PROCEEDINGS OF THE 13th
INTERNATIONAL CONFERENCE ON
INNOVATION & MANAGEMENT

November 28-30, 2016

Kuala Lumpur, Malaysia

Chief Editors

Rubiyah Yusof, Ken Kaminishi, Wang Aimin

Associate Editor

Ma Ying, Geert Duysters, Arnolde de Hoyos, Josu Takala

Editorial Board

Ahmad Rahman Songip, Aizul Nahar Harun, Akbariah Mohd Mahdzir, Alessandro Rossini, Aquatias Christine, Ard-Pieter de Man, Diego Conti, Erika Zoeller, Hiroshi Nakanishi, Hiroyuki Ishizaki, Irmtraut Mecke, John Rijpma, Jussi Kantola, Kazuhiro Fukuyo, Kazuya Inaba, Kwai-Sang Chin, Ladislau Dowbor, Mohammad Ali Tareq, Naoki Ohshima, Nguyen Huu Phuc, Rosa Alegria, Rosa Rizzi, Ruth Y. Lopez Trigo, Sun Zehou, Walter Mcmanus, Wang Yingming, Wang XianJia, Vitoria C. Dib, Wim Vanhaverbeke, Wei Jiang, Wilfred Dolfsma, Xie Kefan, Yoshiyuki Matsuura

The 13th International Conference on Innovation and Management (ICIM 2016)

Organized and Hosted by

Malaysia-Japan International Institute of Technology (MJIT), Malaysia

Yamaguchi University, Japan

Co-organized by

Wuhan University of Technology, China

Tilburg University, the Netherlands

NEF- Pontifical Catholic University of Sao Paulo, Brazil

University of Vaasa, Finland

Organizing Committee

Chairman:

Rubiyah Yusof (Universiti Teknologi Malaysia, Malaysia)

Ken Kaminishi (Yamaguchi University, Japan)

Co-Chairman:

Yoshiyuki Matsuura (Yamaguchi University, Japan)

Mohammad Ali Tareq (Universiti Teknologi Malaysia, Malaysia)

Wang Aimin (Wuhan University of Technology)

Geert Duysters (Tilburg University, the Netherlands)

Arnoldode Hoyos (NEF- Pontifical Catholic University of Sao Paulo, Brazil)

Jos Takala (University of Vaasa, Finland)

Members: (In alphabetic order)

Alessandro Marco Rosini, André Furtado, Andyara Santis, Angelo Palmisano, Antonio Vico Mañas, Aquatias Christine, Ard-Pieter de Man, Beatriz Marcos Telles, Christine Syrgiannis, Cláudio Marte, Deng Mingran, Diego Conti, Erika Zoeller Veras, Felipe Borini, Fernando Grisi, Flávia Pereira de Carvalho, Hiroyuki Ishizaki, Irma Traut Mecke, Isrami Bin Ismail, Ivanete Bellucci, John Rijpma, Jussi Kantola, Kazuhiro Fukuyo, Koiti Egoshi, Kwai-Sang Chin, Ladislau Dowbor, Lennon Jardel de Araujo, Luiz Roberto Calado, Ma Ying, Maria Cristina Amorim, Milton Campanário, Mônica Cairrão Rodrigues, Monique Greve, Naoki Ohshima, Nguyen Huu Phuc, Roberto Bernardes, Rosa Alegria, Rosa Rizzi, Ruth Y. Lopez Trigo, Sun Zehou, Tales Andreassi, Telma Teixeira, Tim de Leeuw, Tsuyoshi Koga, Vinnicius Vieira, Vitoria C. Dib, Walter Mcmanus, Wang Xianjia, Wei Jiang, Wim Vanhaverbeke, Xie Kefan, Yang Liu, Zulaika Hamdon

Executive Committee

Director:

Wang Aimin (Wuhan University of Technology, China)

Ken Kaminishi (Yamaguchi University, Japan)

Members: (In alphabetic order)

Ahmad Rahman Songip, Aizul Nahar Harun, Akbariah Mohd Mahdzir, Alessandro Marco Rosini, Antonio Vico Mañas, Diego Conti, Erika Zoeller Veras, Fernando Grisi, Geert Duysters, Hiroshi Nakanishi, Hiroyuki Ishizaki, Isrami Bin Ismail, Jiang Zhongwei, Kazuhiro Fukuyo, Kazuya Inaba, Ladislau Dowbor, Mônica Cairrão Rodrigues, Ma Ying, Naoki Ohshima, Nguyen Huu Phuc, Rosa Alegria, Rosa Rizzi, Ruth Yamada Lopez, Sun Zehou, Telma Teixeira, Tim de Leeuw, Vinnicius Vieira, Xie Kefan, Yoko Ishino, Yoshiyuki Matsuura

CONTENTS

Part 1

Organizational Innovation, Institutional Innovation and Management Integration Innovation

A Comparative Study on Personnel Recruitment and Selection in Chinese Telecom Sector: The Case of Huawei in Senegal and China Abdoulaye Ba, Sun Zehou, Huang Qing.....	1
Empirical Study on the Antecedents Predicting Organizational Innovation of the Small and Medium Enterprises in Bangladesh Luo Fan, Md. Aftab Uddin, Anupam Kumar Das	8
Measuring the Impact of Staff Governance on Enterprise R&D Output: A Comparative Study Zhong Ye.....	13
Corporate Governance from Islamic Perspective: Review and Synthesis from the Literatures Muhammad Rizky Prima Sakti, Mohamad Ali Tareq.....	18
Linking Business Strategy with Organizational Innovation Shafiq M., Tasmin R.	30
Research on the Customer Centered Marketing Evaluation, Management and Control System Wang Shihui.....	40
Challenges of Malaysian Small Medium Enterprises in Expanding into Overseas Global Market Norazman Saharum, Ahmad Rahman Songip, Mas Bambang Baroto.....	46
Employee Empowerment, Trust, and Innovative Behavior: Testing a Path Model Muhammad Anwar ul Haq, Muhammad Usman, Shaista Khalid	56
The Influence of Mixed Ownership Reform to State-Owned Enterprises' Operating Performance Li Fang, Wu Yantian, Xu Fengju	62
Analysis on Job Satisfaction and Turnover Intention of Core Staff in Micro and Small-Sized Sci-Tech Enterprises in Wuhan Wang Yan.....	67
Market Research and Suggestion of O2O Business Model to ZHOU HEIYA Li Lin, Yang Junjie, Xie Jie, Zhu Linyong, Huang Ying, Wang Tingyu	72
Study on Tunneling Behavior of Substantial Shareholder and Its Regulation Lin Bo, Yang Huijuan.....	75

Development of Analytical Framework for SME's Competitiveness Based on Competency Approach	
Krishantha Wisenthige, Cheng Guoping	79
Non-Governmental Organizations' Responses to Street Children in China: A Case Study of Kunming City	
Yu Yanping, Zhang Mingjie	84
Study on the Impact of Ownership Structure on Earning Management	
Chen Ruiying, Wu Shiyu, Shen Jun	89
A Study on the Influencing Factors of Income Disparity among the Elderly in China	
Gao Yunjiao, Shi Fengyuan	94
An Empirical Research on the Relationship Between Sports Industry and Three Industries in China	
Meng Pei, Xu Hongyi	100
A Research on the Relationship Between Corporate Culture and Management Performance Based on a Fuzzy Evaluation Model	
Xiang Fan	105
Research on the Relationship of Young Employees' Extroversion and Achievement Motivation: The Moderating Effect of Perceptions of Organizational Politics	
Zhan Bei, Lu Shaohua	111
A Study on the Interaction among Learners' Affective, Personality Variables and Their Recasting	
Jiang Yan	117
Investigations on Strategies for Products and Services of Mobile Phone Companies in Congo Brazzaville	
Ngomah Madgil Don Stenay Junior, Zhang Youtang	123
The Impact of Transformational Leadership, Organizational Learning, and Knowledge Management on Organizational Innovation	
Md. Aftab Uddin, Luo Fan, Anupam Kumar Das	134
An Empirical Research on Customer Participation and Its Impacts on Customer Value	
Yang Yiyi	139
A Research on Management Innovation of State-Owned Enterprises under the New Situation of Comprehensively Strengthening the Discipline of the Communist Party of China	
Lin kai	145
A Research on Linking Marketing Capabilities to Marketing Strategy: Implications for Firm Performance	
Alharbi Adel Saleh M, Wang Aimin, Bojan Obrenovic, Begzod Nishanov	149
A Review of Enterprise Top Management Team and Organizational Innovation	
Gui Ping, Wen Feng, Zhong Yanyan	153

The Interpretation and Orientation of Inducing the Enterprise Institution Innovation: Based on the Vision of Emergency Governance	
Zhao Meilin, Yang Yingjia	162
Strategic Research on Auto Racing Industry in China	
Wan Wei, Xu Liting, Hao Yukai	167
Theorizing a Boundary Condition of the Relationship Between Human Resource Management Practices and Turnover Intention: A Proposed Model	
Kabiru Maitama Kura	172
Research on the Upgrading Path of Government Management Mechanism Through Public Participation in Network Environment	
Yang Aijie, Yu Jiejie	177
Performance Measurement in Halal Industry: An Initial Proposed Concept Based on Maqasid Shariah	
Faried Kurnia Rahman, M. Ali Tareq, Akbariah Mahdzir	183
Measuring the Impact of Business Strategy in Management of Change: A Study on Causes of Psychological Contract Violation	
Catherine Muthu	189
Preliminary Safety Climate: A Case at Pulp and Paper Industry in East Coast Malaysia	
Ahmad S. , Roslina M. , Hayati @ Habibah Abdul Talib	195
Roots of Diversity in the Academics Institutions: How HR Manager Can Encounter the Challenges of Workplace Diversity	
Abdul Ghafar Khan, Xu Hongyi	200
Research on Steering Governance of Governments	
Xu Chan	205
A Study and Practice of Art Based on Nanotechnology	
Su Kui, Wang Rui, Luo Wei, Zhang Juwen	209
Perceived Organizational Politics and Employee Turnover Intention: A Longitudinal Study in Nigeria	
Ramatu Abdulkareem Abubakar, Ahmed Ibrahim Abdullahi	215

Part 2

University-Industry Cooperation and Strategic Alliances

Skilling Entrepreneurs on Innovations: A Key for Improving Competitiveness of Leather Products and Footwear Industry of Sri Lanka	
P.P. Ajith Kusum, Song Yinghua	220

Strategic Evaluation of Key Factors Defining Tourism Destination Competitiveness: A Comparison Study Between Singapore and Sri Lanka	
M. Prasad F. Jayasuriya, Cheng Guoping	233
Radiation Effect of Independent Innovation Demonstration Area: A Case Study of East Lake Demonstration Area	
Zhang Shuai, Xie Kefan	242
Research on the Evolution Path of Innovation and Development in East Lake Demonstration Zone	
Wang Wei, Xie Kefan, Peng Hutao	247
Empirical Research on the Efficiency of Industrial Enterprises S&T Resources in Yangtze River Economic Belt	
Zou Wei, Song Weiwei, Chen Mengxue	251
The Impact of Technology Trust and Technology Anxiety on Customer Satisfaction with Self-Service Technologies	
Wang Aimin, Zapan Barua, Md. Aftab Uddin	258
Combined Economic and Social Impact Assessment of Affordable Housing Investments	
Susanna Kunttu, Minna Rääkkönen, Teuvo Uusitalo, Teppo Forss, Josu Takala, Sara Tilabi	264
Bottom up Direction on Kaizen: Production Innovation Activity for Shop Floor Engagement and Development	
Kamal S. K, Hiroshi Nakanishi	270
Measuring Tourist Satisfaction at Taman Negara Pahang: A Preliminary Study	
Chew S.S., Goh H.C., Rosilawati Z., Phang Y. N.	279
The Impact of Contemporary Innovation Management Trends Towards the Organization of IT Projects	
Tasha Ibrahim, Chandana Gamage	285
Manufacturing Industrial Agglomeration, Technological Innovation and Regional Differences	
Yuan Hua, Li Ruoxi, Zhao Hongzhong	295
Analysis of Stakeholders in the Emergency Industry Based on Game Theory	
Fan Sha, Ma Ying, Wang Lijuan	299
The Determinants of Technological Innovation Adoption in SMEs Manufacturing in Malaysia	
Noni Ngisau, Nurhani Aba Ibrahim	304
Study on the Applied and Innovative Personnel Training System of Universities in the New Industrial Revolution Background: A Case Study of the Automobile Engineering Specialty	
Dong Nengdan, Yan Shu	314

Research of the International Market Power of China Textile and Apparel in USA Market	
Zhou Hao, He Boyuan	320
Dynamic Mechanism of Independent Innovation of Biological Industrial Cluster and Its Empirical Study	
Wu Na	325
Country Characteristics and Csr Disclosure in Islamic Banks	
Rochania Ayu Yunanda, Mohammed Ali Tareq, Akbariah Binti Mahdzir	330
Critical Success Factors of Food and Beverages Manufacturing Small and Medium-Sized Enterprises: A Case Study Approach	
Lee Chun Hui, Yee Choy Leong	337
Research on the Development Status of Emergency Industry in China	
Wang Lijuan, Gao Weiyi, Fan Sha	352
Consumer-Participating Mode of Experience Marketing for Agricultural Products	
Chen Junying, Qu Dong, Cheng Yanxia	356
Inspiration of Geely Automobile's Popularity on Overseas Market to Chinese Manufacturing Enterprises: From the Perspective of Quality Innovation	
Xiang Caihong, Zhang Junhao	361
Research on the Biological Components and Evolution of the Innovation Ecological Environment of Cultural Industry	
Liu Bingfeng, Yan Ningning	365
Analysis of Regional Economic Growth and Motivation in Guangdong Province Based on TFP	
Yang Shuxia, Chen Kangsheng, Hu Yan	370
Detecting Hot Issues on Sports Management Research from Common Keywords in Literature	
Tian Huayun	376
Present Situation and Countermeasures of Universities' Technology Innovation in China	
Li Lvcheng, Cheng Guoping	382
Analysis on Coordinated Development of Sports Tourism Resources in Western Hubei	
Liu Mingming	387
Empirical Research on Quality of Hubei Province Urbanization	
Xu Peng, She Wenhao	391
Research on Strategy Selection for the Development of "To Exercise" APP in Universities of Hubei Province	
Liu Yixiang, Gu Jin	395

Part 3

Product Innovation, Technological Innovation, Industrial Innovation and Regional Innovation

The Carbon Emission Dilemma: Solutions May Come from Market or Behavioural Change? Luciano Ferreira da Silva, Arnaldo Jose de Hoyos Guevara, Karina Ribeiro Fernandes, Paulo Sergio Gonçalves de Oliveira	408
How to Extract the Primary Factors for the Local Economic Development Through the Education Systems Re-Design by Text Mining Kenji Kido, Hiroshi Mitsumaru, Masakazu Takahashi.....	408
Impact of Perceived Organizational Support on Organizational Citizenship Behavior Towards Environment: The Mediating Role of Affective Commitment in the Context of Sri Lanka and Pakistan H.P. Rasika Priyankara, Luo Fan, Amer Saeed	414
Research on the Stability of Cultural and Creative Industries Ecological Environment Yan Ningning	420
The Analysis on Importance of Sustainable Appropriation of the Company's Intangible Assets Liu Guolong, Hu Sihong	425
Importance and Evolution of Productive Transformation with Sustainable Innovation at the Ibero-American Countries Arnaldo Jose de Hoyos Guevara, Leda Honorato da Silva Reis.....	429
Analysis on Coordination Function of Intellectual Property Rights in Networking Firm Organizations Open Innovation Ma Yaokun, Li Ming	437
Water Governance: The Future of Grow with Food and Water João Almeida Santos, Maria Cristina Sanches Amorim, Arnaldo Jose de Hoyos Guevara	445
Measurement on Coordination Degree Between Migrants' Population Development and Resource and Environment of Three Gorges Reservoir Area: An Empirical Study Based on Hubei Reservoir Area Zhang Junhao, Xiang Caihong	452
Biodiversity at the Ibero-American Countries: An Overview about the Natural and Social Aspects Arnaldo Jose de Hoyos Guevara, Fábía de Mattos Spadoto, Marcos Ferreira, Tatiana Almendra Dutra.....	457
A Research on Urban Households Potted Greening Product-Service System Design Lu Jiangyan, Hu Chengyi, Zhang Yuanke.....	464

Analysis on the Performance of Innovation Environment Construction in Donghu Innovation Demonstration Zone Based on AHP	
Hao Jiahui, He Qi, Zhou Chaoyang, Xie Kefan	470
Research on the Management and Development of Canada's Arctic Fisheries Resources	
Ye Jing	474
Influence of Environmental Sustainability in Management and Competitiveness Business and Employability-Perceptions of Brazilian Managers	
Nilson Gonçalves Pereira Baptista, Livia Maria Costa Madureira, Arnoldo Jose de Hoyos Guevara	479
Research on the Correlation Between Ecological Vision Library and Innovation in Science and Technology	
Zhang Ziyue	487
Essence of Growing Health Food Markets in Asian Countries	
Hideyuki Aoki, Yoko Ishino	491
Research on the Environmental Publicity and Public Spirit Cultivation	
Jia Minwei, Wang Min	497
Study on the Integrated Care System for the Rural Elderly in the View of Sustainable Development	
Hu Shiyong, Chen Mingwei	502
An Evolution Model Applied to Ecological Building Materials Industry	
Xu Xiaoxiao, Wei Long	509
Predicting Continuance Intention of Mobile Government: Conceptualizing the Roles of Post-Acceptance Beliefs	
Farhi Razali, Marini Nurbanum Mohamad, Ramayah Thurasamy	514
Study on Sustainability in Higher Education	
Nurfauzana Abd Aziz, Hiroshi Nakanishi	520
A Qualitative Investigation of Sustainable Sourcing Practices in the Nigerian Shea Butter Industry: A Case Study of a Top-Tier Supplier	
Sidikat Shitu, Ashemi Baba Ali	525
The Dilemma and Countermeasures on Development of Circular Economy in Iron and Steel Industry in China	
Yin Zhiping	531
Health and Environment Ranking: A Study of the Countries at the Ibero-American Region and Its Challenges ahead	
Cristina M. Alcântara de Brito Vieitez, Arnoldo Jose de Hoyos Guevara	537

Part 4

Environmental Innovation and Sustainable Development

Engineers as Entrepreneurs: A Dual Role for Successful In-House Entrepreneurial Orientation and Talent Retention	544
Idris Osman, Fauziah Noordin, Normala Daud.....	
Temporal-Spatial Evolution Characteristics and Its Causes of Innovation Output in Yangtze River Economic Belt	554
Yang Lei, Zhang Lingyan, Wu Yonghang, Tang Gennian	
The Impact of Social Norm on Total Early Stage Entrepreneurial Activity Rate, Evidence from Malaysia GEM Data by Using Big Data Technologies	562
Hassan Keshavarz, Akbariah Mohd Mahdzir, Naoki Ohshima	
The Co-Innovation Alliance Scan, Tool for Effective Collaboration with External Partners	570
Frans Stel	
A Research on Scientific and Educational Integration Mode for Innovative Talents Training in Marketing Major of University	576
Ma Ying, Hu Jingjing	
Study on the Focus Strategy of Small to Medium Enterprise & Start-up Companies in the Semiconductor Manufacturing Industry Case Study of Minimal Fab	582
Kenji Miyake, Ken Kaminishi	
Management of Future Generation Needs Through Sustainable Development Law and Environmental Ethics	591
Mohd Haris Abdul Rani	
Research on the Modes of Hubei University Innovation Teams Serving for the Innovative Hubei Construction Project	600
Chen Yun, Li Bing, Zhou Jiang	
Game Analysis of Mode Selection about the Industry-University-Research Collaborative Innovation	608
Li Li	
Open Innovation Approach in the Development of Malaysia Higher Education Blueprint	613
Abu Bakar Ngah, Ahmad Rahman Songip	
A Survey on the Contributions of Rational Redeployment of Higher Learning Institutions in the Vast Chinese Countryside to the All-around Healthy Development in China	620
Ke Meishu	

Issues and Challenges of Entrepreneurship Education in Malaysia Hartini Mohamed, Akbariah Mohd Mahdzir.....	625
Enhancing Cooperative Learning in Learning Community: From the Perspective of Knowledge Management Wu Fei	632
An Evolutionary Game Analysis of Higher Vocational Colleges' Industry-Education-Research Cooperation Based on the Triple Helix Model Zhang Ying, Zhu Xinmin, Qiu Yinggui	637
A Study of Opportunities in the College Students Affairs from the Perspective of Industry-University-Research Collaborative Innovation Zhang Qin	643

Part 5

Systems Engineering, Financial Engineering and Industrial Engineering

Challenges and Innovations in Household E-Waste Management in Malaysia: A Comparative Review Zaipul Anwar Zainu, Wan Md Syukri Wan Mohamad Ali, Ahmad Rahman Songip	649
Evaluation of PLM Technology Components Requirements: A Case Study in Automotive Components Manufacturing Company Mee Yee Kow, Teck Loon Lim, Akbariah Mahdzir, Nooh Abu Bakar.....	655
Developing a Method to Evaluate the Performance of Affordable Housing Project Teppo Forss , Rayko Toshev, Josu Takala, Sara Tilabi, Anne Mari Vatunen, Magdalena Mađra Sawicka, Liu Jieming, Susanna Kunttu, Minna Rääkkönen	662
Open Data Innovation: Business Models, Taxonomies and Challenges: Insights from Existing Literature and Research Agenda Wu Tong, Akbariah Mohd Mahdzir	668
The Effectiveness of Hard Skill Training Programs in Manufacturing Industry of Malaysia Chong Tong Leong, Ahmad Rahman Songip, Yip Mum Wai	674
A Discuss on Symbiotic Development of Financial Industry and Manufacturing Industry in Wuhan Wang Zhenqiong	679
Exploring the Shunt Capacity of Transshipment Port in front of the Three Gorges Dam Based on Arena Simulation Liu Qing , Chen Yanqing, Wang Haiyan, Zhang Yajie, Zhang Wei	684

Research on the Evaluation Method of Logistics Service Innovation Based on the Perspective of Logistics Cost	
Zhang Jianming	689
A Critical Review of Cultural Approach to the Brand	
Mahmoud Akbarieh Yazdi, Cheng Yanxia	694
How Information Technology Reduce the Transaction Costs in Retail Industry: Taking Walmart as an Example	
Peng Zhiping, Sun Zehou	698
Consumer Acceptance of SMS Marketing: Evidence from Tanzania University Students	
Salimu Abushiri Jinyevu, Cheng Yanxia	703
Analysis of Online Customer Behavior in Social Commerce: Case Study of Consumers in Jakarta, Indonesia	
Evelyn Pertiwi, Liu Pingfeng, Nie Guihua	708
Rescue Instruction System Design Considering Location Monitoring Based on RFID Technology	
Yu Kan, Lv Wei, Fang Danhui	714
An Empirical Study of Regional Differences of Express Logistics Services Capabilities	
Zhang Yinxia, Liu Mingfei, Chen Bingxue	721
Analysis and Suggestion of Factors Restricting the International Competitiveness of China's Publishing Industry	
Wang Zhaoguo	726
Research on Equity Concentration Influence to Operation Performance in Textile Industry Listed Companies	
Hou Yuwei	731
The Relationship among the Service Recovery, Self-Esteem and Satisfaction after Service Recovery in Online Shopping Environment	
Sun Wei	735
Manufacturing Management Innovation Based on Informational Software Selection	
Xiong Xin, Li Yuni, Li Zhijie, Cheng Tianqi, Wang Yu	741
The Influence of Omni-Channel Retailing on Indonesian SMEs Online and Offline Business Operations	
Evelyn Pertiwi, Nie Guihua, Liu Pingfeng	746
Research on Marketing Strategy Innovation of Health & Medical APP under the Background of the Mobile Internet	
Li Yanqiu, Feng Jun	753
Frustration Towards Franchisee Community Decrease Commitment within Franchisor in Malaysia	
Norazman Saharum, Ahmad Rahman Songip, Mas Bambang Baroto	758

Globalization and Green Supply Chain Management: Role of Multinational Companies in Pakistan: An Institutional Theory Perspective	
Amer Saeed, Yun Jun, H.P. Rasika Priyankara	764
Modeling the Optimization of Vehicles Allocation for Synergistic Operation of Multiple Freight Transportation	
Li Ping, Yang Jiaqi, Zhang Qingnian, Zhang Wenfen	770
A Study on Evaluation of Monitor and Line Monitor's Management Training Effect Based on the Theories of Six Sigma Management	
Xiao Jie	775
Cyberspace and the Identity Matter	
Shabnam Dadparvar, Shen Laijin	782
The Drawback Regime in Brazilian Exports	
Marcela Saga, Fabiana Cazarin, Claudia Yoshimura, Arnoldo Jose de Hoyos Guevara, Alessandro Marco Rosini	791
Comparing and Identifying the Similarities and Differences of Global Project Management Philosophies	
Chew Chu Yao, Low Foon Siang, Chong Heap Yih	799
Autonomy and Creativity of Home-Based Professional Teleworkers: The Mediation Role of Intrinsic Motivation	
N.P.G.S.I. Naotunna, Iris Zhou	805
Study on Management Model Innovation of Huge Petrochemical Engineering Building Project	
Su Hua	809
Impact of Personal Innovativeness of Information Technology on Intention to Use Social Networking Sites	
T.R.Wijesundara, Sun Xixiang	818
Simulation Research of Regional Logistics and Economic Development of Wuhan Based on System Dynamics	
Liu Xiaoping	825

Part 6

Operation Innovation and Modern Manufacturing Innovation

Man-Hour Comparison Between Two Methods of Agile and Waterfall in IT System Development	
Shinobu Komai, Hamdani Saidi, Hiroshi Nakanishi	829
Ranking Critical Success Factors for Sustaining Total Quality Management Implementation in Sudan	
Sharaf Eldin Hamed Ahmed, Sha'ri Mohd. Yusof	837

The Evaluation of Investment Decision Making with Knowledge & Technology Rankings and the Sand Cone Model	
Josu Takala, Patrick Zucchetti, Hosein Daneshpour, Susanna Kunttu, Tero Välisalo, Janne Pirttimäki, Pirkko Kiiski	846
Cost Efficiency and Its Determinants in the Eight Islamic Public Banks in Indonesia	
Shinta Amalina Hazrati Havidz, Ye Jianmu, Chandra Setiawan	851
Decision Support Capabilities of Enterprise’s Management Information Systems: An Empirical Study	
Ahmed Abdulatef Mashli Aina, Wang Hu, Al-Nakib Noofal Ahmed Mohsen Mohammed	856
The Impact of Capital Expenditure on Corporate Earnings in Developing Financial Markets	
Tahir Akhtar, Mohammad Ali Tareq, Muhammad Rizky Prima Sakti	861
Impact of Exchange Rate, Relative Per Capita Income and Relative GDP on China-Pakistan Bilateral Trade	
Najaf Iqbal, Xu Fengju	867
Effects of Leone Exchange Rate Fluctuation on Sierra Leone’s Foreign Trade	
Sesay Brima, Zhao Yulin	873
Comparative Research on the Impact of Transformational Leadership on Banking Project Success in China and Ghana	
Saviour Ayertey Nubuor, Xu Hongyi	878
An Empirical Study of Financial Sustainable Growth Models in O-Film	
Yan Wensheng, Fang Ruyang	886
Research on the Optimization of the Combination Efficiency of Technology and Finance in Wuhan	
Liu Yuanlin, Yang Min, Guo Xinxu, Wei Zhihua	890
Key Success Factors of Commercialization of Ocean Thermal Energy Conversion Product in Malaysia	
Zakaria Bin Yasin	895
The Impact of Audit Quality and Earnings Management Conceptual Review	
Mohammad Reza Hosseini, Mohammad Ali Tareq	901
Study on the Development Approaches of Supply Chain Finance of Commercial Bank Based on Internet Plus	
Yu Haijing, Kang Canhua	907
Drivers of Bank Profitability: A Case of Commercial Banks in Morocco	
Amroui Mouna, Ye Jianmu	913
Innovative Design of “Win-Win” Model of Supply Chain Finance Based on Bank-Enterprise Dynamic Game	
Li Shihua	919

