of transformation, which is based on the condition that there is some kind of identity between a and \bar{a} . It is the key to make sure that a^T is equivalent to a , in other words, to make sure that a^T and a meet the need in $a^T \cong a$ relationship which indicates the transformative the object a^T and the original object a may be equivalent or approximate equivalent. The formula shows that when the object a is transformed into the object a^T , the object a^T meets the relationship $a^T = \bar{a}$, that is to say, the transformative thing a^T is the object \bar{a} .

5) Conclusion: when $a \cong a^T$, $a \xrightarrow{\bar{B}} \bar{A}$, in which $a \xrightarrow{\bar{B}} \bar{A}$ is $a^T \xrightarrow{\bar{B}} \bar{A}$, \bar{A} is the law that apply to the transformative object a^T . If a^T is equivalent to a , \bar{A} is applicable to object a . If \bar{A} is approximate to a , \bar{A} is the approximate solution and law to a .

3.3 The key to the use of transformative thinking model

Among many non a things, it is not easy to find a non a object \bar{a} , which has some kind of identity with the object a . It points out that every difference of things in the world already contains the contradiction, the difference is the contradiction. The things that are different from the object a is infinite. In other words, how to find the non a object is a worthy question.

We have to find out the transformative condition T according to the identity of the object a and \bar{a} and once we find T , it is possible to transform the object a to the object a^T . At the same time, when a^T and a meet the $a^T \cong a$ relationship, a^T is approximate or equivalent to \bar{a} and the law of the object a is also approximate or equivalent.

4 Referring to Transformation Examples of Opposing System

The transformative thinking model points out that in order to seek the law of the object a , we should seek a \bar{a} which possesses certain identity with the object a in a collection which exclude the object a , and then convert a into a^T , equalize a^T with \bar{a} , however, the result is that it is either a or the opposing a , therefore, it's difficult to find the object \bar{a} which has certain identity with the object a in this collection. We illustrate the application of transformation of thinking model on the basis of mechanical system transformation.

If a represents machine set and the real motion of machine set is required, seeking \bar{a} which has certain identity with machine set in a non-machine set collection. If \bar{a} is the minimalist machinery (single), the machine set can be converted into single machine, thus solving the problem of unit movement with the method of single movement. To meet the need of $a \cong a^T = \bar{a}$, the transformation condition T of the conversion a into a^T as follows: the transforming ability PT acted on the transformation system a^T and the works of transforming ability short MT is equivalent to all forces of the machine set and works of moment, and equalizing the kinetic energy of transforming system a^T with that of original machine set. Thus, we can use the method of single machine movement to solve the problem of machine set movement. So the identity of single machine and the machine set is that the energy they possess is equal, and mechanical power acted by them is equal. The equivalence of energy and mechanical power is the indispensable condition of the transformation (Lian Shiyou, 2007).

5 Conclusions

Firstly, the transformative thinking model illustrated in the paper is actually a kind of formalization of the law of the unity of opposites in the dialectical thinking method.

Secondly, applying the formal model into study, work and scientific study, which will play a

guiding role, will deepen the understanding of thought and concept of the law of the unity of opposites and mutual transformation, so as to deepen the understanding of and discovery of interdisciplinary theory. Transformation is a process of discovery, seeking another thing which has the same identity with some things, that it is a process of discovery. Therefore, the transformative thinking model is a kind of creative thinking method.

Thirdly, it is assumed that the transformative thinking model can use some kind of artificial language to describe, and further produced in a program form of reforming process of thinking model.

A Research on Pragmatic Failure in Intercultural Communication

Yu Dongdong

School of Foreign Language, Wuhan University of Technology, Wuhan, P.R.China, 430070
(E-mail: stevenydd@126.com)

Abstract: Intercultural communication has become one of the most important activities of the world today. However, due to the cultural differences among people in different regions and countries, communicative barriers exist among people with different cultural backgrounds, often leading to communicative failure. Pragmatic failure is a major cause of an unsuccessful communication. This paper analyzes the phenomena of the pragmatic failure in intercultural communication and discusses the causes of pragmatic failure from the perspective of the relationship between language and culture. Recommendations are also made on how to cultivate language learners' pragmatic awareness, to develop their pragmatic ability, and to increase intercultural communication competence.

Key words: Intercultural communication; Pragmatic failure; Context; Communication competence

1 Introduction

With the increasing process of globalization, intercultural communication has become more and more prevalent in our daily life. We are no longer constrained by state boundaries but have all become part of an independent international network. One of the key changes this has triggered is the need to communicate effectively with people from different cultures in different languages. However, due to the complexity and intricacy of the differences between different cultures and languages, intercultural communication does not proceed as smoothly as intercultural communication. If we neglect the distinction, pragmatic failures are easily made. To make matters worse, even though the source and the receiver of the communication realize the differences, it is likely that both parties would encode or decode the message based on their own culture and consequently give inappropriate feedbacks accordingly.

Researches on intercultural communication have attracted broad attention in academic circles, especially foreign language field in recent years. The number of papers related to intercultural communication added up to 6,942 from 2003 to 2012, among which 80% discussed the issue in foreign language field. Most of the papers focus on how to cultivate intercultural communication competence (Hu Wenzhong, 2013). Scholars have reached certain consensus of its components, that is, intercultural communication competence is generally studied at three levels: cognitive, emotional and behavioral. For instance, Lustig and Koester believe that intercultural communication competence includes adequate knowledge, proper motivation and well-trained behavior and it cannot be acquired by having any one of the elements alone (Lustig M & Koester J, 2007). Yang Ying and Zhuang Enping state that intercultural communication competence is composed of interwoven systems of global awareness, cultural adaptation, knowledge and communication practice (Yang Ying & Zhuang Enping, 2007).

In western countries, scholars of intercultural communication are mainly from disciplines of communication, psychology and management, etc. Only a few of them come from education field. Ruben points out that the actual needs consist the major impetus for studies of intercultural communication competence in the west (Hu Wenzhong, 2013). Objects of training in intercultural communication competence are mainly multinational company staff, technical personnel, diplomats, business expatriates and overseas students, etc. Specific research objectives include: (1) explaining the causes of the failure of the work in foreign countries; (2) predicting success factors of the work in foreign countries; (3) studying the standards of the staff sent to work abroad; and (4) designing and implementing the training and preparation for expatriate staff.

2 Crucial Factor for Successful Interculture Communication

Hall first put forward the term intercultural communication in his book *The Silent Language*. It can be defined as the interpersonal communication between members of different cultures and backgrounds (E. Hall, 1990). A successful intercultural communication may be attributed to many factors. From pragmatic perspective, it is crucial to clarify the notion of context.

2.1 Context

Context, closely associated with communication, plays a vital role in the process of communication. The concept was put forward by the British anthropologist Malinowski. He initially divided context into

three levels in his theory: discourse context, situational context and cultural context (Malinowski, B, 1923). Based on his theory, scholars did further research on context from different perspectives. In intercultural communication, context can be regarded as the sum of verbal and non-verbal factors that influence the actual communication.

Hall proposed his theory of context in 1976, dividing context into high context and low context. In high context cultures, much of the information has been pre-encoded in the receiver, hence only a small part of the information is conveyed through verbal or non-verbal messages. In low context cultures, on the contrary, most of the information must be presented by the messages sent by the source so as to supplement the loss of information that could have been decoded through context in high context culture.

2.2 Cultural adaptation in a particular context

People of particular ethnic groups tend to have preconceived notion of their own culture. Therefore, cultural communication barriers may frequently occur in intercultural communication. In practice, it is difficult for people to adapt due to cultural differences and the complexity of context.

Context varies in intercultural communication. The way of adaptation of the speakers, therefore, varies accordingly. It largely depends on which culture plays the leading role in terms of the explicit and implicit contextual factors. Fu Yonggang clarified the explicit factors as the general background of communication, including time, place, occasion, language, the specific context, etc. Implicit factors refer to what is deeply rooted in people formed from their own experience and culture, such as value, religion, national psychology, behavioral standards and norms, culture, personal experience, and so on (Fu Yonggang,2002). Implicit factors are relatively stable while explicit factors are temporary and thus variable. Generally, in intercultural communication, people adapt to each other’s culture on the principle of observing the customs of the host. For instance, at the office or public places in a low context culture country, where low context culture is dominant, the speakers should adapt themselves to the low context culture. Likewise, in the same country, if the communication occurs at home of someone coming from high context culture country, where high context culture is dominant, the speakers should adapt themselves to the high context culture (as shown in Figure 1)

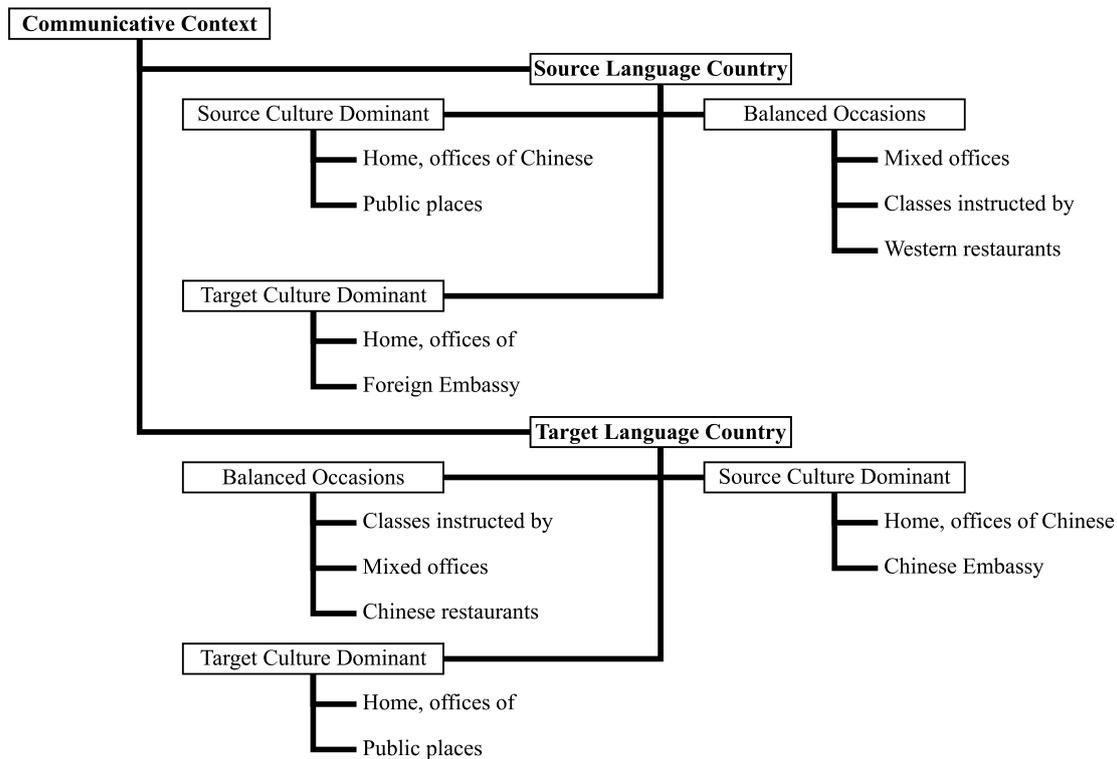

Figure 1 Taking Chinese as the Source Language

2.3 Importance of intercultural communication competence in management

From the previous discussion, it is clear that cultural adaptation is of great importance during intercultural communication. In terms of management, administrators’ objective attitude, empathy,

tolerance of ambiguity, etc. help to avoid misunderstanding and thus build up a positive relationship with their counterparts. Shi and Franklin's study showed that intercultural adaptation of business expatriates was significantly related to job performance in a positive way, and their outstanding performance would guarantee the success of multinational business operation (Shi X & Franklin P, 2006). Another study of Shi also showed that the relevance between intercultural knowledge, intercultural competence, intercultural sensitivity and job performance was higher than the relevance between language ability and job performance (Shi Xingsong, 2014).

3 Analysis of the Reason for Pragmatic Failure

The concept of pragmatic failure is first advocated by British linguist Jenny Thomas (1983) in her *Applied Linguistics*. She holds that in intercultural communications, when the hearer fails to understand the semantic meaning of what the speaker says or gives an inappropriate response to what the speaker means, communication failure or pragmatic failure occurs.

In addition, Thomas distinguished two kinds of pragmatic failure: pragmatolinguistic failure and sociopragmatic failure. Pragmatic failure is not just syntax errors, rather, it is because the wrong way of speaking does not conform to cultural conventions, and thus the communication cannot reach the expected result. Major causes of these two kinds of pragmatic failure include negative transfer of culture, negative transfer of thinking patterns, negative transfer of values, negative transfer of politeness and improper learning or teaching techniques.

3.1 Negative transfer of culture

Due to the profound influence of the customs and tradition, there distinctly exists negative transfer of native culture. The greater the cultures differ from each other, the stronger the cultural negative transfer will be, in which case pragmatic failures are more likely to occur. Negative transfer of culture is closely related to the cultural differences, so in an intercultural communication, it is essential to reveal the hidden culture factors that may lead to misunderstanding or even conflict in order to achieve a successful communication.

3.2 Negative transfer of thinking pattern

Although the way of thinking is different from person to person, generally speaking, people from the same culture share common laws of thinking. However, people from different cultural backgrounds will have much bigger differences since they form their typical way of thinking and knowing under the influence of their own culture. Language is the carrier of thinking and thinking is mainly manifested through language. Therefore, the interference of negative transfer of thinking pattern is one of the major causes that lead to pragmatic failure.

3.3 Negative transfer of values

Obviously, in different cultures, people value different things. The value system is the core of culture. One cannot fully understand a nation's language and its behavioral patterns without fully comprehending the nation's value system. In intercultural communication, we cannot take it for granted that what we value most is also the core of value system of another culture. For instance, it is generally acknowledged that the Oriental cultures speak highly of group interest whereas western cultures place emphasis on individual interest, China and the United States being the typical representatives of the two cultures respectively.

3.4 Negative transfer of politeness

The living habits and social etiquette also vary greatly from culture to culture. Polite language in one culture may be regarded as rude or even offensive in another culture. For instance, An American teacher: Thank you for your help.

A Chinese student: It is not worth mentioning. Moreover, it is my duty.

In this example, the American teacher thanks the Chinese student for his help. In Chinese culture, it is proper and polite for him to respond in this way. However, the word 'duty' in English implies that 'I have to', so the American teacher may misunderstand the help as insincere. Thus communicative failure occurs.

3.5 Improper learning or teaching techniques

For most of the learners, second language acquisition mainly takes place in class. The lack of opportunity to practice using the target language in authentic communication context makes it easier for the learners to use the language in an inappropriate way. Learners are also liable to overgeneralize grammatical rules (Liu Changjiang, Kong Ruizhu, 2010). In terms of teaching methods, many teachers fail to impart adequate cultural background knowledge to the students, resulting in the students' lack of a

sense of cultural difference.

4 Intercultural Communication Strategies

The aim of this pragmatic failure research is to overcome the conflicts under the condition of intercultural communication in order to achieve successful communication. In addition to acquire the correct forms and sounds of the target language, language learners should also know well the knowledge of how the language is pragmatically used in the target culture. Therefore, in order to reduce pragmatic failures, efforts should be made to develop intercultural communication competence from the following aspects: cultivating intercultural communication awareness, avoiding negative stereotypes, developing intercultural communication competence in terms of grammatical competence, pragmatic competence, communication ability and the awareness of context.

4.1 Cultivate intercultural communication awareness

Intercultural communication awareness refers to the ability to understand cultural differences. It also refers to the recognition of people's basic ability to create their unique culture, and the acceptance of the different values and behavioral patterns of different cultures.

In order to improve sensitivity to cultural differences, learners have to be quite familiar with the target culture, including history, philosophy, literature, music, religion, customs, rituals and ceremonies, food and clothing, lifestyle, values, time orientation, the way to solve problems, social systems, etc. Not until they have a thorough understanding of the target culture can the learners hold a tolerant attitude towards cultural differences and evaluate the differences properly. With a critical eye to the foreign culture, they would not feel baffled or disappointed when people from another culture behave beyond their expectation.

4.2 Avoid negative stereotype

The term stereotype is first proposed by American critic Walter Lippmann (1922). He holds that the world is too complicated for humans to perceive so people need to treat the outgroups in the form of generalization and classification. Early theories of stereotype content proposed by social psychologists assumed that stereotypes of outgroups reflected uniform antipathy. For instance, Katz and Braly argued in their classic 1933 study that ethnic stereotypes were uniformly negative (Operario, Don; Fiske, Susan T, 2003).

Stereotype refers to the attributes that people think characterize a group. Stereotypes can help make sense of the world since they are a form of categorization that helps to simplify and systematize information. Within stereotypes, people are as similar to each other as possible. Thus, information is more easily identified, recalled, predicted, and reacted to. However, negative stereotype ignores individual differences. The interference of negative stereotype may lead to false judgment or even prejudices.

Therefore, in intercultural communication, it is necessary to avoid the influence of negative stereotypes. Subjective evaluation will affect the processing of information. An open and tolerant attitude towards foreign cultures, admitting that there are exceptions in stereotypes, helps to prevent forming negative stereotypes of other cultures.

4.3 Cultivate an acute sense of context

To cultivate an acute sense of context, language users should not lay too much stress on language forms. Instead, they should strengthen the pragmatic function of language and make proper inference of language under the specific situational context. Moreover, it is helpful to have an insight into Chinese culture so as to know better the differences between Chinese and foreign cultures. To a large extent, Chinese people tend to transmit Chinese culture in a way acceptable to foreigners. However, the lack of real context while learning English weakens their ability to select an appropriate way to send messages in particular context. Therefore, it is of great significance to develop a sense of context for a successful intercultural communication.

4.4 Develop intercultural communication competence

The concept of 'communication competence' is raised by the American sociolinguist Hymes in contrast with Chomsky's 'linguistic competence'. Hymes (1971) thinks communication competence includes pragmatic knowledge and ability, that is, in the process of using language, not only do the two parties communicate grammatically, they also need to beware of the feasibility, appropriateness, and reality of communication discourse in particular context. Grammaticality, feasibility, appropriateness and reality are the four major parameters of communication competence. Such competence requires adequate cultural knowledge of the target language.

In terms of grammatical ability, language users have to avoid the negative transfer of the native language. At the same time, they have to know well the living habit of people from the target culture, especially their way of conversing. Otherwise, even though the message is sent in grammatically correct way, it may cause confusion or even misunderstanding to foreigners. So it is advisable that a better English learning environment be provided for English learners to practice their pragmatic competence.

5 Conclusions

The trend of globalization is unstoppable. Intercultural communication happens everywhere in this global village. However, communication obstacles or even conflicts do exist in the process of intercultural communication as a result of cultural differences. Therefore, it is necessary for us to raise cultural awareness and form a right attitude towards cultural conflicts caused by cultural differences. Besides, it is also an urgent need in the process of globalization to develop intercultural communication competence and adopt proper tactics to eliminate and minimize the obstacles.

Intercultural communication is by no means just an activity of using a language and language skills. It is a process during which the source and the receiver encode or decode the context as well as the message. In other words, the understanding of language and context co-exist in intercultural communication. Language is inseparable with culture and it is used only in a particular context. These pragmatic failure analyses may help us to know better the pragmatic rules of a certain culture and hence avoid pragmatic failures. To gain success in real communication, we need to cultivate intercultural communication awareness, avoid negative cultural stereotypes, develop intercultural communication competence and have a keen awareness of context.

2 Marxism College, Wuhan University of Technology, Wuhan, P.R. China, 430070

(E-mail: 58395271@qq.com)

Abstract: Utilitarianism thought has existed since ancient times, but mostly in the embryonic stage. Since modern times, many people, such as Bentham (Jeremy, 1748-1832), has made the thorough development to the utilitarianism thought, which made it have a higher level of rationality, but at the same time there are also limitations. Based on this, this paper firstly analyzes its realistic rationality from four angles of moral origin, evaluation standard, social equity and guiding significance, and then discusses its limitations from two aspects of theory and practice.

Key words: Utilitarianism; Rationality; Limitation

1 An Overview of Utilitarianism

1.1 The origin of utilitarianism

Utilitarianism as an ideological trend has a long history. On the history of Western thought, it can be traced back to the hedonism theory of Epicurus, an ancient Greek philosopher. In Epicurus's opinion, pleasure is equated with happiness, but opposite with enjoyment. Tang xia(2014) put forward that the concept of happiness was the most important element in the history of Western ethical thoughts, Muller regards happiness as a core category of his ideology. Muller's happiness thought includes the definition of happiness, happiness and joy, happiness and virtue and personal well-being and overall happiness and so on. Based on view of utilitarian, we should explore and analyses Muller's happiness thought dialectically, in order to present the socialist moral construction revelatory value and useful reference. On this basis, he finds that the purpose of life is to seek happiness and to get rid of pain, which is just one of the greatest interests of the people living in the world. His hedonism theory profoundly affected the western world. French Enlightenment thinkers Helvetius use this as opposed asceticism and the shackles of feudal weapon, which deepens its theoretical connotation and practical significance. Thereafter, British philosopher Mandeville, David Hume, Adam Smith and William Godwin, also has done corresponding research on utilitarianism theory, which places a very important leading role in the rise and development of the modern utilitarianism represented by Bentham and Mill. Utilitarianism of Bentham et al, essentially is a kind of ethical theory, taking actual efficacy or practical benefit as the moral standard. In Bentham's opinion, moral takes the pursuit of happiness as its goal, and the essence of happiness is pleasure which can be measured by substances. Mill inherited the main theories of Bentham, but he denied that pleasure can be measured, because in Mill's opinion, pleasure can be classified to a senior, junior level while the senior pleasure (spirit) is higher than that of lower pleasures (material) (as showed in Figure 1).

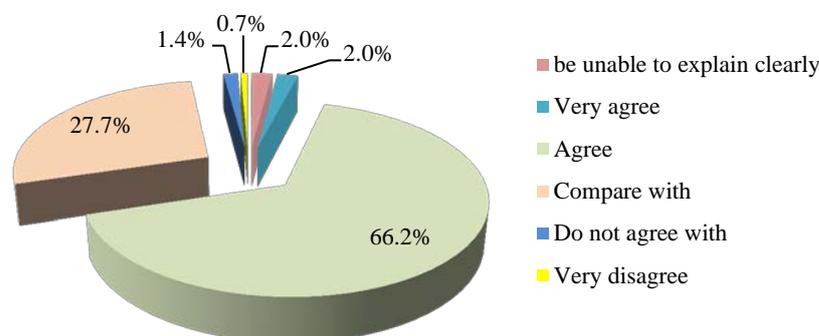

Figure 1 I am a Happy Person

1.2 The principle of utilitarianism

The principle of utilitarianism can be summarized as the principle of happiness maximization, or

the principle of utility maximization. In Bentham's opinion that it seems that the pursuit of happiness and pleasure is the ultimate goal of all human behaviors, so, happy or not, or whether it is to enhance happiness is to determine is the main symbol to decide whether a behavior is correct. In other words, pleasure and pain become a measure of human ethics, and all the behaviors which can increase happiness are rational and kind, and should get approval; but which cannot increase the happiness and even reduce it, are unreasonable and bad behaviors, and should be subject to the negative. The most reasonable behavior is such that can bring the greatest kindness, which is able to give the greatest majority of the community the greatest happiness. In general terms, it is the principle of happiness maximization. In modern times, it seems that the principle of happiness maximization is the fundamental principle to measure everything whether is right or wrong. Of course, the realization of the maximization of happiness is not in conflict with the interests of everyone, that is, the realization of personal happiness is not based on damaging the happiness of others. However, in real life, the conflict of individual interests can be seen everywhere. Therefore, Bentham advocated that the interests of the minority should be subject to the interests of the majority, so as to maximize the benefits. This principle seems to be very reasonable, however, there is a certain contradiction between the largest majority and the greatest happiness itself, which leads to a lot of difficulties in the application then.

1.3 The influence of utilitarianism

Utilitarianism has produced a broad and far-reaching influence on the society, which has formed two camps, advocates and opponents. In advocates' opinion, Utilitarianism mainly thinks about the moral origin on the view of combining utilitarianism from utility, social and moral point, which deepened the cognition of the essence of moral, more persuasive than the inane moral sermon. Utilitarianism also views utility as measure of the behavior of the core standards, which is simple. But those who were against thought that although utilitarianism emphasizes the greatest happiness for the most people, it often tends to egoism in practice. However, the historical impact of utilitarianism is not negligible, whether advocate or opponent (Wang Ruibing, 2008). Utilitarianism was born in the era of the modern enlightenment in Europe. As the product of the enlightenment, it is not only the ideological weapon of the political reform used by the emerging European bourgeois, but also theoretical weapon to defense for the capitalist relations of production and capitalist economy, which strongly promoted the European Society from the era of the feudal aristocracy to capitalist era. Although at the beginning of the 20th century, Principia Ethic published by Moore gave a heavy blow to the classical utilitarianism thought of Bentham et al, but in the latter half of the 20th century, utilitarianism radiated the new vitality in the west, and even in the whole world, which is, of course, related with the intrinsic theory of ethics development, and also has an important association with the actual needs of the western society.

2 Realistic Rationality of Utilitarianism

From the development course of utilitarianism, we know that as a naturalistic ethics concept, utilitarianism has its strong vitality, which can be attributed to its rich ideological content. And on the other hand it is also closely related with undeniable and practical rationality. Specifically, they are listed in the following four points:

2.1 Clarify the moral origin, highlight the value of human

The origin and essence of morals is a timeless question, and the answer to it may even lead to a series of political, religious and social revolution. Appears in the European Medieval Thinkers, morality is the will of God, and the fundamental purpose of practicing moral of man is God. Therefore, people need to depress their desires in order to follow the moral, which is the nature of Christian asceticism ethics, and the reversed causality concept of moral cognition fundamentally is helpless to realize human happiness and pleasure. By getting rid of the bondage of god, utilitarianism tended to explore to the moral origin, value and purpose from the point of view, and sharply pointed out that moral is to people but not to God, and the ultimate goal of moral is to make happiness. This kind of moral concept is a subversive cognitive to the church traditional ethics, which not only produced huge impact to Christian asceticism, but produced profound ideological liberation movement to the European society, and effectively promoted the multiple fields of the European Society of political, economic and other development. As far as the modern development of Europe is concerned, whether the Renaissance or the enlightenment, its fundamental goal is to liberate people from the shadow of God, to re-explore the value of human. Utilitarianism moved the moral judge right from the body of God to people's hands, and teach people how to cognitive self and treat others from the aspects of the combination of morality, happiness and social perspective these. Without any exception, all these reflect the people-oriented

moral pursuit, not only embody human dignity as a man, but also develop the brilliance of humanity, with a great influence on Europe's realm of thought and the social reality.

2.2 Clear ethical standards, enhance the guiding significance

Before the birth of the utilitarian moral view, theology and religion is the Supreme Master of the moral sphere, however, there are two problems in the moral sphere under the guidance of Theology and Religion: a, Moral lacked an objective criterion, prone to only talk about ethics phenomenon, even became a moral supremacy theory and even dogmatism; b, Morality linked with divine, but far away from people's daily life, becoming a bound of human nature, which can be easily seen both at home and abroad China. Neo Confucianism advocated "save heaven, get rid of the human desire", and advocated by the Catholic Church of the Middle Ages in the west, "people's life should take God as the center, and seek to the death in heaven through the abstinence of real life". All these can be the evidence. Utilitarians, did not explore the nature of morality and objective criteria through the vain God and religion. On the contrary, utilitarian think that morality has close association with happiness and even social relations and the economic base, so it can take the real happiness as the moral ultimate off arms, also see promoting the well-being of the people as the judgment of human behavior, to judge whether the behavior is right or wrong and whether it reflects the standard of kindness. This not only theoretically clarifies the cognitive errors followed by people for thousands of years, but also effectively exposes the false essence of the religion and theology in the field of moral hypocrisy, and greatly enhances the vitality of the utilitarianism. Happiness is the core of the utilitarianism, and utility principle, or utility maximization principle is the primary principle of utilitarianism, which set an objective standard to the moral rationality, namely whether it can meet people's needs or promote human happiness. Compared to other unreal moral thought, this greatly increases the guiding significance of utilitarianism thought to moral practice

2.3 The minority subordinate to the majority, promote social equity

Since the birth of utilitarianism, it has repeatedly been criticized, which has an important link with many people their own faulty understanding. Most people think Bentham and Mill's utilitarianism is self-centered and mercenary thought. But actually otherwise, utilitarianism emphasizes not only personal happiness and benefit, but it also stresses collective happiness and interests, and even it put more emphasis on the latter one. This are essentially different with Yang Zhu's "pulling hair Elisha had not also the world", China's traditional pre Qin thinker. The core principle of utilitarianism is the greatest happiness of the majority. There are two aspects hidden in it: social welfare theory and altruism. And this is a great inspiration to the social justice and fairness. First, in the eyes of Bentham, traditional moral values are undoubtedly not in compliance with human nature, which restricts man's pursuit of joy and happiness. So the utilitarianism tries to deny the asceticism, and agrees with one's pursuit of their own interests very much; Secondly, in the affirmation of individual pursuit of profit, utilitarianism does not deny their interests at the same time, because, the perfect social interests should be everyone's interests without damaging the interests of others as the premise, in order to achieve the maximization of the social collective interests; Finally, it is undoubtedly an ideal state that everyone gets his own interests without damaging others' interests as the premise. But the possibility of that state is very low, more the case is contrary to a person or class of people's interests and collective interests (on the contemporary value of utilitarianism, 2008), this time to maximize the benefits of the point of starting, these people should follow the minority is subordinate to the majority principle, for the collective interests of the concessions.