Enterprise Knowledge Collaboration for Decision Making Based on Cloud Big Data Using HDFS	
Riasat Azim, Shawon Barua, Jesmin Rahman, A.B.M Munibur Rahman	923
Evaluation Index System of Civil Air Traffic Management Service Satisfaction in China	
Wu Qian, Zhao Xiao, Hao Yanan, Tian Hanmei	927
Impact of Firm-Bank Relationship on Dividend Policy of the Client Firm: A Study from Pakistan	
Fahad Javed, Jahanzaib Sultan, Chen Xiaofeng	932
Dark Side of Leadership Impact on Project Failure: Towards a Model	
Hussein Ghaleb Abdo Saleh, Wang Hu	936
Performance Analysis of Microfinance Institutions in TOGO	
Abdel-Menaf Ibrahim, Ye Jianmu	940
Military Expenditure and Stock Market Capitalization: Evidence from an Emerging Market	
Assad Ullah, Yang Qingxiang, Zahid Ali, Nadia Hidayat	949
The Role of Islamic Micro-Finance in Enhancing the Wellbeing of the Clients: Exploratory Factor Analysis	
Usman, A. S., Tasmin, R., Ulum, Z. K. A. B., A. A. Abubakar	957
Feasibility Study of the Methods of Hydrogen Distribution from Ocean Thermal Energy Conversion Power Plant: An Initial Proposed OTEC-Hydrogen Logistics Roadmap	
Chanakan Kaeochuen, Akbariah Mahdzir	966
Colleges Media Effects System in the Era of Big Data	
Xu Yang, Huang Linglin	970
An Empirical Research on the Effect of Emotion on Consumers' Repurchase Intention under the Service Recovery Situation	
Liu Mingfei, Sun Qian	977
Financial Inclusion in Rwanda: An Overview	
Bigirimana Moïse, Xu Hongyi	983
Exploration of Big Data Application in University Funding Work	
Yang Zhijie, Xu Xiaobo, Chen Aolan	989
Research on Value Evaluation Method of Electronic Commerce Enterprise Based on EVA	
Wu Min, Shen Jun	994
Analysis of the Influencing Factors and Countermeasures of the Management of Scientific Research Funds in Colleges and Universities	
Wang Yan	999
Selection Criteria of Software Packages for Projects Accounting	
Victoria Lucas Mkonya	1005

Research on Influence Factors of Financing Choice of Small and Medium-Sized Enterprises in China	
Xing Wenjia	1011
Predictors of Acceptance of Electric Cars in Malaysia: Moderating Effects of Driving Experience and Voluntariness of Use	
Hamed Khazaei	1015
Implication of Natural Language Comprehension on Machine Intelligence: A Perspective of Neural Network Mechanism of Intelligence Emergence	
Xu Xuetao	1020
The Effect of Internal Control Information Disclosure on the Value Relevance of Accounting Information: An Empirical Study of Chinese Listed Companies in Warehousing Logistics Industry	
Xu Xuanxuan	1025

Part 7

Risk Management and Innovation

The Linkage of Potential Hazards with Safety Impact: A View from Floating Storage Facility in Malaysia	
Tasmin R., Salehuddin M. F.	1030
Key Indicators to Build Country Resilience	
Valeria Regina Bertonecelo, Arnoldo Jose de Hoyos Guevara	1038
Antecedents of Perceived Risk and Their Influence on Satisfaction and Behavioral Intention toward Self-Service Technologies	
Zapan Barua, Wang Aimin, Sharmin Akter	1043
A Study of Politeness Strategies in Corporate Statements in Crisis Public Relations	
Xie Ruiting	1049
Research on Strategic Risk Assessment Based on Rough Set Approach	
A.B.M. Munibur Rahman, Zhang Youtang, Riasat Azim, Mohammad Abdullah Mahfuz	1053
Research on Early Warning Paradigm for Crowd Stampeding Risk in Public Places	
Zhu Hong, Zhu Zhenjiang, Liu Shangnan, Zhang Hao	1059
Research on Listed Risk of Start-ups on the NEEQ Based on the Hall Three-Dimensional System	
Sun Jihang, Gao Weiyi	1064
The Research of Trust Crisis and Firm Performance Risk: The Mediating Role of Internal Conflict	
Wang Xi	1069

Study on the Regulation Model of Consumer Food Safety Risk Perception Based on Social Media	
Ma Ying, Xie Yingying, Fan Sha, Hu Jingjing	1074
The Correlation Analysis about Impact of Government Subsidies and Enterprises Growth on Credit Default Risk	
Qi Jiarong	1079
Research on the Risk Responding Mechanism of Network Public Opinion in the Era of Big Data	
Zhang Wuqiao	1084
Research on Risk Conduction Identification of Enterprise Financial System	
Deng Xun, Deng Mingran	1090
Research on Engineering Risks Aversion from the Perspective of Engineering Ethics	
Yin Ziwei	1096
Research on the Radar Transfer Path of Supply Chain Risk	
Qiu Yinggui, Yang Liuqing	1100
Research on Food Safety Supervision Mode Based on the Theory of Governance	
Hu Jingjing, Ma Ying, Xie Yingying	1104
Owner-Managers and Risk Perception: Empirical Evidence from Cameroonian Small and Medium Enterprises	
Mbiki Mamai, Du Lijing	1109
Analysis on the Innovation of Modern Logistics Risk Prevention	
Chen Lingling, Zhao Guanghui	1115
The Logical Evolution from Management to Governance of Public Security in China	
Chen Rui	1119
Research on Institutional Innovation of Engineering Ethics Risk Control	
Li Lian, Wang Chuxiao	1126
Mitigating Real Estate Development Risk from Real Option Angle	
Cai Qianfen, Wang Junwu	1131
Research on the Formation Mechanism of Food Safety Risks from the Perspective of Food Chain and Game Theory	
Song Yinghua, Wu Zongyan, Lv Wei, Yu Kan	1135
Empirical Research on a Fuzzy Comprehensive Evaluation of a Highway Emergency Support Capability	
Zhu Jiangbin, Zeng Zihan, Yang Zhen	1141
Construction of the Personnel Management Informatization at the Era of “Internet+”	
Feng Chengjin	1152
A Research on Risk Management of Agent Construction System of Engineering Project	
Li Gang	1157

Study on Social Media Coverage and Management Mechanism in Emergency Events: Case Study of Weibo Coverage on the Wuhan July 6 th Torrential Rainfall	
Yang Mengxi·····	1164

Part 8

Technological Economy, S&T Policy, Intellectual Property and Knowledge Management

Upgrading the Platform of Making Regulation and Technical Standard in Emerging Medical Technology

A Comparative Study on Personnel Recruitment and Selection in Chinese Telecom Sector: The Case of Huawei in Senegal and China

Abdoulaye Ba, Sun Zehou, Huang Qing

School of Management, Wuhan University of Technology, Wuhan, P.R. China, 430070

(E-mail: abdoulayeba125@yahoo.fr, szh-63@163.com, Qinghuang99@163.com)

Abstract: Nowadays personnel recruitment and selection comes with challenges that human resource department must grapple with. Thus, better recruitment and selection strategies result in improved organizational performance. To this end, this paper puts a light on Huawei's recruitment and selection processes in Senegal and China. The main objective is to identify general practices that Huawei uses to recruit and select employees in Senegal and China; therefore, spot out the main problems and challenges that it faces during the process of recruitment and selection, and finally analyze the efficiency of recruitment and selection practices at Huawei. The methodology applied is both quantitative and qualitative. Out of a sample of 100 questionnaires, 80 responses were collected from the different Human resource personnel at Huawei in China and Senegal. The nature of data is both primary and secondary. The findings have shown that, first of all, Huawei uses different recruitment channels in Senegal and China. Also, they indicate that both in Senegal and China, in order to get the required talent, Huawei adopts different processes in recruitment and selection. In addition, Huawei Company uses internal and external sources in its recruitment processes in both countries. Finally, the results regard the lack of qualified and appropriate employees for positions, long recruitment process and working conditions as a big barrier to an effective recruitment.

Key words: Recruitment; Selection; Challenges; Human resource; Effectiveness

1 Introduction

Within today's challenging business environment, Human resource management, also known as human capital management plays a vital role in organizations irrespective of their origin, size, structure and sector. In fact, recruitment and selection is becoming top of the agenda for numerous companies throughout the world. The organization leaders and human resource managers spend considerable time and energy to recruit talent who fit well into their organizational culture. Nonetheless, many enterprises have not come to recognize the importance of recruitment and selection until now. Recruitment is very crucial and important for any organization because it's very necessary for an organization to select a right person for right job. The employees of the organizations directly affect on the performance of the organization and its important decision like to select right person for right job on right time. Nowadays, very few researches have been made on the issue of Personnel Recruitment and Selection practices at Huawei Technologies with the focus on the Senegalese and Chinese context. This topic has raised the researcher's interest because, as stated above, the emphasis is laid on the Chinese multinational telecom manufacturer, Huawei Technologies, which also operates in Senegal. Therefore, there exists unavoidable problems in the framework of personnel recruitment and selection practices both in China and Senegal. Yet, different issues and problem of recruitment are identified like; environmental influence like; technology, social, economic demand, political, recruitment timing, delays in recruitment, methods or sources of recruitment, lack of independencies, increasing pressure from the applicant, sources of recruitment...etc. Finally, this research will give insights on the effectiveness and eventually the shortcoming of the of Huawei's recruitment and selection practices with all its challenges both in Senegal and China.

2 Literature Review

As James A. Breugh and Mary Starke (2000) put forward: "Over the last thirty years, the amount of research on recruitment topics has increased dramatically.... etc. In order for future studies to result in a better understanding of the recruitment process, such studies need to be designed with an appreciation of the complexity of the recruitment process (i.e., the number of variables involved and the nature of their relationships). In this regard, we offer an organizing framework of the recruitment process".

2.1 Recruitment: definitions, strategies and processes

Recruitment is described as "those practices and activities carried on by the organization with the

primary purpose of identifying and attracting potential employees” (Barber, 1998). In other words, the recruitment process provides the organization with a pool of potentially qualified job candidates from which judicious selection can be made to fill vacancies. Successful recruitment begins with proper employment planning and forecasting.

Bratton and Gold (2007) differentiate the two terms while establishing a clear link between them in the following way: ‘Recruitment is the process of generating a pool of capable people to apply for employment to an organization. Selection is the process by which managers and others use specific instruments to choose from a pool of applicants a person or persons more likely to succeed in the job(s), given management goals and legal requirements.’ In addition to that, Companies are now using a good selectivity in the hiring process to ensure getting the right skilled and qualified people for the right job (Pfeffer, 1994; Huselid, 1995). According to Koch and McGrath (1996), there exists a positive relationship between HR recruitment and selection and labor productivity.

In this recruitment process, Barber (1998) described three phases (i.e., generating applicants, maintaining applicant status, and influencing job choice decisions). That is, (a) certain recruitment activities (e.g., advertising) may influence the number and type of individuals who apply for a position, (b) certain activities (e.g., professional treatment during a site visit) may affect whether job applicants withdraw during the recruitment process, and (c) certain recruitment actions (e.g., the timeliness of a job offer) may influence whether a job offer is accepted.

In the past, it appears that many organizations have had the simple recruitment goal of attracting a large number of job applicants for a variety of reasons. For instance: the cost of processing applications (Wanous, 1992). Although recruitment activities have been linked to some of these post-hire outcomes, some researchers like (Williams, Labig, & Stone, 1993) have argued that in recruiting many employers are not overly concerned with post-hire outcomes. Rather, they are interested in pre-hire outcomes such as the number of individuals who apply for a position, the quality of these applicants, their diversity...etc. To sum up, we believe that the first stage of the recruitment process should be the establishment of objectives. If clear objectives have not been established, it is difficult to develop a sound recruitment strategy (Rynes & Barber, 1990).

2.2 Sources of recruitment

Generally, organizations choose the candidates for its recruitment purposes from two kinds of sources: internal (like transfer of employees from one department to other, promotions, internal advertisements...etc.) and external sources (like outsourcing, public advertisement, virtual job fairs (Elizabeth Agnvall, 2007), on-campus recruitment (Fisher, Schoenfeldt and Shaw, 2006) E- recruitment (De Avila. J.2009) ...Etc.)

2.3 Trends and challenges in recruitment and selection

Nowadays the trend in recruitment and selection is that the new technology tools such as social medial and internet-based recruitment have paved the way to reduce recruitment costs.

1) Social networking sites, such as Facebook and Twitter, allow individuals to post and share personal information, which has led many US employers to use social networking sites to screen job applicants (Shea and Wesley, 2006). A reason for using social networking sites to screen employees is that employers might want to verify information provided by applicants.

2) Reducing Recruitment Costs: Challenging economic times are prompting employers to rethink they go about recruiting, with an emphasis on cost cutting (Dessler, 2012).

3) Advertising: while Web-based recruiting is rapidly replacing help wanted ads, a glance at almost any paper or business or professional magazine will confirm that print ads are still popular. To use help wanted ads successfully, employers have to address two issues: the advertising medium and the ad’s construction.

3 Data Collection and Research Methods

3.1 Research approach

The researcher, in order to well approach this topic has adopted an inductive quantitative and qualitative case study, which is based on questionnaires. And that is due to the fact that this research aims to generate an in-depth understanding of strategic recruitment and selection practices at Huawei in the Senegalese and Chinese context. In fact, we hear by inductive approach or research, the fact of moving from particular situations to make or infer broad general ideas/theories. Therefore, the purpose of the research is theory building not theory testing.

3.2 Research strategy

A survey technique has been used in this work. Thus, this research strategy has been adopted in this study because it helped the researcher to collect information from a sample of employees at Huawei Company in Senegal and China through questionnaires.

3.3 Sample selection For this research, a total sample of 100 different human resources personnel was surveyed at Huawei in China and Senegal. During the data collection stage, all the 100 questionnaires (50 in Senegal and 50 in China) were distributed in different managerial level like top level, middle level, lower level managers, and some other employees of human resource department who are directly to the recruitment process of the company but only 80 (38 from Senegal and 42 from China) were returned in the end.

That is, to help enable the researcher get a more representative sample in the framework of personnel recruitment and selection at Huawei in Senegal and China.

In order to get more appropriate and accurate results, the Statistical Package for Social Sciences (SPSS) was used in order to analyze the data obtained from the questionnaires.

4 Analyses and Findings

4.1 Frequency analysis

Table 1 Recruitment and Selection Sources that Apply to Huawei (Senegal)

		Frequency	Percent	Valid Percent	Cumulative Percent
Valid	internal sources	4	10.5	10.5	10.5
	external sources	9	23.7	23.7	34.2
	both internal and external sources	25	65.8	65.8	100.0
	Total	38	100.0	100.0	

Table 2 Recruitment and Selection Sources that Apply to Huawei (China)

		Frequency	Percent	Valid Percent	Cumulative Percent
Valid	internal sources	1	2.4	2.4	2.4
	both internal and external sources	41	97.6	97.6	100.0
	Total	42	100.0	100.0	

The two tables above and graphs below have shown that most of the respondents to question concerning the recruitment and selection sources that apply to Huawei Company in the Senegalese and Chinese context have chosen “both internal and external sources” with respective percentages of 65.8% and 97.6%. As for the lowest percentage, it is 10.5% for “internal sources” in Senegal, compared to 0% for “external sources” in China.

Table 3 Huawei’s Main Recruitment Channels (Senegal)

		Frequency	Percent	Valid Percent	Cumulative Percent
Valid	Online recruitment	1	2.6	2.6	2.6
	Newspaper Ads	3	7.9	7.9	10.5
	Direct recruitment	10	26.3	26.3	36.8
	Campus recruitment	2	5.3	5.3	42.1
	Others (any combination of the responses above)	22	57.9	57.9	100.0
	Total	38	100.0	100.0	

Table 4 Huawei’s Main Recruitment Channels (China)

		Frequency	Percent	Valid Percent	Cumulative Percent
Valid	Online recruitment	1	2.4	2.4	2.4
	Direct recruitment	1	2.4	2.4	4.8
	Campus recruitment	13	31.0	31.0	35.7
	Others (any combination of the responses above)	27	64.3	64.3	100.0
	Total	42	100.0	100.0	

Concerning Huawei's main recruitment channels, the answer "Others" in the tables above and graphs below appeared to be the most dominant in Senegal and China with 57.9% and 64.3%, respectively. In the Senegalese context, online recruitment has the lowest percentage (2.6%) compared to China where online recruitment and direct recruitment have the lowest and equal percentage of 2.4%.

Table 5 Analysis about the Way in which Huawei Conducts its Tests during the Selection Process

		Frequency	Percent	Valid Percent	Cumulative Percent
Valid	Screening Cvs	2	5.3	5.3	5.3
	Interviews	15	39.5	39.5	44.7
	Others	21	55.3	55.3	100.0
	Total	38	100.0	100.0	

Table 6 Analysis about the Way in which Huawei Conducts its Tests during the Selection Process (China)

		Frequency	Percent	Valid Percent	Cumulative Percent
Valid	Screening Cvs	1	2.4	2.4	2.4
	Aptitude test	7	16.7	16.7	19.0
	Personality test	2	4.8	4.8	23.8
	Interviews	8	19.0	19.0	42.9
	Others (any combination of the responses above)	24	57.1	57.1	100.0
	Total	42	100.0	100.0	

As indicated in the tables above and graphs below, both in Senegal and China the highest percentage (55.3% and 57.1%, respectively) of the respondents concerning the manner in which Huawei conducts its tests during the selection process appeared at "Others".

Table 7 Analysis of Problems and Challenges Huawei Faces during the Personnel Recruitment (Senegal)

		Frequency	Percent	Valid Percent	Cumulative Percent
Valid	Salary issues and competition	3	7.9	13.0	13.0
	Communication issues	4	10.5	17.4	30.4
	Lack of qualified and appropriate employees for the positions	6	15.8	26.1	56.5
	Long recruitment process (interviews, timing...et) and working conditions (Overtime works, culture...etc.)	6	15.8	26.1	82.6
	Others	4	10.5	17.4	100.0
	Total	23	60.5	100.0	
Missing	333.00	15	39.5		
Total		38	100.0		

Table 8 Analysis of Problems and Challenges Huawei Faces during the Personnel Recruitment (China)

		Frequency	Percent	Valid Percent	Cumulative Percent
Valid	Salary issues and competition	3	7.1	11.1	11.1
	Lack of qualified and appropriate employees for the positions	10	23.8	37.0	48.1
	Long recruitment process (interviews...etc.) and working conditions (Overtime works, ...etc.)	7	16.7	25.9	74.1
	Others	7	16.7	25.9	100.0
	Total	27	64.3	100.0	
Missing	333.00	15	35.7		
Total		42	100.0		

Both in Senegal and China, only 60.5% and 64.4% respectively responded to the question related to the problems and challenges that Huawei company faces in its personnel recruitment process. All the remaining ones have avoided the question as it is shown by “Missing” in the tables above and graphs below. Most of the respondents in Senegal (15.8% and 15.8%) and China (23.8% and 16.7%) mentioned “the lack of qualified and appropriate employees for the positions” and “long recruitment process and working conditions” as the major problems generally faced by Huawei. Another specific and recurrent problem for Huawei in Senegal lies on communication (linguistic barrier) amounting 10.5%.

4.2 Cross tabulations

Table 9 Level of Education * Position in the Telecommunication Industry Cross Tabulation (Senegal)

		Position in the telecommunication industry					Total
		HR Director	HR Manager	HR Assistant Manager	HR Personnel	HR Assistant/ Specialist	
Level of Education	Master Degree	0	1	0	11	7	19
	Bachelor Degree	0	0	0	11	0	11
	Baccalaureate	0	0	0	5	0	5
	Others (Above Master Degree and other Professional Certifications)	1	1	1	0	0	3
Total		1	2	1	27	7	38

Table 10 Level of Education Position in the Telecommunication Industry Cross Tabulation (China)

		Position in the telecommunication industry					Total
		HR Director	HR Manager	HR Assistant Manager	HR Personnel	HR Assistant/ Specialist	
Level of Education	Master Degree	2	1	10	18	2	33
	Bachelor Degree	0	1	1	5	0	7
	Baccalaureate	0	0	0	0	2	2
Total		2	2	11	23	4	42

As shown in the results of the cross tabulations in the tables above, the level of education tends to determine the position of employees at Huawei both in China and Senegal. In Senegal, the HR Director specially has the first ranking in “Others” (Above Master Degree and professional Certifications...etc.), then comes the HR manager holding a Master Degree, after that, the HR Assistant manager follows within the category of “Others”, besides HR Assistant/ Specialist comes, all holding Master Degrees. Finally, we have the HR personnel. As for China, the HR Director also remains in the categories of highest degree holder “Master Degree”, and then follows the HR managers with “Master and Bachelor Degrees”. Afterwards, the HR Assistant managers most of whom hold Master Degree, HR Assistant/ Specialist follow and finally, HR personnel of which the majority hold a Master Degree as well.

Table 11 Experience in the Telecommunication Industry Position in the Telecommunication Industry Cross tabulation (Senegal)

		Position in the telecommunication industry					Total
		HR Director	HR Manager	HR Assistant Manager	HR Personnel	HR Assistant/ Specialist	
Experience in the telecommunication industry	0-5 years	0	0	1	16	0	17
	5-10years	1	1	0	11	7	20
	>15years	0	1	0	0	0	1
Total		1	2	1	27	7	38

Table 12 Experience in the Telecommunication Industry Position in the Telecommunication Industry Cross Tabulation (China)

		Position in the telecommunication industry					Total
		HR Director	HR Manager	HR Assistant Manager	HR Personnel	HR Assistant/Specialist	
Experience in the telecommunication industry	0-5 years	0	0	11	16	1	28
	5-10years	0	1	0	5	2	8
	10-15es	1	1	0	2	1	5
	>15years	1	0	0	0	0	1
Total		2	2	11	23	4	42

As indicated in the tables above, in Senegal the HR Director and one of the two HR Managers are the most experienced employees (more than 15 years). The other HR Manager, all the HR Assistant/Specialist, and, out of the twenty-seven HR Personnel, eleven appeared to be the second highest experienced employees (10-15years). Finally, the HR Assistant Manager and remaining sixteen HR Personnel have the lowest experience level (0-5 years) in Huawei Company. As in the case of China, the most experienced employee is one of the two HR Directors with more than 15 years; the other HR Director, one of the two HR Managers, two of the twenty-three HR Personnels and one of the four HR Assistant/Specialist fall in the second highest range of experienced employees (10-15years). The remaining HR Manager, five HR Personnel and two HR Assistant/Specialist have 5-10 years of experience; and at last all the rest of respondents are 0-5 years experienced employees. These results have shown a tendency that “years of experience” is a determinant of position at Huawei Company both in Senegal and China.

5 Discussion

The analyses above were carried out in order to answer our research questions. Therefore, based on the findings, in Senegal and China, the main difference about the recruitment channels adopted by Huawei Technologies is highly observed on direct recruitment and campus recruitment. In Senegal, direct recruitment amounts for 26.3% after “Others”, which represents any combination of the responses (Online recruitment, Newspaper Ads, Direct recruitment, Campus recruitment, Others) under the question related to the main recruitment channels in the questionnaire. As for China, campus recruitment is the most used channel in the process of recruitment with a percentage of 31.0% also ranking after “Others”. The results from our questionnaire indicated that both in Senegal and China, Huawei Company used mostly both internal and external sources in its recruitment and selection process. The choice of both internal and external sources is not fortuitous since by internally appointing an employee to higher position will not only reduce the cost of recruitment and selection process but also constitute a means of motivation and employee retention through performance appraisals.

The external source of recruitment on its side, will allow the company to get new talents that can give a new orientation to the company. Concerning the main problems and challenges faced by Huawei in its personnel recruitment process, it appeared that they are almost the same namely the lack of qualified and appropriate employees for the positions, long recruitment process (interviews, timing) and working conditions (Overtime works, culture...etc.) in both countries although in Senegal, communication is a big barrier to the recruitment process. Moreover, both in Senegal and China, there are higher percentages of respondents who did not answer the question about the main problems and challenges faced by Huawei in its recruitment process indicated as “missing” in the tables. Finally, the cross tabulations’ output pointed out that Huawei tends to pay much more attention to the level of education and professional experience in the attribution of different positions.

6 Conclusions

In a nutshell it is clear that recruitment and selection plays paramount important role in every organization. The study reveals that Recruitment is the first stage in the process which continues with selection and ends with the placement of candidate.

After completing this study, we have learnt that research on recruitment and selection practices in Senegal and China are vital for Huawei. The main objective of this research paper was to investigate on

the personnel recruitment and selection process at Huawei Technologies in the Senegalese and Chinese context, and then, spot out the main problems and challenges it faces in the process.

The results of the research have shown that in order to recruit in a more effective and strategic manner and make wiser selection decisions, the top management team needs to create short-and long-term strategic plans (demands of staff), particularly by taking into account the cultural values, the timing, and the communication issues that somehow hinder Huawei's recruitment and selection process in Senegal. Likewise, in China Huawei has to consider the salary issues by increasing the employee wages, improving the working conditions, and reducing the recruitment process timing.

Furthermore, direct recruitment and campus recruitment are the main channels used by Huawei in Senegal and China, respectively. Accordingly, the level of education and professional experience of candidates appeared to be factors which influence the attribution of positions at Huawei in both countries. In sum, the study revealed that there do exist some similarities and differences in the process of recruitment and selection at Huawei in Senegal and China.

Abstract: In the era of global competition, innovation has become a central object to obtain a sustainable future by an organization outrunning their counterparts. Based on the questionnaires survey on Ready-made Garment (RMGs) and small and medium enterprises (SMEs) in Bangladesh, this empirical study aims at finding the impact of transformational leadership (TL), knowledge management (KM), citizenship behavior or positive deviance (PD), and intrinsic motivation (IM) on organizational innovation (OI). Stratified random sampling has been used for collecting the responses of the SMEs in Bangladesh. Data analysis shows that TL, KM, IM, and PD can predict OI significantly. Limitations, implication and further research directions have also been discussed in this article.

Key words: Transformational leadership; Knowledge management; Positive deviance; Intrinsic motivation; Organizational innovation

1 Introduction

In the era of global competition, innovation has become a central object to have a sustainable future for an organization outrunning their counterparts. The past century has seen the rapid advances in innovation. OI has been defined as the successful implementation of noble and useful creative ideas within an organization (Radzi, Hui, Jenatabadi et al., 2013). Amabile (1988) advocated that creative ideas can be ‘anything from ideas for new products, processes, or services within the organization’s line of business to ideas for new procedures or policies within organization itself.’ Recently, researchers have paid interests in this field because of its critical role in the competitive business world for having sustainable performance. Empirical studies mirrored that the antecedents predicting OI are TL, KM, citizenship or PD, organizational climate, and IM which are virtually mentioned in several studies. Besides, organization needs employees’ dedication, cooperation, and a little extra effort for achieving competitive edge. This little extra effort by the voluntary works of employees is really a matter for the organizations to improve it further (Yilmaz and Tasdan, 2009). Employees’ creative and innovative behavior is the key resource for sustainability. If an individual gets bored, it is irrelevant to expect any creative contribution from him. Amabile (1988) posits that individual’s propensity to work and degree of enthusiasm for the activity is the primary condition of IM. Research showed that IM is one of the precursors to the employees’ creativity which leads the firm into the OI. It is imperative for an organization to pile tangible and tacit resources to accomplish OI. A company’s excellence is linked with the utilization of its knowledge resources, i.e. the knowledge of the organization and its employees (Chait, 1999; Ericsson and Avdic, 2003). Hence, dynamic organization requires handful leadership to turn all those antecedents for arousing individual intrinsic motivation for leading to OI.

2 Theoretical Background and Hypothesis Development

The theory of reasoned action (TRA) suggests that immediate antecedent of any behavior is the intention to perform that behavior approved by his social pressure. In the words of Ajzen and Madden (1986, p.454), “the stronger a person’s intention, the more the person is expected to try, and hence the greater the likelihood that the behavior will actually be performed.” Ajzen (1991) theorized in ‘the theory of planned behavior (TPB)’ that individual’s behavioral intention leading to behavior is contingent upon individual’s perceived control of his/her behavior, attitude, and subjective norms. It exhibits, in addition to the previous theory; that those employees who are certain of their positive outcome by their controlled behavior tend to behave positively. Self-determination theory (SDT) opined on the degree to which an individual decision is self-motivated and determined without external interference. Ryan and Deci (2000) noticed that three needs-competence, relatedness, and autonomy-that

* Corresponding author is reachable at mdaftabuddin@cu.ac.bd

affect the inherent growth tendencies towards the subjects. Social exchange theory (SET), proposed by Blau (1964), and the norms of reciprocity (NR) posited by Gouldner (1960) forwards these same tenets a step further from a different perspective that employees feel obliged to reciprocate more if their employer value their contributions and efforts they give in. First three theories revealed that individuals have inherent needs to create and grow and, moreover, that behavior has been regulated by their intention, behavior control, and social approval or disapproval. Social approval or disapproval and perceived behavioral control by them have been affected by the organizational retreat and recognition. SET and NR theories go further that when organization treats employees well, it makes them morally, personally, and socially responsible to bounce it back to organization's wellbeing. In views with the perceived organizational supports (POSs), creative individuals and innovative teams tend to get demoralized when employees see the absent of POSs and equity among themselves.

Previous theoretical explanation strengthens the understanding that employees have inherent tendency to grow, relate, compete (SDT theory) with their firm control of their behaviors in a social interaction (TRA and TPB theories). SET and NR theories show how employees react to the organizational response to them. IN model, and CMC narrated that how an organization can better accomplish their sustainable competitive advantage. Empirical studies state that TL significantly predict IN (Chang, 2016; Tajasom, Hung, Nikbin et al., 2015) and KM (Birasnav, 2014; Han, Seo, Yoon et al., 2016) because TL, like POS theory, foster supportive climate for individual initiative, on the other hand, it helps employees create, transfer, and utilize of knowledge among stakeholders. The supportive climate prepared by TL also instigates the employees to helping each other. This cooperation from TL supportive attitude drives employees' intrinsic motivation and citizenship behavior to the innovative organization (Humphrey, 2012; Jaiswal and Dhar, 2015, Teigland and Wasko, 2009).

H₁: Transformational leadership significantly predicts organizational innovation;

Besides, KM is found correlated with the upgrading of organizational creativity and sustainable innovation. Shieh (2011) mentioned that KM created new knowledge and shared it to other employees. Other literatures also found that KM significantly predicts OI (Darroch, 2005). Therefore, the prevailing studies elucidate that organization needs TL and fair climate to mould KM, the employees' IM and PD for fostering organizational innovation. The following hypotheses have been proposed for further studies:

H₂: Knowledge management significantly effects organizational innovation;

H₃: Citizenship behavior significantly predicts organizational innovation;

H₄: Intrinsic motivation significantly predicts organizational innovation;

3 Research Methods

3.1 Data characteristics

Self-administered questionnaires were sent to RMGs and the other SMEs using stratified random sampling in the greater commercial City-Chittagong of Bangladesh. Analyses of demographic characteristics showed that of the 204 responses, 73.5 per cent represents men and the rest 26.5 per cent represents women. Their age's group consists of 6.4, 51.0, 35.8, and 6.8 per cent belonging to above 18, e 25, 35, and 45 years respectively. Educational profile shows that 15.7 per cent, 57.8 per cent, and 26.5 per cent have completed their bachelor, master, and others, i.e. doctorate or diploma certificate. The analysis of the respondents' job position reports that 37.3 per cent, 51.0 per cent, and 11.7 have been serving lower, mid and top levels respectively.

3.2 Survey instruments

A total of 300 questionnaires were delivered through off line and online survey, but 230 responses were received. In screening tests, 26 responses were dropped out to address the issue of common method bias, missing data, outliers, and data normality. Survey instruments of transformational leadership (Podsakoff, MacKenzie, and Bommer, 1996), intrinsic motivation (Tierney, Farmer, and Graen, 1999), citizenship behavior (Ritz, Giauque, Varone et al., 2014), knowledge management (Gold, Malhotra, and Segars, 2001) and organizational innovation (Miller and Friesen, 1983) were used in this analysis. SmartPLS 2, and IBM SPSS 20 software packages were used for producing the results.

4 Analysis and Findings

In order to estimate the validity of the model and instruments, several statistical test has been tried. Indicators' validity can be measured by performing bootstrapping test through Smart PLS 2. All indicators scored above the cut off value of 0.70 and found significant at $p < 0.000$ that demonstrate the

sufficient level of validity (Urback and Ahlemann, 2010). Besides, internal consistency, like Cronbachs Alpha, of all instruments score above 0.77 (see table 1) which is also above the threshold limit. For convergent validity testing, average variance extracted (AVE) has been recommended. It's been found that that AVE of each construct in this study exceeds 0.69 whereas the minimum rule of the thumb is advised to be at least 0.50. Table 1 also shows the correlation matrix for discriminant validity which reveals that the square root of AVE of each construct is higher than the construct's highest correlation with any other construct in this study (Hair Jr, Hult, Christian et al., 2014).

Table 1 Assessment of the Data and Model Quality

Convergent validity of the items							Discriminant validity among the instruments					
Latent Variables	Mean Value	Standard Deviation	AVE	Composite Reliability	R ²	Cronbachs Alpha	Latent Variables	1	2	3	4	5
1. IM	1.91	0.64	0.690	0.918	0.447	0.888	1. IM	0.831				
2. KM	2.11	0.72	0.725	0.913	0.638	0.873	2. KM	0.667	0.851			
3. OI	1.93	0.66	0.681	0.865	0.727	0.765	3. OI	0.781	0.703	0.825		
4. PD	1.95	0.71	0.697	0.920	0.690	0.891	4. PD	0.807	0.694	0.806	0.835	
5. TL	2.05	0.73	0.714	0.926	0	0.900	5. TL	0.669	0.799	0.702	0.686	0.845

Before going to find the effects of subject variables, researchers control the demographic variables (Table 2) to find the magnitude of their effects on OI. It's been noticed in model 1 (table 2) that demographic variables altogether explain OI by 6.40 per cent, however, age ($\beta = -0.175; p < 0.016$) and gender ($\beta = 0.189, p < 0.088$) of demographic factors are only found significant. Model 2 shows that TL has a significant ($\beta = 0.635; p < 0.000$) effect on OI with a R² value of 0.444. Observation of model 3, model 4, and model 5 reveal that KM ($\beta = 0.348; p < 0.000$), IM ($\beta = 0.543; p < 0.000$), PD ($\beta = 0.338; p < 0.000$) have a very significant effect of OI with R² value of 0.05, 0.141, and 0.04 respectively.

Table 2 Hierarchical Regression Analysis on OI

Variables	Model 1			Model 2			Model 3			Model 4			Model 5		
	β	Std error	Sig.

5 Discussion

This empirical study goes for finding the predictor variables of organizational innovation. In this connection, four antecedents have been picked up from previous literatures which are found theoretically and empirically connected to OI. The prime objective of this study is to figure out the relative importance of each predictor variable to OI. Hierarchical regression analysis shows that all hypotheses are significantly influencing subject variables at $p < 0.000$. Of the predictor variables, TL is the most dominating antecedent explaining OI. Empirical research and theories of leadership, POSs, TPB, and TRA supported these findings that TL drives organizational innovation by engaging the followers' attention for the fulfillment of the organizational vision (Ajzen, 1991; Ajzen and Madden, 1986; Tajasom et al., 2015; Teigland and Wasko, 2009; Tierney et al., 1999). KM is found to effect OI significantly. Theoretically, RBVs signifies the impact of knowledge along with other resources to enhance the capability of the organization (Warnerfelt, 1984). Knowledge creation, transfer, and storing of it help the users to generate new ideas. KM has a significant effect on OI which is found consistent with other empirical findings (Birasnav, 2014; Radzi et al., 2013). Hypothesis 3 assumes the effect of IM on OI. Result shows that it has significant effect on OI which is found consistent with previous theoretical and empirical studies (Ajzen, 1991; Ajzen and Madden, 1986; Amabile, 1988; Coelho,

Augusto, and Lages, 2011; Dewett, 2007; Eisenberger and Shanock, 2003; Ryan and Deci, 2000; Wernerfelt, 1984). Last hypothesis intends to find the effect of PD (citizenship behavior) on OI. It's been noticed that it is also a significant predictor of OI. SET, NR, POSs, TRA, TPB and SDT explain that employees have control on what they behave to their surroundings (TRA, TPB, and SDT) and sometimes they are controlled by the way their surroundings (SET, NR, and POSs) treat them (Ajzen, 1991; Ajzen and Madden, 1986; Blau, 1964; Gouldner, 1960; Ryan and Deci, 2000). This study is also found consistent with empirical findings (Raja and Johns, 2010; Zhang and Begley, 2011).

6 Conclusions

This study, Firstly, aims at finding the potential impact of TL, KM, IM, and PD (citizenship behavior) on OI of the SMEs in Bangladesh. It's been proved that all of them have a significantly influence on OI. Secondly, it is purported to measure the extent of each predictor variable on OI and result shows that TL has larger influence than other variables on OI. Therefore, it is highly recommended that enterprises require to emphasize more on the effective leadership to mould the employees' attitude to OI. It also holds true that KM, IM, and PD are contributing a lot to the OI. It contains several implications both for professionals and academics. The least they might do is to ensure enough resource commitment from the top level management. Two of the few limitations of this study are the scope and size of the research and sample respectively, i.e. 204 samples from RMGs and the other RMGs, and time span used in this research. Further research might be suggested with relatively large size accompanying multiple cross-sectional data. In addition, moderating and mediating effects of other variables might have been used in this study to trace out any latent variable existences.

Measuring the Impact of Staff Governance on Enterprise R&D Output: A Comparative Study

Zhong Ye

School of Management, Wuhan University of Technology, Wuhan, P.R.China, 430070
(E-mail: zhongyede@163.com)

Abstract: This paper is based on Stakeholder Theory and Technological Innovation Theory, classifying 207 A-share listed companies to conduct a comparative study, using the Person correlation analysis and linear regression to explore the relationship between employees involved in corporate governance and R&D output. The results show that, in the capital and technology intensive enterprises, there is a significantly positive relationship between staff governance and R&D output, and for the labor-intensive enterprises, no significant correlation is found between the two. This paper's contribution lies in the research perspective, scope and measurement method: Firstly, it breaks the past research limitation that only see the staff as employees who are hired by firms, this paper explores its impact on innovation performance from a new perspective that regard them as stakeholders; Secondly, in view of the different types of industry enterprise, this paper further excavates the different influence of staff governance on corporate R&D; Finally, thanks to patent database updates, the measure indicators of R&D output is more diverse and more reasonable in this paper, so the results have strong persuasion.

Key words: Staff governance; Innovation performance; Stakeholders; Capital technology intensive enterprise; Labor- intensive enterprise

1 Introduction

In recent years, with the slowdown in China's economic growth, China began to enter the industrial transformation and upgrading period, enterprises "innovation" has been received the unprecedented attention. Government Work Report 2016, the "innovation" has been mentioned 59 times. Building an innovative country should have the following four characteristics: 1) high innovation input, R&D (research and development) expenditure percentage of GDP is generally more than 2%; 2) scientific and technological progress contribution rate more than 70%; 3) the independent innovation capability is strong, the country's foreign technology dependence index is usually below 30%; 4) high innovation output, the number of invention patents around the 20 innovative countries accounted for 99% of the global total. Visible, the driving role of R&D inputs and outputs for the innovation performance is crucial. R&D activities is the most intuitive and critical reflection of enterprise technology innovation, so exploring the key factors that affect the company's R&D activities has important significance.

Many previous studies have shown that a country's population size, level of economic development, legal system, fiscal policy, the degree of competition in the industry and so on will affect the company's innovation activities. As Teitel.S (1994) by comparing the level of innovation in different countries, noting that the population size of the country, units of capital gains have an important impact on the patent and R&D investment. Aghion (2005) pointed out that the country's financial system to support innovation activities for the high cost research activities is very necessary. Chen, Puttitanun (2005) found that the higher the degree of competition in the national market, the better the situation of intellectual property protection, as well as the national innovation level. Sharma studies have shown that a country's financial markets are more developed, the enthusiasm of small business research and innovation is stronger. Widening Chinese scholars, Xiang Yu found that, due to the differences of bank credit for r&d investment project, so our corporate R&D activities are also negatively affected to some extent. Li Danmeng (2009) found that for private enterprises, the higher the degree of industry competition in the market, the greater the intensity of enterprise R&D investment. Weimin and Tang Qingquan (2009) also confirmed that technological innovation subsidies provided by the government for business R&D activities have a significant incentive. Lin (2010) by conducting field research and interviews in more than 10 cities, also found that enterprise R&D activities is significantly positively related to property rights protection policy. Cable, Fitzory (1980) and other empirical study shows that, regardless of the nature of business, industry marketization level and R&D investment has a significant positive correlation.

Clarkson introduced the concept of exclusiveness investment into the "stakeholder theory", put forward that stakeholders invest the physical, human and financial capital or some other valuable things into the enterprise, so as to share a part of the risk of the enterprise. Blair (1995) argue that residual

income is matched with the rest of the risk, for employees, unemployed as a direct result of the enterprise bankruptcy, so employees are more involved in corporate governance requirements. Through the study, Rajan and Zingales (2000) pointed out that with the arrival of knowledge economy, convenience financing resulting decrease in the importance of physical capital, which have led to human capital has more and more important role in the enterprise. Chen Zhongxiang (2007) found that in market economy developed countries, the employees involved in the governance is common, and mainly through the participation of the decision-making, ownership, and benefit sharing of these three ways to participate in corporate governance. Margaret (1995) analyzed the rationality of employee participation in management; employees are given certain rights by institutions to participate in governance, so that their own interests are effectively safeguarded. Blaine (2001) argues that employee participation can improve the efficiency of company management, affect the management decision-making, so as to realize corporate governance. Hiroshi Osano and Mami Kobayashi (2005) starting from the trend of population aging, discusses the labor shortages would happen in the future, and put forward the status of the employees would increase as the trend and, therefore, the enterprise will reform its governance mechanism, give employees more administrative power to adapt to the trend of development.

2 Theoretical Backgrounds and Hypothesis

First, the R&D investment includes not only capital investment, but also involves the investment of talent. Some employees held their knowledge and skills are formed through education, training and other aspects of the investment over time, and these are value-added. Especially in the high-tech enterprises, the employees hold the company's core technology, and the creative work of the staff is the fundamental survival and development of enterprise. Employee participation in corporate governance can not only improve their reward but also provide an opportunity to display their talent. Employees for their own interests on the one hand, on the other hand in order to realize their own value, it will make every effort to put his core technologies and other key human capital, which for R&D investment and innovation performance improvement has an important influence.

Secondly, the staff through participating in corporate governance, that is, to share the control of the company. In the past, most employees don't have control of the enterprise, leading to staff for business situation indifferent, and even secretly against non-cooperative attitude with the management. Sharing control of the enterprise not only let employees shift their identity into a part of the company's managers, mentally for their own interests, will be more active in focusing on the long-term development of the enterprise. Therefore, long-term interest in the company to increase R&D investment and other decisions, employees will choose to take a supportive attitude. This is to some extent; help to improve the company's R&D output.

Thirdly, employee participation in corporate governance is based on the principle of voluntary, and employees with respect to external investors easy access to information, they have a comprehensive understanding of the company's management capabilities and quality. Therefore, the advantage of the information can let the staff to make more scientific decision and improve the efficiency of R&D investment.

Finally, as Li Bingyan put forward the concept of "benefit-sharing" in "Sharing Public Economic Theory", employees to participate in dividends and management is a practice of "benefit-sharing". Due to the success of the research and innovation can bring unlimited excess returns for the company, profit driven directly motivate employees to be more support and increased investment in research, and constantly improve the company's R&D output performance.

According to the theory of enterprise innovation, the lack of funds investment is often the bottleneck of restricting the developing of the enterprise's R&D activity. Zhao, Li Xiaohua through the empirical study show that enterprise's R&D investment has significant positive impact on the enterprise patent applications. Bai Yanzhuang, also found that corporate R&D investment can promote the patent output level. Therefore, employees of the enterprise R&D investment positive impact will transfer to the corporate R&D output. Based on the above reasoning, this paper put forward hypothesis:

Employees participation in corporate governance is positively related to the corporate R&D output.

3 Methods

3.1 Sample

This paper chooses a total of 207 A-share listed companies in Shanghai and Shenzhen from 2007 to 2014, since China from 2007 officially adopted the new accounting standards, the accounting treatment of research and development has made significant changes, this article selected R&D and staff governance situation after 2007 as samples.

In this paper, all data on the condition of employees' shareholding are from WIND database, the total number of patent applications and inventions are derived from Chinese Listed Companies patent research database (CSMAR). In addition, the basic information, financial data and other information of listed companies are from CSMAR database.

3.2 Measures

3.2.1 R&D output

Due to the lack of Chinese listed companies patent statistical databases, Previous studies on innovative output often use ROE and other comprehensive index to measure the results of research and development. This indicator covers too many influencing factors to test enterprise real R&D output. The more accurate and intuitive indicators of R&D output should be the enterprise authorized patent number and the application situation. In the light of the business licensing conditions under the influence of external factors such as the patent policy and audit, enterprise's patent application number is more reasonable. Therefore, we selected the latest data CSMAR patent application database as a measure of corporate R&D output.

ESOP is a measure based on a long-term incentive and its stake in a certain period with the stability, and therefore we choose the average annual number of patent applications after the formal implementation of the ESOP as the measure.

3.2.2 Staff governance

The main way of employee participation in corporate governance is by holding shares in the enterprise; this paper selected its proportion of shareholding to measure the effectiveness of employee participation in governance.

Proportion of employee shareholding = number of internal worker shares / total equity

3.2.3 Control variables

Due to differences in the scale of business, large and small companies invest in R&D efforts will be quite different, large companies usually get more specific assets, including personnel, finance, technology, it implies the need and the ability to have more R&D output. This paper selects total revenue to represent the firm size.

Companies usually longer listed in capital market have richer experience, it also affects the corporate R&D output. Therefore, this article will also choose listed years as a control variable.

4 Results

4.1 The descriptive statistics of main variables

As it can be seen from the Table 1, the maximum and minimum ratio of 207 listed companies in the studies were 9.996% and 0.175%, respectively, for the number of patent applications 1 and 265.4, employee's governance and R&D output gaps between different companies, further proved the necessity of classification comparative study of different industries. The proportion of employee stock ownership and the average number of patent applications were 2.95% and 19.52, it shows that employee shareholding of listed companies in our country is low and less company R&D output in general.

Table 1 Descriptive Statistics

Variable	minimum	maximum	Mean	SD	N
Proportion of employee shareholding	0.175	9.996	2.954303	1.8234506	207
Patent application number	1	265.4	19.5206	23.85693	207
Listed Years	2	24	7.95	4.482	207
Firm size	1.90356672E+08	1.089E+11	3.13505293E+09	9.35071345E+09	207

4.2 The correlation analysis of different types of enterprises

Given the different nature of the industry have different demand for R&D, according to the "Industry Classification of Listed Companies Guidelines", this article will divide the 207 listed companies into capital and technology-intensive (144) and labor-intensive (63): capital and technology intensive industries that are dependent on complex and sophisticated use of advanced scientific

knowledge and technology, including the electronics industry, aircraft and aerospace industries etc.; labor-intensive industries rely on large-scale use of labor, it mainly refers to agriculture, forestry and textiles, clothing, toys, leather, furniture and other manufacturing industries.

4.2.1 Capital and technology intensive enterprises

Through the Table 2 results, for capital technology intensive enterprise, employee shareholding and corporate patent application number has significant positive correlation, employees’ participation in corporate governance has a positive role in promoting corporate R&D output, it consistent with the hypothesis of this article.

Table 2 Person Correlation Analysis in Capital and Technology Intensive Enterprise

Variable	Proportion of employee shareholding	Patent application number	Listed Years	Firm size
Proportion of employee shareholding	1	.858**	.045	.158
Patent application number	.858**	1	.068	.152
Listed Years	.045	.068	1	.524**
Firm size	.158	.152	.524**	1

4.2.2 Labor-intensive enterprises

By Table 3 we can see that the number of employee shareholding in labor-intensive enterprises has no significant positive correlation with patent applications, the effect of staff governance in the enterprise on R&D output is not obvious, and it’s not consistent with assumption.

Table 3 Person Correlation Analysis in Labor- Intensive Enterprise

Variable	Proportion of employee shareholding	Patent application number	Listed Years	Firm size
Proportion of employee shareholding	1	.109	.418**	.412**
Patent application number	.109	1	-.067	-.018
Listed Years	.418**	-.067	1	.316*
Firm size	.412**	-.018	.316*	1

4.3 Linear regression analysis

It can be seen from Table 4 and Figure 1, in capital and technology intensive enterprises, the number of employees’ ownership and the R&D output showing a linear relationship, R square is 0.736, indicating a good model fit, Sig 0.00 is below significance level 0.005, indicating a linear relationship between the two is significant.

Table 4 Model and Parameter

equation	model					estimate of parameter	
	R square	F	df1	df2	Sig.	constant	b1
liner	0.736	395.056	1	142	0	-7.711	8.919

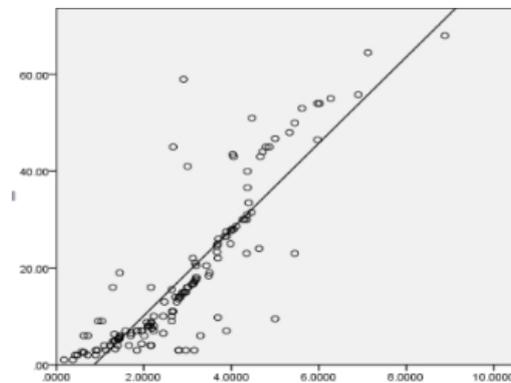

Figure 1 Liner Relationship

5 Conclusions

Based on the Stakeholder Theory and Technological Innovation Theory, 207 A-share listed companies is divided into two categories according to the data about staff governance and R&D output, through the empirical comparative analysis, the conclusions are as follows: first of all, for capital technology intensive enterprises, staff governance is significantly positively related to enterprise R&D output; second, for labor-intensive enterprises, there is no significant correlations between staff governance and R&D output; but firm size and the years of listed is related to the enterprises R&D output. The study's findings suggest that for different industry types, staff governance has different effect on R&D output. We should improve employees' governance mode through considering the nature of the enterprise, strategic objectives, market positioning, business model and so on.

1) The study found that in labor-intensive enterprise, employees did not promote the R&D performance, which explains the low subjective consciousness of employees to participate in corporate governance and the staff own cultural and technical level, will greatly influence the effect of the staff governance. To better use staff governance, the company should improve the awareness and ability of staff to participate in governance.

2) In the study, we found that most of the companies employees shareholding ratio is low, and many companies did not implement employee stock ownership plan (ESOP), in addition, while the ESOP is the main way for employees to participate in corporate governance, but it also includes the board of directors and board of supervisors, staff congress, etc. By analyzing the annual report data of listed companies, found that many companies did not set up employee supervisors, only a few listed companies set up staff director. This shows that staff governance in the listed companies of China attaches no great importance, a part of the management of listed companies don't realize the important role of employees' participation in governance. They view employees just as the employer, rather than the company's stakeholders.

3) Although some companies recognize the importance of employee participation in corporate governance, but in reality there is no system in place but only stay on the surface. Although many companies have implemented employee stock ownership plan, but most is by the means of financing under the difficult circumstances, rather than an incentive policy. And some managers worried about staff governance will disclosure trade secrets, the employee only share interests but has no right to vote, and they did not really participate in the company's internal governance process, and therefore cannot play its role.

Abstract: This paper reviews and synthesizes the literatures on corporate governance in Islamic banks with the aim of identifying key elements and dimensions of corporate governance from Islamic point of view. Drawing from proliferation of literatures in the Islamic banks and corporate governance fields, this study provides the primary elements and attributes of corporate governance from Islamic perspective that have been largely used in studies of governance to date. A review on fifty-seven (57) journal articles, conference papers, reports, and theses, have identified twenty-four (24) dimensions of corporate governance in Islamic banks. From these dimensions, the six most frequently used as corporate governance dimensions in Islamic banks are: sharia scholars, stakeholders' role, responsibility, ownership, transparency, and sharia compliance. The synthesis of governance from Islamic perspective will make several noteworthy contributions to address the gaps in literatures for corporate governance in Islamic banks. This study will provide the basis for researchers to empirically examine the dimensions of corporate governance in Islamic banks and add additional empirical methods in future research.

Key words: Corporate governance; Islamic banks; Islamic finance; Literature review

1 Introduction

The current global financial meltdown has gained interest in corporate and banking sector world-wide. Amongst the lessons learned has been the importance of corporate governance (CG hereafter) frameworks to drive accountable, transparent, and efficient business organizations. There have been several studies in the literature reporting that CG is one of the causes of economic crisis (T. A. R. Dalwai, et al, 2015; H.-A. N. Al-Malkawi, et al, 2012). Moreover, CG practice is also equally important in the Islamic banking and finance. Islamic banks need a prudent CG framework albeit Islamic moral system protects the right of stakeholders (M. U. Chapra and H. Ahmed, 2002). In addition, some of the failures of Islamic banks is due to the existence of weak CG system. The failure of Islamic Bank of South Africa in 1997 and the collapse of Ihsan Finance House of Turkey in 2001 have confirmed that the importance of CG system for Islamic financial institutions (K. Ginena, 2014).

Islamic banking and finance has witnessed as one of fastest growth in the global financial industry, with the current market sizes in a range of USD1.6 trillion to USD2.1 trillion (ISRA, et al, 2016). This prospective segment is predicted to reach USD3.4 trillion by the end of 2018. Nonetheless, despite with the industry has matured and gained experience, the legal and governance framework for Islamic banks remains underdeveloped. ISRA & Thomson Reuters (2015) also confirm that the importance of the application of CG in Islamic banks. Therefore, even though Islamic banking and finance have done very well so far, they should have a prudent CG mechanism.

CG is defined as the system by which firms are directed and controlled (Cadbury Code, 1992). It refers to relationship between corporations and constituents, more specifically, the link between shareholders and management of the firm (M. K. Lewis, 2005). Moreover, Organization for Economic Co-operation and Development (OECD) defines CG as a set of relationship between a company management, its board, shareholders and other stakeholders (OECD, 2004)¹. The topic of CG in contemporary business institutions is one of the most active areas in corporate finance research today. The bulk of research in the form of journal articles, book review, conference papers, and other materials has increased remarkably. Many researchers have argued that CG of financial industry is different with the non-financial industry due to highly regulation, excessive risk-taking, and business model (R. La

¹ OECD in 2004 has issued "Principle of CG" that says: the CG framework should promote transparent and efficient market, in line with the rule of law and the division of responsibilities among supervisory, regulatory, and enforcement authorities.

Porta,2000) -(G. Caprio, et al,2007) In addition, most of the studies on CG have evolved against a setting of capitalism corporate system and mostly based on developed countries (G. Caprio, et al,2007) -(E. H. Kim,2013) Table 1 below specifically provides the publication of CG in banking sector from 1980-2015.

Despite the proliferation of the CG concept in conventional literature, however to the best of author knowledge, there is still sparse research on CG in Islamic banks. Thus, this study attempts to shed light on that important aspect of CG in Islamic banks by the way of addressing the literature gaps of the existing studies on the CG in Islamic banks and its mechanisms. Specifically, in order to address the literature gaps of CG, this study endeavours to identify the key elements and dimensions of corporate governance from Islamic point of view.

This study is organized as follows. Section 2 provides an overview of CG theories. Section 3 reviews the existing studies of CG in Islamic banks from various aspects. Section 4 provides dimension of CG from Islamic perspective. Finally, section 5 is the conclusion and suggestions for further explorations.

2 An Overview of Corporate Governance Theories

The first code on CG can be traced back in 1992 during which Sir Adrian Cadbury (The Chairman of the UK committee on the financial aspects of CG) was launched the Report and Code of Best Practice of CG, also well-known as the Cadbury Report (Cadbury, A, 1992). The report was launched to discover the issues of corruption in UK corporations and to ascertain an accountability frameworks of the BOD. According to Cadbury Code, CG can be defined as the system by which the company is directed and supervised by several parties, for instance board of directors (BOD), management, auditors, to ascertain that the company is moving towards their goals (Cadbury, A, 1992). A later effort arose in 1999 that was presented by Bank for International Settlements (BIS) to which establishing Basel Committee on Banking Supervision (BIS-committee). The BIS-committee had issued the guidelines and mechanisms of CG practices to ensure that there is effective corporate governance at every banking institution.¹ These guidelines were then revised accordingly in year 2006, 2010, and 2015² (Basel Committe on Banking Supervision,2015). The BIS guideline of CG, accordingly, is regarded as the most widely accepted framework of CG in conventional finance (Mizushima, 2013). According to the latest version of BIS guidelines, CG is the division of authorities and responsibilities by which the business affairs of a bank are directed and controlled by its board and senior management.