2.4 Theory to guide the reality, to promote social development

Utilitarianism has innovation in many places. For example, it explores the origin of morality based on interests rather than false deity. And also, after it has an in-depth analysis of the reasonableness of the personal interests, and then has a further analysis of the several relations that may exist between the individual interests and collective interests. All in all, as an important part of the Western Modern Enlightenment thought, utilitarianism has a profound guiding role for social development. As China, after decades of development of reform and opening up, China has leapt to the second largest economy in the world, but in the order of the market economy construction and the principle of the market, there are still many shortcomings. Utilitarianism can exactly play the guiding role. Specifically, the following three points: First, respect for individual interests. Personal interest is not only the main factor of the mobilization of individual labor enthusiasm, but also personal happiness, so, only when personal interests get respected, social morality can be seen. It requires our country to maintain the legitimate rights and interests of the laborer in the present stage of economic construction (Wang Kangri, Chen Xuxin, 2014), gradually through legal construction and moral opinion. Second, pay attention to the

principle of effectiveness. Market economy is the economic benefit in the final analysis, while benefit is fundamental basis to measure the success of economic construction. As a result, the country in the economic construction should start from the utilitarian principle of utility, break in the presence of formalism and bureaucratism, so as to guide the people to pursue the practical effect; third, emphasizing the consistency of individual interests and collective interests. The minority is subordinate to the majority, the individual is subordinate to the collective, which is not only the core idea of the utilitarianism ethics, but also the essential requirement of the collectivism values.

3 Limitations of Utilitarianism

Although utilitarianism has a lot of practical rationality, its limitations in theory and practice cannot be ignored. In fact, the realistic rationality of utilitarianism is the main support of the utilitarianism, and its limitation is the core of the opponents.

3.1 Lack in theory

Utilitarianism has two obvious deficiencies in theory. Firstly, utilitarianism has abandoned the traditional way to view the moral from the point view of God, and pulls it back to the real life. But according to the logic of the theory of utilitarianism, the world does not exist any ultimate value, because, once people found some value more valuable than the existing human value, in other words, more utilitarian, then the current value of the situation becomes precarious, because in the utilitarian view, in order to achieve better use to the maximum benefit, the existing value system inevitably needs to make sacrifices, which exposes the extreme purpose on the noodles dew, while highlights the core of the theory of utilitarianism naturally(Qin Jian,2014). On the so-called extreme purpose, the current all ethics and code of conduct in the final analysis are only means only, which itself does not have the subjectivity, is just a mean to achieve a more utilitarian ethics. The resulting consequence is that in the evaluation system of utilitarianism, rational calculation is the core standards, but sensibility and emotion lack essential living space. Here, all moral obligations, and human dignity and basic rights can be calculation as well as the contents of the bargaining process chip. In the pursuit of utility maximization, it eventually will do harm to human, which makes people become more cold, and also make the entire society lack love and affection.

The theoretical limitations of utilitarianism also reflected in the relationship between the motivation and the results of the neglect. On the general experience of the real life, the behavior people is usually divided into intentional and unintentional, two forms. Although there is homogeneity in the final result between the two forms of behavior, they have a distinctive in law and moral definition. In terms of legal definition, the same cause of death, but with intentional homicide and negligent homicide, has the essential difference in the sentencing process. That is to say, the society in the measure of a person's behavior caused by the consequences, usually also investigates the motivation. But in the theoretical system of utilitarianism, the status of the motive is useless, or there is a lack of space for the existence of the motivation, because utilitarianism only measures the effect as the sole measure. The sanctity of this approach will enable fuzzy for norms of behavior and conform to the boundaries between the norms of behavior, so as to eliminate the sanctity of moral, so that moral becomes instinct for living or becomes a kind of technology, which has a fundamental difference with the essential target of moral to teach people to perform good deeds. Pure utilitarianism will make moral have kind behaviors without kind thoughts in practice. This contradictory situation of development will lead to a dwindling of good deeds, which is just the same as the Chinese," heart of goodness, goodness without admiring; not evil, evil without penalty".

3.2 Negative in Practice

Utilitarianism not only has a larger lack in theory, but in practice, it also has some negative effects. These negative effects are related to both the theory itself and the strategy misconduct of practitioners in the practice. In terms of the negative of utilitarianism in practice, the first point is how to define the relation and difference between the personal interest and the collective benefit. Although utilitarian made it clear that, when there is no conflict between the personal interests, the sum of each individual interest is the interests of society as a whole. But when there is a conflict between the interests of the individual, the interests of the majority are the interests of the whole society. But there exist two operating difficulties: first, how to define what interests are the interests of many people, and what interests are the interests of a small number of people, once lacking a fair and objective way of definition of and a good social environment, there will be bullying, which is contrary to the original purpose of utilitarianism; second, public interest is difficult to sector, compared with the interests of the

individual, and a lot of people tend to view from the individualism and take self-interests as the core, so that the utilitarianism evolves as egoism.

Secondly, the core principle of utilitarianism is the principle of utility maximization. Behind the principle of utility maximization, there is a kind of extremely rational value, that is to say, the greater the function, the greater the value. The popularity of utility principle makes utilitarianism inevitably becomes the first principle of measuring all things, and it is also the only standard to judge the value of life. This pragmatic attitude, though helpful to the development of science and technology, is not necessarily a good trend for people themselves (Zeng Yongheng, 2016). Because in addition to the rational, there are many non-rational elements in the life of people, such as belief, emotion and so on. Once people's irrational factors all need measuring by the effectiveness and usefulness, it inevitably will result in the decline of the humanistic value, which in contemporary China has increasingly come out. Because, in western society, utilitarianism has a complete social foundation and complete restriction conditions, while in China utilitarianism as the exotic, the utility principle greatly affected the Chinese people's real life state.

Finally, utilitarianism has a problem of integration with traditional culture in practice. At present, utilitarianism in China has a large market, and profoundly affected the development of Chinese society. But even the utilitarianism in favor of it, it is also very difficult show his recognition to utilitarianism publicly, because utilitarianism has a natural conflict with the traditional Chinese Confucian values. Confucianism is very valued justice identified, especially Mencius. "Justice" is symbol of the in Chinese traditional culture. The symbol obstructs the understanding to utilitarianism of contemporary Chinese people. Some even directly regard utilitarianism as putting benefit the first, and the one-sided understanding, is not only a kind of slander for the utilitarianism itself is, but also a barrier factor for China to better use utilitarianism to service on social development.

4 Conclusions

Utilitarianism, as an important part of the Western Enlightenment thought, placed a very important role in the growth of the western capitalist class and the establishment and development of the capitalist economic system. Compared to the traditional ethics moral concept, moral idea of utilitarianism has a closer connection with real life, and it fits people's actual demand more, with a strong practical rationality. It not only clarifies the relationship between moral and social, but also provides a set of objective criteria for moral judgment, enhances the practicability of moral. But it is just because the close link with real life, the sanctity of moral self has been weakened to some degrees. Moreover, simple evaluation of the utility makes moral increasingly becomes a survival technique, which is extremely unfavorable to the social development and construction of the harmonious society.

The Optimization Setting of Innovation and Entrepreneurship Education Course for Master of Physical Education Student

Wang Ling, Zhou Yumei

School of Physical Education, Wuhan University of Technology, Wuhan, P.R.China, 430070

(E-mail: wlwl63@126.com, 1174442153@qq.com)

Abstract: This paper adopts references and evidence-based researching methods, uses physical education for postgraduates in Wuhan University of Technology as a case study, and builds up a creative curriculum provision system aiming at promoting abilities of innovation and entrepreneurship for postgraduates of physical education. The educational conception of innovation and entrepreneurship remains weak in physical education colleges and the future career is not optimistic for postgraduates. To strengthen the innovation spirit and practical ability of "sports master students", in order to adapt to the complex and changeable environment, Reform and develop China's higher education is becoming a more and more important task. The results show that it is conducive to the education of theoretical knowledge in a systematic manner by means of taking social demand-oriented principles and set up a variety of courses to add optional elective courses. The sound combination of professional courses and the practice of innovation and entrepreneurship could help to improve capacities and competencies, thus ultimately delivering a physical talent of high quality on innovation and entrepreneurship. The sound frameworks for degree programs, compulsory courses and educational practice will be reasonably designed to form the all-round curriculum network system of innovation and entrepreneurship.

Key words: Sports training of physical education; Postgraduate; Innovation and entrepreneurship; Curriculum provision

1 Introduction

With the rapid development of national economy and social demands of talents in various sorts, the gap between the university graduates and social demand becomes more and more obvious resulting in the difficulties on employment of graduates. The traditional and simple employment education offered by universities can't mention its track on the modern development, which makes an inevitable trend for the higher education in China to build up a new educational model of combination of employment and entrepreneurship. Currently, the Full-time academic graduate students of comprehensive universities majoring in sports training of physical education (hereinafter referred to as graduate of physical education) are facing bleak future in employment. According to the survey of 2015 graduate employment statistics, the employment rate of physical education was only 68.18%. On one hand, reasons for such situation, the nation implemented enrollment expansion policy for graduates on physical education, while the social demands for such professional talents coming to pall; on the other hand, some graduate of physical education devote much time into training, less focus on culture and academic studies, leading to low competencies in innovation and research and less choices in employment.

To "Postgraduates of Physical Education, Innovation and Entrepreneurship, Curriculum Provision" as the key words, access to the relevant research papers a total of nineteen from 2000 to 2016. In foreign countries, the United States is one of the earliest countries to implement innovative education. Peter Drucker (2003) Combining with a large number of enterprises, the paper discusses the connotation, relationship and mutual infiltration and integration of innovation and entrepreneurship. Britain in 1987 the government launched the "Enterprise in Higher Education Initiative, aims to cultivate students' ability of mobility entrepreneurship, to encourage students' autonomous learning, since the government has published a series of policies, and to give support and guidance of entrepreneurial talent training. The German government has put forward the slogan of "to make the university become a pioneer of entrepreneurs", actively research and promotion of innovative entrepreneurial education new model. Chinese scholars on innovation entrepreneurship education research results, Che Zhirong (2004) think that entrepreneurship education is to strengthen the basic knowledge and basic theory of education at the same time, to cultivate students' entrepreneurship and entrepreneurship as the basic content of education. Wang Xueru(2015)mentioned in the cultivation of Sports Master graduate student should keep pace with the times and to the strengthening students practice and innovation ability, encourage graduate students actively participate in research and innovation. Chen Xingsheng (2009) believes that schools in physical

education curriculum setting in addition to a required course should increase the proportion of elective courses for students, which makes the research student to cultivate innovation ability in the course of study. It is pointed out, in the notice of preparation of national employment for 2016 higher education graduates issued by Ministry of Education, that all universities and colleges should stipulate Curriculum, including both compulsory courses and elective courses for credits, on innovation and entrepreneurship and establish Scholarships for innovation and entrepreneurship since 2016.

In summary ,although there is no lack of research related to innovation and entrepreneurship education on sport disciplines ,the current domestic research on the sports master's innovation and entrepreneurship courses are rarely reported .Therefore, the establishment and improvement of educational system on innovation and entrepreneurship, setting great store by cultivation of talents on innovation and entrepreneurship, based on the feature of each discipline, are the urgent research projects for universities.

2 Present Situation Analysis about Physical Education Colleges and Universities of Innovation Entrepreneurship Education

The findings based on references researches and on-site investigations are as follows: first, the innovation and entrepreneurship courses are significantly insufficient in most physical education colleges, and the integration of innovation and entrepreneurship courses into the overall educational system is far from realization; second, the main teaching sources for innovation and entrepreneurship courses are from professors, student instructors and management staff on campus, who can only provide common instructional education due to the lack of physical entrepreneurship experience; third, the establishment of campus practice base on innovation and entrepreneurship is under demand, which provides less ground for the student to adapt to the society and conduct effective practice, for the entrepreneurship courses are just these courses aiming to cultivate entrepreneurship and competencies for students while highlighting practice education. Whether it is during undergraduate study or postgraduate, in the views of some teachers and management staff, the purpose of innovation and entrepreneurship course is only for the provision of employment consultation as well as directions and ideas to start business for the graduates or majors with difficulties in employment .However, sports professional students thinking more agile, possess a strong sense of entrepreneurship, for the especial characteristics of physical education well matches the necessary traits of determination, persevere in efforts, adventure and ambition in entrepreneurs, better than students from other majors in terms of entrepreneurship a comparative survey of entrepreneurship statistics found out the average percentage of graduates, from 43 physical education colleges, engaging in entrepreneurship in the recent three year was 6.5%, far higher than the average percentage of 1.1% from other majors nationwide(Chen Qihu, Xia Qing, Yang Ling,2011). Students from Wuhan Institute of Physical Education scored one gold metal, five silver metals and six bronze metals in the 2016 “Creation of Youth” Entrepreneurship contest for students in Hubei Province, held by Department of Education in Hubei and Provincial League Committee in Hubei. Facing such severe situation of employment, the innovation and entrepreneurship education could cultivate entrepreneurship awareness and competencies for students, foster independence, drive employment by promoting Entrepreneurship, and overcome the difficulties and obstacles fundamentally in the employment issue of graduates from physical education colleges.

3 The Present Situation of Innovation and Entrepreneurship Education in Wuhan University

Wuhan University of Technology put lots of attention into innovation and entrepreneurship education for students, by means of establishment of innovation and entrepreneurship education college, exploration of disciplinary advantages, to push forward development of innovation and entrepreneurship for the university. A tentative entrepreneurship pilot class in institute of economics is on its way consisting of two parts: lessons of entrepreneurship theories (introduction of entrepreneurship, start up project evaluation, business plan) and entrepreneurial practice (innovation design, mock exercise of executive force, practice of entrepreneurial operation). It is exemplary model that the innovation and entrepreneurship education set for graduate of physical education in our university can well borrow from.

An example of 2016 revised curriculum set for graduates of physical education in Wuhan University of Technology shows that there is 9 Degree Courses, 16 elective courses, and the innovation practice and case study is the only one among trans-disciplinary elective courses with six credit hours.

From this point of view, we can see that the innovation and entrepreneurship education still remains weak, which is not conducive to the improvement and cultivation of competencies of entrepreneurship for graduates from physical education colleges.

Therefore we should set great store by the cultivation of innovation spirits and practical competencies aiming to advance the overall development and comprehensive qualities for college students, thus constantly improving education quality for graduates of physical education colleges.

4 The Restructure of Innovation Entrepreneurship Education Course of Graduate of Physical Education

Study of graduates in physical education should follow the development trend of society and economy closely so as to make it best for the future career. Therefore, principles of unity, election and particularity should apply when it comes to Curriculum Provision, which can be well guided by social demand and College Student Development. It has a very significant meaning that we need to properly arrange innovation and entrepreneurship curriculum and well manage postgraduate study and physical education practice. (See figure 1)

		Practice on Sports Clubs	2	24

The newly released innovation and entrepreneurship courses for graduate of physical education in Wuhan University of Technology are not only for the considerations of addition of few Multi-disciplinary studies, rather they are for the purposes of 1) optimizing curriculum and adding more practical elective courses (optional) conducive to the improvement of entrepreneurial competency and increasing the confidence and capacities for startup business; 2) encouraging a studying model of Multi-disciplinary allowing students to benefit from solid theoretical foundation, expanded knowledge and widened sights; 3) improving quality and competency, and combine degree courses with practice on innovation and entrepreneurship, and advance execution ability, coordination ability and leadership through practice so as to form a high quality talent for innovative sports; 4) changing the way of education, and establishing a accumulative step-by-step education model of lecture-independent study-case study on practice while keeping an close eye on politics of current events, exploring market opportunities, taking advantage of specialized abilities, coordinating natural and social resources,

building up valuable interpersonal network and making unswerving efforts toward career development; 5) categorizing the curriculum into different levels of degree courses, compulsory courses, elective courses and education practice, forming a overall network system on innovation and entrepreneurship, based on the different accounting percentage in cultivating sports entrepreneurial talents of various kinds.

Innovation and entrepreneurship of optimization system is divided into two main parts: theory and practice with the importance of practice knowledge in particular. It is a time when the choice of enhancement of practice competency for graduate of physical education is inevitable, and as such the most effective way to establish a practice base is to associate with enterprises so as to ensure the cultivation of practice competencies.

The implementation of innovation and entrepreneurship courses is the key to cultivate actions of innovation and practice for graduate of physical education. The effective combination of employment instruction and entrepreneurship education, like start a public fitness club by working together with associated enterprises, start rafting and rock climbing business together with tourism companies, or establish a rehabilitation club together with a field survival club and a hospital. Meanwhile, graduates of physical education should actively participate into the teaching activities in class, club plannings for specialized sports, daily operation and management and commercial sports tournaments outside the campus as well as take part in the volunteer service, management and operation in large-scale sports events so as to make best of the physical professionalism and enhance practical competency on entrepreneurship.

5 Conclusions

1) Innovation entrepreneurship education curriculum as a kind of education idea and model, has been paid attention all over the world. But there are few reports on the study of graduate of physical education about innovation and entrepreneurship curriculum in China. Therefore, it is necessary to build a perfect innovation and entrepreneurship education curriculum system based on the characteristics of physical education, and pay attention to the training of sports innovation and entrepreneurial talents.

2) To meet requirements of development and changes of the time, it added innovation and entrepreneurship courses in 2016, and optimized curriculum provision and laid solid foundation for cultivating talents of innovation and entrepreneurship.

3) Curriculum set for graduates of physical education stayed committed to the principles of unity, option and particularity focusing on the development of innovation and entrepreneurship, building up a multi-level, all-round system for curriculum of degree courses, compulsory courses, elective courses and education practice. The creation of combination of university and enterprise, a new model of education and method, and implementation of new education management and guarantee system, with the goal to cultivate a comprehensive physical talent of a new entrepreneurial model to meet requirements of development and changes of times.

4) Innovation and entrepreneurship education of design course for graduates of physical education, should have its own characteristics, combined with the spirit of sports, sports professional characteristics and sports college students style, etc. And it is applied to the practice of sports entrepreneurial talent training, at the same time, using the new teaching management mode and the employment guidance system, could offer more reliable opportunities of practice on entrepreneurship, which could be considered as excellent resources of man power, promoting the sustainable development of innovation entrepreneurship education in physical education colleges.

Investigation of Young College Teachers' Ideological and Political Status: A Case Study on Wuhan University of Technology

Gong Chun

The propaganda department, Wuhan University of Technology, Wuhan, P.R.China, 430070
(E-mail: 15596822@qq.com)

Abstract: With the deepening of education reform, major changes have been seen in the age structure of the teaching staffs of colleges and universities. Young teachers have characteristics such as active thinking, be able to accept new things and new ideas quickly, stronger subject consciousness and so on. These characteristics strongly impact on the teachers' intrinsic values, and bring to the ideological and political work of hierarchy, arduousness, complexity and other new challenges. In order to understand and grasp the ideological, political, and operational capacity and life status quo of young teachers under the new situation, to solve problems encountered in the process of the growth and development of young teachers, to further enhance the ideological and political quality and comprehensive ability of young teachers, this paper conducts questionnaires on young teachers of WUT from three aspects such as the young teachers' ideological and political situation, the problems existed, and the cause of the problem and the factors that affect the teachers' motivations respectively, and make analysis of the findings and offer some recommendations.

Key words: Young college teachers; Ideological and political status; Chinese dream; Administerization phenomenon

1 Introduction

General secretary Xi Jinping, at the Forum of Party Work in Universities in 2012 pointed out that, college party organizations shall effectively strengthen the ideological and political building of Young Teachers and treat it as a major and urgent issue of College Party Construction tasks, concern young teachers, grasp the ideological trends of young teachers timely, give them in-depth and meticulous ideological guidance, and help young teachers to progress in the ideological and political quality as well as professional quality.

Young College teachers are the most dynamic and most creative groups; the level of political and ideological quality will influence the future development of colleges and universities. In order to understand and grasp the ideological, political, and operational capacity and life status quo of young teachers under the new situation, to solve problems encountered in the process of the growth and development of young teachers, to further enhance the ideological and political quality and comprehensive ability of young teachers and to guide the healthy development of young teachers, a questionnaire survey on young teachers under the age of 45 has been carried out. Here are the analysis of the findings and some recommendations.

2 The Survey Method and Sample Structure

The objects of the survey on ideological and political situation of the young teachers are mainly for young teachers engaged in teaching works in our University; and the method of quota sampling is adopted. 307 questionnaires were distributed in the 23 Schools of Wuhan University of Technology (WUT), and they are filled anonymously, 307 questionnaires are collected, with 100% recovery rate. Questionnaire data is processed through SPSS12.0 software, reasonable distribution of the samples' sex, age, education, job title, political affiliation, etc., is reasonable, and involves a broader survey, questionnaires have high recovery rate, the results of the survey has a certain universality and representativeness.

Specific sample structure is shown in Table 1 to Table 6:

1) Sex ratio of the sample

According to the collected 307 questionnaires, the sex ratio of the questionnaire is showed in the following table:

Table 1 Gender Distribution of the Sample (N = 307)

Gender	Male	Female
%	48.53	51.47

2) The age distribution of the sample

According to collected 307 questionnaires, the age distribution of the questionnaire is showed in the following table:

Table 2 Age Distribution of the Sample (N = 307)

Age	21-29	30-40	≥40
%	26.71	71.99	1.3

3) Job distribution of the samples

According to collected 307 questionnaires, the working time distribution of the questionnaire is showed in the following table:

Table 3 Job Distribution of the Sample (N = 307)

Working time	Teaching and Research	Party and administrative management	Teaching assistants	Logistics Services	Other
%	57.98	15.31	20.2	0.98	5.54

4) Education distribution of samples

According to collected 307 questionnaires, the education background distribution of the samples is showed in the following table:

Table 4 Education Background Distribution of the Sample (N = 307)

Educational background	Doctor	Master's degree	Undergraduate	PhD	Other
%	40.72	41.04	8.47	9.12	0.65

5) The title distribution of the sample

According to collected 307 questionnaires, the title distribution of the samples is showed in the following table:

Table 5 Professional and Technical Positions Distribution of the Samples (N = 307)

Title	Primary	Intermediate	Deputy High	Senior	None
%	14.33	52.77	20.85	2.28	9.77

6) Political affiliation distribution of the samples

According to collected 307 questionnaires, the political affiliation distribution of the samples is showed in the following table:

Table 6 Political Affiliation Distribution of the Samples (N=307)

Title	CPC member	League member level	Democratic Party	The general public
%	14.33	52.77	20.85	2.28

As can be seen from the above sample distribution, the distribution of teachers' gender, age, education, job title, political affiliation, etc., of the survey are reasonable, and are in line with the reality of the actual situation of WUT. The survey covers a wide and high recovery questionnaire, and the survey results have a certain universality and representation.

3 Investigation Results and the Analysis on Young College Teachers' Ideological and Political Status

This research mainly constructs and designs research questionnaires from ideological trend, living and working conditions and other aspects of young teachers of WUT. The following will analyze the survey results from the perspective of the young teachers' ideological and political situation, the problems, the cause of the problems and the factors that affect those three aspects of teacher motivations.

3.1 From the survey results, the ideological and political status of young teachers of WUT are performed well in general, and are mainly represented in the following areas:

3.1.1 Most young teachers focus on political news, identify with the Party's line, principles and policies, are full of confidence in the economic and political situation and development prospects of the country and society, the overall state of their mind appears to be active, healthy, upward momentum.

The survey shows that the majority of young teachers love the Parties' patriotic education, with a firm political stand, with clear political ideas and actively, and when paying close attention to their own interests, participate in educational reform and social development. Among them, 77.2 % respondents believe in communism, indicating that most of the respondent teachers agree with the mainstream ideology, their political attitudes and ideals and beliefs are generally upright and firm. The findings fully reflect that young teachers of WUT love their country, concern about the politics of current events, and their enthusiasm concerning national affairs is high.

3.1.2 Most young teachers have a strong professional identity, and are very satisfied in their current jobs. And they can educate people as center, passionate in their jobs, and conscientiously fulfill their basic duties as university teachers.

The data shows that 59.28% of respondents are satisfied with their own occupations, there are 70.03% of respondents believe that university teacher occupation is sacred, and decide to strive for it. The survey shows that 55.05% of respondents think that the quality to dedicate oneself to work, to love students shall be pursued by university teachers; 51.14% of the respondents think that the quality of rigorous scholarship should be pursued most by university teachers; 63.52% of respondents believe that educating people is more important than imparting knowledge; 51.79% of the respondents hope to cultivate more outstanding students and treat it as their deeply cherished life goal. These data indicate that the majority of respondents have the correct understanding of their professional responsibilities, have a clear sense of responsibility, and have strong ability and professionalism in fulfilling the basic responsibilities of university teachers.

3.1.3 Most young teachers have positive attitude on ideological and political learning, and are enthusiastic about them.

Data shows that 43.97% of respondents believe that in the current new situation, strengthening young teaching and administrative staffs' ideological work is "necessary"; 30.94% of respondents hold that it is "very necessary." 36.48% of respondents usually consciously learn political theory; 47.23% of respondents occasionally show an active interest. This indicates that the majorities of young teachers are fully aware of the importance and necessity of learning ideological and political theory, and are able to have correct and positive attitude towards the ideological and political theory, most of the young teachers have relatively high motivation on ideological and political theory learning.

3.2 Problems and deficiencies exist in the current young teachers' ideological and political state of WUT.

Overall, the majority of young college teachers' ideological and political status is generally well, but during the course of the investigation, we found that there is still some room for improvement on some problems, which need to be given enough attention.

3.2.1 Most young teachers think that the ideological and political learning is monotonous in form, and boring in content.

The methods and contents of theory of learning directly determine the efficiency and effectiveness of learning. In this survey and study, 60.26% of respondents think that the young teachers' methods of ideological and political learning in WUT are relatively simple and old-fashioned, theoretical studies have replaced all ideological and political work; 60.26% of respondents believe that in terms of the ideological and political work of young teaching and administrative staffs, manner of working should be reformed extensively. Statistics also show that the majority of young teachers have a high degree of recognition on the manner and contents of university ideological and political work.

3.2.2 Serious administerization phenomenon can be found in Colleges, and the pressures of research tasks for teachers are high, which greatly influence the young school teachers' motivation for ideological and political learning.

68.4% of respondents think that our school young teaching and administrative staffs' ideological and political work lies in the efforts to "fade administration, and truly concern about the livelihood of the people", which expresses that the majority of college young teachers have a strong demand for the de-administration of higher education.

Under investigation, we found that for 52.77% of the respondents, the most urgent requirements at their stage is the project and research funding, 55.05% of respondents think that is scientific research published, and up to 61.24% of the respondents hold that should be the position and title promotion. The statistics illustrated that the research tasks and promotion are still imperative for college young teachers.

It from one side reflects that it is evident that the pressure of the research tasks and job promotion is really large.

3.2.3 Young Teachers have limited income, high work pressure, and their benefits need to be improved.

The survey data shows that 35.18% of respondents think that the current major life trouble is the economic income, 27.69% of respondents think that the work pressure is the major life problems. According to the data with reference to Maslow's hierarchy of needs, we can see that young teachers focus on security which belongs to basic survival level. The problem that the basic needs are not well met is an important obstruction that prevents the young teachers' ideological and political level from being effectively improved.

4 Cause Analysis on Our Young Teachers' Ideological and Political Status

Various reasons can account for young teachers' ideological and political status including the social environment, the mechanism, the system, and also the young teachers themselves.

4.1 The influence of social environment

At present our country is in the period of social transition, also a period with all kinds of contradictions and complicated social reality. The change of social environment exerts much profounder influence on the young teachers' thought. Today information technology is developing a rapid way, and Internet is playing an important role in learning, working and living of young teachers. All kinds of speech and thoughts have greater influence on the ideas of young teachers against a more open network environment which is inundated with farraginous information. Under the influence of those factors combined, some young teachers' political beliefs are less than firm, being weak in idea and faith.

4.2 Colleges and universities pay much less attention on young teachers' ideological and political status

Firstly, colleges and universities tend to employ talents who are sharp at personal relationship without considering their ideology. They are also short of practical constraints and norms for young teachers to shape their moral standards and to improve personal accomplishment. Secondly, colleges and universities lay much stress on the performance of institution. Scientific achievements and the success of project funds are seen as apple of the eye, the payment of which is the failure of humanistic care for teachers. It is bound to influence the readiness and effectiveness of young teachers' ideological and political learning.

4.3 Characteristics of young teachers themselves decide that ideological and political work is even harder

Firstly, when recruiting high-level personnel, schools give top priority to outstanding talents who have been studying abroad for years. Therefore, they are prone to be influenced by western culture values and way of life when receiving foreign education. In addition, some young teachers often find it difficult to deal with the contradictory relationship among several kinds of roles. For example, society has a high demand for the duty of teachers but in reality their economic status and professional reputation cannot match with such high demand. There is also a contradiction between the absolute dignity of teachers and the friendship with students. What's more, high expectations for teachers' quality and morality from students and schools are hardly compatible with the reality that teachers possess pluralistic values, to name just a few. Therefore, it is inevitable that the professional growth is full of all kinds of confusion.

5 Recommendations on Strengthening and Improving our Young Teachers' Ideological and Political Status

Higher education shoulders the mission of training builders and successors for the socialist modernization as well as the mission of cultivating a powerful force for implementing the strategy of rejuvenating the country through science and education. To accomplish this arduous task, we need to build a high-quality team of young university teachers. Colleges and universities should start from the strategic height of the Party and country, strengthen the ideological and political work to promote the growth of their overall health when taking their reality into consideration.

5.1 We can use "Chinese dream" to lead young teachers in the thought development, giving special attention to the top-level design, and intensify our efforts to create a good educational atmosphere so as to promote the further development of ideological and political work.

"Chinese dream" is the latest theoretical achievements of sinicization of Marxism, which vividly depicts the common ideal of our people. It is the demonstration of the dream for generations. It embodies

the overall interests of Chinese nation and of the Chinese people, becoming unity flags and high rhythm for motivating people to be united and step forward. Therefore, school should combine the education of "Chinese dream" with education of young teachers in theory, and turn it into the whole process of ideological and political work. In this way, we can firm ideal faith of young teachers, and enhance their confidence in socialism road, theory and system with Chinese characteristics. We need to enrich ways of theory education to establish and improve theory education system which mainly includes inductive education, daily education, and subject education of young teachers. We can help young teachers open field of vision through hot topics as well as situations at home and abroad. We can also use such new medium as Internet community, weibo and mobile phone news to build a network platform for theory learning and situation as well as policy education. Thus we can provide convenience and timely support for young teachers to study theory, situation and policy and ensure the education coverage.