Prior to BIS initiative on CG, Organisation for Economic Co-operation and Development (OECD) has determined the principles of CG which have become a global benchmark for policy makers, investors, and other stakeholders. According to OECD, CG is a set of relationship between a company management, board of directors (BOD), shareholders and other stakeholders (OECD,2015) In latter stage, OECD has issued the revised version of CG principles in 2015³. According to OECD (2015), the

¹ <<http://www.bis.org/BIS/publ/d328.htm>>. Retrieved at 24 February 2016

² The first revision of BIS guidelines of CG, "Enhancing Corporate Governance for Banking Organizations", was launched in February, 2006. The second revision, "Principles for enhancing Corporate Governance", was issued in October, 2010. Lately, in July 2015, BIS has issued "Guidelines: Corporate Governance principles for Banks"

³ The revised version of OECD principles of CG was issued at the G20 Finance Ministers and Central Bank

CG mechanism should encourage transparent, efficient, and fair market. This mechanism should be in line with the rule of law and ascertain effective supervision and enforcement.

These OECD principles are attempted to support economic efficiency, sustainable growth and financial stability. To do so, the principles suggest that good CG framework should provide the right incentives to shareholders, BOD, executives, financial intermediaries, and service providers to achieve objectives that are in the interest of company and shareholders. Moreover, good CG should facilitate effective checks and balances for the well function of an economy (Mizushima, 2013; OECD, 2015). In short, table 2 below exhibits the definition of CG from several standard-setting bodies.

Table 2 Definition of CG from Various Standard-setting Bodies

No	Standard-setting bodies	Definition of CG
1	Cadbury Report (1992)	the system by which the company is directed and supervised by several parties, for instance board of directors (BOD), management, auditors, to ascertain that the company is moving towards their aims
2	organization for Economic Co-operation and Development; OECD (2015)	A set of relationship between a company management, board of directors (BOD), shareholders and other stakeholders to promote transparent, fair markets, and the efficient allocation of resources. It should be harmony with the rule of law and support effective supervision and enforcement
3	Basel Committee on Banking Supervision at BIS (2015)	CG involves the division of authority and responsibilities in which the business affairs of a bank are governed and controlled by its board and senior management.

3 Existing Studies on Corporate Governance in Islamic Banks

Despite the proliferation of publications in the Islamic banking and finance in the form of journal articles, book chapters, conference papers, and reports has been increased substantially, there is sparse research of CG practices in Islamic banks. Research on Islamic banks, particularly on CG, are underdeveloped due to several reasons, among of which the limited quality and quantity of reputable publication avenues dedicated to the subject of Islamic banking and finance¹. In fact, journals in this discipline is lack of visibility

CG is not a new phenomenon in Islam. The fundamentals of organizing the contractual relationship between partners with respect to the division of responsibilities has been continuously practiced in earlier civilizations². Islam stipulates the concept of writing all forms of transactions and the contract should be free from any exploitation. From maqasid al-shariah (objectives of shariah) perspective, CG is the process and structure in managing business and affairs of the company with the goal of maximization of shareholders wealth within the values and principles of maqasid al-shariah (Lahsasna, 2013). Maqasid al-shariah in any muamalat transaction, including in Islamic banks, should be place as an ultimate objective. Ibn-Ashur (2006) highlights the importance of maqasid al-shariah in determining the level of *maslahah* (benefit) and *mafasid* (evil) that existed in particular case, including in the case of Islamic banks. Shariah has governed the banking product innovation and services, hence, shariah compliance is the backbone of Islamic banking business and regulations (Abu, Jasin, Abd Razak, and Sharif, 2014). To uphold shariah compliance principles and ascertain the stakeholders of what Islamic bank doing so, shariah governance is necessitated (Ginena, 2014). Concurrently, shariah governance framework is also used to preserved shariah innovation and promoting stability in the market (Nazri, 2012). One of the importance element in such governance is the existence of shariah supervisory board (SSB), which is responsible in supervising Islamic banks to be comply with shariah principles (AAOIFI, 2010).

In the context of standard-setting bodies, the Accounting and Auditing Organization for Islamic Financial Institutions (AAOIFI), Islamic Financial Services Board (IFSB, 2006), and Bank Negara Malaysia (BNM) had issued the CG frameworks for Islamic bank. The governance standards for IFI are the tools used to realize the sharia prescriptions and meet the need of the IFI. Table below listed the

Governors meeting in Ankara Turkey on September 2015. This revised CG principles were subsequently acknowledged at G20 Leaders Summit in Antalya Turkey on 15-16 November 2015. <Source: <http://www.oecd.org/corporate/principles-corporate-governance.htm>>. Retrieved at 29 February 2016

¹ Definition of reputable and quality journal is referred to journal ranking and impact factors, i.e. Thomson Reuters Journal Citation Reports (JCR) Impact Factor, Institute for Scientific Information (ISI) Web of Science h-index, and SCOPUS indexed which are the renowned indexing system for journals today.

definition of governance with regard to Islamic standard-setting bodies.

Table 3 Definition of CG from Islamic Standard-setting Bodies

No	Standard-setting bodies	Definition of CG
1	Accounting and Auditing Organization for Islamic Financial Institutions (AAOIFI)	Not provided
2	Islamic Financial Services Board (IFSB)	A set of organizational arrangements in which the actions of management of IFIs are controlled in line with the interests of its shareholders, which provide the proper incentives for the BOD, SSB, and management to pursue objectives and facilitate effective monitoring, and comply with sharia rules and principles. The process and structure used to manage and control the business and affairs of the institutions in attempt to enhance business prosperity and accountability with the main objective of achieving long-term shareholder values, whilst considering the interests of other stakeholders.
3	Bank Negara Malaysia (BNM)	

From Islamic point of view, a stakeholder can be defined as the individual or any group whose property rights are at stake or at risk as the consequences of the companies' actions (Iqbal and Mirakhor, 2003). According to these definitions, the company is expected to protect property rights of not only the shareholders but also those who have actively engaged in the process of company seeking profit, and those who adversely affected due to companies' operation. They also argued that any group or individuals who have any express and implied contractual obligations to the companies qualifies as a stakeholder.

Iqbal and Mirakhor (2004) raised several concerns about stakeholder's model and governance in Islamic economic system. They posited that stakeholder model of CG finds strong foundation in the Islamic economic. By drawing from Divine Law of sharia, they discovered that Islamic concept of property rights and Islamic law of contract from both explicit and implicit contracts are the basis for stakeholder theory of CG. This causes them to further propose that all stakeholders ought to be included into decision making activities of the firm's. Whereas the objectives of the firm are to preserve the interests of all stakeholders not only those of just shareholders. A critical review of this paper reveals that the concepts of stakeholder theory and CG are well articulated with convincing arguments and used by two prominent scholars by emphasize on the rules of behaviour or Islamic norms. Hence, according to them, these lead to recognize the role of stakeholders in decision making of a firm. However, far too little attention has been paid to show how to ensure that property rights are protected in Islamic economic system. The discussion of stakeholder theory and CG has not been able to explain a conclusive argument on socio-economic grounds and formal analysis of the economics of stakeholder model in Islamic economic system.

Critically examines, Chapra (2004) commented the work of Iqbal and Mirakhor (2004) on stakeholder model of governance in Islamic economic system. According to him, the paper has valuable contribution to ascertain and justify the stakeholder theory which has been rooted from Islamic principles. Nonetheless, he pointed out the loopholes in that paper especially the lack of evidence to show how to ascertain that property rights are guaranteed in an Islamic economic system. Chapra critically viewed that Islamic norms of behavior do not automatically internalized to protect stakeholders' rights. The existence of moral values or Islamic norms of behavior on stakeholders' rights, albeit its prominent, will not be adequate enough. As a consequence, according to Chapra, it's necessary to have an effective socio-economic mechanism based on incentives and deterrents to protect the stakeholders' rights.

Dusuki (2012) has proposed that the pyramid of maslahah as a viable tool to devise a decision-making framework and managing conflicts arising from diverse stakeholder groups in Islamic financial institutions (IFIs). In addition, the findings are consistent with findings of past studies by Iqbal and Mirakhor (2004), which showed that stakeholder theory in Islamic perspectives provide a strong basis pertaining who can be deemed as a stakeholders and what are the rights and responsibilities. The uniqueness of this study exists in the fact that the application of the pyramid of maslahah in stakeholder management. According to him, the principles of maslahah can be used as a framework for decision-making processes and general guidelines to resolve conflicts arise among various stakeholder groups. For instance, managers of the firms ought to protect the basic needs of their employees by a way of providing sufficient and convenient prayer rooms and guarantying the safety of their employees. This

example reflects the protection of religion and life which is constituted as essential or fundamental responsibilities (*daruriyyat*) to be fulfilled by IFIs.

Bhatti and Bhatti (2012) carried out comprehensive study of CG in Islamic finance. They discuss the concept, framework, and structure of Islamic CG (ICG) and analyze whether its viable in current corporate structure. According to them, the ICG frameworks are in harmony with OECD principles of governance. However, unlike Anglo-model of governance which is based on the spirit of self-interest, the ICG model is built upon ethics and morals to realize the *maqasid al-shari'ah* (objectives of shariah). Moreover, the authors also posit that the ICG model tends to support the stakeholder theory. The critical review of this paper reveals that although they have been extensively discussing the concept and framework of ICG, there has been limited efforts to show how this model can be used properly in Islamic financial system.

Needless to say, there is also a trade-off existed in the context of shariah governance framework. According to Akhtar (2006), CG from shariah perspective stemming from two core dimensions: (1) faith-based that govern of the business in harmony with shariah principles, and (2) profit motive that recognize business activities and wealth maximization. However, the agency structures in Islamic banks perhaps may raise a conflict between the need to comply with shariah principles and maximization of shareholders' wealth (Safieddine, 2009). Agency theory explains the separation of management and ownership of the company, which raise an agency cost (Jensen and Meckling, 1976).

Hassan, Joseph, and Bashir (2003) reported that the major shareholders for Islamic banks are government, government agencies, giant financial institutions, and big individual investors. They raised several concerns on big individual investors form the board of directors (BOD). Accordingly, they indicated that equity holders can be regarded as insiders to the bank, whilst investment depositors (*mudarabah* and *musharakah* account holders) are considered as outsiders to the bank. Therefore, the existence of these two groups raise the conflict between insiders (BOD) and outsiders (investment depositors) due to the occurrence of asymmetric information (Hassan et al, 2003).

In addition to Hassan et al (2003), Safieddine (2009) argued that Islamic banks are facing the trade-off between shariah compliance and mechanism protecting investors right. The managers of Islamic banks are required to balance the interests between maximize shareholders value of their investment, and comply with shariah compliance principles (Akhtar, 2006). Subsequently, based on the contract stipulated between the banks and investment depositors, the managers are able to share in profits but not in losses and prohibit depositors to interfere the management. As a consequence, the depositors are separated from their control right in the management of their funds (Safieddine, 2009).

4 Dimensions of Corporate Governance in Islamic Banks

Despite the proliferation of research on CG in Islamic banks, the majority have strongly emphasizes in investigating CG practices in particular applications and settings (Al-Beshtawi, Zraat, & Al-Hiyasat, 2014; Al-Malkawi et al., 2014; Archer, Karim, & Al-Deehani, 1998; Bhatti & Bhatti, 2009; Bukhari, Awan, & Ahmed, 2013; Mizushima, 2013; Wilson, 2009). These studies oftentimes have different interpretations on the CG concept from Islamic point of view. As a matter of fact, there is little agreement in the use of CG principles or dimensions from Islamic perspective. Accordingly, albeit the literature is reasonably broad however lacks of consistency and strong underpinning principles. Therefore, the aims of this paper is to present the synthesis of literature on CG from Islamic perspective and identifying the broad dimensions that have been employed in the study of CG from Islamic banking and finance.

In doing so, the keyword "corporate governance", "Islamic banks", and "Islamic perspective" were entered into the major research database such as Science Direct, Emerald Insight, Scopus Elsevier, Wiley-Blackwell, Springer, and Taylor & Francis. This first process provides considerable articles in the form of journal articles, conference papers, reports, and thesis. A further step was undertaken to remove articles from database that use the keywords of corporate governance, Islamic banks, and Islamic perspective yet did not precisely address the issues of corporate governance per se. In sum, 57 articles were included in this study. The review employed articles published between 1990 and 2016. The starting point in 1990 was selected since the seminal paper such as Cadbury Report was released.

To form a deeper understanding of CG from Islamic perspective, the characteristics/dimensions of each article were reviewed through manual read by author and calculated the frequency using NVivo 11 software. Hence, if a dimension of CG was considered by ten authors, accordingly, this dimension will then have a frequency of ten. These bulk list of dimensions were listed in a descending order. Figure 1

below exhibits the frequency with which dimensions of corporate governance in Islamic banking and finance have been identified in the analysis.

In most cases, the concept of CG from Islamic perspective is defined by these dimensions. For instance, the report released by ISRA & Thomson Reuters (2016) identified corporate governance concepts related to Islamic banks, namely:

- 1) Sharia scholars qualifications
- 2) Synergies between scholars and practitioners
- 3) Standardization
- 4) Accountability
- 5) Responsibility
- 6) Transparency
- 7) Trustworthiness (Amanah)
- 8) Independence
- 9) Competency

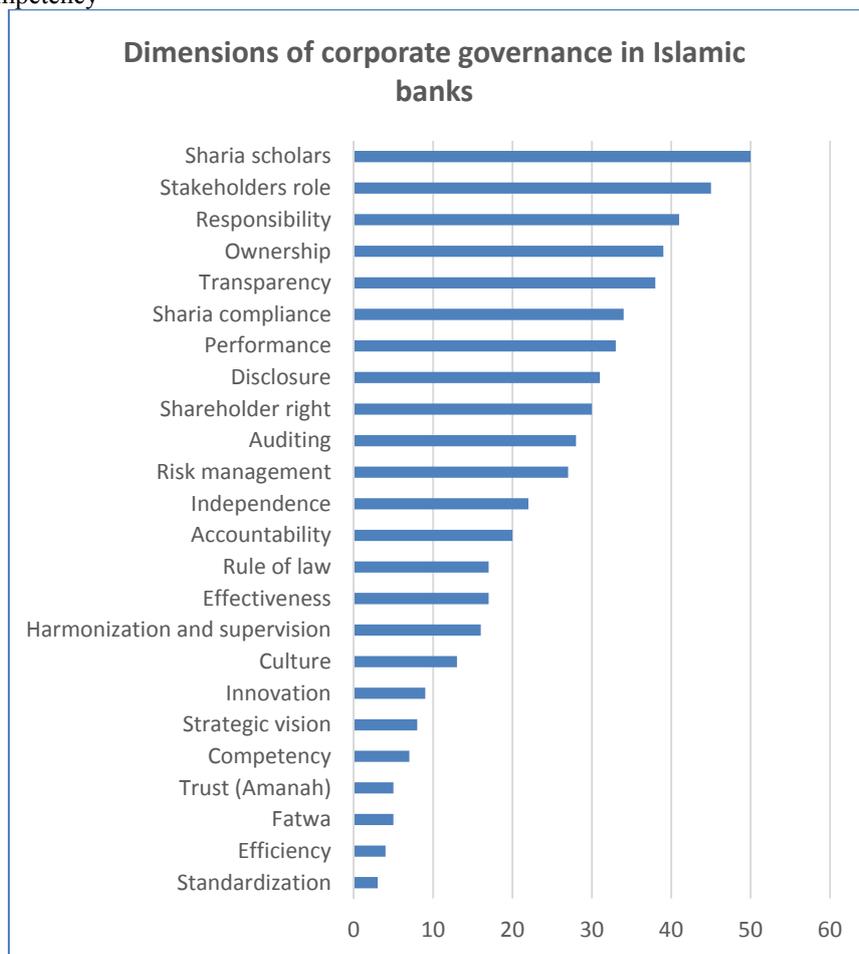

Figure 1 Identified Dimensions of Corporate Governance in Islamic Banking and Finance

It was not surprising to find that different researchers have different characteristics of corporate governance because of their differences in the definition of governance per se. Say for example, Choudhury and Haque (2006) have identified the characteristics of governance in Islamic corporations are *shuratic* process, sharia rules, effectiveness, accountability social responsibility. Whereas Abu-Tapanjeh (2009) states that Islamic principles of corporate governance are identified from shareholders right, equitable, stakeholders’ role, disclosure, transparency, and responsibility. Conversely, Zain, Zulkarnain, and Hassan (2015) included accountability, sharia compliance, performance, and consultation as a proxy for sharia governance in their study.

In sum, there are 24 identified dimensions of corporate governance from the analysis. Most of these dimensions also recognized in corporate governance from conventional literature. Moreover, the most

frequently dimensions of governance from Islamic perspective can be named as follows: (1) sharia scholars, (2) stakeholders role, (3) responsibility, (4) ownership, (5) transparency, and (6) sharia compliance. Each of these frequent dimensions was mentioned in more than 30 articles respectively. In addition, two-third of all dimensions investigated in the corporate governance literature pertinent to the context of Islamic banking and finance being examined by author. Table 4 below shows the citation references for each identified dimensions of corporate governance in Islamic banking and finance

Table 4 Identified Dimensions of Corporate Governance in Islamic Banking and Finance.

5 Conclusions and the Way Forward

This paper has provided the critical analysis and synthesis of the plethora governance literature in Islamic banks. A review of bulk 57 published articles from the Islamic banking literature identified 24 dimension of CG that has been employed in this study. Out of these dimension, the six most frequently used as corporate governance dimensions in Islamic banks are: sharia scholars, stakeholders' role, responsibility, ownership, transparency, and sharia compliance. More importantly, the evidence of this review confirm that despite the proliferation of literature in CG there is ambiguous in defining the CG and its dimensions from Islamic perspective.

The aims of the paper were to investigate and provide the various dimension of CG in Islamic banking and finance literature. Importantly, the contribution of this study is obvious as this has not previously been undertaken in the field of Islamic banking and finance. The evidence of this paper enables us to understand why the CG concept in Islamic banks is so disparate. Accordingly, this paper provides a basis to other researchers for replicating and testing these identified dimensions in further research. Due to the scope and limitations of this paper, future research can address the issues more detail by the way of exploring the theoretical constructs of CG concept in Islamic banks, and investigate the dimensions that constitute CG for Islamic banks.

Linking Business Strategy with Organizational Innovation

Shafiq M., Tasmin R.

Department of Production and Operation Management, Faculty of Technology Management and Business, University Tun Hussein Onn Malaysia, Parit Raja, Batu Pahat, Johor, Malaysia, 86400
(E-mail: hp150039@siswa.uthm.edu.my, rosmaini@uthm.edu.my)

Abstract: Recently, the emerging competitions in the business environment compel organizations for developing dynamic business strategies to be innovative for competitive advantage. Few organizations are using defender, prospector, analyzer and reactor business strategy for the competitive advantages. However, limited empirical evidences are available to show the linkage of these business strategies with organizational innovation, either open or closed innovation. This paper examines the influence of the business strategies on organizational innovation. For this purpose, we used a quantitative research design and collected data from 250 employees of SEMs in Malaysia through a self-administrated questionnaire. The results indicated that the defender and prospector business strategies are not linked with open innovation while reactor business strategy is not linked with closed innovation. While analyzer and reactor business strategies are positively influencing the open innovation in the organization and the defender, prospector and analyzer strategies are positively influencing towards close innovation.

Key words: Organizational strategy; Innovation; SMEs; Malaysia

1 Introduction

Strategy is an ongoing process which determines where organisation will lead, not just a briefing or an idea. There have been several engaged platforms, including opportunities and possibilities, which are discussed as strategy. In literature, Miles and Snow's *strategy types* impacted and opened many debates in management literature. Scholars and consultants and leaders had been directly influenced by these ideas. Four different strategic types have been defined in 'The Miles and Snow typology': Defenders, Prospectors, Analyzers and Reactors. The Defender, Prospector and Analyser strategy types are reflected to display different, yet steady conduct, the way to evaluate circumstances, scope of domains, innovativeness and solving problems. While, Reactors strategy find it difficult to find solutions of problems. Reactor strategy type is usually deliberated unfeasible and not encouraged. There have been numerous studies on strategy and its relationship with innovation. (Williamson, 2003; Kim and Mauborgne, 2005). Interestingly and realistically, innovation is generally considered the backbone and life blood of organizational survival and growth. Product, process, and executive innovations are flagships in corporate efforts to improve efficiency and compete in the world. Innovation has generally been characterized as open and close innovation. There have been many researchers in the association and linkage between strategies and innovation. Tasmin and Woods (2007) proposed substantial linkages between knowledge management strategy and firm's innovation capability among large manufacturers in Malaysia. However, there is a clear shortage of empirical evidences about the relationship. The present literature presents the relationship between four strategy types and open plus close innovation types statistically and analytically. Our approach is to provide an analytical frame of different forms of strategies and its lineage with open and close innovations and the associated advantages and disadvantages for each type. This paper is focused in determining the relationship of four strategies with innovation types. It is important as to strategic innovation has always been a hall mark for the management literature and grasped interest of the researchers and organizations.

2 Literature Review

Strategy is top management level planning and implementation to achieve desired goals for the organisation under particular existing constraints and risks. These include opportunities and possibilities which have been widely discussed as strategy. Based on literature, strategy is just not ideas but the implementation of thinking process. According to Pugh and Bourgeois (2011), strategy is just not the result but a process. In last four decades, many frameworks of strategy have been developed since Five Forces (Porter, 1979; Oster, 1999), the Profit Zone (Slywotzky and Morrison, 2002), Blue Ocean Strategy (Kim and Mauborgne, 2005), the Resource-Based View (Collis and Montgomery, 2008), strategy as Options (Williamson, 1999, Beinhocker 1999), Effectual Reasoning (Saravathy, 2008), and the BCG or McKinsey matrices (Bourgeois, 1997).

Strategy, learning and discovery have improved the current positioning. It is only after much homework and intellectual sweat that the inventions and potential blue oceans sparked by strategic intuition come to the fore. This leads to strategic invention and innovation (Pugh and Bourgeois, 2011). Scholars and consultants have relied heavily on Miles and Snow's insights in developing practical tools and prescriptions for managers. And some managers have read and been directly influenced by their book (Hambrick, 2003). Since its development in 1978, the Miles and Snow typology of corporate-level strategies has formed the basis of many studies. Indeed, articles published in leading management and strategy journals confirm the continuing relevance of the typology. A primary reason for the popularity of the Miles and Snow typology is that it offers a simple and miserly characterization of the strategic stance of organizations (Hambrick and Crozier, 1985).

2.1 Organizational strategy types

Whilst numerous empirical studies have been conducted to validate the existence and characteristics of the Miles and Snow strategy types in different domains, in this study researchers will focus on strategies' relationship with innovation. The Miles and Snow typology defines four distinct strategic types: Defenders, Prospectors, Analysers and Reactors. The Defender, Prospector and Analyser strategy types are considered to exhibit distinct, yet consistent and repetitive behavior in terms of the way they analyse their environment (Parnell and Hershey, 2005), their breadth of product/market domains (Snow and Hrebiniak, 1980), their innovativeness (Parnell and Hershey, 2005) and their use of technology for solving problems (Miles *et al.*, 1978). By contrast, Reactors lack a consistent strategic approach to solving problems. As a result, the Reactor strategy type is generally considered unviable (Conant *et al.*, 1990) and is frequently omitted from studies (Shortell and Zajac, 1990). Because Reactors may vary their behaviour at different times to exhibit the characteristics of a Defender, Analyser or Prospector type, they are also difficult to characterize at a single point in time using objective approaches. During the period of time since its publication, the Miles and Snow typology has been debated and supported by many researchers (e.g. Hawes and Crittenden, 1984; McDaniel and Kolari, 1987; Snow and Hrebiniak, 1980; Zahra and Pearce, 1990). These studies and debates have contributed significantly to the body of knowledge on these strategic types. Studies have found support for either some or all of the strategy types across a number of domains (Atkins, 1994; Hambrick, 1983; Parnell and Wright, 1993; Smith *et al.*, 1986, 1989; Snow and Hrebiniak, 1980; Subramanian *et al.*, 1993; Tan, 1997; Weisenfeld-Schenk, 1994; Zajac and Shortell, 1989). Tasmin *et al.* (2016) reported that furniture manufacturers in Southern Peninsular Malaysia were practicing the strategy of mostly the analyser and prospector approaches.

Defenders: Narrow product market defines defenders' organizations, where the CEO has the expertise in his short domain. Opportunities are not looked for outside the organizational domain. Here the focus mainly remains on quality for operational efficiency (Miles & Snow, 1978).

Prospectors: These organizations always look for new domains and markets. Their thirst for new opportunities though increase their breadth, and competitors have to remain on toes, but it effects the organizational efficiency though always having potential for business (Miles & Snow, 1978).

Analysers: These organizations work in both stable and changing environments, in stable circumstances, the organization is formal and focused on processes and routine tasks, having operational efficiency for market edge. But in the changing environment, the top management looks for new markets like prospectors to have an eye on environment for opportunities and adopting by competitors (Miles & Snow, 1978).

Reactors: These organizations react only when they must react to take corrective actions in their organizations. These organizations do not adjust according to demands of time but only react when they are forced (Miles & Snow, 1978).

2.2 Organizational innovation

Innovation is widely considered the life line of organizational survival and growth. Innovations are now a centerpiece in the ongoing corporate efforts to improve productivity and compete globally (Zahra, 1993). To create value from innovation, executives must make two interrelated decisions (Kotabe, 1990). The first is to select the types of innovations that are compatible with their firms' goals. The second is to decide whether their companies should rely exclusively on internal or external sources for their innovation or to imitate their rivals (von Hippel, 1988).

Recognizing, investigating and developing openings are among shared attributes of organizations which effectively evolve business processes for timely creation of value. There have been many examples of strategizing and innovation, as mentioned in literature, be it high quality modern agriculture products internationalization and production, or acquisitions and merging in technological firms. The

same applies to even bakery industry as described in literature, the company Polarbröd, a bread producer from Northern Sweden, has managed to think outside the box to identify new business opportunities and increased its sales and profitability, becoming the third largest producer of bread in Sweden, in an otherwise shrinking industry. Polarbröd identified opportunities, made mistakes but still got internationalization through innovation and experience Dahlander and Gann (2010). As evident from above examples, organizations use their resources in a balanced way for strategic growth, which usually comprises business model revision or development.

These strategies enable the design of business model. As recent literature on business models had pointed out that business models need to change over time, it was still unclear which strategies and activities would be necessary to achieve such change. According to Dahlander and Gann (2010), if a strategy is good in one context may be otherwise in other contexts. Companies which manage to successfully adapt and renew their business models over time typically display all of these strategizing actions and capabilities in pronounced form. These are not only interlinked, they are complementarities, meaning that their combined use facilitates even more sustained value creation. From a theoretical point of view, each type of innovation has significantly different characteristics:

2.3 Open innovation

A number of papers draw on the openness construct to depict and explain different aspects of the innovation process. Open innovation has been one of the most debated topics in management research in the last decade (Chesbrough, 2003; Christensen *et al.*, 2005; Gassmann, 2006; Vanhaverbeke, 2006; West and Gallagher, 2006). The open innovation model corresponds to companies that are really able to manage a wide set of technological relationships, that impact the whole innovation funnel and involves a wide set of different partners. The extant literature presents the concept of openness in quite different ways; Laursen and Salter (2006a) equate openness with the number of external sources of innovation, whereas Henkel (2006) focuses on openness as revealing ideas previously hidden inside organizations. Our approach is to provide an analytical frame of different forms of openness and the associated advantages and disadvantages for each type.

It is an emerging innovation management paradigm comprised of two dimensions:

1) Inbound Open Innovation, which is the practice of establishing relationships with external organizations or individuals with the purpose of accessing their technical and scientific competences for improving internal innovation performance and

2) Outbound Open Innovation, which is the practice of establishing relationships with external organizations with the purpose of commercially exploiting technological knowledge. (Davide C, Vittorio C and Fedricco F, 2010)

Open innovation is described by a high tension towards technological leadership and internationalization of activities, even R&D; technology and represent critical success factors and require excellent and diversified competencies; R&D and innovation activities have a very high level of risk, both technical and commercial and the level of R&D spending is quite high (as a percentage of sales). This allows to manage and control innovation networks as a whole, from the definition of objectives and risks, through partners' analysis and selection, to the definition of each organization's specific role and contractual form of collaboration, the detailed planning of activities and the measurement of actual results. Obviously, designing and implementing such a complex organizational process requires advanced managerial competencies (Dodgson *et al.*, 2005).