5.2 We should pay attention to integrate theory with practice when carrying out the ideological and political work of young teachers.

Theory learning should pay attention to the combination between theory and practice. We should make it clear what is their fuzzy understanding and answer what they care about most in according to their ideological reality. We should combine theoretical study with the transformation world outlook to guide them to integrate needs of individual development with needs of the state, the school, and society. We must make it deeply understood that young teachers must have high-level morality in teaching, and only in this way can they become the learning model for student. At the same time, in the face of young teachers who are active and have a strong ability in understanding and analyzing substances, we should inherit the traditional ideological and political work mode on the one hand, and absorb the outcome of the development of modern science and technology on the other hand. We should pay special attention to the role of the mass media and computer network, and integrate the ideological and political work with healthy and rich theme activities so as to constantly deepen the connotation of activities, improve teachers' comprehensive quality and make ideological and political work carried out in a profound way.

5.3 We should adhere to the people-oriented principle and solve practical problems.

Ideological and political work of young teachers must always give top priority to people. We should fully understand that the young teachers' working time is short, and they are in a situation in which business only starts up and they are the backbone of their family. Only when the practical problems in life are solved, can they be able work and dedicate heat and soul. When making policies in colleges and universities, we must give full consideration to the characteristics of young teachers and respond to the reasonable demands of young teachers. Besides, we should also improve title appraisal, performance evaluation mechanism, and create conditions to help solve problems of young teachers in life. We need to improve the overall quality of young teachers from such aspects as professional development, problem-solving, and care on physical and mental health. At the same time, we should give them more support, more help and more care to help them build good cultural environment for their all-round development and improve young teachers' happiness index. The real combination between ideological problems with actual problem, the actual measures to promote the comprehensive development of young teachers are definite to enhance the persuasiveness and cohesion of ideological and political education and guide young teachers to work together and to make contributions to the cause of higher education reform and development.

6 Conclusions

All in all, ideological and political education of young teachers in colleges and universities occupy an important position in the ideological and political education system, we should try to follow the law of the ideological and political education, actively explore new methods of ideological and political education according to the actual ideological condition and characteristics of young teachers so as to get better results and promote the reform, stability and development in colleges and universities.

Measuring of Long-Term Mechanism for Graduate Education Quality Assurance

Cheng Guangde

School of College of Marxism, Wuhan University of Technology, Wuhan, P.R.China, 430070
(E-mail: 329651788@qq.com)

Abstract: As for current subjects, government, society and university are participants in strengthening China’s construction of long-term mechanism for graduate education quality assurance. When it comes to policy, internal and external systems supporting graduate education quality assurance should be constructed synchronously, by focusing on the construction of internal system. As to internal assurance system, we should embark on six aspects, i.e. the construction of quality assurance systems for realizing source of excellent students, high level teaching, high level courses, first-class research supervisors, first-rank graduate academic dissertation and effective graduate ideological and political education.

Key words: Graduate; Education quality; System; Assurance

1 Introduction

Now, some academic achievements involved in graduate education quality assurance at home and abroad. At home, Wang Jianhua points, People evaluation the quality of graduate education in line with the quality of the "national legal standard", But it "encounters meeting customer needs and meeting the impact of the market applicability". Xia Wenjin and Guo Daijun point, in the graduate education quality evaluation "has not been able to really establish the self assessment and social assessment", but "this is an important part of graduate education quality evaluation system". Zhang Yunhong, Ma Zaoming think that, quality standards begin to diversification at Stage of mass higher education, it decides by the cultivation of different purposes and different requirements". Domestic scholars have made it clear that graduate education quality evaluation standards should be diversified, less discuss how to ensure quality of graduate education adapt to the new standard. in a foreign country, Since the 1990s, Some scholars claim total quality management theory and ISO9000 standard should be applied in the field of higher education quality, and produced some positive impact in theory and practice Of postgraduate education quality management. In the U.S, set up a named the "national education quality innovation organization" non-profit organization by professional associations, business association, a coalition of private enterprise and university has Changed the present situation of the graduate education quality evaluation by the single the university, But involves academic achievements how to establish graduate quality of long-term effective mechanism seldom.

I try from the perspective of "long-term mechanism" and "system"; I think that three majors affect the quality of graduate education: government, society, colleges and universities, I Put forward the six aspects of establishing graduate education quality of the long-term mechanism.

2 Analysis on the Participants for Construction of Long-term Mechanism for Graduate Education Quality Assurance

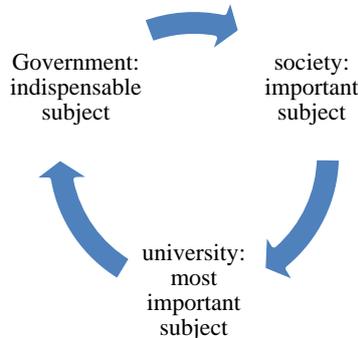

Figure 1 Three Subjects Having Impact on Graduate Education Quality

It’s impossible to meet the requirements of various fields and industries for graduate education

quality merely by the government, because graduate education and development model tends to be diversified (Zhang Yunhong, Ma Zaoming 2011). Currently, construction of subjects (See Fig. 1, Three Subjects Having Impact on Graduate Education Quality) for graduate education quality assurance should be strengthened, and initiatives should be taken to construct a graduate education quality assurance system by multiple participation of government, society and university.

2.1 Government: indispensable subject

In retrospection, the development course of graduate education in China is inevitable succession of gradual transformation from planned economy to market economy. Under the conditions of planned economy, the government is “omnibus government”, which features in graduate education quality assurance in China that, on the one hand, government launches and organizes the movement of graduate education quality assurance, on the other hand, however, government fulfill in assuring graduate education quality; government participates in graduate education quality assurance in various aspects and types. In the process of graduate education quality assurance, government starts with giving assurance instructions, establishing contents and standards for assurance, and finally organizing experts for inspection of performance in graduate education quality assurance. Under the conditions of market economy, the government becomes “half-omnibus government”, when the government gradually starts to focus on the work ought to be done, while undo or do a little work to which the government is not anticipated to fulfill. G. Neave pointed out that, the government should carry out strategic control by policy leverage, and implement related standards by establishment of institutional objective (Xia Wenjin, Guo Daijun, 2014)”, i.e. The government should gradually construct long-term mechanism for graduate education quality assurance through macro means such as education guidelines and policy, financial provisions and so on. However, due to long administrative inertia, the government takes a big part as a micro participant. It's obvious that government is an indispensable subject in the construction of long-term mechanism for graduate education quality assurance.

2.2 Society: important subject

At present, in the new situation of diversified interests of related micro subjects in graduate education, the standing of social insurance for graduate education quality rises on a daily basis in China's long-term mechanism for graduate education quality assurance. Remarkable achievements have been made by social insurance in driving closer connection between university (Or research institute etc.) and the society, causing university (Or research institute etc.) to match social demand, relieving the pressure of governmental guarantee, and providing the public with related references. Over the past ten years, establishment of sound social insurance for graduate education quality has been highly valued by theory circle and practice circle in graduate education. For instance, civil graduate education evaluation and ranking has been develop, involving in national-level organization, such as academic degrees and graduate education evaluation institute, which functions to test national graduate education quality; provincial -level organization, such as Guangdong Scientific Management College, which assesses and ranks by universities and majors. However, social intermediary agents lack of real inter-mediation in terms of administrative intervention and strong official implication. Although the force of social insurance for graduate education quality is weak at present time, with limited influence of social insurance, and inability of exerting its influence for graduate education quality assurance, people from all circles are paying more attention to assessment of graduate education quality by social intermediary, for it is in line with the new trend of world development in graduate education (Yang Lun, 2009), which is a proof of increasing importance of social player representing by social intermediary in the construction of long-term mechanism for graduate education quality assurance.

2.3 University: most important subject

In view of the determinant factors of the development of a thing, internal cause takes a key part. Therefore, university (Or research institute etc) is the most important subject in the construction of long-term mechanism for graduate education quality assurance. Internal graduate education quality assurance system is fundamental, graduate education quality may only be assured unless effective graduate education quality assurance system is constructed by university (Or research institute etc.). Only with the root of internal assurance system, external graduate education quality assurance system is effective in consolidating and strengthening graduate education quality assurance. Internal graduate education quality assurance system is the driving power, internal assurance system of each university (Or research institute etc.) should be countermeasure aligned with its actual situation, so as to push on respective graduate education quality toward a promising future. Connotation-based development is compulsory for graduate education in China, university (Or research institute etc.) should continuously strengthen awareness of quality, engrave “quality first” concept into the heart of faculties and students,

and make efforts to make the best out of graduate education quality assurance and university operational management, so as to realize graduate education quality assurance. Support of university (Or research institute etc.) should play a big role in assurance and improvement of graduate education quality, and regulations and systems must be established in university (Or research institute etc.) (Lu Naigui, Xu Lan 2008).

3 Contents of Graduate Education Quality Assurance System and Long-term Mechanism

Construction of long-term mechanism for graduate education quality assurance should combined internal and external systems by focusing on internal system, that is, synchronous construction of internal and external graduate education quality assurance systems, internal graduate education quality assurance system should be prioritized. External graduate education quality assurance system is mainly constructed from governmental and social aspects. In the part of the government, it should gradually delegate powers to lower levels while strengthening services. As for the society, information databases related to graduate education should be established, and theoretical study on assurance should be intensified to explore theory and method in line with China’s national conditions. Due to limited space, internal assurance system of long-term mechanism for graduate education quality assurance is discussed in more detail. Referencing to the concept of process management, internal graduate education quality assurance system should be established from following xis aspects (See Fig.2, Graduate Education Quality Assurance System).

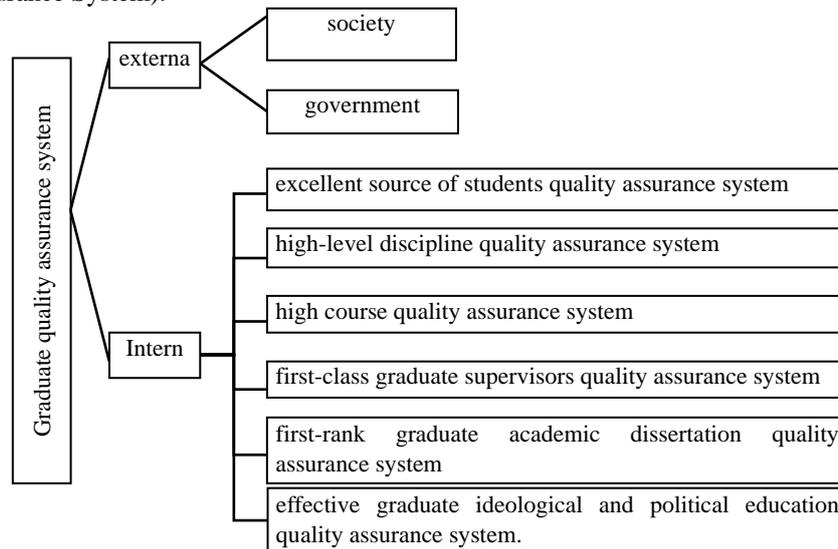

Figure 2 Graduate Education Quality Assurance System

3.1 Excellent source of students quality assurance system

Excellent source of students is the prerequisite and foundation of graduate education quality assurance. Excellent source of students quality assurance system is the first pass of internal graduate education quality assurance system. At first, in the principle of action according to its capacity, university should establish fellowship and scholarship systems that are attractive the graduate students; secondly, myriad forms of incentive, such as bachelor's-master's program , bachelor's-doctor's program and permission of early graduation, should be adopted to retain excellent graduates to study master’s courses; still, increase the weighing of graduate makeup exam, focus on assessment of basic quality and development potential of students, including the type of university as well as degree, consistent between bachelor and master in the university of bachelor's degree.

3.2 High-level discipline quality assurance system

Disciplines are all important platforms for the development of university, first-class graduated may only be developed with first-class disciplines. High-level discipline quality assurance system is the second pass of internal graduate education quality assurance system. Therefore, university should establish discipline construction incentive and restraint mechanism focusing on performance evaluation and dynamic adjustment, construct and improve quality assurance system for discipline assessment and construction of academic degree awarding unit, so as to improve discipline level, and drive the

development of graduates in higher quality through construction of more high-level disciplines.

3.3 High-level course quality assurance system

High-level course quality assurance system is the third pass of internal graduate academic dissertation quality assurance system. Courses construction consists of many aspects, such as construction of training program, construction of teaching materials, teaching form, performance assessment and evaluation, and so on. Course quality assurance system with high-level course construction as the core should be constructed by focusing on teaching quality monitoring and course assessment and phaseout.

According to the requirements of development of various levels and types of graduates, course system with clear levels and logic structure should be constructed. For academic degree graduates, design of course system should be perfectly combined with exercise of innovation ability; for major graduates, course system and industrial demand and occupational qualification should be linked.

Construction of basic degree courses of first-level discipline should be strengthened, with public degree courses be focused in the construction of classic graduate courses, enhance interdisciplinary courses and discipline frontier courses as main international courses, drive construction of high-level courses, such as brand courses fully taught in English; and construct high-level public experiments teaching course.

Discipline frontier theories and late research findings are encouraged to include in construction contents of the courses, and construction of several data-banks of course resources; strengthen case-based teaching relying on graduate joint development base, and construct several case-based teaching data-banks; publish several high-level teaching materials and treatises.

3.4 First-class graduate supervisors quality assurance system

First-class graduate supervisors quality assurance system is the fourth pass of internal graduate education quality assurance system (Wang Jianhua, 2009). Focus on the evaluation of supervisors' academic competence and graduate development quality, improve graduate supervisor quality assurance system covering selection of supervisor, review of enrollment qualification and notice of graduate development quality; construction of first-class graduate supervisors quality assurance system can be carried out through following five aspects: 1)deepen the construction of group of graduate supervisors, explore method for the construction of "special zone of talents"; 2)improve supervisor evaluation system guided by teachers' ethic strength, academic competence and graduate development quality; 3)construct incentive system for improving international ability and level of supervisor; 4)establish system for the construction of group of full-time and part-time supervisors for professional degree graduate; and 5) establish system for dynamic adjustment and exit of supervisor enrollment qualification. The mechanism in combination of reward and restraint should be adopted to increase the percentage of doctoral supervisors publishing high-level international academic papers, the percentage of graduate supervisors undertaking national-level research subject, the percentage of graduate supervisors having international academic background, so as to improve overall quality of graduate supervisors, and ultimately assure graduate education quality.

3.5 First-rank graduate academic dissertation quality assurance system

First-rank graduate academic dissertation quality assurance system is the fifth pass of internal graduate education quality assurance system. The quality of graduate academic dissertation is the main embodiment of graduate education level and quality, an important index for measuring whether graduate is top innovation talent, as well as important reflection of overall strength of university (Or research institute etc.) (Liu Cunxiang, 2012). Therefore, construction of first-rank graduate academic dissertation quality assurance system is indispensable for the construction of long-term mechanism for graduate education quality assurance. The construction of first-rank graduate academic dissertation quality assurance system should be carried out by focusing on improving academic dissertation quality, and embarked from six aspects, namely, thesis proposal, in-process inspection, testing of copy ratio, dissertation evaluation, dissertation defense and random checking of eligibility.

3.6 Effective graduate ideological and political education quality assurance system

Effective graduate ideological and political education quality assurance system is the sixth pass of internal graduate education quality assurance system. It is pointed out in Opinions for Deepening the Reform of Graduate Education jointly published by Ministry of Education of the People's Republic of China (MoE), National Development and Reform Commission (NDRC) and Ministry of Finance of the People's Republic of China (MoF) (Education Research Circular No. [2013]1) that, "morality and knowledge build-up should be taken as the essential task of graduate education." Graduate should be trained as "socialist-minded and vocationally proficient" talent. Thus, sublimation of graduate

ideological quality is necessary to assure graduate education quality.

Aiming to improve graduate comprehensive quality, with ideological and political theoretical course as well as trend and policy course as the channel, relying on “three groups” of graduate supervisors, executives and student cadres, with “four platforms” of graduate CPC construction, mental health education, fellowship & scholarship system and academic & cultural activities as the carrier, construction of effective graduate ideological and political education quality assurance system integrating education, management and service as one, is necessary for the construction of long-term mechanism for graduate education quality assurance.

4 Conclusions

In order to further improve graduate education quality, on the one hand, university (Or research institute etc.) should construct internal graduate education quality assurance system from six aspects, namely, construction of excellent source of students quality assurance system, high-level discipline quality assurance system, high-level course quality assurance system, first-class graduate supervisors quality assurance system, first-rank graduate academic dissertation quality assurance system and effective graduate ideological and political education quality assurance system; on the other hand, university (Or research institute etc.) should establish real internal graduate education quality assurance organization, carry out regular or irregular self-inspection, only in this way, long-term mechanism for graduate education quality assurance can be constructed in university (Or research institute etc.), and play an important role for this purpose.

A Framework for Interdisciplinary Curriculum Innovation

Hu Min

School of Foreign Languages, Wuhan University of Technology, Wuhan, P.R. China, 430070
(E-mail: 48032797@qq.com)

Abstract: This paper summarizes interdisciplinary curriculum innovation inspirations from Chinese artistic conceptions, in accordance with nature, with case studies from visual arts and English literary works. Eighty-Seven Immortals by Wu Daozi in the Tang dynasty and Auguries of Innocence by English painter, poet and print maker William Blake are both timeless state of the art. Qiantang River Tidal Bore Watching by Li Song in the Song dynasty and Early Autumn by American novelist Langston Hughes create a larger room of imagination with a few touches. Composition of Autumn Willow and Double Crows by Liang Kai in the Song dynasty ingeniously designs as the epiphany in Araby by Irish novelist and poet James Joyce. The paper reveals creative and practicable ways of combining two academic disciplines with wider connotations from a broader perspective.

Key words: Interdisciplinary; Curriculum innovation; Visual arts; Literary works

1 Introduction

Western authors have explored in inter disciplinary since the 20th century. From 1960s to the present, the study of ekphrasis in the western world came into being, such as *A Spectator: Ekphrastic Poetry*, a collection of 50 ekphrastic poems by Canadian poet, author Per K. Brask to expresses the poet's attention to interact studies. (Per K Brask, 2012) "Ekphrasis" refers to a graphic and verbal description of a visual work of art. *Whispers in the Galleries: Ekphrastic and Other Poems* also presented poems and relevant paintings together to illustrate modern society. (Lee Marc Stein, 2014). Scott Gutterman's *Sunlight on the River: Poems about Paintings, Paintings about Poems* is a blender of works of poets and painters, a new perspective on how we see and think. (Scott Gutterman, 2015)

Pictures of Romance: Form Against Context in Painting and Literature was written by Wendy Steiner in 1991. It was discovered that literary romance had unrealistic suspense outside of time because Renaissance and post-Renaissance paintings depicted suspended moment of perception with extraordinary clarity and condensed meaning, both of which departed from reality. The difference is that painting is the art of space while literature the art of time. The conclusion was arrived through analyses of works of Keats, Hawthorne, Joyce, and Picasso, while a return to conventions appeared later in the 20th century both in painting and literary works. (Steiner, 1991) Interconnection between literature and the visual arts was discovered in this book by Wendy Steiner.

According to *Visual Art and the Teaching of English as a Second Language* by Ingrid Carre from University of Puerto Rico in 1996, cognitive theories of Amheim and Gardner enlightened combination of visual creation and language learning. In the thesis' point of view, figurative language, and characterization can be taught with facilitation of visual arts. (Carre, 1996)

Word Painting: A Guide to Writing More Descriptively was written by Rebecca Mcclanahan in 1999. Illuminated by the book, visual thinkers who think in pictures can be also developed into verbal thinkers by word painting, transferring visual images into words. Those who are very sensitive to different shades of colors and shapes can also have the ability to uncover evocative words to portray with mind's eyes. (Mcclanahan, 1999) Thoughtful instructions and engaging exercises are provided by the book to weave words together in terms of images.

Painting with Words, Writing with Pictures: Word and Image Relations in the Work of Italo Calvino was written by Franco Ricci in 2001. Italo Calvino (1923–1985) was an Italian journalist and writer. The book is also interdisciplinary to research into the works of Italo Calvino who made the invisible visible from the origin of perception. (Ricci, 2001) Interface between words and images are a fascinating field beneficial to both authors, artists and information technology workers.

When Writing Met Art: From Symbol to Story was written by Denise Schmandt-Besserat in 2007. Denise Schmandt-Besserat (born 1933), a French-American archaeologist and retired professor of art and archaeology of the ancient Near East, discovered that cuneiform script which was one of the world's oldest known system of writing came from archaic counting devices. (Schmandt-Besserat, 2007) American Scientists chose her book *How Writing Came About* as one of the "100 or so Books that Shaped a Century of Science". Writing, which evolved from painting, has its new role to illustrate images and speech to record information across time and space. Schmandt-Besserat's pioneering

research is a key turning point in human history. When visual medium meets with verbal medium, they mutually multiply the capacities to communicate.

Hieroglyphic in Maya, Egypt and China, cuneiform script in Babylon are the oldest known writing system in the world. Cang Jie is the inventor of Chinese characters by observing all things. Cang Jie recorded things by knotted rope first; later the images of all things turned into characters in his mind. In this way, the origin of writing has been closely connected with visual arts. That is why inspirations of writing can be derived from painting. Eastern paintings focus on great art concepts which have no visible form while Western paintings pay more attention to detailed forms. Thus the composition of Chinese painting has complementary effects on English writing. And Vice Versa, elaborate depiction of Western painting will enlighten Chinese writing.

In China, interdisciplinary research has also been conducted. In 2006, Comparing Chinese and English from “Perspective View” was written by He Nanlin, an associate professor in Foreign Language School in Jiangsu University. The article elaborated on perspective, i.e., nearer objects appear smaller and parallel lines meet each other at a point in the distance, in Eastern and Western paintings to inspire English writing. Chinese students are likely to think in the way of Chinese painting with a few words but deeper meaning just like the white space. They write paragraphs without visible unity just like multi-spot perspective in Chinese scroll paintings. Examples of translation from English into Chinese are also discussed by perspective in painting. (He Nanlin, 2006) Other articles are rarely spotted in this interdisciplinary field.

This paper introduces the possibility of interdisciplinary curriculum innovations to help write better English with visual enlightenment from visual arts. Courses like English Writing with Pictures and English Literature with Pictures will be incorporated into the curriculum; minimum words for maximum effect. Further and more interdisciplinary studies of painting and writing should be conducted in the future.

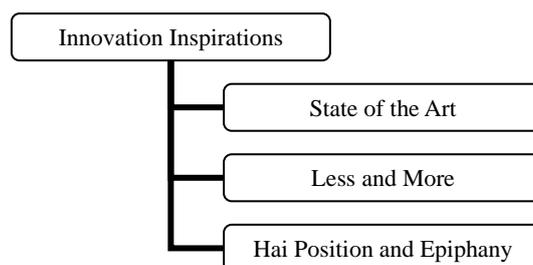

Figure 1 Structure of This Paper

2 State of the Art

Chinese painting began as early as the end of Paleolithic period with rock paintings and the later period of Neolithic with ornamental patterns or designs on potteries. Silk paintings appeared in the Warring States period, then stone relief and portrait bricks in Han dynasty. With cultural exchanges in the Wei, Jin, the Northern and Southern dynasties, Tang and Song dynasties saw great achievements of Chinese painting. In Tang dynasty, there were more than 200 recorded painters due to the reign of Emperor Taizong of Tang China ruling from 626 to 649 who encouraged painting to enlighten the mind and improve human relations. Paintings are painted on paper and silk, then mounted on scrolls to be hung or rolled up. They are also done in albums and on walls, lacquerwork, and other media. From the very beginning, just like Chinese and British literature, the painting subjects were about gods and celestial immortals which could uplift one's state and cleanse one's soul. The Buddha images in Dunhuang Frescoes always inspire the mortals and practitioners. Those works are rare, but still some are passed on with divine protection as is called by Dong Qichang (1555-1636) as “auspicious cloud”.

Artists from the Tang dynasty (618-906) mainly painted the human figure and were also good at Buddhist painting. Wu Daozi's works were exemplary perfection. Wu Daozi (686-760) was from Yangdi (Yuzhou in Henan province in China today). He mastered high level of painting skills before he was twenty and lived a poor life as a folk painter. He was good at Buddhist and Taoist painting and created murals in Buddhist and Daoist temples. Legends go that he entered a cave at the foot of a mountain in the mural on the wall of the palace, and left this world. Then the painting vanished from the wall. Wu's inspiration came from all sources like natural scenery and swordplay, but most importantly from the images in his mind as a messenger of heaven. The first English poem Cædmon's Hymn in old English is similarly the praise for god. The inspired lines sound rather as if copied from the invisible tablet in the

eternal mind. Being messengers of god or Muses, only moral people are chosen to accomplish the noble mission to leave timeless and perfect works to the world.

The silk scroll of Eighty-Seven Immortals by Wu Daozi depicted 87 Taoist immortals paying homage to the supreme deity, measuring 30 centimeters vertically and 292 centimeters horizontally. In the main hall of Daoist temples, the Emperor of Heaven, the Supreme God and Supreme Sovereign of Dao are worshipped. On the east and west wall paint Imperial Sovereign Donghua, Nanji, Xiling, Beizhen, so the silk scroll should be the draft for the mural on the east wall. Without restriction of western composition, parallel lines meeting each other at a point in the distance, 87 immortals walks from the right to the left with fluent fine lines of their dresses and ornaments painted in a clear and determined way which endowed the procession with life-like vividness. Imperial Sovereign Donghua and Nanji with auras were leading supreme god, deities, divine generals, celestial maidens to be presented at court of the Emperor of Heaven. The lines are denser to portray Qiuci (an ancient state in China) band which are more mobile and musical.

The silk scroll is China's best achievements in line drawing techniques of classical portraits. One can only be filled with awe when beholding the indescribable beauty in heaven. Wu Daozi's paintings are endowed with the soul of the portrayed image. The river in his mural can be felt flowing and the dragon dances in the clouds when it rains.

The same messengers of god also appear in English authors like William Blake. Like Eighty-Seven Immortals, Auguries of Innocence has no restriction of artificial composition. It is a poem from William Blake's notebooks *The Pickering Manuscript*. The poem was published in 1863, containing a series of paradoxes which were coincident with virtue and vice in the mundane world. The poem consists of 132 lines and has been published with and without breaks into stanzas. An augury is a prophesy which will not be explicitly illustrated.

William Blake (1757-1827) was an English painter, poet and printmaker who lived in solitude and poverty all his life. Blake was apprenticed to an engraver and later began his career as an engraver, drawing book illustrations and making engravings. He had not only precocious talent of painting but also unworldly vision. He saw God at the window at the age of four and a tree filled with angels at the age of nine. He could converse with Old Testament prophets and could see the soul of an insect. Before his death, he bursted into songs about the things he saw in heaven. William Blake developed his own complex cosmogony and envisioned himself as the living embodiment of the spirit of Milton.

He saw the world with his mind's eyes, fourfold vision. That is why Auguries of Innocence is not just a poem about our time and space. It is about the universe. All human miseries are expressed with images of animals allegorically. The disasters will pass with the glorious arrival of god. Different from the previous rhetoric analysis, the quatrain at the beginning of the poem revealed the boundless time and space from Buddhism, Daoism and Blake's perspective for better comprehension of width and profundity of this poem. In the first four lines, images like sand and flower are not just metaphors. In a sand there are countless worlds in which the river consists of countless sand, according to Sakyamuni. Human beings have no idea about how big or how small the world is. It is beyond the thinking mode of beings in this world. A myriad of time and space coexist and paradises are out of control of our time. Legends exist both in the east and west: after a few days in heaven, thousands of years pass in the mundane world.

A whole new world can be built with one thought of omniscient god. Auguries of Innocence, like Eighty-Seven Immortals by Wu Daozi, are a glimpse of heaven.

3 Less and More

Gong Sun-chou: "What, Sir, is your excellence?"

Mencius: "I understand language and have mastered the fostering of boundless and surging qi." (Owen, 2003)

Qi is a very important concept in Chinese painting. In all kinds of arts, if Qi is in tune with the universe, the work will be touching and convincing. What can be perceived are artistic media, which is the less, but what can be fathomed is Qi, which is the more.

According to Plato, the writer of tragedies is "someone whose nature it is to be two removes from the king and the truth." (Plato, 2003) The king here refers to god who created what a couch is—the true, the real thing. "Images and pictures are only imitations of imitations." (Townsend, 2002) An artist's mission is not to distort but to distill truth from trivial and evanescent happenings.

Li Song (1190-1230) was born in Qian Tang (present day Hangzhou in China), an imperial court

painter in the Song dynasty. Qiantang River tidal bore is a natural wonder described by poets of all times, but seldomly painted by painters. Qiantang River Tidal Bore Watching by Li Song excels in artistic conception, measuring 22 centimeters vertically and 22.3 centimeters horizontally, which is enough for vast space of tides.

The best time to watch Qiantang River tidal bore is the Mid-Autumn Festival, which is indicated by the full moon on the upper left corner of the painting. Pavilions are set on the lower right corner to contrast with the dynamic tides, which are the place to settle down and watch. On the moonlit night, standing on the pavilion by Qiantang River, one is facing the south and the tides come from the east. The distant mountains on the upper right hand enrich the layers of eyesight. It is not necessary to paint every wave and more details, yet a wider space is already depicted. The only line of tides in the painting is the most famous one when Qiantang River enters East Sea, which looks like a girdle crossing the river. After a long waiting at midnight, one can hear the vague rolling first, then the thundering movement of the tides comes in no time and after a breathing-taking moment vanishes in front of your eyes. And that is the eternal moment depicted in this painting (Ding Xiyuan, 2007).

The size of this paint has nothing to do with the vast time and space and Qi in this painting. Likewise, a story does not need every detail to touch the readers.

James Langston Hughes (1902-1967), American poet, playwright, novelist and columnist, is one of the major members of the Harlem Renaissance in the 1920s and one of the earliest innovators of jazz poetry.