2.4 Close innovation

The closed innovators' model corresponds to external sources of knowledge only for a specific, single phase of the innovation funnel and typically in dyadic collaborations, to invest in their internal R&D effort and believe that keeping the innovation process closed allows them to avoid significant costs and risks. In other words, they perceive the openness and the relationships to be too difficult and costly compared to the potential benefits (Laursen and Salter, 2006). The idea is that all the resources (people, money, competencies) and managerial ability should be focused internally to develop innovation.

Therefore, these firms develop most technologies in-house. Technological leadership is expected to be mainly the result of an internal effort instead of being the result of an innovation network. The R&D risk is not too high and there is little need to share it with other parties. It can be managed by the company itself, by using sophisticated managerial tools and techniques. Subsequently, technical alliances are occasional involving a few allies having long-term relationships and restricted threat of rift.

2.5 Hypotheses development

Integration of the business strategy with organizational innovation strategy is central to the

competitive advantage. Organizations are consistently looking for new mechanisms of the integration of the both. There have been many researchers focusing on the relationship of strategy and innovation, as few have been mentioned in below Table 1. Zahira and Covin (1994) mentioned the financial implication of the integration of the organizational strategy with its innovation practice. Williamson (2003) focused on the strategic intent and the organizational innovation. Kim and Mauborgne (2005) related blue ocean strategy with organizational innovation. More recently, Evans *et al.* (2009) linked strategic thinking with organizational innovation. Nuntamanop *et al.* (2013) presented a new model for linking the business strategy and organizational innovation. However, none of these studies focused on the relationship of different types of the business strategy with both open and close innovation (Zahira and Covin, 1994; Gimenez, 2010; Joseph, 2001; Sundbo, 1996). Geminiez (2000) have also discussed in details the limitations and roles of each strategy type in different scenarios, especially focusing SME's. To create value from innovation, executives must make two interrelated decisions (Kotabe, 1990). The first is to select the types of innovations that are compatible with their firms' goals. The second is to decide whether their companies should rely exclusively on internal or external sources for their innovation or to imitate their rivals (von Hippel, 1988).

Table 1 Studies on Business Strategy and Organizational Innovation

Authors	Framework	Constructs
Zahira and Covin (1994)	The financial implications of fit between competitive strategy and innovation types and sources	Strategy and innovation
Fernando A.P. Gimenez (2000)	Coherent strategy for innovation	Miles and Snow Model with innovation in SME's

Kim and Mauborgne (2005)	Blue ocean strategy	BOS and innovation
Beown (2005)	The evolving role of strategic management development	Strategic formulation, innovation
Evans <i>et al.</i> (2009)	Strategic thinking about disruptive technology	Strategic thinking and innovation
Nuntamanop <i>et al.</i> (2013)	A new model of strategic thinking competency	Strategy and innovation

This paper focuses more on relationship between strategy types and appropriate innovation types. Following hypotheses have been developed, after through study of literature from Snow & Miles' four strategy types of Defender, Prospector, Analyser and Prospector, and innovation types.

- H1: Defender business strategy has a positive influence on the open innovation
- H2: Prospector business strategy has a positive influence on the open innovation.
- H3: Analyzer business strategy has a positive influence on the open innovation.
- H4: Reactor business strategy has a positive influence on the open innovation.
- H5: Defender business strategy has a positive influence on the close innovation.
- H6: Prospector business strategy has a positive influence on the close innovation.
- H7: Analyzer business strategy has a positive influence on the close innovation.
- H8: Reactor business strategy has a positive influence on the close innovation.

This results in how a firm will focus those innovations which are dependable with its strategy. This study is based on the basic concept of strategic management. Strategic management is a set of decisions and actions that result in the formulation and implementation of plans designed to achieve an organization's objectives (Pearce and Robinson, 2000), and relates to innovation.

We hope that this paper will inspire researchers to build on the concept and theorize in a way that helps explain which conventional strategy is more relevant to which innovation type

3 Methodology

3.1 Sample

The data for this research paper was collected from the Small and Medium Enterprises two hundred and fifty employees in Malaysia. Organization was the unit of analysis in this research. Demographic analysis is highlighted in the following sections using frequency tests of the respondents. 55.6% of the respondents belong to the 30 to 40 years age group. Respondents of the age category of 26-30 years are followed as 35.2%, remaining 19% are from other groups. Gender wise investigation represent that 58.3% were male respondents, representing male dominant SME in Malaysia. Master's level education (22.5%)

and high secondary certificate were 18.8% while most of the respondents were graduates (47.8%).

3.2 Measures

Market orientation scale of Narver and Slater's (1990) was adopted as measurement scale; market orientation as single construct based on five items was used in this study. 5 point Likert scale was used to measure all items, ranging from 'strongly disagree' to 'strongly agree'. Sisodiya (2008) scale was used to measure inbound open innovation. Five items were used to measure the construct based on 5 point Likert scale ranging from strongly disagree to strongly agree. The scale of Lichtenthaler (2009), of five items was used to measure the outbound innovation.

This study adopts 26 items of Segev's (1978) instrument to measure firm's strategy. According to the description of four types of Miles and Snow's strategy, nine items were developed to evaluate defender type of strategy, 6 items for prospector, five and four items were used to measure analyzer and reactor strategy respectively.

4 Data Analysis and Results

4.1 Measurement model

As a required step in testing the conceptual models, the suitability of the computed variables must be assessed. Confirmatory factor analysis (CFA) was conducted by using AMOS 18. The results of the CFA indicated that all of the values are within the acceptable ranges as shown in Table 2. The factor structure of each model fits the data and all fit indices met the respective criteria with χ^2 =Chi-square; DF= Degree of Freedom; CMIN= Minimum Chi-square; GFI= Goodness of fit index; RMR= Root Mean Square Residual; RMSEA= Root Mean Square Error of Approximation; NFI= Normed Fit Index; TLI= Tucker Lewis Index; CFI = Comparative Fit Index and AGFI= Adjusted Goodness of Fit Index. The criteria for eliminating the items were set on the basis of the factor loadings and the residual values of each item. The factor loadings $>.50$ was selected to retain the items.

Table 2 Confirmatory Factor Analysis (CFA) Tabulated Construct Results

	CR	AVE	Open Innovation	Defender	Prospector	Analyzed	Reactor	Close Innovation
Open Innovation	0.897	0.685	0.828					
Defender	0.911	0.673	0.521	0.820				
Prospector	0.867	0.522	0.620	0.516	0.722			
Analyzed	0.839	0.512	0.672	0.791	0.598	0.716		
Reactor	0.884	0.605	0.603	0.715	0.514	0.590	0.778	
Close Innovation	0.862	0.624	-0.290	-0.028	-0.096	-0.139	-0.158	0.790

Figure 1 showed the results of measurement model. At the first stage, all latent constructs were correlated to test the measurement model fitness of all constructs. The model showed a good fit as the values to CMIN/DF=1.40, df = 808, χ^2 = 1130.476, GFI= .918, RMR= .058, RMSEA=.057, TLI=.896, AGFI=.848, CFI=.915. These values indicated a good model fit for the measurement validation through CFA.

Convergent validity is the construct indicators that reflect a large amount of the mutual proportion of variance among factors. It determines the amount of correlation among the measures of the same concept (Amran, 2006, Arbuckle, 2011; Hair *et al.*, 2010). Convergent validity deals with construct loadings, average variance extracted (AVE) and construct reliabilities. Average variance extracted is the sum of square of standardized factor loadings to represent how much variation in each item is explained by latent. The average variance extracted is the average percentage of variation explained by the measurement items in a construct. The standard value of AVE is .50 or greater. Table 2 shows the average variance extraction of each construct and results showed that all the constructs have more than .50 of average variance extraction, that shows all the constructs have sufficient amount of convergent validity. Range of Average Variation Extractions are 0.512 - 0.685.

The threshold value of the construct reliability is .70 or above (Amran, 2006; Cooper and Schindler, 2011). Table 2 shows that all the constructs have adequate reliability of all constructs ranges from .817 to .911. Therefore, the current study does not violate the convergent validity of the constructs. Discriminant validity referred to the extent to which an instrument contains a construct that was truly distinct from all others. Discriminant validity is the degree to which similar constructs have distinct

values. In this type of validity, the responses are measured without cross loading in terms of latent constructs (Arbuckle, 2011; Hair *et al.*, 2010). Discriminant validity is violated when the correlation among exogenous constructs is more than 0.85 (Cooper and Schindler, 2011). In discriminant validity the value of the square root of average variance extraction should exceed than the value of inter-construct correlations. Table 2 shows the inter-construct correlations. Results indicate that all the constructs have adequate discriminant validity as the square root of average variance extracted is greater than the inter-construct correlation of each variable and also the values of inter construct are less than .85. It means results provide sufficient evidence of discriminant validity of the constructs.

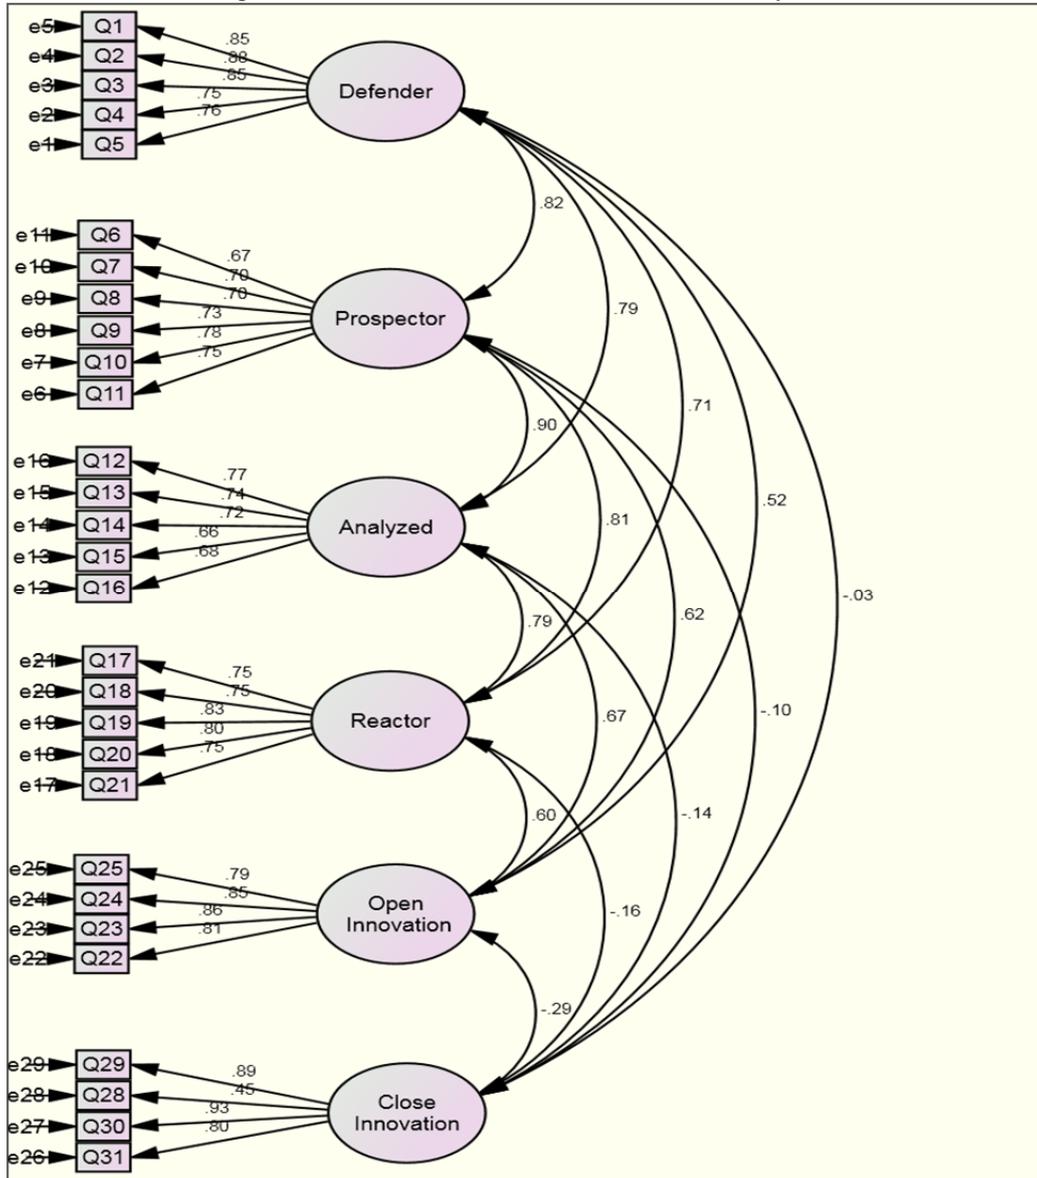

Figure 1 Measurement Model

4.2 Hypotheses testing

The proposed structural model consists of 8 hypotheses, as indicated in Figure 2. Structural model composed of basic six constructs which are namely defender, prospector, analyzed and reactor business strategy, open innovation and closed innovation.

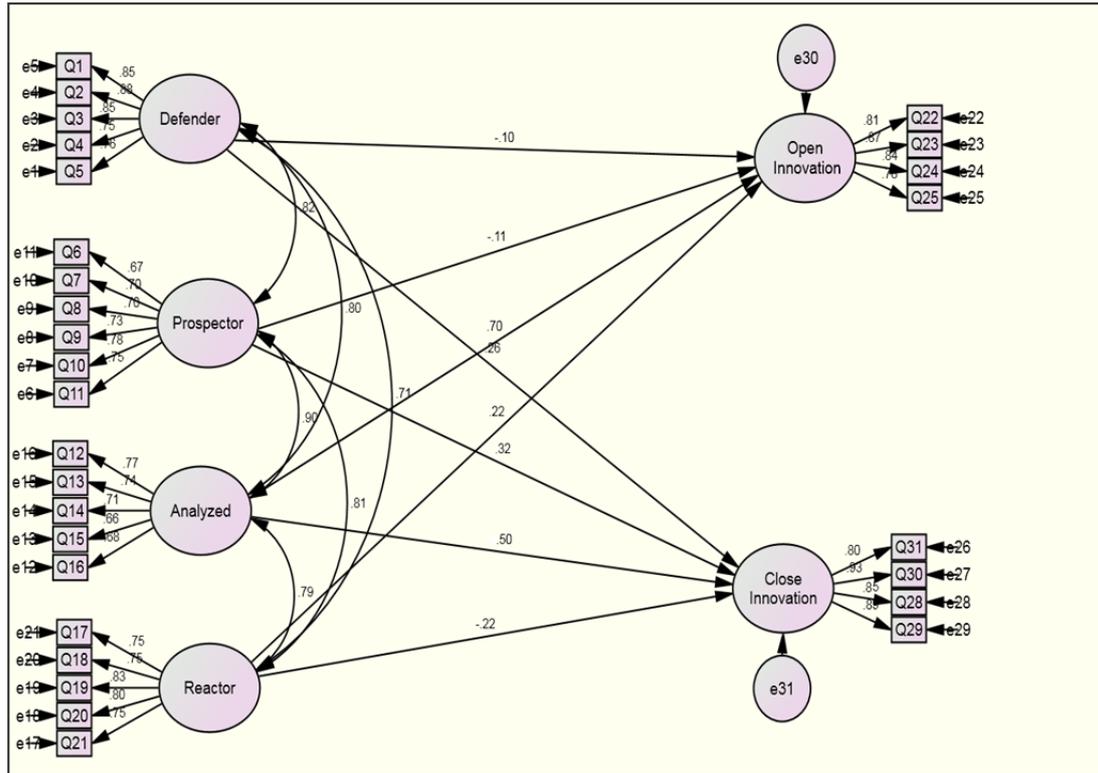

Figure 2 Structural Model of the Six Constructs

First hypothesis of the study states that H1: Defender business strategy has a positive influence on the open innovation. So the standardized path coefficient of this was -0.10 and unstandardized path coefficient was -.113 with p value above than 0.05. Thus, this provides enough evidences to reject research hypothesis H1. Thus, this study found no relationship between defender business strategy and open innovation. Second hypothesis of the study states that H2: Prospector business strategy has a positive influence on the open innovation. So the standardized path coefficient of this was -0.11 and unstandardized path coefficient was -.120 with p value above than 0.05. Thus, this provides enough evidences to reject research hypothesis H2. Thus, this study found no relationship between prospector business strategy and open innovation.

Third hypothesis of the study states that H3: Analyzer business strategy has a positive influence on the open innovation. So, the standardized path coefficient of this was .70 and unstandardized path coefficient was .910 with p value less than 0.05. Thus, this provides enough evidences to accept research hypothesis H3. Thus, this study found positive relationship between analyzed business strategy and open innovation. Fourth hypothesis of the study states that H4: Reactor business strategy has a positive influence on the open innovation. So, the standardized path coefficient of this was .21 and unstandardized path coefficient was .243 with p value less than 0.05. Thus, provides enough evidences to accept research hypothesis H4. Thus, this study found positive relationship between reactor business strategy and open innovation.

Fifth hypothesis of the study states that H5: Defender business strategy has a positive influence on the close innovation. So, the standardized path coefficient of this was .26 and unstandardized path coefficient was .321 with p value above than 0.05. Thus, this provides enough evidences to accept research hypothesis H5. Thus, this study found positive relationship between defender business strategy and close innovation. Sixth hypothesis of the study states that H6: Prospector business strategy has a positive influence on the close innovation. So, the standardized path coefficient of this was .32 and unstandardized path coefficient was .356 with p value above than 0.05. Thus, provides enough evidences to accept research hypothesis H6. Thus, the current study found positive relationship between prospector business strategy and close innovation.

Seventh hypothesis of the study states that H7: Analyzer business strategy has a positive influence on the close innovation. So, the standardized path coefficient of this was .50 and unstandardized path

coefficient was .684 with p value less than 0.05. Thus, this provides enough evidences to accept research hypothesis H7. Thus, this study found positive relationship between analyzed business strategy and close innovation. Eighth hypothesis of the study states that H8: Reactor business strategy has a positive influence on the close innovation. So, the standardized path coefficient of this was -.22 and unstandardized path coefficient was -.262 with p value above than 0.05. Thus, this provides enough evidences to reject research hypothesis H8. Thus, this study found no relationship between reactor business strategy and close innovation. Table 3 below shows the results of the path analyses between the innovation and the strategy

Table 3 Path Analyses of the Business Strategies and the Innovations

Path			Estimate	S.E.	C.R.	P	Label
Open_ Innovation	<---	Defender	-.113	.113	-0.999	.318	Not significant
Open_ Innovation	<---	Prospector	-.120	.205	-.584	.559	Not significant
Open_ Innovation	<---	Analyzed	.910	.246	3.697	0.00	Significant
Open_ Innovation	<---	Reactor	.243	.114	2.132	.033	Significant
Close Innovation	<---	Defender	.321	.146	2.202	.028	Significant
Close Innovation	<---	Prospector	.356	.026	13.59	0.00	Significant
Close Innovation	<---	Analyzed	.684	.300	2.283	.022	Significant
Close Innovation	<---	Reactor	-.262	.146	-1.787	.074	Not significant

Regression Weights: (Group number 1 - Default model)

5 Discussion and Conclusion

Researcher aims to examine the relationship of business strategy with organizational innovation strategy. For this, we proposed eight hypotheses related to the business strategies (i.e. defender, analyzer, prospector and reactor) and its relationship with organizational innovation, either closed or open innovation. Our results suggested that the defender business strategy focus on the passive approach and strives to work with the current status of the organization. Thus, it is more likely that the organizations having defender business strategy will resist organizational innovation importing from the outside of the organizational boundaries. However, defender business strategy is more linked with the closed innovation performance of the organization. Similarly, this is the case of the prospector business strategy. The organization having prospector business strategy are more focused to enhance their business and mostly focused on the new opportunities to promote their business activities. These organizations are ready for in-house innovation and rely on their capabilities. Thus, prospector business strategy is closely linked with closed innovation strategy. Meanwhile, analyser business strategy focuses on the market information and closely analyse the dynamic situation of the business environment and have the ability to cope any situation and turbulence. Thus, analyser business strategy is positively related with both open and close innovation. Finally, the reactor business strategy is a passive business strategy and it contemplates on the changes in markets environments. Mostly, it is impossible for this type of the organization to meet the competitive dynamic business challenges, through closed innovation. In addition, organizations having high levels of reactor business strategy are positively linked with open innovation.

Research on the Customer Centered Marketing Evaluation, Management and Control System

Wang Shihui

School of Economics, Wuhan University of Technology, Wuhan, P.R. China, 430070

(E-mail: bbmg_wangshihui@163.com)

Abstract: Customer centered marketing evaluation, management and control is the focus of marketing management. This paper pointed out the necessity and importance of the customer centered marketing evaluation, management and control system to the marketing work, respectively from the angles of deep customer demand survey, customer satisfaction evaluation, marketing behavior review and customer relationship management, explored the composition and operation mechanism of the marketing evaluation management and control system.

Key words: Customer; Marketing; Evaluation; Management and control

1 Introduction

Marketing management is the process of collecting relevant information, researching customer demands, constantly mining customer internal demands and then meet customer demands. Under the condition of new economic norm and the continuous adjustment of the industry, it is especially important to fully judge the situation, constantly improve the level of recognition, seriously look up deficiency and diagnose problems, and correspondingly optimize the layout of marketing strategy and sales strategy. As for industries at the critical moment of industry turnaround and transformation, enterprises should be with more strong sense of crisis, further enhance the management and control strengths and utilize more scientific and effective management tools. Marketing assessment management system is mainly to evaluate the effect of enterprise marketing tools, technology and method in the practical application process, and in the process of analyzing enterprise marketing ability, improve the enterprises marketing ability and efficiency(Neng he Wang 2012;Mathews et al.,2016).In the domestic and foreign research, the research of the marketing evaluation management and control system mainly includes two aspects: the design of marketing evaluation index system(Kontis et al.,2015)and the marketing evaluation method. Many researches concerning to the design of marketing evaluation index system(Martin,2016), but it lacks of correspondingly indicators and quantitative models (Zhixin Du, Kang Qi, 2013; Han Mei, He Yue,2015), and exists strong subjective indicators. (lvshi Guo, 2011). The methods of marketing assessment mainly include the customer lifetime value method (CLV) and the return on investment evaluation method (ROI). Customer centered CLV focuses on the customer's cognition and satisfaction, which is related to the long-term development and benefit of the enterprise, but this approach ignores the problem of investment in marketing costs; In contrast, ROI evaluation method can avoid this problem, but it is easy to sacrifice some high costs investment projects which will bring long-term development to the enterprise (Zhang Li, Zheng Ling, 2012).

Therefore, when selecting evaluation method, the enterprise should assist with other evaluation models, and improve the assessment process by means of technology in order to realize the balance between intangible benefits and long-term development, and the combination of short-term assessment with long-term monitoring of the enterprise (Shen Guanglong etc, 2006). In retrospect, Scholars at home and abroad generally recognize the importance of adhering to the customer as the center in the management and control system of marketing evaluation system, but as how to build the customer centric marketing evaluation and control system, it has not been effectively resolved. For this reason, this article attempts to rely on the market information big data analysis, take the form of a more scientific market information analysis to construct the marketing evaluation, management and control system to seek innovative marketing model and system.

2 The Customer-Centered Deep Customer Demands Survey

In order to improve the efficiency of marketing management, enterprise needs to adhere to taking customer as the center, carry out the market information collection and explore the deep customer demands from the perspective of management control and evaluation. Specifically, aimed at the review, analysis and evaluation of marketing behavior, systematically collect, do statistics, collate and analyze the market and customer big data, Multi-angle analyze the marketing team's marketing efficiency. It will

be helpful to continuously strengthen the internal effective and perfect communication between the marketing team and the production department, continuously provide quality value-added services to the production department. Through leading the frontline sales team from “the customer as the center” marketing ideas to collect market and customer information, supervise and regularly provide Market Research Report, the market information can be retained and accumulated, and can be the basis for the construction of marketing assessment control system. The comparisons between the customer centered and the enterprise centered are shown in Table 1:

Table 1 Customer Centered Deep Customer Demand Survey

customer demand	Customer-centered performance	Enterprise-centered performance	Thoughts to establish the marketing evaluation, management and control system
Customer Solution	The problems existing in the customer actual purchase and use; Customer demand for the purchasing way, pre-sale and after-sale service.	Potential problems considered in the design of an enterprise; various needs subjectively considered	Coordination between demand side and supply side
Customer Cost	Customers should / hope to pay how much cost	Pricing from the perspective of enterprise product cost	Pareto optimal on Pursue of the consumer surplus and producer surplus
Communication	Strengthen communication with customers	Need to carry out what kind of sales promotion activities	The transformation from One-way communication to two-way communication
Convenience	To allow customers more convenient to buy and use	Enterprise self-owned distribution channels and network	Sales network optimization

Evaluating on the cognition and development situation of the “Customer centered” marketing concept is the process to examine whether the marketing concept has transformed from the enterprise centered to the customer centered. Deepen the use of “customer centered” 4C marketing ideas, centering around the “demands solution, customer cost, two-way communication, purchase convenience”, conduct marketing activities, to further promote the scientific analysis of market situation and ensure that marketing activities is reliable and effective.

3 Customer Centered Customer Satisfaction Evaluation

Customer centered customer satisfaction timely evaluation and dynamic evaluation is an important basis and link of the construction of marketing management and control system. To explore the performance, reason and essence of customer satisfaction level can help enterprises shoot the arrow at the target in the construction of marketing evaluation, management and control system, and carry out targeted improvement work. Whether the work to maintain the existing market and open up new markets and so on is effective, must be based on customer satisfaction as the premise. Around the center of the customer, customer satisfaction that the Marketing evaluation management and control system try to ensured is not only set up the customer complaints department, Smile service or behave kindly, but also need to develop higher customer service standards based on the status quo of customer satisfaction. This extra value and service is not only a set of rules or actions, but the attitude of the entire company, and it is an important part of corporate culture. Customer centered marketing evaluation, management and control is also a kind of philosophy thought of enterprise management, that is, to create value for customers, or to say, to create the customer value. Customer centered customer satisfaction evaluation must follow the following steps:

3.1 The customer satisfaction index

To establish a set of scientific customer satisfaction degree evaluation index, the first to do is to study the structure of customer demand, and evaluate from several aspects of the demand structure. The basic structure of customer requirements is shown in the first phase of Figure 1:

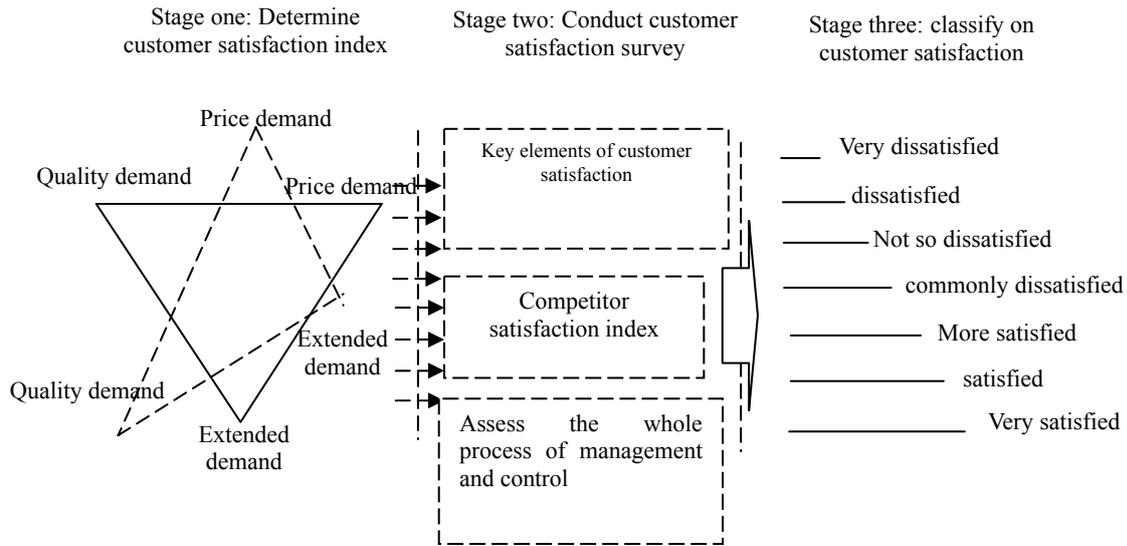

Figure 1 Three Stages of Customer Satisfaction Evaluation

The quality requirements in Figure 1, in addition to the basic performance indicators, there are aesthetic, economic natures, etc; Epitaxial demand includes service needs, psychological and cultural needs, etc.; Price demand includes price level, price to quality ratio, price elasticity and so on. In the provision of products or services, all the 3 basic customers' needs should be considered.

But different consumer groups have different demand intensity for these demands. At the same time, there is a level of satisfaction after consumption. When the customer demand intensity is high, slightly inadequate will lead them to be dissatisfied or very dissatisfied, When the customer demand intensity is low, it needs only a low level of satisfaction. Therefore, the triangles in Figure 2 will show different shapes. In the construction of marketing evaluation management and control system, we should determine the main demand structure according to different customer needs to meet different levels of customer requirements and satisfy customers.

3.2 Customer satisfaction survey

To evaluate the degree of customer satisfaction, it is necessary to establish a set of product related project which is capable of reflect the degree of customer satisfaction to the product. As the customer has different intensity requirement for the product demand structure, and the product is made up of many parts and each part with many attributes, if a part or attribute of the product does not meet the requirements of the customer, they will make a negative evaluation and feel discontent. Therefore, the enterprise should, according to the customer demand structure and the characteristics of products, select the subjects that not only can fully reflect the status of customer satisfaction but also can be representative of the subject as the evaluation index of customer satisfaction. Fully refers to the evaluation of the subject's setting should include both the core subject of the product, and the intangible and the extension of the product subject. Otherwise, not only we are unable to fully understand the degree of customer satisfaction, but also it is not conducive to enhance the level of customer satisfaction. In addition, due to large number of factors that can affect customer satisfaction or dissatisfaction, it is impossible to treat all the factors as measurement indicators, so, enterprise should choose main factors that is representative as the evaluation subjects.

Customer satisfaction survey is shown in the second stage of Figure 1, one content of the customer satisfaction survey is the key elements to determine the cause of customer satisfaction, that is to judge whether the customer management can effective improve and bring customers a unique consumption experience. For example, customers are more interested in what products or services, and whether the satisfaction analysis is reliable or reasonable.

The second content of customer satisfaction survey is the index to evaluate the satisfaction of the company and the main competitors. Reasonable and effective customer satisfaction survey and analysis is a very important factor to effectively strengthen the comprehensive competitiveness. The evaluation of the satisfaction index of the company and the main competitors, can make the satisfaction index be better in place to achieve the standard.

The third content of customer satisfaction survey is the whole process of control survey. In the process of customer satisfaction survey, more diversified consideration should be given to the overall management and control system, and control in advance, control in-process, and Ex post control, should be effectively enhanced to a practical and effective level. This is very important for customer satisfaction survey to issue a special data report, which can effectively improve the overall customer satisfaction evaluation.

3.3 Customer satisfaction degree

Customer satisfaction is a kind of psychological state as well as self-experience. The psychological state must be defined, otherwise, it is hard to evaluate the customer satisfaction, and then is also hard for the marketing assessment management and control to achieve its results. Psychologists believe that the emotional experience can be divided into several levels according to their cascades, therefore, the customer satisfaction degree can accordingly be divided into seven steps. As shown in the third stage of Figure 1, it specific includes:

1) Very dissatisfied: indignation, anger, complaints, anti propaganda

Very dissatisfied state is referred to as customers, after the consumption of a certain product or service, are indignant, angry from embarrassment, angry intolerable. Customer not only attempted to find opportunity complaints but also use every opportunity to carry out anti propaganda to abreact the unhappy of heart.

2) Dissatisfied: anger, annoyance

Dissatisfactory state refers to the atmosphere or trouble state produced after customers' consumption of a certain product or service. In this state, customer can reluctantly or barely endured and hope that through a certain way to compensate, at the appropriate time, will also carry out anti propaganda, remind his friend and relatives not to buy the product.

3) Not so satisfied: complain, regret

Not so satisfied refers to the complaint, regret state after customers' consumption of a certain product or service. In this state, customers though are dissatisfied, but also can reluctantly accept.

4) Commonly dissatisfied: no significant positive or negative emotions

Commonly dissatisfied state refers to a state in which a customer has no apparent emotion in the process of consuming a certain product or service. That is, without saying good or bad, just able to pass.

5) More satisfied: favor, affirmation, praise

The more satisfactory state refers to the favor, affirmation and praise state that customers formed in the consumption of a commodity or service. In this state, customers are fairly satisfied with the heart, but to the higher requirement are far worse, and to the worse is comforting.

6) Satisfied: satisfaction, praise and pleasure

Satisfied state is the satisfaction, praise and happy state that customers formed in the consumption of a commodity or service. In this state, customers not only to their own choice to be sure, but also willing to recommend to friends and relatives, while their expectation is basically consistent with reality, there is no a clear regret.

7) Very satisfied: excited, fulfilled, grateful

Very satisfied state refers to the excited, fulfilled and grateful state that customers formed after the consumption of a commodity. In this state, customer expectations not only fully meet without any regrets, but may also greatly exceeded their own expectations. At this time the customer is not only proud of their choice, but also possible to use every opportunity to recommend and publicize the product to relatives, hope others buy the product.

To sum up, in order to establish an effective customer satisfaction evaluation system, we can first start from the intensive study of customer demand structure of three demand elements "quality, extension, price", At the same time, according to the characteristics of the product, we can choose some representative subjects that can fully reflect the status of customer satisfaction to investigate. We must ensure that the customer satisfaction survey content is comprehensive, correspondingly and targeted, and ensure the control of the whole process of investigation, so that the investigation is effectively. The second is to further grasp and understand the seven steps of customer satisfaction, to achieve fairly knowing of the score, to grasp the customer satisfaction status all the way and adjust the marketing strategy timely and properly.

4 The Review of Customer Centered Marketing Behavior and the Customer Relationship Management

To construct the Marketing evaluation management and control system needs to continuously collect and accumulate market, sales and customer related information and regularly carry out marketing review and analysis, to restore the market conditions within the selected time period and assess the impact of the current marketing work on the current performance and the later performance, so that to ensure that the company's development direction is consistent with the market changes, and to be able to continuous improve the marketing level of the company.

Based on above, the Marketing evaluation management and control system can help the company timely formulate and revise the regional market management and fractionize customer management and company management to make it not only consistent with the company's strategy, but also in line with the objective situation of the market. The Marketing evaluation management and control system is helpful to the marketing team to accumulate experiences having real data support and enhance the sensitivity of the team to the market environment change as well as provide a solid analysis basis and an evaluation tool for the post marketing work. A retrospective view of customer centered marketing behavior as well as its performance are shown in table 2:

Table 2 A Retrospective Perspective and Performance of Customer Centered Marketing Behavior

Analysis and evaluation perspective	Analysis and evaluation behavior	Analysis and evaluation content
Market area	Quantitative analysis of marketing behavior	Product sales radius and customer structure optimization. Sales volume and market share. Sales price of different products. Sales volume, sales price, inventory, etc. product mix. Number of customers.
distribution channel	Quantitative marketing performance	
Sales branch	Quantify the implementation of the overall marketing strategy and marketing performance	

The above data acquisition, analysis and evaluation can help enterprises more clearly control the sub companies in the regional markets and sales channels on the marketing performance, and Make each branch can carry on the horizontal comparison so that each branch can make horizontal (with other branches) and longitudinal (With competitors in the market area and in the sales channels) compared. Thus, it is possible to find out the advantages and disadvantages of each branch and further optimize the marketing strategy. For the coincident market area of different branches, this type of analysis can be used to find out which companies have what competitive advantage and also play an important role for the future to confirm the market area of each branch and to prevent disorderly competition between regions.

Customer relationship management is an important way and means for marketing evaluation, management and control, but to highlight the customer as the center, it is necessary to collect customer data as much as possible and optimize the customer portfolio, through customer visits and daily behavior information recording to administrate the sales team and sales behavior. Customer centered customer relationship management assist the marketing evaluation, management and control system to promote the performance of marketing management and customer service, the specific classification management as shown in table 3:

Table 3 The Customer Centered Customer Relationship Management

working types of customer relationship management	working content of customer relationship management	points of marketing evaluation, Management and control
Customer positioning and sales behavior management	In daily work, optimize the work behavior Customer portfolio analysis, management Tracking sales behavior and sales intensity	Customer selection and sales behavior tracking
Action plan management	Management area and Key customer action plan Follow up customer action plan	Marketing plan monitoring
Customer visit	Preparation before visiting Customer visit report	Customer communication detail management
Management layer support	Support the work by tracking the sales representative of the daily work. support the inter regional, inter firm joint visit	Cross region, cross sector coordination

In the difficult situation of the current and future period, establishing the marketing behavior management system and using auxiliary information tool to diagnose problems, scientifically formulating the marketing strategy, optimizing the marketing management process, and more systematically and comprehensively managing the sales behavior and teams will further provide the basis and protection for the cement industry development to against the contrarian trend.

5 Conclusions

With today's marketing work more and more sophisticated, more and more networking and personalizing, as well as the competition more and more fierce and homogenizing, the customer centered marketing evaluation management and control has become the focus of marketing efforts. Carrying out the customer centered deep customer demand survey and only by doing it, can ensure that the premise of the marketing evaluation management and control work with a rational basis. "Multi angle, multi dimension" Conducting the marketing analysis and the evaluation Review, acquisition and recording the accurate multi-dimensional data, and strive analysis preciseness and assessment justice, only by doing above, can ensure the arrow of the marketing evaluation, management and control work shoot at the target. Focusing on the customer centered marketing behavior review and the customer relationship management, only so can ensure that marketing evaluation, management and control work to be implemented.

Abstract: Small Medium Enterprises (SMEs) in Malaysia play an important role in the country's economic development. The aim of this study to discuss the challenges of SMEs in expanding into overseas global market due to international expansion. The focus of this paper is the challenges of SMEs in expanding into overseas global market. The current trend of economic growth, globalization, ICT technology and the rapid industrial development has made Malaysia as one of the most open economies in the world.

Key words: SME (Small Medium Enterprise); Internalization; Challenges of SME; Tangible and intangible factors of SME's; Types of SME's exports

1 Introduction

The increasing development of globalization in the international business environments is very crucial in today's business economy. Induced by globalization, it is highly expanding concentrate on the internationalization of small firms. In spite of the fact that SMEs is the biggest source of development and creation of employment, and are not much noticeable or presence in global market with respect to their commitment and local advancement. There is a lack of research on small and medium enterprises and export improvement in developed nations. Standardization plays an imperative part in today's market and business, particularly when the organization tries to enter the global business sector to compete and experience internationalization.

As more companies enter the global business environment, there is expanded rivalry. Expanding rivalry brings about a decrease in the capacity of small and medium firms to manage their improvement ways (Todd, et al, 2007). Additionally, incorporate that trade liberalization expands the limit of good producers and retailers to enter the market, hence SMEs find it quite hard to survive or even keep up their present business position in their particular markets. (Singh, et al, 2010)

1.1 Definition of SME

The definition of SME in one country might be different from another and each country might have its own specifications of it. The definition that is used mostly with the quantity of employees and the amount of total net asset, investment level and sales also been used in some countries (Adam, I. O., et al, 2015). Another article also demonstrates that SME covers an extensive variety of meanings and values, which could be different based on their approved statistics (Olang'o, et al, 2014). Small firms are the foundation of basically all economies around the world. (Wattanaputtipaisan, 2003; McDougall, et al, 2003)

Although there is no universally agreed meaning of SME, a percentage of the regularly used criteria are the count of the employees, estimation of total assets, turnover, estimation of the size of capital and sales (Olang'o, et al, 2014). However, other researchers, recognizes that among all the different definitions, the quantity of employees and workers have been used the most in definitions, but still with that, there are different definitions from high and low number of employees (Adam, I. O., et al, 2015). The majority of them define SMEs with employees less than 250. Definitions based on size differ significantly, as per what is normal in other countries, for instance, for more than 20 years, Canada has marked SME organizations as firms with not more than 100 workers manufacturing sectors and bellow 50 in the service field. Medium-sized organizations are frequently depicted as having 100 to 500 employees (Fedorowicz, 2002).

1.2 SMEs and internationalization

Internationalization is characterized as the activities that pass through the national boundaries; it is

planned to add values in associations. These days, internationalization influences all organizations, big and small. Progressively, SMEs are faced with global rivalry and compelled to play a critical part in worldwide markets. (Al-Hyari, et al, 2012)

Small companies are turning out to be highly global, contributed somewhere around twenty to twenty five percent of global activity of manufacturers (Al-Hyari, et al, 2012). To globalize, small firms usually experience significant challenges, the challenges are difficult and both could be internal to a specific company or radiating to the bigger market environment that SMEs perform, including the challenges involved in trade policy (Fliess, et al, 2006). Still exporters could face overwhelming difficulties that reduce their capacity to realize such development chances. However, To become successful in the foreign markets is not that simple such as, social contrasts, savage rivalry, and expanding motion in the business sector (Ates, et al, 2013; Li, et al, 2004). Smaller and younger industries could be especially helpless to exporting challenges, as asset requirements and hierarchical restrictions expand their powerlessness (Neupert, et al, 2006).

Universal trade is vital, specifically for improving nations, as it could increase employment and imports (Dusoye, 2013). Export activities expand productivity, enhance trade adjusts, and help to manage the issues of destitution and unemployment (Evangelos L. Psomas, et al, 2010). However Success in trading in small organizations depends widely on foreign market intelligence. In this way gathering of related data ought to be a need in supporting SME's development and exports, it doesn't convey that different elements, for example, the education level and capital accessibility must not be counted (Ghauri, et al, 2003). Internal business situation has been progressively influenced by global financial elements, and the capacity for smaller companies to disconnect from outside rivalries have reduced, particularly for a company which work in worldwide businesses (Al-Hyari, et al, 2012).

2 Challenges of SMEs

SMEs play an important role in economic activity through employment, innovation and development (Turner R, et al, 2012). Small organizations are without a doubt critical to keep up solid financial development; nonetheless, the way to maintain their execution in the long run is a major problem. Feasible and reliable high is portrayed performance by performance management practices (Ates, et al, 2013) .

The applied suggestion expresses that boundaries caused the business activities to be more troublesome abroad in comparing to residential market exercises. In that admiration, evacuation or minimization of those boundaries could help to a higher export rate and performance, a very admirable objective of governments (Al-Hyari, et al, 2012) .

SMEs is habitually stood with significant challenges. Contrasted with bigger organization, SMEs benefit less regularly from economies of scale, and less have access to a wider asset base. As a result of the typically low value proportion of SMEs, they are moderately powerless against external events contrasted with bigger organizations. That this represents not only bigger companies face many risks as well as SMEs, whose survival is all the more effortlessly debilitated due to their little arrangement of – both budgetary and non-money related – assets (Muhammad Khalique, et al, 2011). It gets to be significant to research the challenges and constraints that are able to help the SMEs to address these issues in order for SMEs to participate in economics improvements and the development (Zaroug Osman Bilal, 2015).

2.1 Management challenges

We should not question the significance of ventures in SMEs, yet the management group in general and the project management group in particular does just a bit to give SMEs direction on overseeing activities. Researchers have examined variables, adding to the performance of SMEs yet work has concentrated essentially on the commitment of the management group (Turner, R., et al, 2012). Risk management may help SME supervisors to recognize critical dangers that could imperil the achievement or presence of the organization so as to proficiently adapt to them. Misconstruing or neglecting to perceive the risks can – in the most pessimistic scenario – have appalling outcomes, going from client's misfortune to harming liability, environmental damage and conceivably, even insolvency. Notwithstanding, numerous SMEs don't – or not sufficiently – apply risk management rehearses, generally because that they can't stand to rededicate assets because of their requirements (Craig C. Julian, 2012; Mohd Zulkifli Muhammad, 2010).

A brief audit of the literature demonstrates that there are a few studies centered upon senior corporate management visions, projections, future management visions, future desires, potential

opportunities and threats connected with the new business environments (Coskun,2002).

2.2 Marketing challenges

Marketing issues and execution of marketing choices are not selective to big organizations settings. Small and developing firms face marketing issues for their basic survival and development. Insufficient experimental proof is available, then again, on the part of marketing in the advancement of small enterprise research. Given this deficiency of literature, it is hard to survey rapidly the relative impact of marketing on the improvement of small enterprise research (SER). While there has been used of hypothesis and experimental exploration from the marketing discipline, there has been no predictable example of its use (Romano, et al,1995).

Research has demonstrated that planning is an issue for small enterprise management, which has a tendency to be responsive in style. Since few firms do not have the specialists and authorities available in bigger ventures the directors of the business need to have common knowledge (Fuller ,1994). The researchers have perceived the studying on marketing as a tricky process for more than 20 years (Simpson,et al,2006). Research on SME's marketing and their exercises have been generally restricted to clarifications of specific sorts of conduct that found in SMEs. Characterized export marketing issues as "those gaps, which need to be filled before the competitive producer becomes a successful exporter ". Internal export challenges are characteristic for the company and normally are related with not enough company assets for marketing expert, for instance, issues relating to meet import quality models, and setting up the suitable plan and picture for the export market (Ghauri ,et al,2003).

Issues identified with the poor association departments of export and company's absence of equipped employee to manage the exports, the powerlessness of poor finance trade deficient data about foreign markets. Albeit truly segmented, they organize interior problems that impact export activities of manufacturing companies in developing countries, entering foreign markets (Ghauri ,et al,2003). External export issues are identified with the business, the export market and the macro environment. Macro environment challenges are components beyond the association's control, for example, the absence of fitting trade institutions, unfavorable trade rates, unlucky deficiency of an empowering national export strategy, and global agreements (Ghauri, et al,2003).

The management structure in SMEs regularly implies that practically there is no marketing planning and numerous of small sized companies' failures outcome from insufficiencies in marketing. Researchers have discovered this responsive style, even among exporters where it may be expected there would be a more systematic approach to marketing (Fuller ,1994).

3 An Example

SMEs play important roles toward export around the world (Fletcher D, 2004). SMEs also represent the newest sector in economies for respective country especially in Asia. This small business at the early stages will face challenging factors within their competition to achieve their business goals (Kent E. Neupe,2006). SMEs need to meet export requirements at early stages with limited resources in different organizational structure increase their confidence level in the global market environment (Katsikeas,et al,1994; Leonidou,1995; Lönnqvist, 2004).

Furthermore, various researchers found that problem faced by SMEs is financing problem, rules or regulation of the host country, lack of experience and foreign market contact (Bell, et al,2001; Bones,2007). According to related researches, [SMEs doing export also facing issues on resources and organizational skills, language barriers, and demographic issues(Fletcher,2004). Furthermore, the problem also found that challenges on the global market are foreign market opportunities, policies, regulation and start-up cost (Leonidou,1995).

Another major study, classified internal and external challenge factors involve in global market industries (Leonidou,1995; Li, H.-H., JK.,et al,2004). Internal barriers can be categorized into formational, functional and marketing, while external barriers such are procedures, government deregulation and business environment (Neupert, et al,2006). Related research mentioned that problem to find middle man or third party, product acceptance, and financing were important factors faced by SMEs exporters. Other researches, indicated that lack of training, knowledge, lack of infrastructure, failure workforce, lack of ISO implementation and experience (Angelogiannopoulos, et al,2007).

According to some scholars, define many reasons to initiatives SMEs to meet their competitor in the global market are (Dr. Jan Fedorowicz,2002):

- Suitable website for SMEs to get direction from government program and information
- A comprehensive inventory of market and business information

- Mentor mentee services either free or at subsidized rates.
- Improve skill building, especially developing in the international trading system.
- Assistance with trade shows and exhibitions
- Tax incentive from government to encourage SMEs in the global market
- Incentive for SMEs to be a major international logistics hub

SMEs that involved in the higher export transaction involved acquired higher export profitability and export marketing strategies (Neupert, K. E., Baughn, et al,2006; Salvo, et al,2008). Furthermore, (O’Cass, et al,2003) business in global market strategy did not have any relationship within export performance and supported by recent argument (Abdul Adis, et al,2010), clarified that there were no related between global marketing strategy

4 Importance of Intangible Factors Towards SMEs Success

Various authors, scholars and experts clarified (Bones,2007), Four (4) key forces management in SMEs role today are intangibility such as globalization, digitalization, innovation and organizational restructured. Furthermore, other researchers also, clarified that increase in knowledge-based economy, such as intellectual property, reputation, human capital and customer relationships (Jarvis, et al,2006). Others, classified that more than 90% of SMEs in service sector generate income from the intangible assets. Furthermore, SMEs can be successful improved targeting the intangible assets such as customer’s tribes, brands, and intellectual property (Brooking,2010).

Table 1 Classification of Common Success Factor (Lonnqvist, 2004) Success Factor

	Financial	Non-Financial
TANGIBLE	Economic Growth Liquidity Product/Service Costs Profitability Capital adequacy	Delivery time Quality Products Production Volume Productivity Stock turn time Service volume
SUCCESS Factor		
INTANGIBLE	Brand value Goodwill Value of immaterial properties	Competencies Customer satisfaction Customer retention Innovation Motivation Personal satisfaction

Table 1, Classified critical success factors based on not only on financial and non-financial but also tangible and intangible challenged for performance planning and management. The two upper boxes aspect of tangible assets and lower boxes are difficult to be measured which are intangible assets (Lönqvist,2004).

This research will make in-depth studies the areas of leadership, innovation, image and reputation, entrepreneurial competencies, and organizational culture as they consider critical success factors for SMEs. A major factor has been identified SMEs need to remain in business and need to have self-confidence to become a large firm both domestic and global. Therefore, researchers need to find how important SMEs growth can be successfully overcome the barriers and rewarded (Li,et al,2004).

5 SMEs’ Exporting in Developing Countries

Growing in SMEs business in global market competition forces government to meet market oriented policies within the domestic and foreign market. Growing technologies in business operation can reduce cost of information and time capabilities in global economy (Mohd Zulkifli Muhammad,2010). Therefore, because of these factors a new small business was not only growing in domestic industries, but their global market activities such as trade, technology and investment.

SMEs involved their business in the global market, particularly meets challenges within SME supplier’s connection within larger Multi National Enterprise in local markets. In this situation SMEs faced higher barrier requirement in international operation compared to larger firms because of capabilities. Others clarified that importance of strategic alliances by SMEs (Gomes-Casseres,1997) However, much of the research, clarified that (1) when small business uses alliances to do foreign business operation, (2) how and when to use alliances and (3) alliances competitive performance.

Many analysts, classified SMEs into three capabilities and challenges (McMahon, et al,2001). Firstly, capabilities to meet international competitors, second able to accept globalization pressure and thirdly they need to be protected by government from globalization effect. According to related research, SMEs can be described able to facing international market competition. However, SMEs needs to be knowledgeable to compete successfully in international markets and other researchers, clarified that the barriers, mostly due to differences in rules and regulation, socio-cultural and procedural differences (Hassan, et al,2011). Barriers to globalization hinder the entrepreneur's ability to overcome problems, develop and able to meet international operation in the global market (Leonidou,1995). Furthermore, others (Shoham, et al,1995), identified the primary barriers in global market include business attention, government policy, foreign rules and procedures. It is also defined that challenges in international markets include difficulty in collecting payment from foreign customers, and high cost of global market transaction. It is also will affect cash flow problems for exporters (O'Cass, et al,2003; Da Silva, et al,2000).

The high cost in global markets such as insurance, market research and distribution cost. Therefore, due to this issue will result in higher production costs in the market and the SMEs will increase the price of the product. As a result, increase in product price will make the product less demanded in the foreign (Da Silva, et al,2000). SMEs need to be creative in a foreign market exporter such as to build a good relationship (Kotabe, et al,1992). Therefore, without this assistance some SMEs found that it is difficult to market their product, especially host country governments protect their domestic industries. Thus, government policy can act as a barrier to success in the global market (Lages,2000).

Fluctuations in currency can create losses due to currency is devalued. Therefore the price of exports will increase in the target market and reduced demand (Karunaratna,1997). As a result, SMEs needs to find out how to overcome pricing and promotional policies according to the environment. SMEs need to adapt products to meet foreign customer's demands (O'Cass, et al,2003). As a result, adjusting pricing in the global market are important decisions in their business practice and will affect SMEs company profit. If the SMEs did not meet the price level according to the host country and their agreement venture could be terminated (O'Cass, et al,2003).

Promotional strategy also needs to organize by the SMEs because it is required from the target market (Cavusgil, et al,1994). As a result, it gives local competition inspire with the foreign competitors that able to meet local market requirement. It is important that knowledge of local markets by SMEs in foreign market will stimulate the firm to develop products according to demographic requirement. However, whether to accept and adapt the SMEs product demand based on localized strategy and benefit to the local market (O'Cass, et al,2003).

6 Types of SME's Exporting

Up to the middle of 1990s the firms reviewed based on export and administration studies were frequently divided into exporting companies and non-exporting companies are highly vs. limitedly exporting firms. During the past 10 years the world has increasingly concern toward the firms, which involved their operation to the oversea countries, or sales straighter rather than the firms, which grow and get powerful first to the home country then involve in oversea market and sales. These companies have been named fully differentiated in different studies: born global Madsen inter- national new ventures (INVs), global beginners (Knight, et al,1996; Oviatt, et al,2005), or high technology beginners (Jolly, et al,1992). In the lately, the term born again international companies have also suggested, to explain long-established companies which, used to concentrate on their domestic markets, but abruptly opt for fast internationalization (Bell, et al,2008).

The most important reasons for development of these new kinds of firms are (Knight,et al,1996; Madsen, et al, 1997; Rialp, et al, 2005): (1) the great significance duty of niche markets, (2) the develops in procedure of technology, (3) the improvement in communication of technology, (4) the intrinsic, improvement of small firms, (5) the definition of internationalization that have become more available to all companies and higher backing tasks for the higher international connections and collaboration, and (6) the higher amounts and usage of international networks.

Looking at the definitions used in different Articles that concentrated on born global, many reviews have obviously shown that there are a lot of differences. According to an analysis of 55 studies which dealing with global startups, have discovered that two criteria were more often used in these descriptions: (1) the time frame from creation to beginning of exports/oversea activities and (2) the portion of exports into that time frame. Lowest used criteria were the time of establishing of the firm, the quantity of

export target countries, and even more limitedly the kind of target countries (Dominguinhos P,2004)

Focusing on the time frame, some comparatively few studies used a time frame of one or two years from the creation to the beginning of export. Some relatively other studies used a period of three years, but in most of the studies a period time frame of six years has also been used, obviously influenced importantly, by the precursor studies (Oviatt, et al,2005). In few studies only the reference “in the first years’ is at work. Thinking the role of exports, some studies do not impose any exact share, in some studies 5, 15, or 25%, respectively has been used as the lower portion in exports. In regards to the foundation, some studies have concentrated on companies founded in 1978 or more recently, or in some studies in 1990 or more recently, but most of the studies do not place any borders due to witnesses from the existence of global startups before the mid 1970s. In some studies, the lowest demand of at least three countries of exports has been used; in some studies, even higher, harder demanding reservation like exports or functions in two continents, but merely behind a rather long time since the foundation. Furthermore, significant specifications of the operation should be that the oversea sales should be continuous and important for the company (mainly increasing role) (Dominguinhos P, 2004). As the prior discussion it shows there are big differences in the description used for bearing global. These variations can have a high influence on the outcome of connected manners, strategies, and export efficiency

According to the description and descriptions introduced above, we have agreed on two varies categorization to the present study: (1) a weaker categorization and (2) a narrower categorization. In the weaker classification the firms only, separated into two subgroups according to the time frame and the being of exports: no exports vs. exports within three years from the foundation, without any extra terms. The sub- groups are named as truly traditional exporters and born global.

In the second categorization three terms were focused (1) the period and the being of exports: no exports vs. exports within three years from the foundation, (2) the share of exports in three years: if the exports portion had overtaken the 25% limit of the whole sales during the agreed period of time, and (3) the ongoing and significant/ large role of exports: if the share of external sales had attained the 50% limit of the whole sales. The sub-groups are named as traditional exporters and truly born global. These cutouts of 25%, according to the previous studies that on the truth if the global sales attain to that area the firm must take the international operation very strict and the globalization is not far-flung after that.