Hughes's novel *Early Autumn* has only 444 words. More than eight years later, past lovers coincidentally met each other in New York. Mary saw Bill first and he felt rather unexpected. She expected a kiss but only got a handshake. She could not wait to tell him they are in the same city and asked about him. He neglected her thinking about him all these years and answered routinely with a successful story. Then there is nothing left for her to say but "oh" with misshapen chaos of well-seeming forms. The readers will never know why the couple departed from each other and married someone else and need not to know. In psychological time, many years are but a moment. The frame of the story also fits into others' love lives. Love is the most unstable and whimsical fever, heavy lightness and still-waking sleep. Marriage is destined without human intervention. Mary is the heart breaker and heart-broken one. Lost love can never be found, gone with the fallen leaves on the street. Bill asked about her husband but Mary talked about children and work. He invited her just out of politeness. With the lights on, the night was falling. At the end of the story, the lights blurred and behind them are a pair of tearful eyes and the loss of love of her life.

Qiantang River Tidal Bore Watching by Li Song in Song dynasty and *Early Autumn* by American novelist Langston Hughes create a larger room of imagination with a few touches, at the same time, reveal the truth of universe and human lives.

4 Hai Position and Epiphany

Xie He (5th century) was a Chinese writer, art historian and critic of the Liu Song and Southern Qi dynasties, from *The Record of the Classification of Old Painters*, Xie summarized "six principles of Chinese painting". According to the six principles, besides the insight of life, the composition of writing and painting should also be ingeniously arranged. Hai is the last of The Earthly Branches which was built from observations of the orbit of Jupiter. The celestial circle is divided into 12 sections to follow the orbit of Jupiter. If the celestial circle is on a piece of paper, Hai position is on the lower right hand which is very important for the vitality of spirit resonance of Chinese painting.

Liang Kai (1140-1210) was known as Madman Liang, painter of the Southern Song dynasty. He was born in Shandong and worked in Lin'an (later Hangzhou of China), where he was well-known for mastery in sketch style of painting to evoke the atmosphere with minimal use of details, effortlessly recording the picture with perfect concentration. Later he practiced Zen Buddhism which inspired him with sudden enlightenment and spontaneity.

Autumn Willow and Double Crows is a round picture with the round moon on the lower right hand. According to the position of the moon and the flying crows, it is the time of rising on the east. The two crows are flying toward the west, with the wings and abdomen relatively exposed, representing Ying and Yang. Our eyes follow the willow upwardly and the Qi is also upward with the block of small branches on the lower left corner. With a turning on the highest point, the eyesight will meet the moon and signature of the artist on the Hai position. In late autumn, with crisp air and clear chirping, the welling silence of the mind is fulfilled in nature (Ding Xiyuan, 2007).

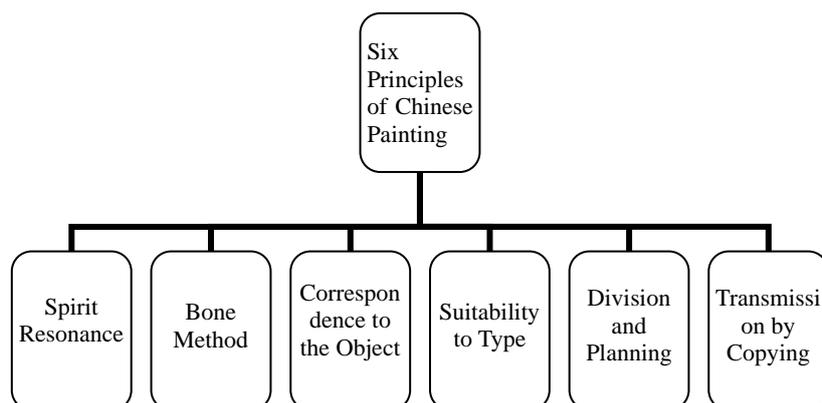

Figure 2 Six Principles of Chinese Painting

Also at the end of *Araby* by Irish novelist and poet James Joyce, the eyes of the boy's mind reveals the truth of his first love driven and derided by vanity.

January 6th, The Epiphany, which is the day when the Three Wiseman arrived and gave their gifts to baby Jesus; while as a literary term, a spiritual and intellectual illumination of the nature. It is like the sudden wisdom given by divinity at an unexpected moment. The short story is carefully arranged like a painting with every detail to reveal the truth.

There is no light, no belief; the windows closed on both sides of the blind street, no communication; children playing in the shadow, no hope. The girl, Mangan's sister appears with aura in the boy's eyes is actually an ordinary girl. Even colorful objects cannot be found in the story but the color brown is used for two times. The three books the boy found in a dilapidated yard of a priest represent romantic love, religious love and materialist love; the sexual, spiritual and financial sides. This love has distracted the boy from religious ceremony, controlled him to masturbate, and allured him to spend all the money foolishly. The first love is an unfulfilled wish, and the quest of self-discovery. There is almost no communication in this love, in the only conversation the boy just behaves weirdly without focusing on hearing what has been said and giving the proper answer. The pronoun "I" appears in the middle of the plot to signify the awakening of the soul. The immediate and overwhelming pain is revealed by first person point of view of the boy.

After all the obstacles, the books to read, the teacher's scold, the drunken uncle, the ending is a well-chosen position for the epiphany, just like Hai position in Chinese painting. By the flirtation of two men and a woman overheard by the boy, the dark side of love is revealed, meaningless and irrational. Life is just like the empty bazaar, when all the cravings fade, the reality weighs. It turns out that the story is just about an ordinary boy falling in love blindly with an ordinary girl. *Araby* takes the form of a quest which is ultimately in vain.

5 Conclusions

From the three parts of analysis, the most elevated state and maximum effect by a few touches and ingenious composition, the most representative examples of both visual arts and language arts shed light on the state of the artist.

In the realm of language arts, there are three sources of the ideas. The inspired lines sound rather as if copied from the invisible tablet in the eternal mind. Being messengers of god or Muses, only moral people are chosen to accomplish the noble mission to leave timeless and perfect works to the world. The rational lines are written with clear conscience and laborious work. The devious lines are driven by acquired concepts and lusts, contagiously degrading and misleading the readers.

Like the ethics of other forms of arts, language arts ethics is the prerequisite based on universal human moral codes. The moral standard is not decided by mankind but rather the rules of the universe. Kindness, honesty, agreement of writing with thoughts and behaviors are very important in the Eastern and Western world.

Besides language techniques, it is more important to enlighten students with language arts ethics. Counter examples are plagiarism, rumors, libel, hearsay, foul language, flattering, double talk, animal instinct, alienation, which is just the outlet of personal moods and craving for wealth and fame. The

works written in this way will only contaminate human minds and society in spite of superb technique and ornate language.

Considering the connected origins of visual arts and language arts, more practices to train visual abilities should be given and appreciation of Chinese painting can be introduced in English writing and literature class. Courses like English Writing with Pictures and English Literature with Pictures will be incorporated into the curriculum.

Being in accordance with the universe rules, with tranquil and true self and beneficial effects on the appreciators, visual arts will provide a new source of enlightenment for language arts with the ultimate goal of interdisciplinary curriculum innovation.

Research on the Job Satisfaction of Coaches and Management Strategies in Commercial Fitness Clubs

Li Liang

Division of Physical Education, Wuhan University of Technology, Wuhan, P.R.China, 430070
(E-mail: liyanhh74@sina.com)

Abstract: The coach is the main body of operation in commercial fitness clubs, while the job satisfaction of coaches decides the quality of service provided by the club in a great extent. This study investigated 2751 coaches' job satisfaction in 45 commercial fitness clubs in Shanghai, Wuhan Hubei and Xi'an Shanxi. The results showed that the participants with higher satisfaction in terms of work environment, management system and communication compared with other variables. Different gender, education background, age and coaching certificate of the coaches have effected on different degrees of satisfaction to the career development, participation in decision-making, salary, work recognition, management system and communication. Suggestion should be given that the clubs should optimize the management strategies, in particular, focus on helping coaches to make a good career planning and enhancing their sense of belonging.

Key words: Fitness clubs; Coach; Satisfaction; Management strategies

1 Introduction

With the improvement of people's living standard, health has become one of the most important issues in our daily life. Participating in the commercial fitness club has gradually become one kind of life style. The successful operation of commercial fitness club involves many aspects, such as enrollment, courses, arenas and equipment, finance, coaches and so on. As the main body of operation of the commercial fitness club, coaches' work efficiency, work value, work methods determine the service quality of fitness clubs to a great extent, and these can be reflected mainly by the coaches' job satisfaction. Therefore, in recent years, the relevant research regarding the commercial fitness club has gradually developed. At present, in China, the research on the commercial fitness club mainly concentrates on course design, management idea, business operation mode, recruitment and so on (Lan, 2010). However, these kinds of studies are mainly from the perspective of the club building but rarely from the perspective of coaches. This means little attention is paid to the coach satisfaction when they were working in the fitness club. Even if there were a few studies about the coaches, but they are also focused on investigating the current situation of coaches in various regions (Wu, 2009; Chen, 2008), the coaches' job satisfaction hasn't raised much attention. In contrast, researchers and practitioners in foreign countries focus more on job satisfaction of fitness club, such as the income satisfaction of different types of coaches (Maguire, 2001), job satisfaction of coaches of different races (Se-Hyuk, 1996), the relationship between coaches' self satisfaction and job performance (Curry, 1986), the impact factor of service quality of coaches (Papadimitriou, 2000), the role of coaches in the employee-customer chain in the fitness industry (Makover, 2003), the relationships among service quality, value, coaches' job satisfaction, and future intentions of customers (Duncan, 2002; Basheer, 2012), etc. These studies have greatly promoted the development of fitness clubs abroad, and improved job satisfaction. We urgently need to strengthen this research in China. This research will take Shanghai, Wuhan and Xi'an cities as an example, aiming to explore the factors that affect the job satisfaction, and then raise an ideal management strategy so as to provide scientific evidence and basis for fitness club development.

2 Data and Methodology

2.1 Questionnaire survey

Based on the literature review and practical experience summary, questionnaire with title The Influence Factors on Coaches' job Satisfaction of Commercial Fitness Clubs was designed, instrument validity and reliability were also established. Job satisfaction was defined in variables of the salary, work environment, management system, work recognition, career development, communication, participation in decision-making. Instrument with a five-point Likert scale indicated the level of member satisfaction (5=high satisfaction, 4=satisfaction, 3=middle satisfaction, 2=low satisfaction, 1=none satisfaction). This study randomly selected 3000 participants from 45 different commercial fitness clubs in Shanghai, Wuhan and Xi'an, 2768 questionnaires were collected, and 2751 were valid, in which 1624

were from men and 1127 were from women aging from 15 to 60 years old.

2.2 Interview

This study randomly selected 15 participants from different commercial fitness clubs with various backgrounds. A semi-opened interview was conducted, targeting to explore the different effect factors of job satisfaction, and collect their comments and suggestions that may be inspiring to the managers in club management.

3 Results

3.1 Overall job satisfaction

In all of the 7 variables, the mean value of the three variables of work environment, management system, communication was higher than others, which were 3.671, 3.611, 3.652 respectively. This indicates that they got high degree of job satisfaction in the aspects of working environment, club management system, and communication compare with others. This may because the fitness club in large cities has relatively good condition, management idea of club was more advanced, fitness coaches' personality was generally more outgoing. However, participants got lower score in work recognition ($M=2.953$) and career development ($M=2.612$) dimension, the reason may be related to that a great number of fitness coaches are part-times, their work were not stable enough (see Table 1).

Table 1 Descriptive Statistics for Each Variable

Variable	N	Minimum	Maximum	Mean	SD
Salary	2751	1.2	5	3.013	1.052
Work environment	2751	1.6	5	3.671	0.981
Management system	2751	1.6	5	3.611	1.085
Work recognition	2751	1.2	5	2.953	1.078
Career development	2751	1.4	5	2.612	1.009
Communication	2751	1.2	5	3.652	1.114
Participation in decision-making	2751	1.4	5	2.991	0.937

3.2 Gender difference

Table 2 Results of Gender Differences on Job Satisfaction

Variable	Gender	N	Mean	SD	<i>t</i>	<i>p</i>
Salary	Male	1624	3.26	0.721	-1.154	.240
	Female	1127	3.34	0.768		
Work environment	Male	1624	4.04	0.807	-3.235	.241
	Female	1127	3.92	0.656		
Management system	Male	1624	3.31	0.816	.541	.590
	Female	1127	3.24	0.911		
Work recognition	Male	1624	3.16	0.826	1.212	.227
	Female	1127	3.17	0.767		
Career development	Male	1624	3.00	0.794	1.209	.024*
	Female	1127	3.31	0.823		
Communication	Male	1624	3.22	0.789	.868	.408
	Female	1127	3.16	0.730		
Participation in decision-making	Male	1624	4.01	0.694	-.049	.000**
	Female	1127	3.21	0.710		

* $p < .05$; ** $p < .01$.

Male and female coaches have different roles in the commercial fitness club. From table 2, independent sample *T* test showed that there were statistically significant difference among career development ($t=1.209, p=0.024<0.05$) and participation in decision-making ($t=-.049, p=0.000<0.01$) between different gender. Specifically, male coaches' job satisfaction is lower than female on career development, the reason may be that males are the pillar of the family, their own expectation is much higher. At the same time, male coaches got higher score on participation in decision-making, this was because in the field of sports, it was really a male dominated society, so male coaches gain more opportunities in the club's decision-making.

3.3 Education background difference

The fitness coaches' degree is divided into three levels, college diploma, undergraduate, graduate. From table 3, there were statistically significant difference among salary ($f=2.369, p=0.043<0.05$), work recognition ($f=1.747, p=0.000<0.01$) and career development ($f=3.691, p=0.004<0.01$) in different education background. On the salary variable, those who have higher education level are lower in the satisfaction, which was in line with the current situation of our society, that is the higher the education, the higher the income expectation. On the work recognition, undergraduate coaches were the lowest. Regarding the career development, the higher the degree, the lower the satisfaction. Because people with higher degree are willing to get higher position. In fact, the development space of fitness coaches was relatively limited, only few coaches can be promoted to the management position.

Table 3 Results of Education Background Differences on Job Satisfaction

Variable	Diploma		Undergraduate		Graduate		<i>f</i>	<i>p</i>
	Mean	SD	Mean	SD	Mean	SD		
Salary	4.300	1.332	3.328	1.295	2.925	0.385	2.369	0.043*
Work environment	3.141	1.052	3.317	0.842	3.233	0.273	4.409	0.125
Management system	3.257	0.908	3.408	0.887	2.500	0.555	2.153	0.063
Work recognition	3.242	0.901	2.775	0.908	3.450	1.029	1.747	0.000**
Career development	3.875	0.770	3.583	1.025	3.201	0.583	3.691	0.004**
Communication	3.414	0.984	3.275	1.106	2.950	0.886	0.538	0.747
Decision-making	3.214	1.161	3.141	1.203	3.650	0.592	1.798	0.117

* $p<.05$; ** $p<.01$.

3.4 Age difference

Table 4 Results of Age differences on Job Satisfaction

Variable	Diploma		Undergraduate		Graduate		<i>f</i>	<i>p</i>
	Mean	SD	Mean	SD	Mean	SD		
Salary	3.181	1.172	3.216	1.042	4.401	0.000	2.516	0.042*
Work environment	2.632	0.908	3.025	1.173	3.801	0.781	1.874	0.137
Management system	3.041	0.989	3.409	1.185	4.200	0.001	1.865	0.038*
Work recognition	3.215	1.061	3.352	1.014	2.782	0.920	1.732	0.163
Career development	4.735	1.062	3.504	1.241	3.516	0.112	1.737	0.162
Communication	2.512	0.926	3.371	0.954	3.817	1.271	0.356	0.005**
Decision-making	4.501	1.082	3.321	1.026	3.501	0.345	0.925	0.431

* $p<.05$; ** $p<.01$.

According to the career characteristics of fitness coaches, the age was divided into three levels, younger than 20, 21 to 30, older than 30. In fact, there were very few coaches who are older than 40 years old. From table 4, there were statistically significant difference among salary ($f=2.516$, $p=0.042 < 0.05$), management system ($f=1.865$, $p=0.038 < 0.05$) and communication ($f=0.356$, $p=0.005 < 0.01$) between different ages. In terms of salary, older people have higher degree of satisfaction, this was because the fitness coaches' work experience was very important. The older coaches with much experience have higher income. Also older coaches got higher degree of satisfaction on the management system. Due to shorter working hours, the younger coaches need a period of adaptation. About the communication, the older the coach, the higher the satisfaction. It was reasonable since older coaches obtain more work experience, and are better at communication with customers.

3.5 Coaching certificate difference

The fitness coaching certificates will also have an impact on the job satisfaction. From table 5, independent sample T test showed that there were statistically significant difference among work recognition ($t=1.798$, $p=0.027 < 0.01$) and career development ($t=1.431$, $p=0.024 < 0.05$) between the coaches with or without certificates. On the work recognition, coaches hold coaching certificate have higher satisfaction than those without certificate. Because although the club hired a group of coaches without qualification certificate, manager of the club may not value them, and then resulting in their lower job satisfaction. In terms of career development, coaches hold certificate got lower job satisfaction. Actually, licensed coaches want to be able to make greater progress in career. For those without a license, their dream was to get a job.

Table 5 Results of Coaching Certificate Differences on Job Satisfaction

Variable	Certificate	N	Mean	SD	<i>t</i>	<i>p</i>
Salary	Hold	1947	3.123	0.367	.708	.240
	Without	804	3.341	0.723		
Work environment	Hold	1947	4.04	0.741	.712	.241
	Without	804	3.92	0.554		
Management system	Hold	1947	3.31	0.612	2.030	.590
	Without	804	3.25	0.814		
Work recognition	Hold	1947	3.76	0.839	1.798	.027*
	Without	804	3.17	0.592		
Career development	Hold	1947	3.00	0.780	1.431	.024*
	Without	804	3.41	0.863		
Communication	Hold	1947	3.19	0.921	.538	.408
	Without	804	3.14	0.837		
Participation in decision-making	Hold	1947	3.11	0.698	-1.545	.071
	Without	804	3.09	0.818		

* $p < .05$; ** $p < .01$.

4 Conclusions

Commercial fitness club coaches have different satisfaction levels in terms of salary, work environment, management system, work recognition, career development, communication, decision-making. Overall, coaches had higher job satisfaction on the work environment, management system and communication. Meanwhile, their work recognition and career development satisfaction were much lower. Male's satisfaction on career development is lower than female, but higher than female on decision-making. The higher education degree of coaches, the lower satisfaction on the job salary and career development. The undergraduate coaches have the lowest satisfaction on work recognition. Older coaches may get higher job satisfaction in terms of salary, management system and

communication. Coaches with qualification certificates have higher work recognition, but lower career development.

Based on the conclusion, suggestion was given that the commercial fitness club should adjust the management mode and actively optimize the management strategies. Some detailed suggestions are as following: 1) To guide the coaches to make career planning, avoid seeing the work as a survival tool. They should have a long-term development plan. 2) Establish incentive salary system. The coaches work longer has higher salary, but this situation should be broken. Clubs should employ the performance evaluation. Those who work better should get more income. 3) Provide more training chance to coaches, like teach young coaches communication skills. 4) Optimize the management system, try to create a comfortable working environment for all coaches and enhance their sense of belonging to the fitness club.

Literature Review on the Voice Taking and Future Prospects

Shi Wenting

School of Management, Wuhan University of Technology, Wuhan, P.R.China, 430070
(E-mail: 982259884@qq.com)

Abstract: In the face of increasingly complex and volatile external environment as well as the challenges of globalization and diversification, the role of voice in the era of knowledge economy is becoming more and more significant. Research indicates that the implementation of effective voice can lead to rapid response to the environment and improve the competitive ability of the enterprise. Based on a literature review, this paper discusses meaning, measure and related theories of “voice taking”. Then it sorts out related empirical research of voice taking, and analyzes the variables as antecedents, mechanism and outcomes of voice taking. At the end of this paper, some suggestions are put forward for future research.

Key words: Voice taking; Judge; Advisor

1 Introduction

Facing the complex market environment in the new century, it is different for companies to identify risks and opportunities, which make companies increasingly rely on employees' ideas and concerns in order to improve organizational process and effectiveness (Dyne, et, 1995; Morrison, 2011; Grant, 2013). Effective adoption of voice makes companies respond rapidly to the environment and enhance market competitiveness (Whyte, 1998; Gladwell, 2008; Grant, 2013). Managers should welcome voice of employees, however, because voice may challenge the current situation and even the interests of voice's targets (Morrison et, 2000; Dyne et, 2003; Burriss, 2012), it is common that employee's voice do not be taken in companies.

Facing this phenomenon, scholars make efforts to clarify the reasons why voice cannot be taken from the perspective of voice, and ignore the reasons and mechanism why the targets wouldn't like to take voice (Zellars, 2002; Morrison, 2011). In fact, scholars do not pay attention to voice taking based on voice's targets until recent years, and the research is still in its infancy, related theoretical and empirical analysis is still relatively scarce. In China, research in this area is more rare. Through literature retrieval, filtering and sorting, the author searched the collection of journals called EBSCO, Psyc Articles, science online, Wiley online library database from year 1980 to year 2015, which topic or keywords are voice taking, decision-making and so on. After careful reading and content analysis of relevant literature, the author got what we needed and some international journals are listed in the following table (see Table 1). Based on this, this paper talks about “voice taking” form several aspects: meaning, measurement and empirical researches, and suggests some future research directions in the field, in order to arouse the attention of domestic scholar and provides reference for the domestic scholars whose research are carried in Chinese situation.

Table 1 Some International Journals of Voice Taking (1980-2015)

Number	Name of Journal	Article number
1	Academy of Management Journal	4
2	Journal of Applied Psychology	5
3	Journal of Personality and Social Psychology	6
4	Journal of Behavioral Decision Making	3
5	Organizational Behavior and Human Decision Processes	5
6	Journal of Behavioral Decision-Making	2

2 Meaning of Voice Taking

In earlier research about team decision behavior, scholars assume that members have equal decision-making authority and are responsible for the results (Sniezek ET, 1995). However, some scholars found that leadership behavior has a direct impact on personal performance (Campbell et, 2003) as the further research, and roles of team members is gradually differentiated (Katz et, 1966). Based on team roles difference, Sniezek (1995) proposed the “judge–advisor system” mod, JAS for short. This system is often used by subsequent scholar to study voice-taking (Sniezek, et, 1995; Sniezek et, 2001).

Unlike individual decision and group decision-making, JAS contains a judge and several advisors. Among them, Judge has the power of decision-making and he will receive one or several suggestions in the decision-making process, then final decision is made through connection of the comprehensive advice and own opinions (Sniezek, et, 1995).

Although there is no consistent definition of voice taking, through literature review we can find that there exist two roles in voice-taking behavior, judge and advisor. Judge make decision and responsible for it, and advisor provide judge with relevant information and suggestions. Based on this, we consider that voice taking should follow the following two conditions: 1) an individual have decision-making author; 2) judge would consider the suggestion provided by advisor, but not necessarily fully take it.

3 Related Theories and Measurement of Voice Taking

3.1 Related theory of voice taking

Although voice is important for judge, advice discounting is common. Currently scholars have put forward several theories to explain this phenomenon. The first one is differential information. Asymmetric information makes judge prefer their decision, thereby reducing voice-taking behavior (Yaniv, et, 2000; Yaniv, 2004a). The second one is anchoring. Judges regard their own opinion as anchor, and voice can have a slight effect (Tversky, 1974). The last one is egocentric bias. Judge thinks that their opinion is always better than others, thus reduces voice taking (Krueger, 2003).

3.2 Measurement of voice taking

According to current studies in voice taking, scholar use WOA (weight of voice) to measure the degree of change to show voice taking of judge (Harvey et, 1997; Yaniv et, 1997). WOA is calculated as follows: $WOA = | \text{final decision} - \text{the initial decision} | \div | \text{advice and content} - \text{initial decision} |$. The final result of WOA changes from 0 to 1. 0 suggests voice has no effect on the final decision of judge and 1 suggests the final decision and suggestion have the same content. In addition, it suggests that voice is taken but advice discounting exists when result fluctuates between 0 and 1.

Currently, development and design of voice taking's scale is still in the exploratory stage. In 2014, Fast (2014) and colleges studied the measurement of voice taking, and developed four-items scale of voice taking. Specifically, items with low load coefficient are excluded through exploratory factor analysis, and four items are retained. Then, compare the scale of voice taking and similar behavior scale ("consideration" dimension of leadership behavior and "shared vision" dimension of transformational leadership). Last, test the discriminant validity and convergent validity. Four-items scale contains "asks me personally to tell him/her about things that I think would be helpful for improving this organization", "asks me personally to tell him/her about how things have been done in my previous job(s)", "seeks out task-related knowledge from me" and "asks me personally what skills I have that s/he may not know about that might contribute to our performance here", which is an important step in the empirical researches.

4 Related Empirical Researches of Voice Taking

Through view of the existing research literature, antecedents of voice taking include individual and environmental factors. Specifically, individual factors can be classified into three aspects: judge's features, advisor's features and voice's feature; Environmental factors contain task difficulty and reward; Mediators contain judge's trust in advisor, judge's self-confidence in accuracy of final decision and so on; Moderators contain age, level of education and experience; Outcome variables contain accuracy of judge's final decision, judge's confidence in final decision and advisors' voice (see Figure 2).

4.1 Antecedents

From the perspective of judge's features, the individual factors include dealing style, the degree of self-confidence, ability and mood. 1) Five styles identified by Scott and Bruce (1995) are rational, intuitive, dependent, spontaneous and avoidant, and judges' differing styles can affect the way they accept and respond to advisor advice. 2) The degree of self-confidence. The more confident the judge is, the less voice would he takes (Harvey et, 1997; Francesca et, 2007). 3) Ability. The competent judges think there is no need to refer others' opinion and focus more on their own opinions, which leads less voice taking. 4) Emotions. People who feel incidental gratitude are more receptive to advice than are people in a neutral emotional state, and people in a neutral state are more receptive to advice than are people who feel incidental anger (Francesca, 2008).

From the perspective of advisor's features, the individual factors include the degree of self-confidence, professionalism, and intimacy with judge. 1) Price (2004) and colleges found that

compares with the general confident advisor, judge is in favor of the overconfident advisor's suggestions. 2) Professionalism. Judge prefer to consider the advisor's suggestion who have more expertise ((Goldsmith et, 1997; Harvey et, 1997; Sniezek et, 2004). 3) Comparing various factors, Feng (2006) found that intimacy with judge effects judge's voice taking mostly.

From the perspective of voice's features, the individual factors include quality, style and cost. 1) Quality. Judge prefers voice with high quality compare with poor quality advice (Gardner et, 1995; Lim et, 1995; Yaniv et, 2000). 2) Type. Dalal and Bonaccio (2010) divided it into three types: recommendation for, recommendation against and information, and the type of advice given by an advisor can influence the way it is received by the judge. 3) Cost. Patti (2006) found that voice taking is positive connected with pay for advice.

In addition, these are some environmental factors effecting voice taking, including task difficulty and reward. 1) Task difficulty. Francesca (2007) and his colleagues found that judge rely more on voice when facing difficult task, comparing to simple task. 2) Reward. Sniezek (2004) suggests that appearance of money increase frequency of voice taking.

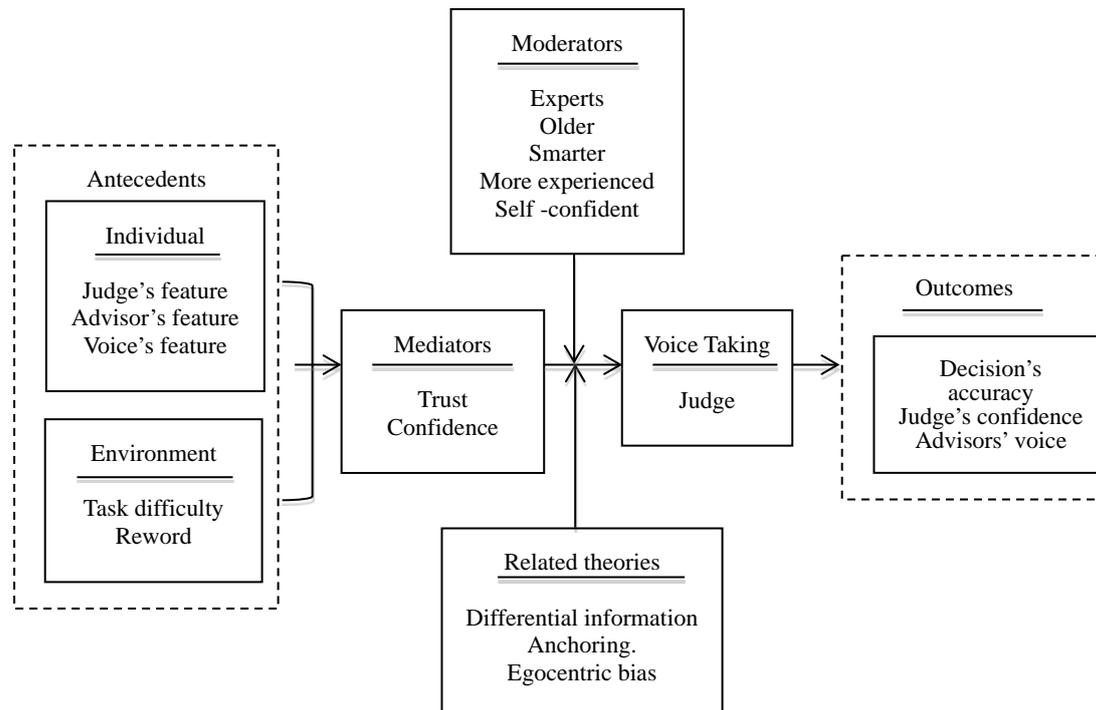

Figure 1 Integration Framework of Voice Taking

4.2 Mediators and moderators

1) Mediators contain judge's trust in advisor and judge's self-confidence in accuracy of final decision. Sniezek (2001) found that judge is willing to accept the voice of advisor who he trusts when the other conditions are same. On this Basis, Galinsky (2008) definite trust as "individual's willingness to accept his/her weakness based on positive expectation for others' acts" in research, and found that judge's trust in advisor mediates the relationship between judge's mood and voice taking.