For more info, the necessity of minimum 50% share of oversea sales was chosen to show the ongoing growth and significant role of overseas sales. Without this kind of additional terms, e.g., a company which has started its overseas sales within three years from the foundation (share of total sales may even go over the 25%), possibly according to an unwanted inquiry, but which stops majorly or whole the exports over the three years, would be categorized as a born international.

The name born global shows operation in various countries or that located on different continents. Because these terms were not put, as it has also been the case in a lot of previous studies even though the condition is used, it was decided that the term “born international” will be used in this article to describe most real the nature of these SMEs.

As argued before there are clear existence evidences that born international companies history is much durable previous 1990s. In fact, e.g. in the research (Aspelund, et al,2005) the oldest born global firm in their sample was founded already in 1884. However, their number was obviously increased during 1990s (Moen, et al,2002). In their analyst, most of the French and Norwegian global companies, which founded in 1990s, can be categorized as born internationals. The outcome in Denmark also shows the same status. As well as there are a lot of born global firms outside hi-technology sectors too, for example, in the user goods and the service departments (Knight, et al,1996). This looks to be the case, especially in lower developed countries with small domestic markets. Hence, it was decided not to put any restrictions for born global firms, according to the time period of foundation, or series of industry.

Many specifications are considered to describe the born global companies (Knight,et al,1996); (a) concern on highly specialized international market niche, (b) developing their export/oversea activities quickly into many markets, (c) entering to their lead markets more faster compare the traditional companies, (d) processing very quickly the steps of globalization (e) they may use leap-frogging in their activity tactics development, and (f) they use more solidarity and alliances in compare of traditional companies. Many authors discuss that the being of this type of firms is concerned on hi-technology sectors, but there are witnesses that these kinds of firms are not limited merely to hi-technology sectors (Madsen, et al,1997). Based on a recent investigation, the share of oversea sales of Danish born global was, on average 71%, whereas the relative share in US-based born global was 47%. For a latest study modeling the aspects affected the speed of globalization (Oviatt, et al,2005).

7 Export Barriers

Obligation to export market is a base of the export marketing traits in a company. The manager's audit and operation in overseas market drive of SMEs in order to get and reach higher globalization traits experiences (Reuber, et al,1999). Export direction is total trend, ideas, and conception of a company's management, which indicate the company's practices for export operations. The aim is to higher the export level of Small Medium Enterprises and based on this view the top management behaviors and sustainability is more efficient in export approach (Cavusgil, et al,1994; Solberg,2002). Companies must start overseas by geographical and cultural, which are more similar markets for beginning (Johanson, J,et al,1990).

Based on the meaning of this strategy the high vagueness of the globalization causes the companies to start the procedure with overseas markets, which are physically, and lettered alike to the native market firms. So, few additional practices of resources are needed to defeat the export obstacles. Despite of this gradual strategy, there are still extra export obstacles recognizably at every level of the globalization process, from the beginning stages until the latest committed stages. (ACS ET AL, 1997) Globalization traits have caught the attention of many researchers on having the negative role in the export barriers perception in small and medium enterprises (Katsikeas, et al,1994; Katsikeas, et al,1995).

The perceptual formation export obstacles have researched, particularly based on country's growth rate and organizational influence (Lages,2000). Which some other researches are mostly general in nature. Furthermore, other researchers (Morgan,1997), found three export obstacles categories of as approach barriers, activities obstacles, and information obstacles. Others, classified five aspects regarding the significance of obstacles in exports include on thinking entanglement in paper productions exporting. Cluster opinion that there are five driving forces in the significance of export barriers included on thinking entanglement in paper production exporting. These aspects were measured in regards to the global trade literature, and named as public export procedures, approximate market distance, and lower of export obligation, outside economic limitation and competitive rivalry. Export obstacles generally as internal and external. The internal obstacles are relevant with organizational resource capability and a company's approach to export trade (Leonidou,1995). Outside obstacle root from the home and host surroundings in the company acts and searched export obstacles in an analogical research among normally and outspread exporters (Katsikeas, et al,1995).

Significant groups of export obstacles based on finite magnanimity, unidentified chance, and absence of needful resources, unreal dread and administrative immovability in meaning of managerial standpoint. Bureaucracy, that is one of the elements of unofficial export obstacle, can further weigh an outside obstacle. The conception of export obstacles seemed to be different based on company sizes and cluster too. To support others propose that, however company measure can be interdependent in some barriers realized by managers, it could be defeated by including exporting tasks by devious manners (Mittelstaedt, J. D., et al,2003).

Many analysts, categorized export obstacles based on company size groups. Prepares an experimental evaluation of non-exporter realization, which prevents the beginning of export tasks with presumption, which these obstacles will influence, their further efficiency (Katsikeas, et al,1995). Furthermore, they propose that for analytical targets, interior obstacle can be broken down additional within actions, informational, and marketing; during the outside obstacles are divided into procedures, government, activity, and environmental. Export obstacles are classified into five wide areas: pecuniary, managerial, according to the market (comprising both local and global markets), industry particulars and company particulars (Shaw, et al,2004). Export obstacles are presumed to be the most significant obstacle, according to the market. The psychological obstacles are indicated to be the most important obstacles in export activity (Hornby, et al,2002).

Results demonstrate that there are a lot of divers in manager perceptual of export obstacles among the companies from every country, lending belief to divers export task levels. Study the penury influences of unofficial export obstacles e.g. transportation expenses, heavy custom operations, expensive rules and bribery. In poor countries, these unofficial obstacles, practice as export expenses which mutilate the efficacious assign of resources, they are decreasing salaries, lowering agronomical revenue, and increment destitution. Likewise, after controlling for self chooses prejudice and for driving force which may influence both export operations and Internet connection, companies with technology availability exported higher compare to alike companies. Internet availability influences organization and service companies to a like degree. Furthermore, researchers discover that Australian exporters using the Internet realized export obstacles to be more down in comparing to a sameness category of

exporters (Hornby, et al,2002).

8 Conclusions

SMEs in expanding into overseas global market made its challenges for entrepreneurs meet their standard and requirement from export nation countries. The impact of globalization, recession, ICT knowledge and business documentation should aspire SMEs becoming more competed within global competitors. Although this study does not reflect the empirical study of SMEs in Malaysia. To compete in today's global market, SMEs will need access to learn and willing to accept new advance ideas. For example, advanced technology has affected the ways in which global market documentation is prepared and shipped. As a conclusion, in this study given and overview of challenges and factors of Malaysia's SMEs in a global market environment. Furthermore, the Malaysian government has recognized the important of SMEs for the economy and has implemented policies, action plan and programs to support SMEs in these difficult circumstances.

Abstract: The motive behind this paper was mainly to uncover the trust mechanism in the field of employee empowerment and innovative behavior. It was hypothesized that structural empowerment and psychological empowerment will influence innovative behavior. Empowerment was also hypothesized to influence trust. We also posited that trust will act a mediator. Data came from 410 respondents employed in the manufacturing, banking, cement, telecommunication sector in Pakistan. Regression analysis proved our hypothesis. In the end, suggestions and recommendations have been given.

Key words: Empowerment; Trust; Innovative behavior

1 Introduction

Innovation is at the core of organizational success (Thornhill, 2006) and this role has been empirically evidenced also (Martins & Terblanche, 2003). The organizations rely on their best human capital in order to produce innovations. These are the employee who offer creative ideas which the organizations materialize into innovations and turn into their competitive edge (Patterson, Kerrin, & Gatto-Roissard, 2009). Given the importance of innovative behavior for organizations, understanding the mechanisms involved in innovative behavior is an important area of study. Strictly speaking, in the recent turbulent economic times, gaining innovative edge is also imperative to survival of an organization.

Innovative behavior is intentionally introducing new ideas, services, products, processes, and/or procedures in the workplace by an employee. These may be limited to an employee's own unit, may relate to a group or an organization as a whole (West & Farr, 1990). Innovative behavior is also "opportunity exploration, idea generation, idea promotion, and the implementation of ideas" (Scott & Bruce, 1994). Innovative employees look for opportunities to give novel solutions to. They propagate their ideas effectively. They build support for the implementation of those ideas. They conclude with idea implementation which also includes ideas testing, modification of the outcomes, and finally the commercialization (Dörner, 2012). According to Åmo (2006), innovativeness also includes modification of routines, simplification of work, service improvement, or giving new offers to customers. The innovative workers engage in any one or many of earlier mentioned activities at a time (Scott & Bruce, 1994). Yuan (2012) recalls that element of "newness" in all the descriptions of innovation does not necessarily entail that the idea has to be new for the world as a whole. Innovativeness implies anything that is novel for a particular context of the organization or individual. Moreover, innovativeness ranges from radical innovations to incremental (Axtell et al., 2000), from administrative to technological (Van de Ven, 1986), and from soft to hard.

Though, empowerment has already been found to relate with innovativeness, yet mediating mechanisms in this realm remain to chart out. In this study, we test a path model involving organizational trust as mediator. Moreover, the studies from a developing context are also lacking in the literature. We use the data from manufacturing sector of Pakistan.

2 Literature Review and Hypotheses

2.1 Empowerment and innovative behavior

Power refers to the "ability to get things done, to mobilize resources, to obtain, and use whatever a person needs to achieve the goals of the organization" (Kanter, 1993). The level of control which employees can exercise over their work is linked with their performance. Power in formal connotation, means the decision making discretion. Alternatively, informal power is related with support and communication in the workplace (Kanter, 1993).

Employee empowerment is mostly view from two perspectives: structural, and psychological. Employees have structurally empowerment if they can approach information, support, resources, and

chances for learning and growth (Laschinger, Finegan, Shamian, & Wilk, 2004). Access to information occurs when employees have knowledge, both formal and informal, for the effective performance of their jobs. Likewise, they should also have technical knowledge and expertise and an understanding of decision and policies of organization. Access to support means receiving performance feedback from fellows, either superiors or subordinates, in the organization. Access to resources involves employees' ability to monetary resources, and implements required to complete their task (Kanter, 1993). The focus of structural empowerment is employee's actual interpretation of the work conditions (Laschinger et al., 2004). Psychological empowerment pertains to employees' psychological state of being empowered and having a feeling of control over their job (Spreitzer, 1995). In order to make psychological empowerment comprehend-able, Spreitzer (1995) cracks it into four dimensions: "meaning, competence, self-determination, and impact". Meaning refers to the correspondence between beliefs, values, behaviors, and requirement of job of an employee. Competence is confidence over one's abilities to do the job. Self-determination entails a state of mind that one has control over one's work. Impact is the feeling that one able to influence organizational outcomes. A difference to be noted between the two perspectives is that the former is the perception about the conditions empowering the employees in the workplace, whereas, the latter is the psychological reaction to such conditions (Laschinger et al., 2004).

Empowered employees offer novel ideas which otherwise are impossible. Empowerment facilitates employees to engage in "trial-and-error", a vital requirement in the process of innovation (Ramamoorthy, Flood, Slattery, & Sardesai, 2005). Empowerment allows experimentation and unconventional techniques which land into innovations and inspire original ideas (De Spiegelaere, Gyes, & Hootegem, 2014). Roberg (2007) shows that empowerment is related innovative behavior. Hence, we hypothesize that:

H1: Structural empowerment influences innovative behavior positively.

H2: Psychological empowerment influences innovative behavior positively.

2.2 Empowerment and trust

According to Mayer, Davis, and Schoorman (1995), trust occurs when party A is willingly vulnerable to the actions of party B while expecting that party B will perform an act important to the party A, regardless of party A's ability to control the action of party B. Party A would be trustor, whereas party B would be trustee in such situation. In essence, the trustor takes the risk to pose confidence over the trustee, and the trustor is vulnerable in such a way that he/she may lose something (Schoorman, Mayer, & Davis, 2007) in this interpersonal transaction (Bhattacharya, Devinney, & Pillutla, 1998). In organizations, employees do their tasks on the trust of supervisor (Bhattacharya et al., 1998). Trust may be either vertical or lateral. Vertical trust denotes employees' trust on their supervisor. Lateral trust entails trust between peer at a similar hierarchy in organization (Stull & Aram, 2010).

According to Laschinger and Finegan (2004), structural empowerment predicts trust in management. The environment which provides structural conditions to managers is responded by employees through increased trust in their manager. Laschinger, Finegan, and Shamian (2001) also held that structural empowerment develops a sense of psychological empowerment among employees which in turn builds trust of employees over their supervisor and organization. Moye, Henkin, and Egley (2005) found that empowered employees will function to eradicate mistrust between supervisor and employees. Moye and Henkin (2006) advise the way manager can improve trust among subordinates. They argue that when manager decrease dependence on control and monitoring mechanisms, employees feel empowered. They signal employees about the trusting behavior of bosses. Hence, empowerment and trust may be thought the relate positively.

H3: Structural empowerment influences trust positively.

H4: Psychological empowerment influences trust positively.

2.3 Trust and innovative behavior

Carmeli and Spreitzer (2009) have empirically connected trust with innovative behavior. They argue that trust creates a psychological contract between employer and employee. Psychological contract augments relationships with organizational peers. This relational connectivity affects thriving among individuals. The connectivity in turn, enhances employee innovative behaviors in the workplace.

Clegg, Unsworth, Epitropaki, and Parker (2002) has explained the role of trust in terms of, trust that heard and trust that benefit, in the process of innovation. They explicate that employees' trust that their organization will listen to their suggestions will have positive effect on idea implementation aspect of innovative behavior. In other words, the more the employees have belief that their suggestions are taken considerately, they will argue for the application of their ideas. Alternatively, the "trust that benefit" will operates at personal level. It is linked with the perception of outcomes and rewards. The more the employee have trust that their effort will bring rewards, the more they will engage in innovative behavior (Clegg et al., 2002).

Lastly, we also hunch that trust will intervene the connection between employee empowerment and innovative behavior. Empowerment develops a psychological feeling among employees that their organization rests trust upon them. One such feeling is developed; employees more likely go beyond the roles described for them. They engage in such behaviors which uniquely advantage their organization. Off such behaviors, innovative behavior is also a common behavior. Hence, we hypothesize that

H5: Trust will positively influence innovative behavior

H6: Trust will mediate the influence of structural empowerment of employees on innovative behavior.

H7: Trust will mediate the influence of psychological empowerment of employees on innovative behavior.

3 Methodology

3.1 Participants and procedures

The sample for this study was drawn from the manufacturing sector of Pakistan. In order to enhance the representation, we used a multistage sampling with a unique criterion at each stage. At the first stage, all the companies having an employee strength of at least 300 were selected from all provinces. Next, we randomly choose the companies in such a way that at least 5 companies are selected in each industry, that is, manufacturing, banking, textile, cement, and fertilizer.

We sent the questionnaire to at least 50 employees in every companies selected in each industry. Questionnaires were sent both by postage and using google forms. By both ways, 645 questionnaires were circulated across all the companies. The number of returned responses were 410, with response rate of 63 percent. After sorting the questionnaires for usability, 8 were discarded for lack of information. Hence the total usable sample was 402 responses. The sample comprised of 57% male and 43% female respondents. The average age was 29 years.

3.2 Measures

Innovative behavior was measured using the instrument of De Jong and Den Hartog (2010). It was measured on a behavioral frequency scale (1=rarely, 6=often).

Empowerment was measured across two dimensions: structural empowerment, psychological empowerment. The instrument on Conditions for Work Effectiveness Questionnaire – II (Laschinger, Finegan, Shamian, & Wilk, 2001) was used for structural empowerment. The factors of structural empowerment were access to opportunity, information, support and resources. For psychological empowerment, we used the scale by Spreitzer (1995). It was operationally defined in terms of meaning, competence, self-determination, and impact.

Trust was measured with the help of scale by Mayer and Gavin (2005). The scale consists of 10-items on 5-point Likert scale.

3.3 Control variables

Gender: the effect of gender was also controlled for spuriousness of inference. However, in this era, we may no longer assume any differences between males and females because now females have improved access to opportunities.

Age: was used age as control variable. It is generally observed that people usually tend to be more innovative at younger age because they are enthusiastic and have fresh ideas.

Education: was also used as a control variable.

4 Data Analysis

4.1 Descriptive results

The table below (see Table 1) shows presents a summary of descriptive statistics. All the correlations were significant ($p < .001$). For assessing convergent validity, average variance extracted (AVE) were calculated. All values were above 0.5. The constructs also had discriminant validity since maximum shared variance (squared correlations) were below AVE (Fornell & Larcker, 1981).

Table 1 Descriptive Results

Constructs	Mean	SD	AVE	1	2	3	4
IB	3.413	1.703	0.710	(0.251)			
SE	3.761	1.613	0.753	0.413	(0.321)		
PE	2.343	1.530	0.792	0.501	0.567	(0.321)	
TRUST	3.127	1.731	0.776	0.492	0.478	.541	(0.292)

IB=Innovative Behavior, SE=Structural Empowerment, PE=Psychological Empowerment, AVE= Average variance extracted

4.2 Confirmatory factor analysis

The hypothesized measurement model was test using AMOS. In the first run, the model fit values showed that model was fit ($\chi^2/df=2.981$, CFI=0.971, TLI=0.987 RMSEA=0.31). A second model was also test to check if there were any method biases (Podsakoff, MacKenzie, Lee, & Podsakoff, 2003) whether there exist any alternative explanations of proposed measurement model. In this model, all the variables were loaded on a single factor. The model fit ($\chi^2/df=4.981$, CFI=0.671, TLI=0.787 RMSEA=0.87) was out of the suggested threshold (Hu & Bentler, 1999).

4.3 Hypotheses testing

We ran linear regression for testing hypotheses testing. It must be noted that we ran separate regression models for structural and psychological empowerment. Baron and Kenny (1986) procedure was used to examine the inter-mediation model. The table below (see Table 2) reports the result of hypotheses. H1 states the structural empowerment has positive influence on innovative behavior. The results of regression analysis provide the support ($\beta = 0.405$, $p<0.001$). Similarly, in H2, psychological empowerment proved a positive predictor of innovative behavior as hypothesized ($\beta = 0.517$, $p<0.001$). Next, we regressed trust structural empowerment and psychological empowerment respectively. The results were same as posited ($\beta = 0.393$ $p<0.001$; $\beta = 0.418$, $p<0.001$). This also proved the second condition of mediation tested to be true. Third, we ran the model with trust as independent variable and innovative behavior as dependent variable. The hypothesis proved as proposed ($\beta = 0.402$, $p<0.001$). This also fulfilled the third condition of mediation. In the fourth and last step, we regressed the trust on structural empowerment, then trust on psychological empowerment and innovative behavior respectively. The results proved that fully mediated the effect of both structural empowerment and psychological empowerment separately on innovative behavior (see Table 2).

Table 2 Regression Results

Steps	Constructs	Standardized beta	Standard error	Adjusted R ²
Step 1				
Outcome	Innovative behavior			
Predictor	Structural empowerment	.405***	.031	.367
	Psychological empowerment	.517***	.027	.436
Step 2				
Outcome	Trust			
Predictor	Structural empowerment	.393***	.034	.410
	Psychological empowerment	.418***	.045	.481
Step 3				
Outcome	Innovative Behavior			
Predictor	Trust	.402***	.071	.383
Step 4				
Outcome	Innovative Behavior			
Mediator	Trust	.306***/.351***	.082/.051	
Predictor	Structural Empowerment	.385***	.074	.513
	Psychological Empowerment	.485***	.041	.590

Note: results have been reported after controlling for Age, gender, qualification, and tenure. *** $p<.001$

5 Discussion and Conclusion

The results coincide with our underlying theoretical frameworks. This paper adds to literature by uncovering the trust mechanism in field of empowerment and innovative behavior. We advise the managers to be mindful of the fact of that employee empowerment is necessary for both trust and innovative behavior.

However, we remind that the cross-sectional studies lack the establishment of causality. Since, we also use cross-sectional data which may be a limitation for this study. Further studies should be conducted with longitudinal design. Mixed methods may also bring in-depth conclusions. Across the occupation studies should also be conducted.

The Influence of Mixed Ownership Reform to State-Owned Enterprises' Operating Performance

Li Fang, Wu Yantian, Xu Fengju

School of Management, Wuhan University of Technology, Wuhan, P.R. China, 430070

(E-mail:250218181@qq.com, rainbow_wyt@163.com; xufju@163.com)

Abstract: In July 2014, the first batch of four policies reform pilots was carried out in China, which marked a new round of mixed ownership reform on state-owned enterprises officially in full swing. In this background, firstly, this paper built a conceptual model which shows how the mixed ownership reform influences state-owned enterprises' corporate governance, and then further influences their operating performance. Based on this model, through empirical analysis, the results showed that, there are positive effects in different dimensions.

Key words: Mixed ownership; Reform of state-owned enterprises; Corporate governance; Operating performance

1 Introduction

The exploration and practice of China's mixed ownership reform has experienced a long process, until the end of 2013, as The 18th Plenary Session passed Decisions of Several Important Problems on Comprehensively Deepening Reform and the publication of 2014 Government Work Report, the prelude of Actively accelerate the development of the mixed ownership economy formally opened. Then the first batch of *four policies reform pilots* marked a new round of mixed ownership reform on state-owned enterprises officially in full swing. This round of mixed ownership reform aims at exploring the combination forms and routes of state ownership and market economy, in order to achieve the magnification and competitiveness promotion of state-owned capital. In this background, this paper tries to explore the specific influence of reform policies to state-owned enterprises' operating performance. So far, empirical researches on the correlation of corporate governance and corporate performance has been relatively mature, recently policy researches about the mixed ownership reform of state-owned enterprises also have sprung up; but what is the specific influence of this new round of mixed ownership reform to state-owned enterprises operating performance is a worthy topic. The mixed ownership economy refers to an economic form, which integrates different ownership capital such as state-owned capital, collective capital, private capital. Decisions of Several Important Problems on Comprehensively Deepening Reform raised it to the height of China's basic economic system.

1.1 Foreign research review

Foreign mixed ownership reform models are as follows: "Temasek" model of Singapore, "hosting bureau" mode of Germany, "the introduction of the private system, relax market regulation" mode of The United States, "asymptotic private" model of Japan, "equity transformation" and "Mechanism reform" binary model of other western European countries.

Researches about the influences of corporate governance to enterprise performance: (1) Equity structure: Overly dispersed ownership structure makes a multitude of small shareholders have not enough incentive to supervise the operator (Grossman&Hart,1980). (2) The board of directors' characteristics: many scholars used Tobin Q to measure enterprise performance, and found a variety of relationship between the board characteristics and corporate performance. (3) Senior management incentive: Most scholars believe that there is significant positive correlation between the incentives of senior management and corporate performance (Mehran H,1995)

1.2 Domestic research review

In terms of mixed ownership reform: domestic scholars generally agree that the core of reform is property rights system reform and corporate governance. In the aspect of equity structure, traditional model of dominant state-owned capital should be abandoned (Wenkui Zhang,2006), equity diversification and diversity should be actively promoted (Xing Jing, Yangqing Ye,2014).

Influence factors to state-owned enterprises performance: reviewing the existing literature, researches directly on the Influence of mixed ownership reform to state-owned enterprises' operating performance are sparse. In view of corporate governance is the core of mixed ownership reform, researches about the influences of corporate governance to enterprise performance have a strong reference. Operational efficiency and performance of enterprises whose state-owned property right is relatively higher is lower (Yifan Hu ,2006). Corporate governance has a positive effect on return on

equity, while has a negative effect on price / book value ratio.

The selection of enterprise performance evaluation index has presented a trend from single indicators to multiple comprehensive ones (Donghui Shi,2004).

2 The Conceptual Model of the Influence of Mixed Ownership Reform to State-owned Enterprises' Operating Performance

Based on the above, combined with the understanding of relevant policies, the conceptual model is established in the following train of thought (as shown in Figure 1). The overall train of thought: the mixed ownership reform influences state-owned enterprises' corporate governance, and then further influences their operating performance. In particular, according to the first batch of *four policies reform pilots* of China's central state-owned enterprises, the government implements the pilots from four aspects: restructuring of state-owned capital investment company pilot; developing mixed ownership economy pilot; the board of directors exercising senior management personnel selection, performance evaluation and salary management pilot; dispatching the discipline inspection group to state-owned central enterprises pilot. And then it could be speculated that, the four pilots will probably influence corresponding aspects of corporate governance successively. The changes that mixed ownership reforms bring to corporate governance will probably influence state-owned enterprises' operating performance at market and finance levels.

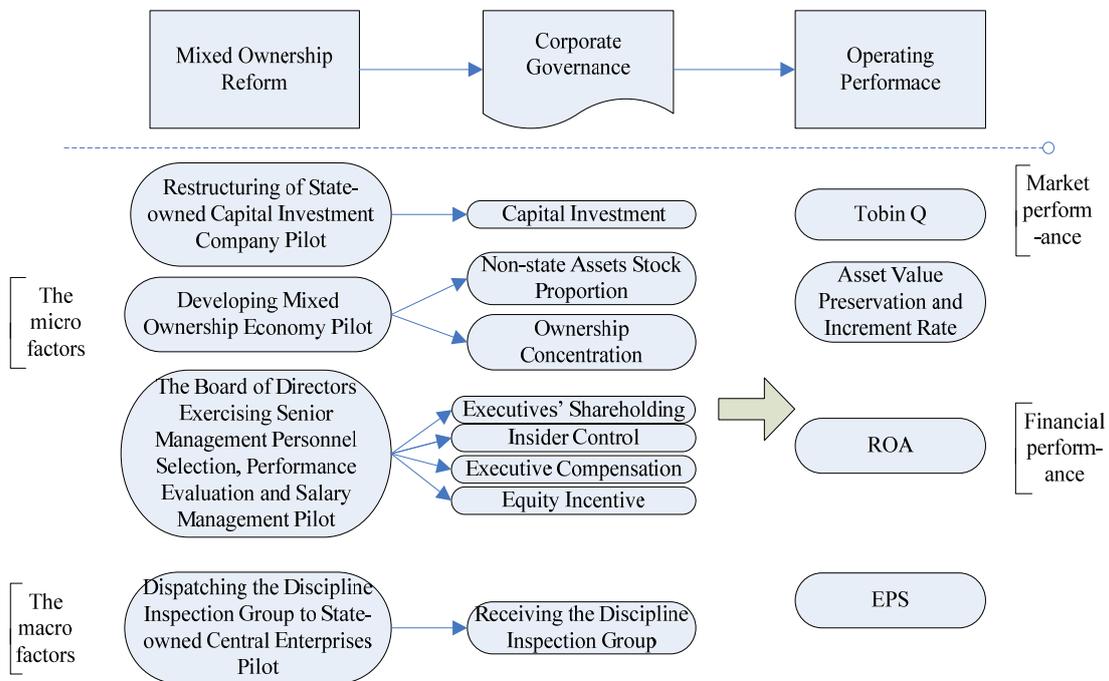

Figure 1 The Conceptual Model of the Influence of Mixed Ownership Reform to State-Owned Enterprises' Operating Performance

3 Empirical Research

3.1 Sample selection and data sources

The 22 listed companies of the 6 state-owned central enterprises under the first batch of *four policies reform pilots* are chosen as research objects, the research samples are their relevant data disclosed from 2009 to the first half of 2015, each time node is half a year, there are totally 286 samples. Data is from the CMSAR database, annual and half annuals report of the listed companies.

3.2 Research assumptions

Based on the above, the research assumptions are as Table 1.

Table 1 Research Assumptions

Assumptions	Influence Factors of Corporate Governance	Correlation relationship	Operating Performance Evaluation Index
1	Capital Investment	significant positive	Tobin Q
2	Non-state Assets Stock Proportion	significant positive	
3	Ownership Concentration	significant negative	Asset Value Preservation and Increment Rate
4	Executives Shareholding	significant positive	
5	Insider Control	significant negative	ROA
6	Executive Compensation	significant positive	
7	Equity Incentive	significant positive	EPS
8	Receiving the Discipline Inspection Group	significant positive	

3.3 Empirical research model

Tobin Q, Asset Value Preservation and Increment Rate, ROA and EPS are chosen as dependent variables, respectively represented by $Y_1 \sim Y_4$; capital investment, non-state assets stock proportion, ownership concentration, executives' shareholding, executive compensation, insider control, equity incentive, receiving the discipline inspection group are chosen as independent variables, respectively represented by $X_1 \sim X_8$; asset size is chosen as control variable, represented by Size. Accordingly, the empirical model of the influence of mixed ownership reform to state-owned enterprises' operating performance is as follows:

$$Y_i = a_0 + a_1X_1 + a_2X_2 + a_3X_3 + a_4X_4 + a_5X_5 + a_6X_6 + a_7X_7 + a_8X_8 + a_9\text{Size} + \varepsilon_i \quad (1)$$

($i=1,2,3,4$; ε_i is random disturbance.)