In addition, See (2011) found that judge's self-confidence in accuracy of final decision mediates the relationship between judge's ability and voice taking. When judge is confident in the accuracy of final decision, he thinks his own opinion is better than others', and there is no need to pay more attention to voice of employee.

2) Studies have shown that many antecedents of voice can be used as moderators as well. For example, voice of experts would be less undervalued (Goldsmith, 1997; Harvey, 1997; Sniezek, 2004); judge would welcome the voice of employees who are older, more educated, smarter or more experienced, because this kind of employees made judge trust them for reasons (Feng et, 2006); judge prefer the voice of employee who is self -confident (Lawrence et, 2003; van et, 2005). In addition, task difficulty can be used as moderator. Comparing to simple task, judge rely more on voice when facing difficult task (Francesca, 2007).

4.3 Outcome variables

1) Accuracy of judge's final decision. Voice allows judges access to knowledge above and beyond what they could have as an individual. In addition, integrating multivariate and unconnected voice can reduce random error (Stewart, 2001). Thus, voice taking can greatly improve the accuracy of decision-making (Gardner et, 1995; Yaniv, 2004a; Sniezek et, 2004).

2) Judge's confidence in final decision. Judge should make effort to understand and react to the advice proffered by the advisors. As effort to process and comprehend advice increases, so does a judge's overall confidence in their final decision (Bonaccio et, 2006).

3) Advisors' voice. Fast (2014) found that managers with low managerial self-efficacy are the least likely to receive employee voice because they send signals that voice is unwelcomed, owing in large part to their feeling of being personally threatened by those who speak up. And in turn, the environment makes employees feel unsafe and lead less voice.

5 Conclusions

Based on a literature review, this paper discusses meaning, measure and related theories of "voice taking". Then it sorts out related empirical research of voice taking. We can see that the empirical research and theoretical research on voice taking are relatively scarce. For this reason, we believe that all aspects of voice taking remain to be strengthened and expanded. Our studies suggest several opportunities for future research.

1) Verifying and revising scale of voice taking. There is no influential relevant scale. Thus, future studies need to adopt more samples (different culture, different industries and different level) to verify the reliability and validity of the existing Scale.

2) Pay more attention to the mechanism of voice taking. Scholar focus more on antecedents of voice taking but there is little research on Mediation mechanism and regulation mechanism.

3) Strengthening the indigenous research of voice taking. Future studies can collect datas from countries and areas in different cultural backgrounds, investigating whether there are significant differences of voice taking in different cultural backgrounds. In addition, future studies can develop scale of voice taking applicable to our scenario.

Genre Theory and Discourse Module for Introduction in Academic English Writing and Teaching Settings

Xiao Xianming

School of Foreign Languages, Wuhan University of Technology, Wuhan, P.R. China, 430070
(E-mail: ericaxiaoxm@163.com)

Abstract: This paper traced how genre-based pedagogy were conceived by researchers in the different scholarly traditions, and offered a particular view of genre-driven pedagogy and its practical applications in academic English writing of introduction. This view of a genre-based teaching approach largely consisted in a prior discussion with genre definition in which a particular genre-based pedagogy occurs. Research findings revealed that discourse module for induction writing is successful for novel writers and students to be instructed to the ways in which writing steps and prompt context knowledge of introduction have been moulded in their specific disciplinary cultures.

Key words: Genre theory; Discourse module; IMRD; EAP

1 Introduction

Writing effectively is a long-term pursuit both for the students and teachers of second language learning and teaching. Over the last decades, there has been an increasing need for the competence of English to write and communicate in academic and research settings, which has led to the burgeoning of English for Academic Purposes (hence EAP), sometimes referred to as English for Specific Purposes (hence ESP)(Fernandez Toledo). Thus the teaching theories of EAP has been in the full ascendancy. Novel English pedagogies for EAP or ESP have sprung out batch after another. Among which genre-based analysis is one of the well-attested theories for the teaching and learning of academic writing. It has generally been tackled as the approach of linguistic performance research in academic or professional settings.

Genre analysis is broadly considered as the study of linguistic behaviour in academic and professional research settings(Bhatia, 1997), whether in terms of changing views of discourse to be rhetorical/social actions, as in Miller (1984) and Berkenkotter and Huckin(1995) or of learning to write to be communicative purposes, as in Swales(John Swales; John. Swales) and Bhatia (Bhatia, 1993). For the last decades or more, genre has been conventionally connoted with literature and literary criticism, and more recently used primarily in linguistics, referring to a distinctive type of text. The Routledge Encyclopaedia of Language Teaching and Learning(Byram) has defined the genre approach as: “A framework for language instruction”, clearly indicating that the genre framework supports students’ writing with generalized, systematic guiding principles about how to produce meaningful passages.

Under the context of writing, genre specifically refers to socially, generally recognised ways of using language, providing students with explicit knowledge about language. Genre theory is based on the assumption that language is goal-oriented evolving within a culture and members of that culture (a community) usually have little difficulty in achieving their social purposes in the texts they use frequently and are able to draw on their repeated experiences with such texts to read, understand, and perhaps write them relatively easily (Hyland, “Genre Pedagogy: Language, Literacy and L2 Writing Instruction”). Moreover, writing is in part to be thought as a practice based on the reader and writer’s expectations: it will increase the chance for the reader to interpret the text purposes if the writer could trouble himself to anticipate the reader’s expectation arising from what texts he or she has read previously of the same kind. In more precise assumption, the relationship between readers and writers could be compared to be dancers following each other’s steps, each configuring sense from a text by speculating what the other is probably to do on the base of prior texts influence (Hoey). Therefore, the theoretical assumption of genre-based pedagogy lies in that readers and writers have possessed a preliminary schema of prior knowledge which can be shared with others. When it comes to need, the schema knowledge can be sublimely transferred into new situations to help students read and write the similar texts efficiently and effectively.

The objective of this paper is to report on theoretical and pedagogical issues in the wide scope of genres and to evaluate the merits and disadvantages of the genre approach to teaching writing in EAP. The paper endeavours to try out the following concerns:

- 1) What is a genre?

- 2) Mainstreams of the genre approaches
- 3) Working within ESP genre pedagogy

This paper enters into the genre-based pedagogy, providing an accessible review on current theory and research in the wide scope of genres, and applying the understandings of different genre-based approaches to language teaching, especially with the focus on the practical concerns of Introduction writing module, dealing with genre as an organizing principle, teaching and learning practices.

2 Concept of Genre and Genre-based Pedagogical Schools

There is a great deal of theoretical disagreement about the definition of genres. The most influential figure in this field, Swales (1990, p.58), has disseminated a genre as: “a class of communicative events, the members of which share some set of communicative purposes. These purposes are recognized by the expert members of the parent discourse community, and thereby constitute the rationale for the genre. This rationale shapes the schematic structure of the discourse and influences and constrains choice of content and style”. This definition prompts the core idea that genre is a set of communicative events and certain conventions or rules are generally associated with a writer’s purpose. Martin (2009, p.309) shared crucial standpoint with Swales that most of genres contain a set of communicative purposes within certain social situations and that each genre has its own structural quality according to those communicative purposes. Miller(1984, p.151) also emphasizes the action function of a genre, arguing that a genre should be defined not in terms of “the substance or the form of discourse but on the action it is used to accomplish”, which has been extremely influential not only in ESP genre analysis but more generally. Therefore, it is probably to identify the communicative purposes and the structural features (including both standards of organization structure and linguistic features) when genres are employed in writing teaching process. Byram(2000, p.235), one of the leading representatives of SFL, defined a genre as: "A staged, goal-oriented, purposeful activity in which speakers engage as members of their culture. When this framework is used for the language instruction, the student writers will be encouraged to mimic the staged, goal-oriented purposeful activities they engaging as members of their culture.

2.1 Mainstreams of the genre-based pedagogical approaches

In terms of different concentrations and learning strategies, it is customary to identify three distinctive schools of genre-based approach to writing: Australian Systemic Functional Linguistics (SFL), North American New Rhetoric studies, and English for specific purposes (ESP). The three trends differ in the educational contexts to which they have been applied, their intellectual roots, and the weight they give to either context or text(Hyland, 2004, p.24).

- 1) Systemic Functional Linguistics: genre as social purpose

Genre analysis in Systemic Functional Linguistics (typically called the ‘Sydney school’) is a framework of research analysing the discourse structures of texts. Jim Martin and Joan Rothery are two important figures in the early development of genre analysis in Sydney school whose work underpinned the Disadvantaged Schools Project in Sydney (Paltridge 304). Sydney school described genre as “a staged, goal oriented social process” (Martin, 1992, p.505), focusing on the interactive, purposeful, and sequential trait of different genres, such as description, procedures, recounts or expositions, and on the principles that language has been systemically determined by the contexts. In the latter study, Martin (2000, p. 120) further explores the connotation of genre in SFL and sharpens his idea as follows: “In functional linguistics, genre theory is a theory how we use language to live; it tries to describe the ways in which we mobilize language; genre theory is a theory of the borders of our social world, and thus our familiarity with what to expect.”

Genre-based pedagogy in SFL aims at teaching primary and secondary schools, helping students involve effectively in the planning curriculum and the broader community. The core method of this approach has been placed on the teaching of formal, staged qualities of genres in order to help students recognize the specific linguistic features. Social functions and contexts of texts are central to this framework as interactions can only be understood by considering them against their social setting.

- 2) North American New Rhetoric studies

Rhetorical genre studies are pervasively influential in the US where genres are regarded as part of the social communicative processes by which knowledge about the real world are included(Artemeva). Genres, in this view, both acknowledge and endeavour to the constitution of social contexts, as well as socialisation of individuals. New rhetoric researchers are more prone to explore how genres evolve in different socio-cultural settings to achieve particular purposes, how genres cluster together in sets, and

how genres form systems and networks (Derewianka, 2003, p.134), whereas Sydney school largely accented linguistic methods for analysing genres (Hyon, 1996, p. 696). Miller(1984, p.165)also argues that genres “serve as keys to understanding how to participate in the actions of a community” and that the failure to understand genre as social action turns activities such as writing instruction from “what should be a practical art of achieving social ends into an act of making texts that fit formal requirements”, a view that the genre approach should focus not only on the form of communication but also on the social action it is used to accomplish. Eventually, Miller summarizes that "a rhetorically sound definition of genre must be centred not on the substance or the form of discourse but on the action it is used to accomplish" (p. 151).

In line with extraordinary attention on the social contexts of genres, researchers in New Rhetoric fields have made use of ethnographic rather than linguistic methods for analysing texts, developing extraordinary descriptions of academic and professional contexts surrounding genres and the actions texts perform within these situations (Miller, 1994; Hyland, 2004; Smart, 1992). Likewise, the New Rhetoric approach emphasizes a consideration of what kinds of social contexts produce a particular genre in order to increase the efficacy of the genre approach. As an approach to the teaching of writing, rhetorical genre-based pedagogy has come into prominence in part as a response to process writing, which, it was felt, did not realistically prepare students for the demands of writing in academic contexts(Horowitz).

3) English for specific purposes: genre as professional competence

ESP genre analysis is a development of text linguistics and the description of academic genres, moving from a focus on lexico-grammatical features to rhetorical moves and, later, to a focus on rhetorical context(Paltridge, 2014, p.304). ESP researchers are interested in taking genre as a device for understanding and teaching the kinds of written language required of non-native speakers in academic and professional settings, because they generally agree on considering genre as a set of structured communicative events. To understand the communicative behaviours behind the texts and analyse the structures of the texts is the pursuit of this school. Swales, whose research has been seminal in shaping genre theory in ESP, describes the underpinnings of genre analysis from three key interrelated notions: discourse community, genre, and task. He uses communicative purpose as an important thread to bind the three terms cohesively: “It is communicative purpose that drives the language activities of the discourse community; it is communicative purpose that is the prototypical criterion for genre identity, and it is communicative purpose that operates as the primary determinant of task (p. 10).”

Researchers in this trend, such as Swales(1990, 2004) and Bhatia (2002, 1993), propose that EAP genre applications can help Second Language Learner of English have a good command of the functions and linguistic conventions of texts that they have read in their major field. They advocate teaching learners the formal features of texts so that the students can learn how to control the rhetorical organization and stylistic features of the academic genres of English-speaking discourse communities(Martin, 2013). This emphasis is also very often found in ESP, where researchers analyse and describe such genre as the literature review, business letters, science reports, formal meetings, sales promotion letters, job applications, and so on (Derewianka; John Swales).

ESP genre approaches have been acknowledged to be an influential writing pedagogy by stating clear what is to be learnt, offering a coherent set of structure/schema for studying both language and contexts, making sure that course targets are derived from students’ needs, and providing the resources for students to understand and analyse texts. Students could benefit from genre pedagogical instruction in not only the shared kindness of that writing but also the uniqueness of what they could actually perform themselves. Since the publication of John Swales’s ground-breaking book at Genre Analysis: English in Academic and Research Settings in 1990, it is well-recognized to say that there has been dramatically increasing interest in the genre pedagogical potential among language involvers.

3 Working within ESP/EAP Genre Pedagogy

Genre-based pedagogies rest on the idea that ways of writing are community resources for creating social relationships, rather than solely the property of individual writers struggling with personal expression. The ESP genre-based pedagogy focuses on the implications of genre theory and analysis for English for Academic Purposes, primarily with a view to helping students achieve control over the communicative purpose, structure and language features of particular genres that they will encounter in professional and academic contexts. For this aim, ESP scholars have rendered various descriptions of genres as pragmatic discourse models for EAP and professional writing learning and teaching. The work

by Swales(1990, 2004), based principally on the notion of “move” analysis, has been of great influence in the pedagogical instruction in EAP and ESP teaching.

As might be acknowledged, there exist four broad conceptual macrostructures of the research article (RA) called IMRD (Introduction, Methods, Results and Discussion) pattern(Bruce, 1983; Martin, 2013; Swales, 2009). Among IMRD, there are empirical evidences to show that introduction and discussion sections are the most challenging parts to write for English academic learners (Martin, 2013, p.335). In his masterpiece of genre analysis, Swales proposed an appropriate model used for the analysis of the Introduction unit. Later in 2004, he extended and revised the model, making it be adopted universally by many researchers as the rhetorical strategy in RA Introduction analysis. The key moves of this model could be explained clearly to learners.

<p>Move 1 Establishing the research context (citations required) via Step 1*Claiming importance of the research topic and/or Step 2 Reviewing the research topic Move 2 Creating a research space (citations possible) via Step 1A**Criticising previous studies and/or Step 1B Reporting contradictory findings and/or Step 1C Indicating a gap in existing literature and/or Step 1D Adding to what is known Move 3 Presenting the Present Work (citations possible) via Step 1 (obligatory) Announcing present research descriptively and/or purposively Step 2* (optional) Presenting RQs or hypotheses Step 3 (optional) Definitional clarifications Step 4 (optional) Summarizing methods Step 5 (PISF**) Announcing principal outcomes Step 6 (PISF**) Stating the value of the present research Step 7 (PISF**) Outlining the structure of the paper</p>

Figure 1 Revised Move 3 Structure (J. Swales, 2004, P.232) for the Analysis of RA Introductions

This model is a typical RA Introduction in academic English settings consisting of three-move structure, each of them undertaking a different rhetorical function as follow:

Move 1 (Establishing the research context) is for the writers to settle work in their research field by accentuating the interest of their study (Step 1) and/or describing what is known about their research topic by reviewing items of previous research (Step 2), with the main purpose of reinforcing the importance of their research and demonstrating their credentials as qualified writers.

In Move 2 (Creating a research space), writers must then justify the existing literatures and projects, giving their personal evaluation to the publications in order to create a research space which permits them to present their novel claims to the other members of their disciplinary community. For this purpose, it is stereotyped to conduct a reasonable criticism of any weak point or a new improvement of the research method in the previously published work by other researchers (Step 1A) and/or to report the contradictory findings from the reported article (Step 1B), and/or find possible knowledge gaps through regarding previous work (Step 1C), and/or contribute new findings as a continuation of previous research topic (step 1D). Subtle hedging devices could be used to avoid subjective boast or blunt criticism in the writing.

As regards Move 3 (Presenting the present work), it is generally recognized to commence with a specification of the main purpose of the research or a description of the unique features of it (Step 1). For realizing this step, the writer could employ different linguistic discourses to indicate the purpose of the study, typically linguistic exponents used being an explicit noun phrases, such as “The target/aim/purpose of this study attempts to show or was/is to explore/ examine/ reveal/ test/determine...”, or the use of deictic sentences to state the present text usually followed by a verb predominantly in present tense (e.g. “This paper presents/reports/describes...”). Other available options associated with this move are also available, for example, the presentation of the structure of the paper, related work, current understanding, defining the scope of study and etc. In step 5, the writer can highlight the contribution of their research in an effort to convince the related research peers in their field, mainly by anticipating the principal findings and enhancing the value of one’s research as indicated in Step 6. After that, the writer is going to illustrate the organization of the paper as in Step 7.

4 Conclusions

The concept of genre suggested in this paper ultimately attempts to be a staged, goal-oriented, purposeful activity in which speakers engage as members of their culture. Genre has become a key concept in language learning and teaching, and the research methods of genre-based pedagogy also exert a concern with context as well as form and emphasize the dominant role of description and analysis rather than preliminary classification. Summarily, there are three distinctive schools of genre-based approach to writing, namely, Australian Systemic Functional Linguistics (SFL), North American New Rhetoric studies, and English for specific purposes (ESP). The three trends contribute to different language teaching methods with the emphasis of genre given to three aspects: (a) genres as types of goal-directed communicative events; (b) genres as having schematic structures; and strikingly (c) genres as disassociated from registers or styles.

Research findings have figured out the three moves of the Introduction under the support of genres as having schematic structures, making it be adopted universally by many researchers as the rhetorical strategy in RA Introduction analysis. The three moves of the Introduction can be seen as working “from outside in”: first talking about the field as a whole, then progressively narrowing the scope so that only the current investigation is being addressed (Berkenkotter, Carol 419).

The type of writing suggested in this paper attempts to integrate genre theory and genre-based teaching approach to the learning of academic English writing, and adopts a discourse model for Introduction writing in which it is assumed that students or fresh writers learning to write academic papers are easier to be instructed to the ways in which writing steps and prompt context knowledge of Introduction have been moulded in their specific disciplinary cultures. Flexibility of the genre-based approach has influenced ESP language pedagogies by moving away from a highly restricted view of process to an informed theory of language and a moulded pedagogy grounded in research of texts and contexts in which novel writers may feel more confident about the rhetorical options they can choose depending on the context and type of writing.

Psychological Capital: A Positive Resource for Employee Innovative Behaviour Towards Public Sector Performance

Kknp Rathnayake, Chen Zhixia

College of Public Administration, Huazhong University of Science and Technology, Wuhan, P.R. China, 430070

(E-mail: nishanipr@yahoo.com, chpsy@sina.com)

Abstract: This paper extended the boundaries of positive organizational behavior to public sector organizations. Specifically, the relevance of psychological capital (PsyCap), composed of the positive psychological resources of hope, efficacy, resilience and optimism, was conceptualized in support with public sector reforms. On the basis of extant literature review and arguments grounded in the resource-based theory, and broaden-and-build theory, this study identified psychological capital as a positive resource for employee innovative behavior especially towards public sector performance through effective reforms. Addressing the research gap of limited studies at multiple levels of analysis, a theoretical model was derived, in which PsyCap can lead to innovative behavior of employees towards organizational performance through authentic leadership in a public environment that was perceived by disappointed reforms, resistance to change, power abuse, laziness and despair. Our study extended these theories to South Asian context (i.e., Sri Lanka), thereby providing external validity to the findings of research in Western contexts.

Key words: Psychological capital; Employee innovative behavior; Authentic leadership; Public sector performance

1 Introduction

Today's workplace of business as well as public is changing at a much faster and more dramatic pace than ever. Therefore, in order to sustain and gain a competitive advantage in such an environment, firms must be innovative (McAdam & Keogh, 2004). Particularly, employee innovative behaviors (e.g., developing, adopting, and implementing new ideas for products and work methods) are important resources that make an organization successful in dynamic environments (Yuan & Woodman, 2010). New ideas to the public sector are introduced through reforms. During the last few decades, the public sector around the world has been explored to major reform proposals and significant modification in government norms, structures, and behaviors (Pollitt & Bouckaert, 2011). Therefore, public administrative scholars and practitioners found to be busy analyzing, evaluating, and even proposing reforms (Aberbach & Christensen, 2014). Thus, the results have not been ended up with increased performance as expected. Moreover, they were highly criticized for their incapability of defining public issues, proposing appropriate solutions, and failures in implementations. In contrast, many reform studies suggest that leaders (political and administrative) in public sector more often control hierarchically reform processes due to their exclusive formal participation rights (Christensen & Lægveid, 2001; Pollitt & Bouckaert, 2011). In such a context, it becomes essential even for public sector organizations to maintain strategic human resources to be successful in the reform process as well as authentic leadership to have an impact on the follower's performance.

Sources of sustainable advantage for organizational positive change were well-explained by the resource-based theory of the firm (Acedo, Barroso, & Galan, 2006; Newbert, 2007). This theory proved the positive relationship between strategic resources (i.e. those that are valuable, rare and difficult to imitate or substitute) and organizational performance (Crook, Ketchen, Combs, & Todd, 2008). Thus, it is essential to manage and recognize the human, social and psychological capital to do best for such an innovative change within the organization (Luthans & Youssef, 2004). Nevertheless, Luthans et al. (2008) and Avey et al. (2009) discussed the importance of psychological and attitudinal strengths of individuals than other strategic resources. As a result, a new movement of positive psychology emerged which became concerned with what is right with people and building on that instead of trying to just fix what is wrong with people (Luthans and Youssef, 2004). Consequently, the positive organizational scholarship (POS) and positive organizational behaviour (POB) movements which can be applied to the workplace positivity were emerged. Similarly, a positive, genuine, transparent, ethical form of leadership, broadly termed authentic leadership (AL), is now recognized as a positive approach to organizational leadership that can help meet today's challenges (Avolio & Gardner, 2005; Avolio, Gardner, Walumbwa, Luthans, & May, 2004; George, 2003; Luthans & Avolio, 2003; Walumbwa, Avolio, Gardner, Wernsing, & Peterson, 2008). More

importantly, authentic leaders develop and influence their followers by energizing them with positive psychological states, which are conducive to their performance (Gardner & Schermerhorn, 2004) which could provide better solutions to inherent issues of resistance to change, lower productivity, power abuse and despair in public sector organizations.

On the basis of extant literature review and arguments grounded in the resource-based theory, and broaden-and-build theory, this study identifies psychological capital as a positive resource for employee innovative behavior especially towards public sector performance through effective reforms. Our study extends these theories to South Asian context (i.e., Sri Lanka), thereby providing external validity to the findings of research in Western contexts.

2 Psychological Capital: Core Construct and Study Hypotheses

Positive psychological capital is a higher-order core construct which is composed of four components: efficacy, hope, resilience, and optimism. PsyCap is more directly concerned with 'who you are' and more importantly 'who you are becoming' (Luthans, Avey, et al., 2006). PsyCap can be defined as "an individual's positive psychological state of development that is characterized by: (1) having confidence (self-efficacy) to take on and put in the necessary effort to succeed at challenging tasks; (2) making a positive attribution (optimism) about succeeding now and in the future; (3) persevering toward goals and, when necessary, redirecting paths to goals (hope) in order to succeed; and (4) when beset by problems and adversity, sustaining and bouncing back and even beyond (resilience) to attain success (Luthans, Youssef, et al., 2007). PsyCap is state-like and open to change and development as compared with largely fixed traits such as personality (Luthans, Avey, & Patera, 2008; Luthans, Youssef, et al., 2007). Many studies have found that the relationship between PsyCap and employee attitudes, behavior and performance at individual levels of analysis (Avey, Luthans, & Youssef, 2010). Addressing this research gap of limited studies at multiple levels of analysis, our study examines those cross-level interactions where the strength of the relationships among individual-level predictor (employee PsyCap), team-level predictor (authentic leadership) and outcome criterion differ as a function of individual-level (employee innovative behavior) and organizational/industry level (organizational performance).

3 Psychological Capital, Innovative Behavior and Organizational Performance

Limited studies investigated the relationship between hope and creativity (Rego, Machado, Leal, & Cunha, 2009). Rego, Sousa, Marques, and Cunha (2012) examined the relationship between optimism and creativity. Similarly, Tierney and Farmer (2002) also found the relationship between efficacy and creative performance. Research suggests that the positive psychological resources of efficacy, hope, resilience, and optimism have the potential to improve innovative behaviors of employees in the workplace (Abbas & Raja, 2015). Hope is "a positive motivational state that is based on an interactively derived sense of successful (1) agency (goal-directed energy) and (2) pathways (planning to meet goals)" (Snyder et al., 1996). Individuals with greater hope are able to conceive of many strategies to reach their goals and proactively develop alternative plans in case the original one does not work (Snyder, 1994). This ability leads for them to actively work on creative ideas for solving problems, and they regard problems and opportunities from different angles (Zhou & George, 2003). In addition, high hope individuals tend to be independent thinkers (Luthans, Youssef, et al., 2007). Hopeful employees "tend to be creative and resourceful, even with tight budgets" (Luthans, Youssef, et al., 2007). Optimism is a generalized positive expectancy (Carver et al., 2009) and a positive explanatory style of attributing positive events to personal (internal), permanent (stable) and pervasive (global) causes and negative events to external, temporary and situational ones (Seligman, 1998). Optimistic leaders pursue new and creative approaches towards problem solving (Peterson, Walumbwa, Byron & Myrowitz, 2008). Optimists are essential to introduce changes to a system as they always prefer to have positive expectations about results without being resistant to them (Avey et al., 2008). Self-Efficacy, or confidence, is "one's belief about his or her ability to mobilize the motivation, cognitive resources, and courses of action necessary to execute a specific action within a given context" (Stajkovic and Luthans, 1998b). Grounded in social cognitive theory, efficacy motivates the selection of challenging goals, and mobilizes the cognitive mechanisms of symbolizing, forethought, observation, self-regulation and self-reflection toward goal pursuit (Bandura, 1997, 2012). Efficacious individuals are inventive, resourceful (Bandura & Cervone, 1986), and creative (Tierney & Farmer, 2002) and those individuals to be more likely to generate and apply innovative ideas in their workplace (Abbas & Raja, 2015). Resilience is "the developable capacity to rebound or bounce back from adversity, conflict, and failure, or even positive events, progress, and increased responsibility" (Luthans, 2002a). Resilience is

a very important psychological resource, because repeated failure can prevent us from moving forward (Hsu et al., 2014). Resilience can help organizations and their members survive, overcome, learn from and grow through challenges (Youssef and Luthans, 2005). Moreover, resilient leaders are likely to encourage themselves and even their subordinates to take risks and exhibit innovative behaviors (Peterson et al., 2008). Although not addressed by Avey, Reichard, et al.'s (2011) meta-analysis, PsyCap has also been found to influence employees' creative performance, problem solving and innovation at the individual-level. For example, Sweetman, Luthans, Avey and Luthans (2010) and Rego et al. (2012c) found that PsyCap was positively related to creative performance, and Luthans, Youssef, and Rawski (2011) found that PsyCap was positively related to problem-solving performance and reported innovation.

Also excluded from Avey, Reichard, et al.'s (2011) meta-analysis is the relationship between PsyCap and performance at the team and organizational-levels of analysis. For example, by using an experimental design with engineers, Walumbwa, Peterson, Avolio and Hartnell (2010) found that leader PsyCap was positively related to follower PsyCap, which in turn was positively related to follower performance. According to broaden-and-build theory, positive emotions share the capacity to broaden people's momentary thought-action repositories and widen the array of thoughts and actions that come to their minds (Bakker & Demerouti, 2008; Fredrickson, 2001), thereby increasing the potential for the demonstration of innovative behaviors such as sharing creative ideas and providing suggestions for improvements at work (Avey, Luthans, & Youssef, 2010; Avey, Reichard, et al., 2011). Research on PsyCap suggests that PsyCap contributes to positive emotions. The broadened inventory of positive psychological resources such as hope, efficacy, optimism, and resilience may be helpful in problem solving and enhancing creativity since employees with a positive mindset are more creative (Luthans et al., 2011; Rego, Sousa, and Marques, 2012). Moreover, innovative behaviour of these employees may lead to positive change in organizations (increased performance). Similarly, innovative behavior of employees mediates the relationship between employee PsyCap and organizational performance. Therefore, we propose the following hypotheses:

H1: Employee psychological capital is positively related to employee innovative behavior.

H2: Employee innovative behavior mediates the relationship between employee psychological capital and organizational performance.

H3: Employee innovative behavior is positively related to organizational performance.

4 Moderating Role by Authentic Leadership

Organizations need leaders today to challenge the status quo, create visions of the future, and inspire organizational members to want to achieve the visions (Robbins & Judge, 2013). In contrast, previous research on leadership demonstrated that corruptive and unethical leaders negatively influence on employee attitudes, behavior and performance. In the public administration practitioner literature, many researchers observed that public sector employees greatly suffer from despair, apathy, anxiety, poor job satisfaction, less productivity, less innovativeness and less efficiency due to its ineffective leadership. In such a context, authentic leadership plays an important role as it's a promising way to think about ethics and trust in leadership because it focuses on the moral aspects of being a leader (Robbins & Judge, 2013). The primary quality produced by authentic leadership, therefore, is trust (Robbins & Judge, 2013). Previous research found that authentic leaders can influence follower performance (Lord & Brown, 2004). According to Avolio et al. (2004), the behaviors of authentic leaders are viewed by followers as being guided by high moral standards and characterized by fairness, honesty, and integrity in dealing with followers. As a result, followers get motivated to exhibit positive behaviors and have a sense of self-worth and obligation to reciprocate (Illies et al., 2005; Yukl, 2002). Similarly, George (2003) observed that authentic leaders motivate followers by means of modeling and transferring a deep sense of responsibility to deliver positive outcomes over an extended period. Although a great deal of research has focused on examining the relationship between PsyCap and workplace outcomes, there has been comparatively limited research on the factors that may moderate such a relationship (Newman et al., 2014) especially by authentic leadership.

Wang et al (2014) also found that the relationship between authentic leadership and followers' job performance through leader-member exchange was stronger for those low in PsyCap. Research found that more participative or authentic styles of leadership might facilitate the deployment of PsyCap by individuals. For example, even though employees or teams report high levels of PsyCap, leadership may be needed to channel this in the right way to guide the behaviors that yield superior outcomes (Newman et al., 2014). As such, although we expect participative or authentic styles of leadership to accentuate the

positive relationship between PsyCap and desired outcomes, other more authoritarian style of leadership may constrain the deployment of individual-level PsyCap. Drawing from this theoretical, empirical, and practical literature, we derive the following hypothesis:

H4. Authentic leadership will moderate the relationship between employee psychological capital and their innovative behavior such that the psychological capital will be more positively related to employee innovative behavior when authentic leadership exists.

Considering all the four hypotheses, the theoretical model shown in *Figure 1* can be constructed for the study.

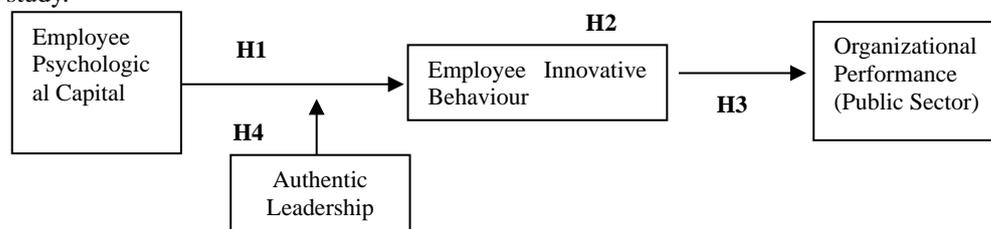

Figure 1 Conceptual Model of the Study

5 Conclusions

Policy makers should seriously consider the use of effective reforms today than ever. More importantly, the reforms will have little impact if the conditions under which they are implemented do not support the introduction of these reforms (such as leadership, the strong institutional culture, high degree of professionalism of employees, and support from the Ministries). Empirical research also suggests that superficial knowledge and insufficient understanding of human beings cause the failure of an organization to mobilize its human resources. Thus, fierce and dynamic today's global economy calls for different positive psychological resources within each employee (i.e. PsyCap) and an authentic leadership to create a trustful environment. Empirically it was proven that PsyCap and authentic leadership can influence employee work performance, increasing positive workplace behaviors while decreasing negative behaviors and improving trust. Accordingly, this conceptual paper will be set out to review and explore the impact of positive PsyCap and authentic leadership on employee innovative behavior and public sector organizational performance in Sri Lanka. The concepts and constructs discussed in this study will have practical implications for the development of human resources and authentic leadership style especially in public sector organizations. In conclusion, by combining PsyCap and leadership, this study is to be found the relationship between organizational performance and employees' innovative behavior contingent on employees' PsyCap.

Advantages and Disadvantages of Networked Arts Education in Non-Arts Colleges and Their Improvement

Zhan Wei

School of Arts and Communications, Wuhan Polytechnic University, Wuhan, P.R.China, 430023
(E-mail: 45671053@qq.com)

Abstract: As a form of aesthetic education, arts education plays an important role in quality education in Chinese colleges. The network age has brought both opportunities and challenges to arts education in colleges, and how to meet its challenges is what arts teachers should consider in the new age. In this paper, we use fuzzy synthetic evaluation (FSE) method analyze the current situation of arts education in the network age, consider that both opportunities and challenges have been brought by the network age, recommend that arts teachers should ponder values orientation in networked orientation and keep pace with the overall development of education cause.

Key words: Arts education; Average college; Network; New characteristic; Fuzzy synthetic evaluation

1 Introduction

With the development of digital information technology, nowadays information disseminated is being spread by network quickly, impacting greatly on the traditional educational assumptions and teaching modes (Luxuan Fan, 2015). The arts education in non-arts colleges aims to increase their quality of aesthetics, which is quite different than that in the arts schools (Hu Jin and Rong Zheng, 2014). The network age has changed the landscape of the arts education for college students, and makes it acquire new characteristics. It not only has brought opportunities to the students and researchers, but also has posed enormous challenges (Li Lei, 2014).

2 Method

In 1965, Zadeh introduced fuzzy set theory to analyze imprecisely informative data (Zadeh, 1965). Now we develop this fuzzy synthetic evaluation (FSE) method to analyze the current situation of arts education.

2.1 The classification of factors

The factors set $U = \{u_1, u_2, \dots, u_m\}$ are classified into s type by some kind of attribute,

$$U = \{u_{i1}, u_{i2}, \dots, u_{im}\}, \quad i = 1, 2, \dots, s \quad (1)$$

They match the conditions:

$$m_1 + m_2 + \dots + m_s = m \quad (2)$$

$$U_1 \cup U_2 \cup \dots \cup U_s = U \quad (3)$$

$$(\forall i, j)(i \neq j \Rightarrow U_i \cap U_j = \emptyset) \quad (4)$$

2.2 The determination of evaluation set and weight set

1) The determination of evaluation set

$$V = \{v_1, v_2, \dots, v_n\} \quad (5)$$

2) The determination of weight set

A. Factor class weight set

The weight of class i factors U_i are defined as $a_i (i = 1, 2, \dots, s)$, so the factor class weight set

$$A = (a_1, a_2, \dots, a_s) \quad (6)$$

B. Factor weight set

The weight of No. j factor in class i is defined as a_{ij} , so the factor weight set

$$A_i = (a_{i1}, a_{i2}, \dots, a_{im_i}) \quad i = 1, 2, \dots, s \quad (7)$$

2.3 The first level FSE

To synthetically evaluate the factors of first level, the single factor evaluation Matrix of first level FSE is defined as

$$R_i = \begin{bmatrix} r_{11}^{(i)} & r_{12}^{(i)} & \cdots & r_{1n}^{(i)} \\ r_{21}^{(i)} & r_{22}^{(i)} & \cdots & r_{2n}^{(i)} \\ \vdots & \vdots & & \vdots \\ r_{n1}^{(i)} & r_{n2}^{(i)} & \cdots & r_{nn}^{(i)} \end{bmatrix} \quad (8)$$

The FSE of class i factor is defined as

$$B_i = A_i \circ R_i = (a_{i1}, a_{i2}, \dots, a_{im_i}) \circ \begin{bmatrix} r_{11}^{(i)} & r_{12}^{(i)} & \cdots & r_{1n}^{(i)} \\ r_{21}^{(i)} & r_{22}^{(i)} & \cdots & r_{2n}^{(i)} \\ \vdots & \vdots & & \vdots \\ r_{m_i1}^{(i)} & r_{m_i2}^{(i)} & \cdots & r_{m_in}^{(i)} \end{bmatrix} = (b_{i1}, b_{i2}, \dots, b_{in}) \quad (9)$$

2.4 The second level synthetic evaluation

The single factor evaluation Matrix of second level FSE is the Matrix of first level FSE

$$R = \begin{bmatrix} B_1 \\ B_2 \\ \vdots \\ B_s \end{bmatrix} = \begin{bmatrix} A_1 \circ R_1 \\ A_2 \circ R_2 \\ \vdots \\ A_s \circ R_s \end{bmatrix} \quad (10)$$

So the second level FSE is defined as

$$B = A \circ R = A \circ \begin{bmatrix} A_1 \circ R_1 \\ A_2 \circ R_2 \\ \vdots \\ A_s \circ R_s \end{bmatrix} = (b_1, b_2, \dots, b_n) \quad (11)$$

If some sub-class sets U_i still have many factors, we can divide them again. Then we have third level model or multiple level model.

3 Numerical Analysis and Results

3.1 The opportunities brought by network-age arts education

Digital information technology has injected vitality into the arts education in non-arts colleges, promoting its development of arts education tremendously, and provides writers and artists with a new platform.

3.1.1 New characteristics of educational contents

The network age has seen a substantial improvement in educational contents, of which cultivation of creative ability has become a critical part. The computer network has vastly expanded the scope of educational contents--every college has its own online arts library which collects various forms and thoughts of arts, and shares network resources with one another. This not only has sped up the spread of various forms of arts, but also has stimulated students' creativity. For example, students in many colleges have set up such arts societies as drama clubs so as to enrich the arts life on colleges campuses.

3.1.2 New characteristics of educational objects

In the network age, such methods as network videos and visiting scholars' lectures have been used in non-arts colleges to largely solve the difficult problems confronting traditional arts education. In the network learning environment, with their learning interest stimulated, college students can enjoy high-quality arts education, more actively enhance self-culture and acquire knowledge. On the one hand, this decreases the high cost of arts education to some extent; on the other hand, this promotes initiative of educational objects in learning knowledge.

3.1.3 New characteristics of the educational means

Educational content and educational objects' learning depend on educational means. The Internet, as a new educational means, has provided new learning experiences by encouraging students to use their senses, arousing their enthusiasm for learning, and improving the interactivity of teachers and students.

3.2 The challenges facing arts education in non-arts colleges in the network age and solutions

The network has changes the route of transmission of traditional arts. "Like a double-edged sword, the network is not only a seedbed and a multiplier of excellent music culture, but also a hotbed and an

incubator of vulgar or indecent network music.” (Zhong Yi, 2009)

3.2.1 Network proficiency

The advent of network has greatly changed arts education (Meng Jian, 2000). First, it poses a challenge to arts educators’ network proficiency. The blackboard-based teaching has been replaced by in multimedia-based instruction, including use of PowerPoint slides, computer and projector. Also, teachers are supposed to know how to use relevant software. This is a big challenge to the educators who cannot embrace new technology (Yang Dechu and Hong Yan, 2002).

Therefore, arts courses should be based on network and connected to the dynamic world, which can widen both students’ and teachers’ horizons. Furthermore, arts teachers should adopt proper teaching theory which can guide them add popular elements from the Internet, so as to enrich course contents and arouse students’ passion for knowledge (Li Huaizhe, 2010).

3.2.2 The relationship between teachers and students

The original relationship of teacher-student has been broken, and has been replaced by the relationship of teacher-computer-student, with the lively, friendly person-to-person communication changing into the relatively cold human-machine communication. Facing the alienate relation, teachers, students and colleges should take measures to eliminate the side effects of network education.

Teachers should communicate with their students outside the classroom, learning about not only students’ study, learning progress and knowledge acquisition, but also their life and hobbies, so that they can carry out teaching according to students’ characteristics. Students should communicate with their teachers more actively, instead of getting engrossed in the network world and ignoring people and things in the real world. The network just provides better learning conditions and platforms for them, and students should not be engrossed in it. Colleges should perfect their administrative system, for a good system is the guarantee for promoting arts education (Qing Lie, 2004).

3.3 Numerical analysis

3.3.1 Parameter characterization

To analyze the current situation of arts education, we set the parameters as follows,

Table 1 Parameters of FSE

Intrinsic Factors	Educational Contents (F_1)
	Educational Means (F_2)
Extrinsic Factors	Network Proficiency (F_3)
	The Relationship between Teachers and Students (F_4)

The survey information is taken from students so the educational objects are not included in the factors. The weight of each factor is defined by single factor evaluation Matrix

$$\begin{matrix} & F_1 & F_2 \\ F_1 & 1 & 1/3 \\ F_2 & 3 & 1 \end{matrix} \tag{12}$$

The weight vectors of factors

$$b_1 = \sqrt{1 \times \frac{1}{3}} = 0.5773503 \tag{13}$$

$$b_2 = \sqrt{3 \times 1} = 1.7320508 \tag{14}$$

Then

$$w_1 = \frac{b_1}{b_1 + b_2} = \frac{0.5773503}{0.5773503 + 1.7320508} = 0.2483341 \tag{15}$$

$$w_2 = \frac{b_2}{b_1 + b_2} = \frac{1.7320508}{0.5773503 + 1.7320508} = 0.7499999 \tag{16}$$

3.3.2 Survey information

The survey information is taken from a music class in a non-arts college, there are 120 students in this class.

Table 2 Survey Information

Factors	Evaluation Level				Weight
	A	B	C	D	
Educational Contents	15	15	60	30	0.24833341
Educational Means	0	30	45	45	0.7499999

So the fuzzy relationship Matrix is

$$R_1 = \begin{bmatrix} \frac{15}{120} & \frac{15}{120} & \frac{60}{120} & \frac{30}{120} \\ 0 & \frac{30}{120} & \frac{45}{120} & \frac{45}{120} \end{bmatrix} \tag{17}$$

Then we get the single factor evaluation result of intrinsic Factors

$$B_1 = w \circ R_1 = (0.2483341 \quad 0.7499999) \begin{bmatrix} \frac{15}{120} & \frac{15}{120} & \frac{60}{120} & \frac{30}{120} \\ 0 & \frac{30}{120} & \frac{45}{120} & \frac{45}{120} \end{bmatrix} = (0.0310418 \quad 0.2185418 \quad 0.4054171 \quad 0.3433335) \tag{18}$$

According to the same calculation process, we get the single factor evaluation result of extrinsic factors

$$B_2 = (0.1874999 \quad 0.3743753 \quad 0.15520881 \quad 0.2812500) \tag{19}$$

3.3.3 The calculation of synthetic evaluation

The synthetic evaluation includes all intrinsic and extrinsic factors. The weights of these factors are $w = (0.8333333 \quad 0.1666666)$ (20)

The fuzzy relationship matrix R_2 is given by the first level FSE

$$R_2 = \begin{bmatrix} B_1 \\ B_2 \end{bmatrix} = \begin{bmatrix} 0.0310418 & 0.2185418 & 0.4054171 & 0.3433335 \\ 0.1874999 & 0.3743753 & 0.1552088 & 0.2812500 \end{bmatrix} \tag{21}$$

So the result of synthetic evaluation is

$$C = w \circ R_2 = (0.8333333 \quad 0.1666666) \begin{bmatrix} 0.0310418 & 0.2185418 & 0.4054171 & 0.3433335 \\ 0.1874999 & 0.3743753 & 0.1552088 & 0.2812500 \end{bmatrix} = (0.0571181 \quad 0.2445140 \quad 0.3637157 \quad 0.3329862) \tag{22}$$

The value of evaluation level is defined as

$$A = 95, \quad B = 85, \quad C = 75, \quad D = 50 \tag{23}$$

We get the final score of synthetic evaluation is

$$0.0571181 * 95 + 0.2445140 * 85 + 0.3637157 * 75 + 0.3329862 * 50 = 70.14 \tag{24}$$

4 Conclusions

Based on our Numerical analysis result, we may face the fact that networked education has indeed impacted on the arts education in non-arts college, but it has also been providing more opportunities.

Thanks to network technology, the impossible in the arts education in non-arts colleges has become possible. Higher education in China has been universalized; educational contents have been enriched; teachers have an extensive educational platform; initiative of educational objects has been stimulated. On the whole, arts education in non-arts colleges has been greatly improved.

To preserve traditional arts, influenced by the network, people tend to abandon their own beliefs and thoughts, even the artistic spirit passed down within their nation. Thus many local customs and practices have been destroyed by modern technology in the environment of network (Jiao Jianying, 2002). Non-arts colleges should pay more attention to this situation, and guide students to take a healthy and positive outlook towards arts while monitoring and controlling the influence of network on students.

What arts teachers should do is to ponder values orientation in networked orientation, to figure out the essence of education in the new age, to adapt to the rapidly changing age, to seize the opportunities, to face up to the challenges, and to keep pace with the overall development of education cause.

Analysis of the College Counselors Management Responsibility Mechanism

Wan Xiang

The Development of Science and Technology Institute, Wuhan University of Technology,
Wuhan, P.R. China, 430070
(E-mail: 20354336@qq.com)

Abstract: College counselors, who play a very important role in the daily management and political education of the college students, are attracting more and more attention from the public. Through extensive literature review, the current research status on college counselors was firstly summarized. Then, a questionnaire survey method was adopted, the problems existed in the management of college counselors were thoroughly analyzed from five aspects, which are, the salary system satisfaction, the professional level, the management responsibility, the evaluation and incentive system, and the training level. Finally, based on these problems, the corresponding solutions and strategies were furthermore proposed. This study is not only essential in solving the problems facing the college counselors, but also of benefit to improve the student work management level of the university.

Key words: College counselor; Questionnaire survey; Salary satisfaction; Management responsibility; Evaluation and incentive; Training

1 Introduction

In the recent three decades, the higher education of China has got great development. The college counselors, as an important group, have contributed a lot in this period. With the Minister of Education of China issuing the *Opinions on Strengthening and Improving the Construction of College Counselors and Teachers in Charge and the Provisions on the Construction of College Counselors Team*, the structure and quality of the college counselor teams has largely improved. However, problems associated with the management of college counselors have gradually appeared. Through extensive literature reviews, it can be found that a large amount of research has been carried out regarding the problems of college counselors (Zhou Jialun, 2011; Michael Schaub, 2012); the fundamental reasons are believed that a lack of management responsibility system, and the corresponding scientific evaluation mechanism has not yet been established (Schwitzer A M, 1996; Du Yanhua, Ma Xiaojing, 2016). Mechanism innovation is widely recognized as the fundamental direction to solve the problem of college counselors (Ying Y U, et al, 2014; Qiu Jin, 2012). At present, the majority of researches are about the experience analysis of college counselors' work (Young T L, et al, 2015; Yan Jianyi, 2014); few researches have been carried out from the perspective of management evaluation method and responsibility system. Thus the study of the management responsibility system is essential in solving the problems occurred in the college counselor team.

2 Problems Existed in the Management of College Counselors

Since the beginning of the 21st century, China's universities have experienced a large expansion in the scale and enrollment. Accordingly, the college counselor team is enlarged. However, the original selection, training, and evaluation mechanism aiming at the college counselors do not change. These old mechanisms are unable to meet the requirement of the university development. In this section, the problems existed in the management of college counselors are deeply analyzed.

2.1 Unsatisfactory with the salary system

A questionnaire survey has been carried out regarding the salary satisfaction degree; the results are shown in the Figure 1. Generally speaking, the salary level of the college counselors in China's university is not high. Seen from the Figure 1, 86% of the college counselors are not satisfied with their salary or very dissatisfied, especially compared with the teachers. Although the official regulations take the college counselors as an important composite of the teacher team, however, there is still a big gap between the college counselors and college teachers with respect to the salary level. In China, the college counselors tend to implement a post appointment system. Their salary packages only include the basic salary and a small amount of allowance, while the full-time teachers have more incomings like post allowance and class allowance. This binary difference situation always disappoints the college counselors.

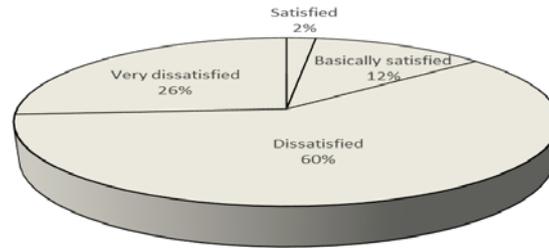

Figure 1 Results of the Questionnaire Survey Regarding the Salary Satisfaction of the College Counselors

2.2 Inadequate in the professional level

Seen from the present situation, college counselors are selected among the fresh graduate, and many of them are the outstanding representatives of the student cadres. Although they work with passion and vitality, they are short of the general knowledge of the ideological and political education, as well as the psychology study and necessary working experience. Thus, these college counselors show poor coordination ability in the management of the college students. It can be seen that the specialization level of the counselors remains to be improved.

2.3 Unclear in the job responsibility

The Provisions on the Construction of College Counselors' team have 8 principles for the job responsibilities of college counselors, but in practice, college counselors take a number of responsibilities, including the student education, management, consulting and serving, more specifically, the ideological and political education, dormitory management, reward and punishment management, poor students helping, psychological counseling and other content. Besides, various tasks from administrative organs at all levels of the school are delivered by the college counselors, and too much work needs to be accomplished by them. Meanwhile, it is a very serious problem that the current post-90s generation has poor self-care ability, psychological ability, self-discipline awareness, and some other issues. All kinds of unexpected and unforeseen problems emerge in an endless stream, which leads to the long-term overdraft with the college counselors. Under this kind of unclear work responsibility, it often leads to the ideological and political education work to the student becomes a mere formality.

2.4 Unsound in the evaluation and incentive system

Since the college counselors are mostly served by the fresh graduates, at present, there are no corresponding professional promotion channels in the work mechanism. In the questionnaire survey, 73% of the college counselors hold a general attitude toward the current evaluation and incentive mechanism, 16% of them are dissatisfied, 6% of them are satisfied, as shown in Figure 2. In addition, most counselors do not think this work shows a good future and do not have the intention to engage in this work for a lifetime. As for the working period, some teachers take this work as a working experience after graduation; if possible, they would like to transfer to a full-time teacher or continue a further study. 48% of them choose to work within 2 years, 46% of them choose to work 2-5 years, only 6% of them choose to work more than 5 years, as shown in Figure 3. Working in a short time period inevitably affects the continuity and systematicness of the student work. Regarding the counselors' evaluation system, some universities purely take the employment rate and the study results of students to assess the pros and cons of them; other universities haven't yet set up a scientific evaluation system, accordingly, there is no effective incentive mechanism.

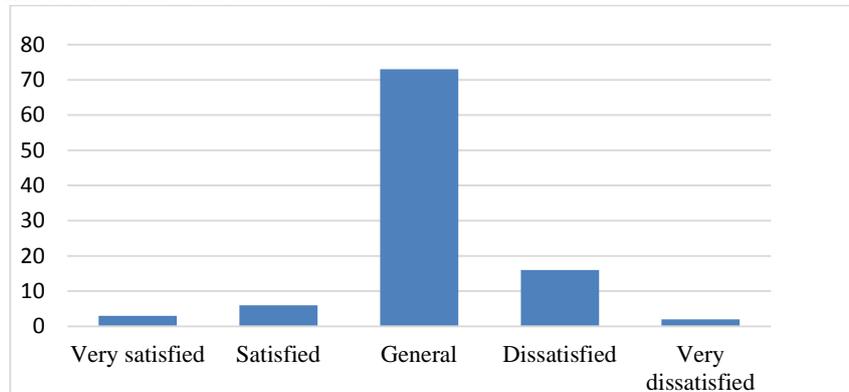

Figure 2 College Counselors' Attitude toward the Evaluation and Incentive System

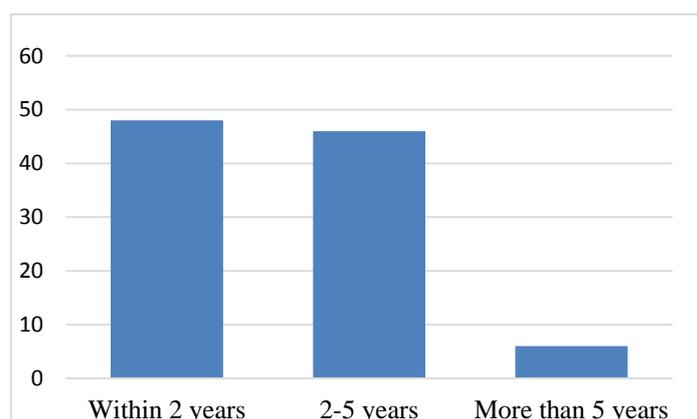

Figure 3 College Counselors' Planning on the Working Period

2.5 Insufficient in the training

The ideological and political education combines the features of scientific, theoretical and political in one, which needs special research and training. Since the college counselors tend to work for a long time under huge working pressure, they usually have little time and energy to take the appropriate training and guidance after work.

3 Establish the Management Responsibility Mechanism of the College Counselors

3.1 Improve the salary level

Gradually establish a new salary structure that combines a basic salary, performance pay, and the welfare. The basic salary is based on the work accomplished by the counselors or their ability to complete the work. Performance pay is the salary which bases on the work performance of the counselor, this part can make the excellent counselors get due reward and make the bad-performance ones to be punished. Besides, the universities should provide a wide range of benefits for the teaching and administrative staff, as well as the counselors.

3.2 Establish a multi-conclusion evaluation mechanism

Gradually establish a multi-conclusion evaluation mechanism linked with the evaluation results. The real conclusion evaluations can be divided into 3 grades, that is, traditional evaluation grade, record evaluation grade, and performance record evaluation grade. The implementation procedures of the multi-conclusion evaluation are divided into self-evaluation, school evaluation, publicity evaluation, and the evaluation of the construction leading group.

3.3 Establish an incentive system for the ideological and political education

Based on the traditional promotion channel, the promotion system of professional technical position (like teaching assistant, lecturer, associate professor, and professor) can also be set among the college counselor group. Dual career development channel, on the one hand, is to solve the contradiction between the scarcity of the administrative post and the demand of staff promotion, on the other hand, is to timely recognize the staff growth and strengthen the incentive for employees. The establishment of the dual career development channel can help the counselors to exert their own potential, and also can stabilize the counselor group.

3.4 Establish a formal training system

Currently, the training system of the college counselor is quite informal. Establishing a formal training system is of significance to improve the professional level of the college counselors. On the one hand, it helps the counselors make sustainable career planning, and provides a variety of training system, like vocational training and personalized training in line with the needs of their own development; on the other hand, it provides a learning platform to encourage more counselors to participate in academic study.

4 Conclusions

This study has thoroughly analyzed the problems existed in the management of college counselors, and then the corresponding solutions and strategies are proposed as follows, the college counselors' salary level should be gradually improved, a multi-conclusion evaluation mechanism, a new incentive system, and formal training system should be gradually established. These four institutional mechanisms

are of benefit to provide promotion channels for college counselors; meantime, they are of benefit for the counselors to realize the stabilization and professionalization.

A Study on Optimal Allocation of Information Resource of University Library under Web Environment

Shao Tianxi

The Retired Department of Wuhan University of Technology, Wuhan, P.R. China, 430070
(E-mail: 2960889179@qq.com)

Abstract: With the development of the new media, the form of information carrier presents the trend of diversification and cause the change the information needs and reading behaviors of the readers. As the center of information and culture in university, the university library needs to optimize information resources by corresponding measures to meet readers' diversified information needs. This paper analyzes the feature of information needs and the change of reading behaviors in university under new media environment, and the influence on the university library of the new media. At the same time, this paper proposes the ways on optimal resource allocation in the university library.

Key words: New media; University library; Information resource; Optimal allocation

1 Introduction

The new media is system of media forms which depends on the new technical, such as digital magazines, digital newspapers, digital radio, digital television, digital cinema, SMS, mobile TV, network, desktop Windows, touch media. With respect to newspapers, magazines, radio, television of the four traditional media, the new media is aptly called the "fifth media. Under the new media environment, all kinds of information are appeared, the growth of knowledge and update are rapidly, information carrier emerges diversified trend, which gave birth to the changing information needs of readers and reading behavior, which no longer subjects to time, space and the environment limitation. Zhang dandan (2015) put forward that based on all-around understanding of information resources of university libraries, its integration system was studied mainly in its components and level structures. Ye peizhen (2015) explored that As a new social information platform, the modes of library information service are effective expanded by the application of WeChat and analyzes its development situations, points out the problems, and puts forward some proposals to solve the problems. As the information and cultural center in colleges and universities, the University Library to readers and an important platform for the dissemination of knowledge carriers, which should follow the development trend of the E times, taking appropriate measures to adjust its information resources building strategy, optimize the allocation of information resources to meet the diverse readers of reading needs. (As showed in Figure 1).

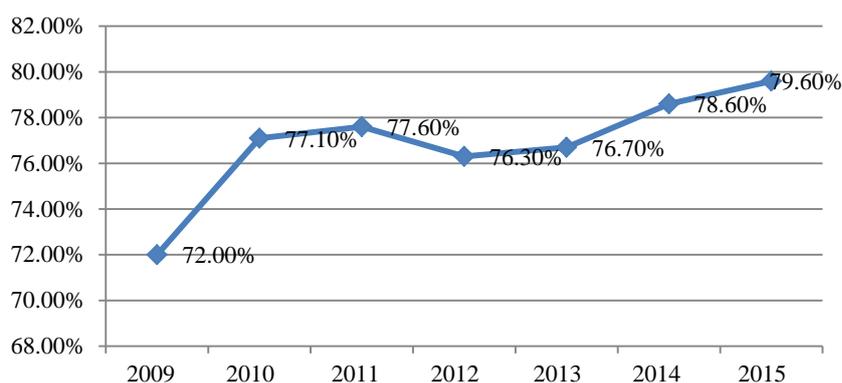

Figure 1 Comprehensive Reading Rate Changes in 7 Years

2 The Information Demand's Characteristics and Reading Behavior Changes of University Readers under the New Media Environment

2.1 The information demand's characteristics of university reader

2.1.1 The diversity of information demand

As follow is the diversity of information demand among university readers under the new media environment:

1) The information sort is diversity. Compared to the times of traditional reading, the demand of information to the readers increases greatly and the demand for the sort of information increases as well, from the news, politics, literature, poetry and music to academic papers and works of science and technology, etc.

2) The information type is diversity. The diversity of readers' information demand is also reflected in various types of information demand. Not only limited to single paper books, newspapers, but also including various types of digital resources, such as electronic books, electronic journals, dissertations, conference papers, reports of science and technology, standard, picture, multimedia resources, etc.

3) The information content is diversity. University library services for different readers, such as scientific research personnel, teachers, graduate students, undergraduates, administrative and management personnel, etc. Different types and different levels of readers have different demands of information content and research fields.

2.1.2 The timeliness of information demand

Timeliness is the urgency of the readers for access to information. In the era of information explosion of new media, as the pace of life is increasing, readers put forward higher requirements in having access to information timeliness and timely. They need to have a very efficient way to obtain information and in the way to get a large number of information resources and expanded knowledge. Timeliness of information demand is a respond to a timely access to information for the readers, is a development of The Times resulting from the changes.

2.1.3 The value of Information demand.

Under the new media environment, readers not only need to get large amount of information timely but also need to get useful information for them.

In the traditional reading area, due to the limitation of access to information, inconvenience of looking for information, readers feel so difficult to obtain and clear up their information efficiently, so that much information resources are unknown. Therefore, there are many relative resources wasted. However, in contemporary society, because of the convenience of access to information, readers have a higher request in the value of information. They hope to get information via a variety of convenient and quick ways and then extracting, filtering, integration of useful information from it. That is the value of information demand.

2.2 The reading behavior changes of university readers

1) The changes of the ways of reading. Under the new media environment, as the appearance of the network resources and the rich diversity of reading form, the reading forms of university readers begin to borrow from paper literature reading to digital literature. Readers become increasingly use computers, mobile phones, ipad, and other electronic reader devices to read. As a consequence, the behavior of readers is no longer restricted by time, space and environment.

2) The approach changes of reading. Under the new media environment, library is no longer the only way for readers to get access to information resources. In addition to borrowing from the library, readers can also search what they want from Google, Baidu and so on.

3) The changes of reading forms. Under the new media environment, university readers are no longer limited to one-way reading form. They also need to have the interaction and communication of two-way reading. They also want to participate in the library construction through the reader driver and a variety of ways to participate in the library information resource construction.

3 The Influence of New Media on University Library

Because of the emergence of new media, the change of readers' information demand and reading behavior, university library inevitably affected by a strong impact and are faced with new challenges. The traditional printing document, a single form of electronic journals, electronic books and others cannot adapt to the development of Times and cannot fully satisfy the readers' demand of the diversity of the information data, timeliness, value. These changes have a great influence on the university library, including in the following two aspects:

3.1 The influence on the library collection structure

New media require library to change to give priority to the traditional printing document resources construction idea, change the traditional library collection structure and finally develop into the physical resources and virtual resources and the combination of multiple types and contents enrichment. This is the inevitable developing trend of university library information resource construction

3.2 The influence on the service form

As the diversity of channels of access to information, readers gradually reduce the dependence on entity library. The number of readers who borrow paper document from library is reduced year by year. In fact, they look for information more depend on the network, electronic reader and mobile phone. Especially for the Web2.0 application in the library, the space of library (both in physical space and virtual space) become more interactive and cooperative. Readers are no longer satisfied with merely resources information. They expect to participate in the construction of the library and use the library in new ways, such as Micro letter, or code scanning, virtual consultation, new concepts and new technologies such as mobile library. Therefore, with the help of the advanced service concept and technology change in the direction of diversification and interactive, Library service model should be developed at the same time.

4 The Optimal Allocation of Information Resources in University Library

The new media brings a big impact to university libraries by altering readers' demands for information and reading behaviors. University library should take active measures to cope with, optimizing the collection structure, improve service levels, meet the challenges brought about a series of new media. The first is the optimal allocation of information resources. Library should actively change the traditional reading of the era of information resources construction of the guiding ideology and the service concept, adopt corresponding measures to optimize the library information resources configuration, optimizing the collection structure, provides the high-quality service for the library to carry out the diversity of information literature safeguard.

4.1 To adjust to construction concept of information resources and establish the new media thinking

With the tide of new media, university library should change its concept of information resource construction, ideas, establish new media thinking, use of limited resources construction funds, reasonable distribution of funds proportion of each type of resource, to establish a steady development of printed resources, vigorously develops the digital resources of the guiding ideology, based on the current, future, formulate scientific and reasonable library information resources construction and development policy and information resources procurement principles. To properly handle the macro and micro, our purchasing and procurement, cooperation collection value and reader demand, functions and service functions of collection, real collection and virtual collection, purchase documents and purchasing service, printed literature and electronic literature and so on various aspects, the relationship between the literature resources system under the guideline of clear in the direction of the optimization, the reasonable development. To realize library collection structure optimization, to adapt to the changing needs of readers, so as to improve the library meet rate to attract readers and information resources.

4.2 To enhance professional abilities of librarian interviewers

Library acquisition librarian is the core of the library collection construction force; its professional quality directly affects the quality of the library information resource construction. Under the condition of the limited budget, new requirements for librarian interviewers include the numerous publication products, complicated procurement methods, various ways of purchasing, and the diverse and growing number of readers and so on. The library must improve the comprehensive quality of librarians, in order to adapt to the change of various factors and still guarantee the quality of library collection resources to meet readers' needs.

1) Librarian interviewers should pay close attention to the frontiers in the field of library development at any time, to strengthen and domestic first-class university library and university library abroad exchanges and learning, learning at home and abroad advanced first-class university library development concept, the concept of management, especially in the advanced experience of the construction of literature resources, looking for the library with the domestic first-class university library, campus library of gap, with the scientific and advanced development concept to guide the library literature resources construction.

2) Librarian interviewers of university library should fully understand the school subject distribution, professional settings, the distribution of the readers, and strengthen the contact with school teachers and students of the colleges, gain insight into the different levels and different professional readers in the reading trends of the new media environment and literature demand situation. Thus when making purchasing, they can conduct a 'know fairly well and on-demand' way of ordering. This will make the literature acquisition work more targeted, systemic and scientific.

4.3 To rational allocate and steadily develop the printed resources and digital resources

In the university library should form proportion coordination between all kinds of resources, complement each other, complement each other in the organic system, form a comprehensive, coordinated and sustainable development of resource system, type, subject to a comprehensive literature carrier type of mutual coordination, the rational use of the literature purchases funds.

1) Type printing resources and digital resources coordinated development is the new media era of the inevitable choice of realizing optimal allocation of information resource in university library. Readers of university library faces have undergraduate and graduate students; teachers and management personnel, with undergraduate, person that use is the main library printed resources library must make sure the main group of basic reading requirements. In addition, in order to achieve the undergraduate course teaching evaluation, such as various types of professional certification of printed literature especially the requirement of Chinese books, the library can't blindly due to the impact of the new media development of digital information, ignore the printed resources construction. Therefore, under the new media environment, university library should handle the printing resources and digital resources coordination, in maintaining the steady development of printed resources at the same time, focus on digital resources construction, and gradually increase the proportion of digital resources in the library information resources construction, to ensure that part of the traditional reading literature needs, and to meet the demand of most digital reading of the literature.

2) While focusing on digital resources construction, library should make rational allocation for the proportion of different types of resources. For example, in order to achieve the undergraduate course teaching evaluation, all kinds of professional certification, and junior student some readers demand for Chinese books, library should ensure Chinese books a year purchases as required; For declining prices are very high and utilization of foreign periodicals and the foreign language books, can be cut gradually and to develop in the direction of digital resources, because this part of the resources of the readers are mainly senior students and teachers, most of them refer to own the resources, through the network to buy foreign paper periodicals and books more funds into the construction of electronic journals, electronic books, can improve the utilization of this portion of the resources, to avoid resource waste of relative purchase costs.

4.4 To make library collection structure diversified by making collection resources type richer

In order to meet the different levels in colleges and universities, the diversity of different status of readers' information needs, library information resource configuration is not only confined to books, periodicals, newspapers and dissertations, conference papers and other common type of literature, and should be continuously introduce more types of information resources. Especially for digital resources, with a variety of rich variety of digital resources, readers need to use a variety of media equipment more convenient to refer to all types of literature information, such as audio, video, pictures, information, science and technology, all kinds of statistical analysis data report, etc. Library should broaden the resources interview, conform to the development requirements of The Times, on the premise of guarantee the quality of interview, order a variety of types of information resources, and the reasonable allocation of various resources to buy proportion, meet all kinds of readers' information needs.

4.5 To make full use of the free resources as collection resources effectively

In using the literature purchase funds to purchase all kinds of literature resources at the same time, the library should also attach importance to free resources development and utilization, the formation and pay attention to the purchase of literature resources mutually, coexistence of complementary mechanisms. For limited budget of the library, this is a good resource complementary way. Free resources can be divided into network free resources and resources through various channels to donate.

1) Network free resources. With use value of the network free resources, university libraries can be filtered by professional disciplines, organizations, reveal and integration, introduce to the readers in the most convenient and effective way, not only to enrich the library collection resources, and also helps to improve the library service level, so as to promote the development of school teaching and scientific research.

2) Donations free resources. For years, donor resources have become an important supplement of library collection resources, donation work no matter whether the library funds shortage, donation work should not be ignored. Any library collection resources are hard to avoid there is some limited and incomplete, through donation work, the library can get a lot of valuable literature resources. Library should at the same time of strengthening the construction of normal resources, resource endowment propaganda work, through all kinds of ways to attract the school teachers and students, alumni, social people from all walks of life and group donated all kinds of useful documents for the library.

4.6 To increase the reader engagement of library information resources construction through

extensive readers interaction,

Information resources construction of university library should be to meet with the demand of the readers for the purpose, in the interview at the same time, librarians to procurement resources library should give full play to the role of the masses of teachers and students, through a variety of reader interaction, listen to their opinions and Suggestions about the construction of library information resources, make the broad masses of teachers and students actively participate in the library in the construction of literature resources. Various departments of teachers such as representative for the library resources acquisition consultant, please them to participate in the library books now mining activity and recommend all subjects are useful to the library literature resources, to carry out the questionnaire, open resources recommendation system, a reader forums, interviewed librarians to each department, fully understand the various departments subject literature demand situation of professional Settings, teachers and students and so on.

4.7 To promote the co-construction and sharing by strengthening the interlibrary cooperation,

With the rapid expansion of various literature resources, the rapid development of user requirements, any information service, including the library can't rely on their ability to meet all kinds of user information demand. Therefore, the university library should strengthen the institutions and library and information service institutions of cooperation, make full use of all kinds of co-construction and sharing mode maximum meet the demand of readers of all kinds of literature. Such as through joint procurement of digital resources, funds allocation, collaboration and other forms to save money, the purpose of the expansion of resources; Cooperation between library interlibrary loan and document delivery way to satisfy the readers for the demand of information resources in our school can't get.

4.8 To strengthen the construction of characteristic resources by highlighting the characteristic collection resources

With the rapid development of university library, the popular library service is more and more cannot satisfy the need of research and learning, college teachers and students characteristic collection resources is becoming the focus of the construction of university library. The construction of characteristic collection would have become a worldwide trend; almost all of the world famous universities have its own unique collections. The characteristic library collection is the basis of the service in library, to play a positive role in promoting subject construction of the school. University library should be based on the key discipline of the school, the backbone of the professional and high quality courses, etc., through purchase, exchange, donation, collection the characteristic resource digitalization, and collect the school related colleges and scientific research groups in the form of scientific research, excellent courseware and key collection, key construction, highlight the characteristics of library collection, and ensure the characteristic discipline the system artiness and integrity of information, promote school's subject construction, meet the needs of university readers of literature.

4.9 Torational allocation of information resources according to the reader's utilization

Libraries spend a lot of money for information resources construction, its produce benefits mainly reflects in the utilization of resources. The reader using situation of library should be based on all kinds of resources to develop information resources configuration principle. Starting from the analysis of readers' utilization, in a planned way, targeted for information resources construction, avoid the blindness of information resource configuration and informality. For the high utilization of resources can be appropriately increased purchasing proportion, the low utilization rate of resources can consider to buy or not buy less, and by way of interlibrary loan and document delivery meet the low utilization rate of this part of the resource demand of the readers. Make the limited funds to maximize efficiency.

5 Conclusions

The rapid development of new technology, new business and its implementation in university libraries is leading the reading trend of University and College readers. University libraries should always follow the era development trend, sets up the dynamic development of the construction concept. It should be based on the current, and to take into account in the future, adjust the construction goal and the key of library according to the readers' timely changing demand. Libraries should also take corresponding measures, reasonable allocation proportion of all kinds of information resources construction, optimize the collection structure, and construction of scientific and reasonable system of library, for the school education teaching and personnel training, scientific research, discipline construction, social services, and provide strong literature information guarantee cultural inheritance.

The Operating Features and Management Innovation of University Official WeChat

Li Juan, Fang Qi

Wuhan University of Technology, Wuhan, P.R. China, 430070

(E-mail: 626500943@qq.com, 708957274@qq.com)

Abstract: University official WeChat has become an important tool for disseminating information and creating positive image. The research methods of this study is computer aided content analysis. This study takes five Chinese universities official WeChat as the objects of study and investigate in their functions settings, article issued and content categories to find the operating features of universities official WeChat. Based on the operating features, the management innovations include functional positioning, satisfying the motivations of users groups, finding out users' preferences and paying attention to contents creation.

Key words: Chinese universities official WeChat; Operating features; Management innovations

1 Introduction

With the development of the Internet, new media has become an important tool for Universities propaganda. According to data released by the Ministry of Education (2016), until January 2016, among the thirty-two provincial education departments, twenty-three provincial education departments opened official Weibo and twenty-two provincial education departments opened official WeChat. Among seventy-five universities which directly under the ministry of education of the People's Republic of China, seventy-three opened official Weibo and all of them opened official WeChat. The date shows that WeChat of universities and colleges gradually arouse great attentions of administrators and become more influential.

Huang Chaofeng and Shi Zhouyan (2016) expound the development history of WeChat in China and the research status of Universities WeChat. On January 21th, 2011, Tencent Company has launched a mobile social APP called WeChat. Until now, the latest version is WeChat 6.3. Currently, a university or a college has different types of WeChat, including functional department, academy, student organization or even a class. This article takes WeChat of universities as research objects. Based on the authority of official WeChat of universities and colleges, official weibo of universities are operated by official agencies of universities, representing voices of universities.

Nowadays, there are two research teams focusing on measuring and evaluating WeChat of universities and colleges (Zhang Qiu and Yang Ling, 2014). The first one is data lab of 《Southern Weekly》, which ranks WeChat of universities and colleges and makes ranking list about them, on the basis of three indicators: communication power, growth power and activity. communication power can be connected with page views and likes of pictures and articles in WeChat accounts; growth power means link relative growth amount compared to the last statistic cycle of the same WeChat account' communications power; activity represents the frequency of items of WeChat official accounts notifications-pushing per week. Another team is *China Youth Daily*. In order to evaluate the influence of WeChat of universities and colleges, *China Youth Daily* makes the ranking list of WeChat of universities and colleges every Monday since January 2014, based on project 211a provincial universities and vocational colleges respectively.

In other countries, when it comes to the relationship between social networking and college students, researchers pay more attention on Facebook instead of WeChat, because the influence off Facebook is greater than WeChat. Severin and Taknard (2007) affirm that the uses and gratifications theory is a psychological communication perspective that focuses on how different people use the same media messages for different purposes in order to satisfy their psychological and social needs and to achieve their goals. Some researchers use gratifications theory to discuss Facebook addition among college students. For example, Koc and Gulyagic (2013) discuss the usage characteristics and provide some opinions about the functions of social networking services. Field (2009) states how to use SPSS to process data and Bharathi (2014) studies the reasons why college students use Facebook.

2 Statement of the Problem

This study determined the operating features of universities official WeChat. Specifically, this study

observes the following questions:

- 1) External manifestations. It includes the manes, the portraits and the functions introduction of universities official WeChat.
- 2) Function Settings.
- 3) The contents of universities official WeChat. It refers to the quantity, published time and content categories.

2.1 Hypothesis

- 1) There are some similarities about the function settings of universities official WeChat.
- 2) Published time of universities official WeChat are regular.
- 3) The quantity of different content categories is inconsistent.

2.2 Method

This study utilized content analysis. It is a research method to depict the contents objectively, systematically and quantitatively. Content analysis originated in the field of communication in the early 20th century. Hermeneutic content analysis, Empirical content analysis, Computer aided content analysis are all belongs to contents analysis. Considering that this study use SPSS as a tool to assist in analyzing the data, it is Computer aided content analysis.

2.3 Sampling

The WeChat ranking of Chinese universities is published by Southern Weekend Data Lab. It is counted once a week including the quantity of articles, the amount of reading, the quantity of giving a thumb up and the WCI index. Extracting ten ranking lists among the published lists from 2016 January to May and then counting the highest ranking number. The ten ranking lists were randomly-chosen. This study took the top5 as the sampling, they were Wuhan University; Zhejiang University, Xiamen University, Huazhong University of Science and Technology), Shanghai Jiaotong University.

3 Results and Discussion

3.1 The manes, portraits and functions of universities official WeChat

Table 1 Basic Information and Functions of Five Universities Official WeChat

Name	Portrait	Wechat ID	Information Services	Interaction Area	Campus Scenery	Micro Home
Wuhan University	cartoon character	luojia1893	√		√	√
Zhejiang University	school badge	zdnew99	√		√	√
Xiamen University	school badge	xmu-1921	√	√	√	
Huazhong University of Science and Technology	cartoon character	Ihuster	√		√	
Shanghai Jiaotong University	school badge	love-SJTU	√	√	√	√

The names of these five universities official WeChat are the manes of the universities. It makes the users easy to find out the WeChat. Wuhan University official WeChat and Huazhong University of Science and Technology official WeChat use cartoon characters as the portraits and the other three universities use school badges as portraits. After communicating with editorial staff, they said that using cartoon characters could increase affinity and it was also very special and using school badges were solemn.

The fiction areas are usually in bottom of the WeChat interface and the fictions of universities official WeChat can change. University official WeChat generally has three functions, they are inquiry, service and interaction (Huang Chaofeng and Shi Zhouyan 2016). The five universities official WeChat pay attention to inquiry and service. Information services aim at teachers and students. Students and teachers can check out their curriculum, book loaning information, seminar reports. On the other hand, universities official WeChat lay emphasis on campus scenery and the editorial staff said they went to show a good school image by showing great campus scenery to users. Only two universities official WeChat provide interaction area in bottom of the WeChat interface, however, users can send messages directly in the chatting interface. Micro Home refers to the systems of Universities official WeChat. In general, if users want to have further information, they need to click Information Services and the WeChat interface will show more functions, users click the information they want and they can get it.

All these operations are in the same WeChat interface. But things are different for Micro Home. Micro Home usually links to university's homepage and it can give more information than the other systems.

3.2 The content of universities official WeChat

1) the information quantity of universities official WeChat

From June 12th to June 19th, the quantity of WeChat article from Wuhan University official WeChat, Zhejiang University official WeChat, Xiamen University official WeChat, Huazhong University of Science and Technology official WeChat and Shanghai Jiaotong University official WeChat is seventy-three. Among these, the largest number is twenty-two WeChat articles which belongs to Huazhong University of Science and Technology official WeChat and the least number is seven WeChat articles which belongs to Xiamen University official WeChat.

In addition to Xiamen University official WeChat, the other four universities official WeChat publish one or more WeChat articles every day. Under normal circumstances, WeChat articles have photos and text, some universities official WeChat make innovation and publish voice instead of articles such as Huazhong University of Science and Technology official WeChat, it sometimes publishes Goodnight Voice in chatting interface.

2) Information published time

Using SPSS to analyze the published time of these seventy-three WeChat information. Morning refers to 8:00-12:00; noon refers to 12-14:00; afternoon refers to 14-18:00; evening refers to 18-22:00; night refers to 22:00-24:00. WHU is abbreviation for Wuhan University; ZJU is abbreviation for Zhejiang University; XMU is abbreviation for Xiamen University; HUST is abbreviation for Huazhong University of Science and Technology; SJTU is abbreviation for Shanghai Jiaotong University;

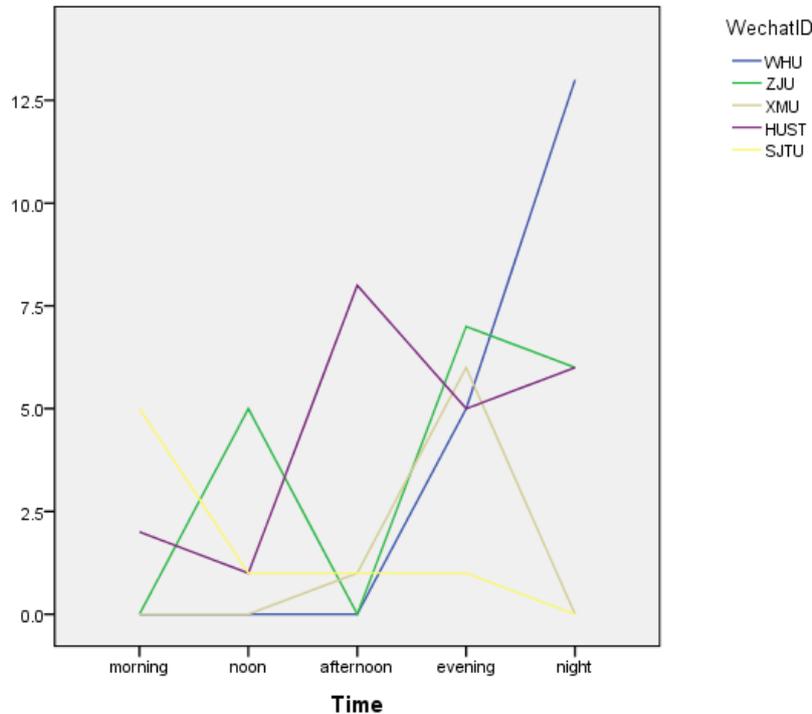

Figure 1 Universities Official WeChat Information Published Time

Figure 1 shows that the published time of these five universities official WeChat are irregular. In general, the published time concentrated in evening and night. After communicating with back-office staff, there are large amount people in WeChat operation are students, they are busy at their studies, they only have time in the noon or in the evening to edit and publish WeChat information. The publish time and publish frequency of these five universities official WeChat are different. For example, Huazhong University of Science and Technology official WeChat publishes information at different time of a day and the publish frequency also irregular. However, Wuhan University official WeChat publishes information once a day but they publish two or more articles at every turn.

3) The content of universities official WeChat information

The content of universities official WeChat information can divide to four categories, they are

announcements, typical deeds, activity promote and belles-letters. Announcements include notification, recruitment, policies, new rules. Typical deeds refer to advanced characters and advanced collectives. Activity promote attends to promote activities, seminars, study sessions and other activities inside school or outside school. Belles-letters describe campus scenery and campus history to express love to their university.

In these seventy-three samples the proportion of four contents categories are similar. However, after analyzing different universities official WeChat, figure 2 indicates that the preferences of the content categories of universities official WeChat information are different.

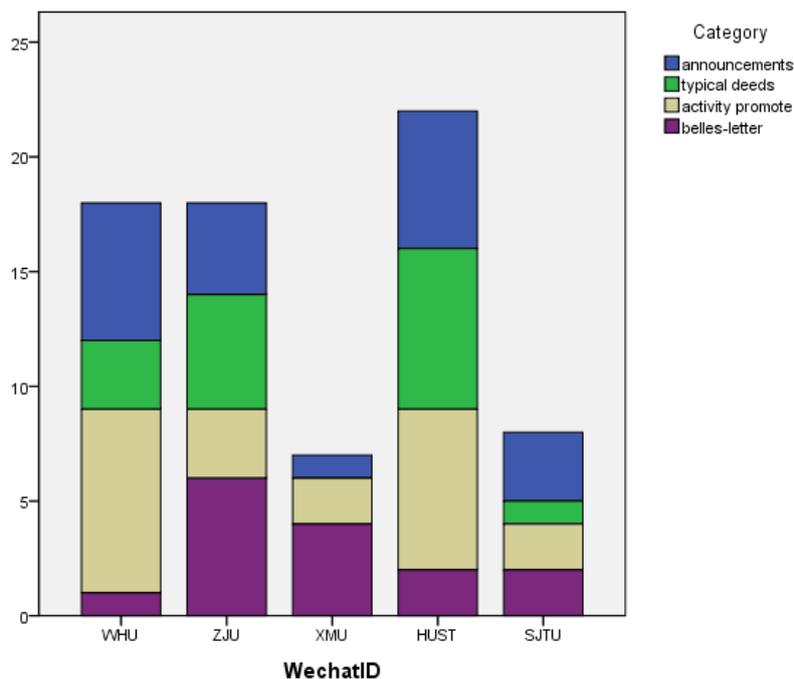

Figure 2 The Proportion of Four Contents Categories of Five Universities Official WeChat

4 Conclusions

The results of this study show that universities official WeChat need to be improved and the operation teams should make management innovation for universities official WeChat.

1) User groups and functional orientation

Universities official WeChat intend to ingratiate Internet Age. With the continuous expansion of WeChat users, students and teachers can deal with their things through universities official WeChat and the university can create a positive image as well as expand influence.

In general, the operation team of universities official WeChat is under the leadership of the University Communist Youth League. The operation team constitutes of students and teachers. Teachers are responsible for operations and students give assistance to teachers. The whole people in the operation team of universities official WeChat are not professional, as a result, it is not easy for them to operate universities official WeChat very well. The operation team should know their users' groups clearly. For universities official WeChat, the users are not only students and teachers but also students' parents, the leaders of education institution even students from other universities. The users use universities official WeChat for a specific purpose and the operation team must know their purposes and satisfied them. For teachers and students, they want to have more service from universities official WeChat such as timetable information, seminar announcement. These services make things convenient for them. For students' parents, their motivation maybe the school policies or the overall strength of the school. The operation team of universities official WeChat need to pay attention to these motivations and do more survey to find out these motivations. Then, they can adjust and improve the features of universities official WeChat to satisfy the demands of potential users.

2) User preferences and content creation

For any WeChat, content is vitality and it has a direct impact on the spread and influence. First, the

operation team should understand users' reading preferences. The most users of universities official WeChat are teachers and students, they like fragmentation reading and they don't like long articles which may wear out their patience. So it is better for the operation team to publish articles which are short and add some pictures to make them interesting. Secondly, interaction and user-centered are also very important. Finally, the staff in operation teams of universities official WeChat need to be aware of the importance of content planning to make the content attractive.

Study on MY Flexitank: Your Bulk Liquids Specialist ?

Nurfauzana Abd Aziz, Hiroshi Nakanishi

Malaysia – Japan International Institute of Technology Universiti Teknologi Malaysia, Malaysia
(E-mail: fauzana.aziz@gmail.com, h.nakanishi@utm.my)

Abstract: This paper focuses on sustainability and utilization of Flexitank in the bulk liquids industry. There are variety ways on transporting liquids in bulk quantities. For example, there are ocean tanker, ISO tanker as well as IBC and drums have been used to transport liquids in bulk. How can Flexitank beat all these tanker in forms of usage, cost saving, time consuming and flexibility? The mindset of transporter, shipper and logistic provider mostly will bias towards ocean, ISO, IBC and drums instead of Flexitank though Flexitank falls as second lowest cost in the world as bulk carrier. Can Flexitank industry sustain in the logistic and transport industries? Through studies, following results were obtained as follows. (1) Flexitank, (2) MY Flexitank and (3) bulk liquids transport.

Key words: Flexitank; Bulk liquids; Bulk liquids transport

1 Introduction

What is Flexitank? A Flexitank is a large plastic bag, fitted with a loading and discharge valve. Prior to loading, the flexi-tank bag is laid out into a box container. Unlike the tank container, which is re-used repeatedly, the Flexitank is designed for one trip. The empty contaminated bag must be disposed in an approved waste facility. Certain materials can be incinerated and others might be suitable for shredding in preparation for recycling. Currently, containers are tested and approved by issue of a safety certificate (CSC); however, Flexitank are tested independently of the container. At present, there are no regulations forcing manufactures to test the integrated package of bag and box, although trade associations have developed their own test programs. The flexi tank can accept a variety of nonhazardous liquids such as latex, wine, lubricants, additives, edible oils and many more, depending on the material with which the tanks are made [2].

The market for Flexitanks is driven by their merits of being environmentally friendly, taking the least amount of time and effort in filling and discharging and are compatible with the most number of fluids that are transported. Moreover, Flexitanks overcome many of the problems associated with ISO tank containers, IBCs or drums. Furthermore, since these tanks are used once, they vastly reduce the risk of cross-contamination. On the other hand, the major constraint faced with Flexitanks during transportation is when fully laden. The weight of the 24,000 litre bag causes the side wall of the box container to distort outwards beyond the ISO container. The side wall is designed to withstand a certain pay-load for static cargo. The flexi tank load is liquid and the laden bag effectively forms the shape of the box [2].

Cargo surge during movement and transport of the box results in potentially excessive side and end wall loads and potential instability during trucking and lifting. Also, Flexitanks are not suitable for certain fluids that are hazardous or fall under the Dangerous Goods category of the IMDG (International Maritime Dangerous Goods) Code. Environmental issues also arise during the disposal of these Flexitanks in case of single-use ones. Recently there are many manufacturers who have come up with quality plastics for use as Flexitank material which can be a driving factor for this market [2].

Flexitanks have its own Code of Practice to ensure on safety of using Flexitanks. Manufacturers and operators of Flexitanks for use in shipping containers shall meet the following requirements [1]:

Table 1 Requirements of Flexitanks for Use in Shipping Containers

No	Requirements
1	The criteria used for selecting containers to transport Flexitanks should be as detailed in Part 1 of this Code.
2	The Flexitank system shall be tested against and comply with the Flexitank Test Criteria specified in Part 2 of this Code.
3	Flexitanks shall be designed and selected in such a way as to avoid permanent negative influence on the cargo and the container. Flexitank shall be fully compatible with the cargo intended to be carried.
4	The Flexitank shall be marked with the following information (which must be visible when the righthand door of the container is opened): 5a. Unique Flexitank number. B. Manufacturer's name and / or recognised logo.

5	An A4 size Caution Label shall be applied to the container's left-hand door.
6	Insurance terms for Flexitank shipments shall be checked by the legal departments of shipping lines; but in any case there should be insurance cover for not less than US\$5 million per single incident for all parties involved in the chain.
7	Both the Flexitank shipper and operator shall have emergency plans in place. Emergency contact details of the Flexitank operator shall be clearly marked.
8	Flexitank manufacturers and / or operators shall prepare manuals for Flexitank fitting, loading and discharge.
9	Flexitank operators should comply with, as a minimum, the instructions given in the Flexitank manufacturer's manual.
10	The filling volume shall be controlled by at least one of two methods. Either: a. calibrated measuring equipment; or b. the weight of the cargo.
11	The Flexitank manufacturer and operator shall be certified to ISO 9001 (or similar Quality Assurance programme).
12	The following details are required when a Flexitank shipment booking is made: a. Cargo shall be booked as "non-hazardous bulk liquid in Flexitank". b. The Material Safety Data Sheet (MSDS) conforming to the information required in annex B. shall be provided. c. COA impact test reference number.
13	Flexitank companies shall be an Associate Member of the Container Owners Association.

The requirements stipulated in the Code of Practice basically shows that Flexitanks provider needs to perform a very high operating procedure. This is to prevent contaminating, leaking, stability so on and so forth. It is believed that, if any of Flexitanks provider failed to follow the standard it will results to the worse circumstances i.e leak on board and etc. Thus, Flexitanks provider are forced to follow all the rules, otherwise a strict action will be taken towards them.

2 Defining Excellence

Flexitank has been proven as cost saving solutions on transporting bulk liquids [3].

2.1 Save Money on Bulk Liquid Packaging

Flexitanks are an economical bulk packaging option for domestic and international shipments. Flexitanks deliver raw goods to filling destinations where unit packaging and distribution can be handled much more economically. Some companies take advantage of economic free trade zones to repackage liquids upon arrival and reduce customs charges [3].

2.2 Save Money Loading and Unloading

Loading and unloading times are reduced by up to 90%. That's because human operators unload drums. By contrast, pumps transload bulk liquids from tank cars and storage containers to and from Flexitanks. You load and unload liquids in half the time. Multiply that by the number of shipping containers you transport each year, and the cost savings really add up [3].

By using Flexitank container companies can save significantly by reducing their transportation. Compare with tank container companies would pay only one way freight of the 20 FT container. You would not need to return container and pay for this as in tank containers [6].

2.3 Transport More Liquid per Container

With Flexitanks, you can fit up to 31% more liquid inside a standard 20' container then with ISO totes or drums. Drums create dead space. You're paying for freight costs, so why not fit more liquid inside? You also reduce the number of containers on which you pay tariffs or duties [3].

2.4 Save Money on Cleaning

Flexitanks are single-use bulk packaging. There's no need for expensive cleaning and repositioning. Furthermore, the chemicals used to clean metal and plastic drums result in an annual 295 million gallons of wastewater according to the **Environmental Protection Agency** [4]. By transporting via Flexitank, you're also reducing an environmental burden. This can be an especially important consideration for companies who are "going green" [3].

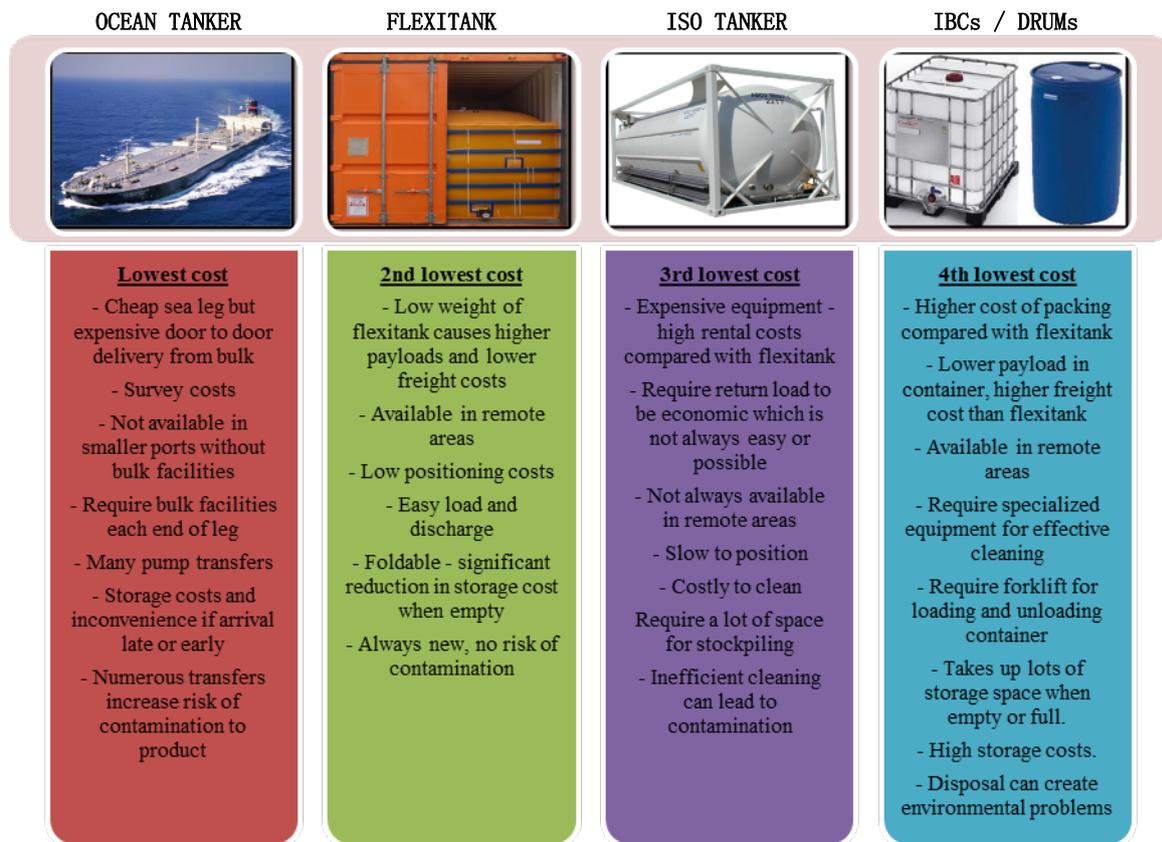

Figure 1 Comparison of all tankers
Source: Adapted from MY Flexitank website

3 Challenges

The market for Flexitanks is driven by their merits of being environmentally friendly, taking the least amount of time and effort in filling and discharging and are compatible with the most number of fluids that are transported. Moreover, Flexitanks overcome many of the problems associated with ISO tank containers, IBCs or drums. Furthermore, since these tanks are used once, they vastly reduce the risk of cross-contamination. On the other hand, the major constraint faced with Flexitanks during transportation is when fully laden. The weight of the 24,000 liter bag causes the side wall of the box container to distort outwards beyond the ISO container. The side wall is designed to withstand a certain pay-load for static cargo. The flexi tank load is liquid and the laden bag effectively forms the shape of the box [5].

Cargo surge during movement and transport of the box results in potentially excessive side and end wall loads and potential instability during trucking and lifting. Also, Flexitanks are not suitable for certain fluids that are hazardous or fall under the Dangerous Goods category of the IMDG (International Maritime Dangerous Goods) Code. Environmental issues also arise during the disposal of these Flexitanks in case of single-use ones. Recently there are many manufacturers who have come up with quality plastics for use as Flexitank material which can be a driving factor for this market [5].

Based on the number of times a Flexitank is used, they can be categorized as multi-trip or single-trip. The first Flexitanks were designed on the basis that they would be for multi-trip use. This meant that cleaning and repositioning costs were incurred. However, these costs have been eliminated with the single-trip Flexitank, the type now most commonly in use. The single-trip type now accounts for more than 95% of the global market [4].

Geographically, the Flexitank market is mainly concentrated in India, China and Malaysia as these are emerging markets followed closely by the rest of the Asia Pacific region. Europe is also seeing a surge in the demand of Flexitanks mostly in the U.K. and Germany. Canada and the U.S. dominate the demand side in the North American region. Large orders for Flexitanks has also been seen recently from

the Rest of the World, especially South Africa, Brazil and Russia [5].

Some of the key players involved in the manufacturing of Flexitanks are: Braid Logistics (UK) Ltd., Trans Ocean Ltd., Print-Packaging.Com (P) Ltd., Infinity Bulk Solutions (IBS), MY Flexitank Industries Pte Ltd, SIA Flexitanks Ltd and many more.

There may also be some challenges using the Flexitanks, such as loading and unloading facilities may not have proper set up for loading and unloading the product. Some carriers and rail companies may not accept Flexitank due to risk factors. And disposable of the bag may be a challenge as every country may have different regulations and requirements about it [6].

As you can see by using Flexitank container companies can save significantly by reducing their transportation. Compare with tank container companies would pay only one way freight of the 20 FT container. You would not need to return container and pay for this as in tank containers [6].

4 Why Flexitank (or MY Flexitank)?

Table 2 Comparison of all Flexitanks Provider

PROVIDER	YEAR INC	BENEFITS CLAIMED
Braid Logistics Malaysia	23/12/2015	Global Availability Safety – Operates using strict guidelines from govt body Environmentally Friendly Integrated Supply Chain Traceability Quality Assurance – Raw Mat used R & D
BLT Flexitank – China	Dec 2003	Simple, reliable and economical Fast loading / discharging time High space utilization Environment friendly No risk of cargo contamination Lower transport rates Low storage cost for empty tanks Covered by a factory warranty and insured
GE Flexitank Singapore	29/04/2015	High quality products and services Modern production equipment and technology High quality product R&D team Skillful staff 24 hours emergency response mechanism Systematic product tracing system
IBL Flexitank Malaysia	2003	Specifically designed for one-time-use only Environment-friendly construction – recyclable Lower weight compared to a container load Easy to dispose Simple and fast installation
MY Flexitank Malaysia	01/01/2006	More economical – next lower cost to Ocean Tanker. Food grade. One way system. Higher payloads than drums or IBCs. Readily available. Always new – no risk of contamination. Significant reduction in storage cost when empty. Quick loading / discharging compared to drums and IBCs. No need for forklift to load or unload container. Available in remote areas. Low positioning costs.
One Flexitank Malaysia	21/02/2014	Resilience Safety Stringent tests Quality assurance Contamination free Competitive pricing Designed for performance

LAF – China	2006	PP Raw Mat Safe and Reliable User-friendly Eco-environmentally Cost-effective
SAFT – China	2009	Low costs---saving freight and cleaning cost High payload---can contain 24,000 liters liquid Time and labor saving---easier to operate Environment friendly---food-grade and degradable
SIA Flexitank - Ireland	2011	Multi size 100% tested Environmentally friendly Contamination free and sterilized Custom build
Hinrich Flexitank – Malaysia	Sept 2015	Reliable Competitive Value For Money Strong and highly durable Saves transporters the substantial costs associated with returning, cleaning, and demurrage
TS-Flexitank	2000	Very low positioning cost No cleaning cost, No disposal cost Cost effective Low labour for handling, filling and loading No need for forklift to load or unload container No need for intermediate bulk storage Available in remote areas Clean and environmentally friendly No risk of contamination No demurrage on Flexitank only on container. No return loads needed

4.1 Competitive Advantage

Flexitanks falls number two as bulk liquids transporter as it was designed to be more efficient solution to offset the drawback of other existing options. From a simple comparison that highlights the benefits of the Flexitank shows out of eleven (11) providers, ten (10) have agreed that using Flexitanks is a cost saving. This confirmed that Flexitank business is relevant in the market where most palm oil and chemical players prefer to choose Flexitank as their first option. The costs of Flexitanks become lower due to many factors, i.e on raw material, usage of container and also during disposal time where other tankers cannot tolerate this.

Compared to the other Flexitank providers, MY Flexitank seems to have more advantages as they produce and manufacture their own products. This situation allows MY Flexitank to have more R&D than Flexitank traders.

5 A View from Users of MY Flexitank

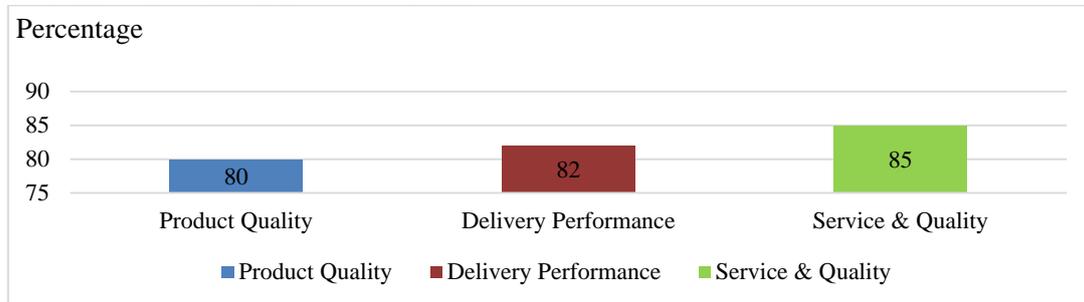

Figure 2 Customer Satisfaction Rating for 2015

There was a survey performed in 2015 to measure satisfaction of MY Flexitank’s customers. The score is between 80% and 85%, where it shows that, most of client satisfied towards quality, delivery

performance and service and quality of MY Flexitank. The customers that participated on the survey are as below:

Table 3 Customer Survey Report

No.	Customer	Product Quality	Delivery Performance	Service & Support	Total	%
1	ACCORD COMMODITIES	36	45	48	129	90%
2	ACIDCHEM	48	48	48	144	100%
3	AG-SEVEN	48	48	48	144	100%
4	ASACO	48	48	36	132	92%
5	CATT LOGISTICS CO	40	48	42	130	90%
6	CENTROTRADE COMMODITIES	36	36	36	108	75%
7	DE RIJKE	36	48	48	132	92%
8	DRIY PHI	48	48	48	144	100%
9	EDGEPONT	48	48	48	144	100%
10	INTER-SPED	48	48	48	144	100%
11	LOC NINH RUBBER CO	48	48	48	144	100%
12	MAL TECH RUBBER CO	48	45	48	141	98%
13	METALCO	36	36	36	108	75%
14	ORIENTAL RUBBER	36	36	36	108	75%
15	OMEGA	48	48	48	144	100%
16	POLYGREEN CHEMICALS	36	39	36	111	77%

21	TRANSMODE OVERSEAS	36	36	48	120	83%
22	UNIGREEN CHEMICALS	40	33	42	115	80%
23	WURFBAIN	36	36	36	108	75%
OVERALL AVERAGE					118	82%
			of total 48	of total 48	of total 48	of total 144

6 Conclusions

Based on the survey conducted, it is empirically proven that there is way for Flexitanks to grow in the logistic industry. Most of customers satisfied with the quality of Flexibags where it's at equivalent with the other tanker, i.e IBC, drums and etc. By using Flexitanks, shipper can save a lot especially on return cargo, low cost disposal method and also time consumed. Even being in the middle of competition and facing crucial price war among the Flexitanks provider, MY Flexitank still standing with their high quality product. It is understood that some clients might not really focus on low price and tolerate with the quality. Most customers chose to receive good services besides the performance and quality products. We shall focus on R&D to make the products better and to maintain good customer relation and service. By taking advice from customers, does not meant we are bowed to all the request but in positive manner, it is good for the improvement of company. Having said that, it is proven that MY Flexitank still standing with a very competitive price without compromise on the quality.

An Empirical Research on the Factors Affecting Consumer Intention of Using Online Video Platforms

Zhu Meifan¹, Li Shengting²

1 National Base of College Students' Cultural Education for All-round Development, Wuhan University of Technology, Wuhan, P. R. China, 430063

2 School of Marxism, Wuhan University of Technology, Wuhan, P. R. China, 430063
(E-mail: 975212912@qq.com, 980157305@qq.com)

Abstract: As the internet booms, the online video platform has attracted a wide range of eyeballs. This thesis is intended to focus on online video platforms and enquire into the factors affecting their consumers' intention. With Icourse online video platform as case, it applies SPSS and LISREL model to empirically study the factors affecting consumers' intention to use Online video platform in three aspects - consumer perception factor, consumer requirement factor and content factor. Hopefully, the result will be helpful for live online platforms to improve consumer satisfaction and attract more attention on their way of future further development.

Key words: Empirical research; Online video platform; Consumer intention; Factors

1 Introduction

As the internet booms, people's life is enriched. Their demand for social contacts and entertainment is also increased, which results in developments of online video platforms. Online video platforms such as Icourse, HuYa and YY have been more and more popular among people and attracted numerous users overnight. As more and more online video platforms spring out, competition becomes more intensive. To attract attention, online video platforms are supposed to learn the factors on consumers' intention, make correspondant changes to meet the tastes of customers.

At present, both Chinese and foreign researchers have obtained some achievements in studying consumer intention. Based on Technology Acceptance Model, Wei (2015) constructed a theoretical network financial behavior model to study influential factors and mechanism of consumer intention of online banking platform. They concluded that Technology Acceptance Model accounts for consumer intention in some way; risk perception and joyful perception have great effects on consumer intention. Based on TAM and in the light of features of WeChat, Tang (2015) built an influencing factors model of WeChat consumer satisfaction, taking in factors such as media richness, social presence and social influence, finding that effects of consumer perception and social influence on WeChat consumer satisfaction are remarkable. Wen (2014) comprehensively applied UTAUT theory, risk perception theory and media richness theory to construct a structural equation model on the basis of receipt factor, risk factor and content factor.

To sum up, researchers' attention is mainly focused on consumer intention and satisfaction of online financing products or social communication softwares while less has been paid to newly arising Online video platforms which are special and different, and which is why those former consumer intention models need to be improved and the study of this paper is of some theoretical significance. It is intended to enrich and extend *the Technology Acceptance Model* in the internet field to build consumer intention factor model, which will hopefully provide reference for research on online video platforms.

2 Theoretical Foundation

2.1 Technology acceptance model

Davis' Technology Acceptance Model (Davis, 1989) which absorbed nutrients from Theory of Rational Actions and Theory of planned behavior. TAM (Lee, 2009) has been widely applied in the study of information technology adoption behaviors, in which perceived usefulness and perceived easiness of use have effects on people's behaviors. Through influencing perceived usefulness and perceived easiness, External variables influence behavioral intention and then influence adoption behaviors. Online video platform is a newly arising socialized media and is an application of

information technology in the internet field to some extent, so the study will adopt the perceived usefulness and perceived easiness as consumer perception factors.

2.2 Use and satisfaction theory

As a socialized media, online video platform is characteristic of medium and information dissemination. Meanwhile, it is different from Technology Acceptance Model in that Use and Satisfaction Theory (Severin, 2001) takes audiences as research focus and explains the psychological needs of consumer intention from angle of audiences, which shows that motivation of using some media is to satisfy themselves, that is, the behavior of medium user is goal oriented. Users may fully learn their needs and then choose the appropriate media to meet their needs. Katz (1999) analyzed plentiful articles about social and psychological functions of mass media, chose dozens of demands and then divides them into five categories as follows in Table 1.

Table 1 Category of Demands for Online Video Platform

Category	Description
cognitive needs	To access to knowledge, information, and understand
emotional needs	To experience emotional, aesthetic feelings and pleasant feelings
personal integration needs	To enhance their own confidence, credibility, status and stability
social integration needs	To enhance contacts with friends and family
pressure relieving needs	To escape or transfer attention

2.3 Media richness theory

Media richness theory was firstly put forward by Daft, Lengel and Trevino (1986), in which media richness refers to the ability of a medium to spread information as well as content quality. According to the theory, those media are rich when they can overcome different knowledge backgrounds and make clear those unclear questions so that both communication sides may deal with all kinds of complicated subjective information and reach a consensus. So, the obvious richness is characteristic of abilities of fast feedback, disseminating implications, conveying personal feelings and using natural languages.

3 Research Model and Hypotheses

Based on Use and Satisfaction Theory, Technology Acceptance Model and media richness theory, the study selects consumer perception factor, consumer requirement factor and content factor as key factors of analysis. Before analyzing, here we put forward relevant hypotheses as follows.

3.1 Consumer perception factor

On the basis of variables of Technology Acceptance Model, we are going to measure the consumer perception (CP) in two dimensions-perceived usefulness and perceived easiness of use. Perceived usefulness (PU) refers to the degree to which the user thinks the online video platform may improve their utility. Perceived easiness of use (PEU) refers to the degree to which the user thinks the online video platform can be easily used. Then, here are the following hypotheses.

- Hypothesis 1(H₁): consumer perception factor for ICourse online video platform can be positively reflected by perceived usefulness.
- Hypothesis 2(H₂): consumer perception factor for ICourse online video platform can be positively reflected by perceived easiness of use.
- Hypothesis 2(H₃): consumer perception factor for ICourse online video platform is positively correlated with consumer intention.

3.2 Consumer requirement factor

On the basis of variables of Use and Satisfaction Theory and in the light of real conditions of online video platform, consumer requirement factors (CR) may be divided into 3 dimensions-social contact (SC), interaction (IN) and entertainment (EN). Though Online video platform does not have such obvious social attributes as in other social softwares, it is a gathering place for those with same hobbies where users may communicate through comment or direct messages. Interaction is mainly reflected by barrages between anchor and user or between one user and another. The barrage brings in new opportunity to allow users to the express personal views and opinions freely. Entertainment is mainly reflected by the satisfaction of spiritual needs of users. Users may relax themselves, relieve mental pressure and obtain spiritual pleasure. Then, here are the following

hypotheses:

- Hypothesis 4(H4): consumer requirement factor for ICourse online video platform can be positively reflected by social contact factor.
- Hypothesis 5(H5): consumer requirement factor for ICourse online video platform can be positively reflected by interaction factor.
- Hypothesis 6(H6): consumer requirement factor for ICourse online video platform can be positively reflected by entertainment factor.
- Hypothesis 7(H7): consumer requirement factor for ICourse online video platform is positively correlated with consumer intention.

3.3 Content factor

According to media richness theory, content factor (CF) is mainly measured in two dimensions-information content richness (ICR) and information quality richness (IQR). Information content richness refers to the degree to which online video platform can contain varieties of information in all fields. Information quality richness refers to the degree to which information provided by the online video platform is reliable. Meanwhile, content factor may influence consumer perception. Then, here are hypotheses as follows:

- Hypothesis 8(H8): content factor for ICourse online video platform can be positively reflected by information content richness.
- Hypothesis 9(H9): content factor for ICourse online video platform can be positively reflected by information quality richness.
- Hypothesis 10(H10): content factor for ICourse online video platform is positively correlated with consumer intention.
- Hypothesis 11(H11): content for ICourse online video platform is positively correlated with consumer perception.

According to the theoretical basis and hypotheses above, the study provided the model of the factors of consumers' intention in using online video platform. The model is as follows in Fig. 1.

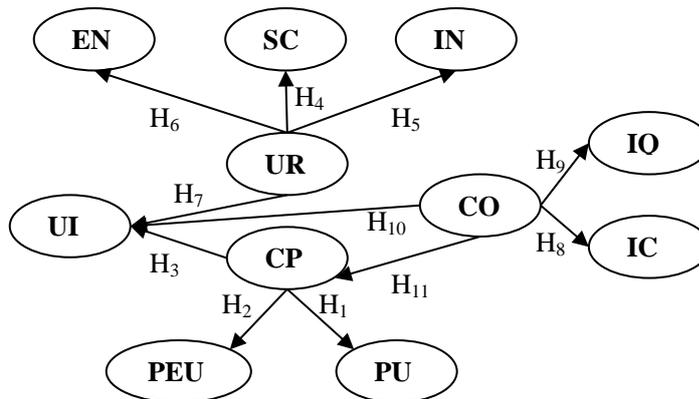

Figure 1 Model of the Influencing Factors

4 Questionnaire Design and Data Processing

Herein, we design a questionnaire for collecting data and testing the presented conceptual model. There are 11 latent variables in the model, in which consumer perception factor, consumer requirement factor and content factor are of the second order latent variables which are measured by observational variables related to the first order latent variables belonging to them. The other eight first order latent variables are measured by the relevant observational variables. The questionnaire takes Likert's 5 level questionnaire. Number 1 refers to extremely disagreement and Number 5 refers to extremely agreement.

To guarantee reliability and validity, in the questionnaire we selected mature measurement standards from domestic and foreign studies and made adjustments as necessary according to the features of online video platforms. Besides, we made necessary modifications according to interviews and experts' opinions in the process of designing the questionnaire. Finally, here are determined 24 questions in the questionnaire, among which questions about perceived usefulness

and perceived easiness of use come from articles (Wang, 2013; Vijayasathy, 2004; Zhou, 2011); questions about social contact, interaction and entertainment come from article^[12]; questions about information content richness and information quality richness come from articles (Chen, 2004; Dennis, 1998; Vickery, 2004; Trevino, 1987). All questions are listed in the Table 2. Questionnaires are filled by users from ICourse online video platform. 250 questionnaires are distributed, among which 225 effective questionnaires are recycled.

Table 2 Questions in Questionnaire

Latent variables	Questions
perceived usefulness	I think ICourse online video platform is useful.
	I think ICourse online video platform enrich my entertainment life.
perceived easiness of use	I think ICourse online video platform expand my social circle.
	I think it is easy to learn to use ICourse online video platform.
	I think ICourse online video platform is easy to operate.
	I think it is easy to masterly operate ICourse online video platform.
social contact	I will read the comments from other users.
	I will send message to who owns same hobbies with me.
	I will express my personal views and opinions freely.
interaction	I will write barrage to anchor and communicate with them.
	I will write barrage to communicate with user who watch the same live Anchors will reply to me soon.
entertainment	I think watch online live will relax me.
	I like spending time in watching live in ICourse online video platform.
information content richness	I feel happy to watch live in ICourse online video platform.
	ICourse online video platform cover a wide range of field.
	ICourse online video platform contains plentiful information.
information quality richness	ICourse online video platform meets my need of information.
	The quality of information in ICourse online video platform is high.
	Information in ICourse online video platform is realible.
consumer intention	Information in ICourse online video platform is useful to me.
	I want to watch live in ICourse online video platform .
	When it is possible to me, I will watch live in ICourse online video platform.
	I will watch live in ICourse online video platform later.

5 Data Analysis and Model Test

5.1 Test of reliability and validity

In order to test the stability and consistency of measurement results in the above questionnaire, the study takes software SPSS22.0 to do statistical analysis and use Cronbach's Alpha reliability coefficient as the measurement index. In general, when Cronbach's Alpha is greater than 0.7, the stability and consistency of questionnaire can be guaranteed. The test results can be seen in the table 3. All results are greater than 0.7, showing that the questionnaire passes the test of reliability.

Then, SPSS22.0 is used again to test validity, that is, whether the above questionnaire can reflect the research purpose through questions in the questionnaire. The study takes average extraction of variance (AVE) as measurement index. In general, when average extraction of variance is greater than 0.6, the validity of questionnaire can be guaranteed. The test results can be seen in the Table 3. All results are greater than 0.6, showing that the questionnaire passes the test of validity.

Table 3 Result of Testing Reliability and Validity

Latent variables	Cronbach's Alpha	AVE
perceived usefulness	0.828	0.744
perceived easiness of use	0.824	0.741
social contact	0.833	0.751
interaction	0.891	0.822
entertainment	0.817	0.737
information content richness	0.831	0.756
information quality richness	0.820	0.758
consumer intention	0.825	0.741

5.2 Test of model

After the test of reliability and validity, we run software LISREL to carry on structural equation analysis validation, structural equation model parameter estimation and path analysis. The output path of model can be seen in the Fig. 2. After analyzing the path relationship, we study validation for the relationship between variables in hypotheses according to path coefficient results. The results of hypotheses are as follows in Table 4. The fit of model parameter values are as follows in Table 5.

Table 4 Results of Hypotheses

Hypotheses	Path Coefficient	Results
H ₁	0.82	support
H ₂	0.84	support
H ₃	0.34	support
H ₄	0.72	support
H ₅	0.83	support
H ₆	0.77	support
H ₇	0.25	support
H ₈	0.88	support
H ₉	0.81	support
H ₁₀	0.45	support
H ₁₁	0.24	support

Table 5 Fit Results of the Model

Fit index	x2/df	RMSEA	NFI	TLI	CFI	GFI
results	1.55	0.077	0.844	0.90	0.91	0.86

6 Model Results Discussion

According to the analysis above, 11 hypotheses passed the model test.

Consumer perception factor for ICourse online video platform has a positive impact on consumer intention, and users pay great attention to it. The factor is positively reflected by perceived usefulness and perceived easiness of use, which means that if ICourse online video platform can bring conveniences to users' life and is easy to operate or learn, it will attract more consumers. That is, developers and operators of ICourse online video platform can motivate consumer intention through improving the usefulness and easiness of use. In addition, they can improve the internet technical services by expanding accommodation of users and avoiding the block of live broadcasting.

Consumer requirement factor for ICourse online video platform has a positive impact on consumer intention. The factor is positively reflected by social contact, interaction and entertainment. According to the results, the main motive of online video platform users is making a relationship with those who have the same hobbies. Meanwhile, when they have interaction with one anchor, they meet their psychological need, relax themselves, relieve their mental pressure and obtain spiritual pleasure. Thus, developers and operators of ICourse online video platform must improve the social features of online video platform and add more functions to promote communication. Meanwhile, they can also optimize the function barrage, and make it better for interaction between anchor and users. Then, they can enhance entertainment to attract more users.

Content factor for ICourse online video platform has a positive impact on consumers' intention. The factor is positively reflected by information content richness and information quality richness. And content factor has a positive impact on consumer perception factor. The result means that users focus more on the classification and field of information that online video platform can provide. A wide range of various forms of network broadcast content can attract users who have different preferences. Meanwhile, the reliability of information is also a key point. Thus, the developers and operators of ICourse online video platform can add more fields of live online broadcasting and strengthen the control of information quality.

7 Conclusions

On the basis of Use and Satisfaction Theory, Technology Acceptance Model and media richness theory, the research integrates consumer perception factor, consumer requirement factor

and content factor to build a model to enquire into the factors of using online video platforms. The results show that consumer perception factor, consumer requirement factor and content factor all have positive impacts on consumer intention. Therefore, The ICourse online video platform can motivate consumer intention through improving the usefulness and easiness of use. Or, they can improve internet technical services by expanding accommodation of users and avoiding the block of live broadcasting. Meanwhile, they can add more contents of live online broadcasting or strengthen the control of information quality.

Nevertheless, some other factors may have impacts on consumer intention, such as risk perception, value perception and social influence. Besides, the study does not have further analysis on whether the impacts are relevant with different groups of users. In later study, the size of the sample will be extended and users will be divided into different groups so that the study can provide specific advices to developers and operators of online video platform of different groups.