3.4 Descriptive statistical analysis

Through the data processing of SPSS 19.0, the variables' descriptive statistical analysis is shown in Table 2.

Table 2 Descriptive Statistical Analysis

Variable	Variable Name	N	Min	Max	Average	Standard Deviation
Y_1	Tobin Q	286	0.1	8.75	1.5681	1.31136
Y_2	Asset Value Preservation and Increment Rate	286	-0.56	5.01	1.133	0.45768

Coefficients(a)		Unstand ardzied Coeffici ents	t	Sig.	Unstand ardzied Coeffici ents	t	Sig.	Unstand ardzied Coeffici ents	t	Sig.	Unstand ardzied Coeffici ents	t	Sig.
	(Constant)	11.146	16.707	0.000	1.170	26.289	0.000	6.392	1.608	0.109	-1.245	-4.715	0.000
	X ₁	0.332	6.443	0.000	-	-	-	1.103	3.981	0.000	0.065	3.334	0.001
	X ₂	-	-	-	-	-	-	-	-	-	0.607	2.918	0.004
	X ₃	1.922	2.960	0.030	-	-	-	-	-	-	-	-	-
	X ₄	-	-	-	0.007	3.208	0.001	-	-	-	-	-	-
	X ₅	-	-	-	-0.041	-1.711	0.088	-0.990	-3.464	0.001	-	-	-
	X ₆	-	-	-	-	-	-	4.882	3.566	0.000	0.430	3.396	0.001
	X ₇	-	-	-	-	-	-	-	-	-	-	-	-
	X ₈	0.322	2.608	0.010	-	-	-	-	-	-	0.119	2.141	0.033
Size	-2.021	-14.608	0.000	-	-	-	-2.922	-4.291	0.000	-	-	-	
Y _{i(t)}	0.205	4.595	0.000	-	-	-	-	-	-	-	-	-	

Modified regression models are respectively as formula (2) ~ (5):

$$Y_1 = 11.146 + 0.333X_1 + 1.922X_3 + 0.322X_8 - 2.021Size + 0.2045Y_{(1)} \tag{2}$$

$$Y_2 = 1.170 + 0.007X_4 - 0.41X_5 \tag{3}$$

$$Y_3 = 6.392 + 1.103X_1 - 0.990X_5 + 4.882X_6 - 2.922Size \tag{4}$$

$$Y_4 = -1.245 + 0.065X_1 + 0.607X_2 + 0.430X_6 + 0.119X_8 \tag{5}$$

4 Conclusions

In conclusion, most chosen influence indicators of mixed ownership reform, on the whole in different dimensions, have significant correlation relationship with state-owned enterprises' operating performance. It proves that, to some extent, mixed ownership reform has positive influence to improving state-owned enterprises' performance.

While the correlation between ownership concentration(X_3) and operating performance does not agree with the initial assumption, in addition almost no piloted state-owned enterprise has begun to adopt equity incentive, which requires further study.

Analysis on Job Satisfaction and Turnover Intention of Core Staff in Micro and Small-Sized Sci-Tech Enterprises in Wuhan

Wang Yan

Business School, Wuhan Huaxia University of Technology, Wuhan, P.R. China, 430223
(E-mail: mandy9905303@126.com)

Abstract: The paper takes the core staff of Wuhan science and technology small and micro enterprises as the research object, and constructs the 11 dimensions of job satisfaction. Combined with descriptive statistical analysis, it analyzes the relationship between job satisfaction and employee turnover. The findings indicate that core talents of technology-based micro enterprises in Wuhan have certain turnover intentions. Their turnover intentions have a moderate negative correlation with job satisfaction. Core employees of technology-based micro enterprises are correspondingly pleased with colleagues, subordinate relationship and work condition, but they show relatively low satisfaction with salary, opportunities of training and promotion.

Key words: Micro and small-sized sci-tech enterprises; Job satisfaction; Turnover intention; Correlation

1 Introduction

The research and development employees account for a major proportion of the micro and small-sized sci-tech enterprises and master certain core technology. Such enterprises have played unimportant part in both the transformation of technological achievements and the accomplishment of innovation-driven development in China. These enterprises are developing rapidly in the fierce market competition with the help of their new products and technology. The talents who have a command of the new technology are keys to the survival, transformation and development of the enterprises, and are also an important factor that influences the enterprises' rapid growth. Therefore, how to avoid brain drain has become significant for their human resources management. As the important theme of human resources management, the job satisfaction has been studied as a dependent variable or an outcome variable. Studies have found that job satisfaction can influence the employees' performance, the rate of absenteeism, turnover rate, and physical and mental health. If the employees' turnover intention and its influence factors are known in time, measures can be taken to reduce the actual turnover behavior. Through the CNKI database retrieval, it shows a lot of research on the relationship between job satisfaction and turnover intention of Chinese and foreign literature. Wu Jingshan (2010) from the perspective of population characteristics studies factors influencing enterprise's R&D staff job satisfaction, she found that gender, age, annual income is of R&D personnel job satisfaction have significant effect, post to job satisfaction no significant effect. Tan Xiaohong (2013) thinks the factors that affect the job satisfaction of R&D personnel are salary, growth and development, work environment, work achievement, work itself, social support and so on. Wang Xueli (2014) believes that the reasons for the loss of R&D personnel include corporate factors, personal factors, social factors. Li Xianyin (2016) believes R&D of the distribution of equity, interpersonal justice and turnover intention are significantly related in the high-tech enterprises. However, the academic circles have not been related to the relationship between job satisfaction and turnover intention for Micro and Small-sized Sci-tech Enterprises.

In order to keep the talents and provide theoretical guidance for the talents management practice, this article takes the core talents of the micro and small-sized sci-tech enterprises as research subjects, investigates their job satisfaction and turnover intention and analyzes the correlation between these two aspects.

2 Research Samples and Scales

2.1 Research samples

The research subjects are the core staff of the micro and small-sized sci-tech enterprises, specifically referring to employees who have relatively high education background, master the professional knowledge and skills and play an important role in the enterprises' survival and development. This research is designed to investigate the enterprises in the micro and small-sized enterprises park of science and technology in Wuhan, involving 300 core employees from electronic information industry, software R&D service industry, industrial automation, industrial design, modern

services, precision machinery manufacturing industry and environmental protection industry. 300 questionnaires in total have been given out and 265 effective questionnaires have been obtained. The retrieval rate reaches 88.33%.

2.2 Research scales

This study employed the MSQ (Minnesota Satisfaction Questionnaire) that is revised by domestic researchers, with 5-point Likert scale to measure the subjects' satisfaction. One point means being the least satisfied and five means being the most satisfied. The higher the point is, the higher the job satisfaction is. The turnover intention scale in this study modified on the basis of the scale of Griffeth, Hom, Mobley and etc., includes two questions in total with 6-point Likert scale to measure the possibility for subjects to accept a new job. One point means being the least likely and six mean being the most likely. The higher the point is, the higher the turnover intention is.

3 The Reliability and Validity Analysis of Research Scales

3.1 The reliability of scales

By analyzing the research data of job satisfaction scale and turnover intention scale, it is concluded that the coefficient of job satisfaction scale is 0.932 and the coefficient of turnover intention scale is 0.814. The reliability of these two scales are both more than 0.70, which shows that the used questionnaire has good reliability and can be accepted.

The job satisfaction scale includes eleven dimensions that are the operators, the superior, further study, colleagues, development of achievement, promotion, administrative units, subordinates, working environment, social approval, and treatment (Valentine S, Greller M M, Richtermeyer S B ,2006). Except that the reliability coefficient of subordinates is 0.684, the others' reliability is all greater than 0.72, which indicates that the reliability coefficient of job satisfaction scale is high in every dimension.

3.2 The validity of scales

These extracted eleven factors of job satisfaction scale are consistent with those of the original design, and overall satisfaction presents high positive relativity with its eleven factors. The operators, the superior, further study, colleagues, development of achievement, promotion, administrative units, subordinates, working environment, social approval, and treatment of the eleven dimensions and overall satisfaction with the Pearson correlation coefficient was 0.762, 0.746, 0.707, 0.577, 0.825, 0.822, 0.716, 0.703 and 0.688, 0.790, 0.812. So it can be seen that the scale of job satisfaction has a good structural validity.

4 Analysis of the Core Staff' Job Satisfaction

4.1 Satisfactory aspects

Table 1 Descriptive Statistical Analysis of Job Satisfaction and Turnover Intention

	Average value	Standard deviation	Sample size
The operators	4.1070	0.42753	265
The superior	3.9281	0.48564	265

Social approval	3.8246	0.58700	265
Treatment	3.7573	0.62130	265
Colleagues	4.1645	0.56720	265
Overall satisfaction	3.9016	0.40316	265
Turnover intention	3.4912	1.24086	265

From the data in Table 1 can be seen, the core talent for business operators and colleagues satisfaction average of more than 4 points, which shows that the core talent of the two satisfaction is

relatively high.

The dimension of the operators involves their own leadership, plans for the future, the importance and guarantee of employees' benefits as well as their communication with employees. Through the analysis, it can be found that the investigated core talents agree with the enterprise operators in terms of their management ideas, operating modes and communication with leaders, which reflects that the operators attach great importance to employees' benefits, which is recognized by core talents.

Meanwhile, this dimension involves the accessibility between colleagues, how they get along with each other, opportunity to make friends and cooperation spirit. It shows that the core employees have a friendly and harmonious relationship with each other. Such jobs meet their needs of social communication, which also indicates the harmonious and friendly interpersonal environment in the micro and small-sized sci-tech enterprises.

4.2 Satisfactory average aspects

From the data in Table 1 can be seen, the superior, administrative units, subordinate, work environment, development of achievement, social approval that several factors satisfaction level is not too high, the average value between score 3 and the score 4, namely, between general satisfaction and satisfaction.

Superiors, administrative units, subordinates and other factors are the social environment where the core talents work. These environmental factors include superiors' leadership and their communication ability, the interaction between external units and administrative departments, the leadership of one's own, and the ability to direct subordinates etc. (Allen D G, Shore L M, Griffeth R W ,2003). The reasons of the low satisfaction are as following: 1.the enterprises have no thorough communication channels, well-coordinated mechanism, smooth information delivery and harmonious relationship, and contradictions can't be resolved in time. 2. Insufficient contact with external enterprises and administrative department causes the obstruction of information and ill-informed connection. 3. core talents feel a loss of enthusiasm and creativity, because their leadership has not been exerted.

Work environment includes lighting, ventilating, equipment, traffic, operating funds, and the comfort of environment. The research findings show that the working condition in technology-based micro enterprises requires further improvement. It is obvious that good work environment can help enhance work efficiency and keep the core talents.

The other two dimensions----development of achievements and social approval mean the opportunity of developing abilities, a sense of personal achievements, social prestige and status. The study shows those core talents are not satisfied with their achieved personal value in working due to the very limited development space and opportunities, which leads to low job achievement.

4.3 Unsatisfactory aspects

Core talents in the three aspects of the average which include further study, promotion and treatment of the satisfaction row in the final. This shows that the incentive factors of small and micro enterprises of science and technology is insufficient.

On-job training involves the opportunities offered to core talents, the degrees of training and the training atmosphere etc. The research finds that core talents in technology-based micro enterprises hold a sense of crisis that no training brings no job. However, the enterprises don't provide them with enough training opportunities, which suggests micro enterprises have not attached great importance to training of the core talents and don't support them in terms of time and financial due to their inner problems in finance, management and system, thus the training atmosphere is unsatisfactory.

Promotion includes the policy, opportunity and the fairness of career advancement. In technology-based micro enterprises, core talents don't get full recognition and attention on promotion from their superiors. Due to imperfect promotion system, unfairness and injustice exist. Having no chance of promotion, core talents can't find an outlet to show their knowledge, skills and values, which limits their advancement and causes low social recognition.

Benefits include salary, welfare and stability of occupation. The data in chart 1 shows that if the order is put from high to low, the recognition of the core staff for their treatment in technology-based micro enterprises ranks low in job satisfaction dimensions among the 11 ranks, namely last but two, which indicates that there is a gap between core staff's expectation and reality, so they are dissatisfied. This reflects that enterprise managers, lacking of modern salary administration concept, have not established scientific salary system. Besides, it also shows that technology-based micro enterprises which start business on their own venture capital mostly are in the initial and growth stage, so it is difficult for them to meet the salary requirements of the core staff. Enterprises are willing to keep talents, but may not be able to provide stable positions and content material rewards for them, thus affecting

their core roles to create value.

5 The Core Staff Correlation Analysis Between Turnover Intention and Job Satisfaction

5.1 Turnover intention of core staff

According to the Table 1, the average of turnover intention of respondents is between 3-4, which suggests that their turnover intention is “hard to say” or “slightly likely to go”. It shows that the core talents of science and technology small and micro enterprises have a certain turnover intention. The standard deviation of turnover intention is more than 1.2, which is much larger than the average standard deviation of job satisfaction. It shows that the core talent's turnover intention is more obvious individual differences comparing with the job satisfaction. And the influence factors of turnover intention are more complex.

5.2 Correlation analysis between turnover intention and job satisfaction

Table 2 The Correlation Analysis of Turnover Intention and Job Satisfaction

	The operators	The superior	Further study	Development of achievement	Promotion	Administrative units	Subordinates
Turnover intention Pearson Correlation	-0.318	-0.28	-0.315	-0.393	-0.336	-0.33	-0.325
Sig.(2-tailed)	0.001	0.003	0.001	0.000	0.000	0.000	0.000
N	265	25	265	265	265	265	265
	Working environment	Social approval	Treatment	Colleagues	Turnover thought	Turnover intention	Overall satisfaction
Turnover intention Pearson Correlation	-0.326	-0.391	-0.424	-0.004	0.444	1	-0.423
Sig.(2-tailed)	0.000	0.000	0.000	0.964	0.000		0.000
N	265	265	265	265	265	265	265

Table 2 shows the relationship between turnover intention and job satisfaction and their various dimensions. From the point of view of statistical data, the correlation between turnover intention and job satisfaction is medium-negative, which suggests that core staff are usually confident and self-reliant in a more dominant position in the workplace; their relationship with colleagues is not likely to affect their choice to turnover. This finding fully prove that technology-based micro enterprises should pay attention to employee satisfaction survey in order to keep core staff.

6 Conclusions

The findings indicate that core talents of technology-based micro enterprises in Wuhan have certain turnover intentions. Their turnover intentions have a moderate negative correlation with job satisfaction. The operators, the supervisors, administrative units, subordinates, working environment, further study, moved rise, development and achievement, treatment etc. factors are associated with turnover intention, and is negatively related to the role. But there is no correlation with their relationship with colleagues. Investigated core talents feel generally satisfied with most aspects of their enterprises. The satisfaction degrees from low to high are colleagues, the operators, administrative units, working environment, the superior, subordinates, development of achievement, social approval, treatment, further study, promotion. Core employees of technology-based micro enterprises are correspondingly pleased with colleagues, subordinate relationship and work condition, which suggests these enterprises enjoy good organizational atmosphere, harmonious interpersonal relationship and satisfying work condition. However, core talents show relatively low satisfaction with salary, opportunities of training and promotion, which reflects their desires for personal growth have not been satisfied and enterprises' incentive mechanism remains to be improved.

Abstract: O2O (Online To Offline) is a new e-commerce business model, emerging in recent years. The momentum of O2O business model development is very rapid, which has attracted a lot of financial support from venture capital institutions, and caused the extensive concern inside and outside the industry. It is very important to analyze the operation mechanism of O2O business model and research marketing route for O2O enterprise. This paper used exploratory case study of HUBEI “ZHOU HEI YA” Food Co., Ltd and took 550 consumers of pot-roast in Wuhan as a research sample. It suggested that ZHOU HEIYA should further enhance the consumers’ recognition of O2O business model through strengthening interaction between online and offline; make full use of Wechat, micro-blog and other online marketing channels; guide consumers to pay by online order system, in order to realize sound integration and interaction between online and offline. Finally, it predicted that the future of O2O business model will be a multi-level, multi-dimensional complex ecological system to keep the diversity and depth of development.

Key words: O2O business model; Physical store; Market survey; Interaction

1 Introduction

The rapid development of technology promotes the combination of traditional industries and the Internet, creating a new mobile international business model—Online To Offline(hereinafter referred to as the “O2O”) business model. O2O business model combines the advantages of online shopping and offline shopping, has become a marketing innovation paradigm. With the continuous development of electronic information technology, electronic commerce presents the trend of rapid growth in China from 2009, online retail sales grow nearly 10 times from 2009 to 2014. However, by the end of 2014, online retail sales accounted for 10.6% of the total amount, means that nearly ninety percent of the business off the e-commerce, means that e-commerce is facing both opportunities and challenges, so that the research of business model that online and offline combined becomes extremely urgent; O2O model arises at the historic moment(WangShaSha,2015).

O2O business model is considered as a general commercial model where the customers book their merchandises and services online, then enjoy their services offline, which combines the offline business opportunities with Internet, turning the internet into a front stage of offline trade (Dongmin Kim, Izak Benbasat ,2009). The O2O business model has showing the increasing tendency currently, and it has been widely applied in fast-moving consumer goods (hereinafter referred to as the “FMCG”) field, such as restaurants、entertainment、tourism and so on. Since Alex Rampel (2010) put forward the concept of O2O business model, it has arisen a universal and ardent discussion. John Doerr (2011) put forward the concept of “SO+ LO+ MO” firstly, which meant “Social+ Localization+ Mobile”. The business O2O model has been divided into square model, mall model and agency model by LuYiqing, LiChen (2013). CuiJian (2014) believe that the current understanding of O2O business model has not limited to the initial concept of “Online To Offline”. With the continuous development of commercial model, people's understanding of the O2O business model is also more abundant, such as “Offline to Online”. O2O business model is a new style to promote the interaction between online and offline in consumption (Hangjung Zo, K. Ramamurthy ,2009).

Through the analysis of the above literature, we find that both domestic and overseas research play a fundamental role in enriching the O2O business model theory. But the concrete research on practice of O2O business model is rare. Thus, based on the data of Chinese FMCG industry, this paper used the new theory of marketing channel to put forward suggestions for construction of HUBEI “ZHOU HEI YA” Food Co., Ltd. (hereinafter referred to as the “ZHOU HEI YA”) O2O business model.

2 Case Selection and Research Design

2.1 Case selection and introduction

In this research, we chose the typical case of Chinese FMCG industry to carry out exploratory research and summarize the O2O business model of the case subject. The case is selected to meet the following three conditions: firstly, the enterprise has a good brand reputation, high market share and advanced marketing channels in contrast to competitors in Chinese pot-roast industry. Secondly, the enterprise's traditional channel is mature. Thirdly, the enterprise has a new attempt and achieved some achievement in the O2O business model innovation. All of the above are shown in Table 1.

Table 1 Introduction of "ZHOU HEI YA"

Company Name	HUBEI ZHOU HEI YA FOOD CO.,LTD		
Founding time	1996	Location of Formation	Wuhan
Registered capital	156 million yuan	Sales Revenue	2400 million yuan (2014)
Brand Concept	More entertainment More happier	Sales Network	600
Main Channel	Self-support Stores Business to Consumer	Output	50000ton/year

2.2 Research design

2.2.1 Research method

1) Literature research method

In order to prevent the one-sidedness, this study used a variety of channels to gather information, including the use of monographs, journals, statistical yearbook and a certain amount of foreign literature to obtain indirect theoretical knowledge (Chen Jun, Sally Dibb, 2010).

2) Questionnaire survey method

Taking 550 consumers of pot-roast products market in Wuhan as the research sample, this paper wants to obtain recognitions, advices and suggestions of consumers to "ZHOU HEI YA" O2O business model through questionnaire and interview. The questionnaire contains 13 items, including 12 closed items and 1 open item.

2.2.2 Hypothesis

H1: Consumers' recognition to O2O business model of "ZHOU HEI YA" is low.

H2: Consumers tend to purchase products of "ZHOU HEI YA" in physical stores.

H3: The integration degree is low and the interaction degree is weak between online and offline of "ZHOU HEI YA".

2.2.3 Sample definition

The available sample is 543 eventually with effective rate of 98.72%, which meets the demand of marketing research basically. All of the above are shown in Table 2.

Table 2 The Sample's Composition

	Category	Number	Proportion
Gender	Male	213	39.3%
	Female	327	60.2%
	Invalid	3	0.5%
Age	18-26	445	82%
	Above 27	98	18%
Occupation	Student	331	61%
	Freelancer	71	13%
	Office worker	141	26%

3 Survey Results Analysis

The basic descriptive statistics analysis, correlation analysis and multiple response analysis were finished by using EXCEL and SPSS software.

1) Male interviewee account for 39% and female percentage is 61%, including 213 males and 327 females.

2) The age of interviewee is mainly concentrated in 18~26, accounted for 82% of the total sample and the ratio of over 27-years-old is 18%. It revealed that the target market of "ZHOU HEI YA" is concentrated in younger groups. The number of students accounted for 61% of the total sample, freelancer and office workers accounted for 13% and 26% of the total sample respectively.

3) The 168 interviewees understand O2O business model, accounting for 31% of the sample. However, 367 interviewees have no idea about the O2O business model, achieving 69% sample share,

which shows most consumers may have not pay attention to this new consumption model. Therefore, the O2O consumption model enjoys bright market prospect.

4) The physical stores are offline terminals, thus important nodes and strong points of O2O business model. Bad service attitude, inconvenient payment, cumbersome system of membership card and etc are all the main problems. The percentage of interviewees complaining about waiting for a long time for the dissatisfied service is 38.5%, so it is necessary to improve physical store's related services and promote the customers' shopping experience.

5) Consumers prefer traditional physical store shopping among three consuming models of the physical stores, Business to Consumer (hereinafter referred to as the "B2C") and O2O. The proportion of Consumers choosing O2O business model is 12.6% and that of interviewees selecting B2C business model is 13.2%.

6) The main channel of information receiving concentrate in physical stores, with the ratio of 53.4%. A half of information pushing is through online channels, including Wechat and Micro-blog, with the share of Wechat reaching to 19%.

4 Conclusions

This study found that consumers' recognitions and participations to O2O business model are low, especially female consumers. There is no significant correlation between age and recognition of O2O business model. There is a significant correlation among gender, age, occupation and recognition of O2O business model. The experience of O2O and occupation don't exist significant correlation (Blanca Hernández, Julio Jiménez, M. José Martín, 2011).

1) "ZHOU HEI YA" should further enhance consumers' awareness of O2O business model., it is very important to future marketing activities.

2) According to the survey results, there is no fixed consumers group and are not concentrated in one age level or a professional category. It shows that "ZHOU HEI YA" should have a good guidance of consumers in different age and occupation in the field of O2O business model.

3) Customers still prefer to the traditional consumption models of "cash + merchandise" in physical stores. "ZHOU HEI YA" should further guide the customers' consumptive habits to make capital and information freely flowing on the Internet.

4) "ZHOU HEI YA" should establish its own CRM (Customer-Relationship-Management) system, in order to fully collect and analyze the big data. The service training on staff and the consumers' experience should be further strengthened to play a strong role of terminals in the O2O business model.

5) "ZHOU HEI YA" accumulates strong competitiveness on its reasonable structure and extensive layout of physical stores, which benefits to promote online marketing and payment and realize the interaction of online and offline. Therefore, the enterprise should further optimize promotion activities, increase information pushing channels, strengthen online news pushing, and provide customized information based on big data to accurate marketing, achieving virtuous and closed cycle of "drainage - conversion - consumption - response" for customers.

Abstract: In China it is common that the substantial shareholders tunnel the company to gain private benefits through connected transactions, dividend policy. These acts infringe the interests of minority shareholders, harm the healthy development of the capital market. After analyzing the data of the stock market, the paper draws the conclusion through researching the relationship between the tunneling behavior of the substantial shareholders and external supervision that the relevant departments shall intensify supervision to curb the tunneling behavior.

Key words: The tunneling behavior; Connected transactions; Governance structure; Government monitoring

1 Introduction

Although our capital market has developed for many years, its legal supervision environment has been improved, it is a common phenomenon that the substantial shareholders of the listed companies tunnel the company and infringe minority shareholders' interests by connected transactions, dividend policy, capital occupying, reducing the holding and put it into cash and other methods. After the reform the shareholder structure, a series of regulatory measures involved in insider trading, connected transactions, information disclosure and other aspects have been introduced, which in a certain extent, protect the interests of minority shareholders. But at the same time, the substantial shareholders occupy the interests of the company also become subtler, which makes it more difficult for minority shareholders to find their tunneling behavior to make the wrong decision. Therefore, it is necessary to make in-depth study of tunneling behavior of the substantial shareholders.

Tunneling, also known as the "tunnel effect", is the activities of the substantial shareholders of the company gain the control benefits using control to occupy the interests of the company, which causes great harm to the capital market. Therefore, it becomes the focus of research at home and abroad. Abroad, Johnson, La porta and Shleifer (2000) put forward the concept of tunneling for the first time. It is pointed out that the concentrated ownership structure will lead to tunneling, controlling shareholders will transfer resources from the listed companies for its exclusive use through concealed way. Morck et al (1988) study concluded, when the substantial shareholders' equity gradually increases, it will gain private benefit through control. But when the control reaches a certain level, its concern is the interests of the company and will reduce occupying the interests of the listed companies. Wurgler (2000) study points out that tunneling behavior of the substantial shareholders will reduce the efficiency of the allocation of capital market and cause adverse effect on the investment and financing environment. At home, Li Zengquan, Sun Zheng, Wang Zhiwei (2004) study finds that the substantial shareholders increase their holdings, its occupation of the listing company's funds also increases, while holding to a certain proportion, the occupation of the listing company's funds reduces. Gao Lei and He Shaohua and Huang Zhizhong (2006) think that the concentrated ownership exacerbates tunneling of the substantial shareholders, while the equity structure of checks and balances has no impact on tunneling of shareholders. Wu Yuhui, Wu Shinong (2011) study think that when there exists interests conflict between management and shareholders, the substantial shareholders and minority shareholders at the same time, the higher the level of protection of minority shareholders, the lower the tendency of tunneling of the substantial shareholders. In the tunneling way, Liu Feng, He Jiangang (2004) study find that if the controlling shareholders have a higher shareholding ratio, they tend to take the connected transactions, high dividend to realize private benefit, while if the controlling shareholders don't have a high shareholding ratio, they take the capital occupying, related-party guarantee and other means to tunnel. With the deepening of these studies, theoretical support is provided for our country to regulate the capital market and protect the interests of minority investors.

2 The Meaning and Characteristics of Tunneling Behavior

“The substantial shareholders” means the largest shareholder in the company. There still exists difference in its meaning and that of the controlling shareholders. The controlling shareholders are shareholders who hold shares high enough to affect the company's major decisions and daily operation. Thus, the substantial shareholders are not necessarily the controlling shareholders.

“Tunneling” is also called “tunneling behavior”, “benefit transfer”, refers to the behavior of the substantial shareholders to occupy the interests of minority shareholders. The substantial shareholders use illegal means to occupy the interests of minority shareholders. They often take illegal means to cover up, pass false information to the capital market to affect minority shareholders to make correct judgment, at the same time, it also hinders the healthy development of the capital market. Tunneling behavior often has the following characteristics:

1) Tunneling is a kind of interest transfer behavior, which often happens at the cost of occupation of the interests of the other party or other more parties.

2) It is often the substantial shareholders of the company who implement the tunneling behavior, because the substantial shareholders often have higher shares, with advantage of information right, control and other. They can use connected transactions, related-party guarantee, capital occupation and other means to transfer interests so as to gain private benefits.

3) The tunneling behavior is hidden. To protect the interests of minority shareholders and investors, maintain the healthy development of the capital market, the supervision department formulate laws and regulations and the corresponding measures. However, tunneling behavior is on its contrary. In order to avoid supervision and punishment, the tunneling behavior of the substantial shareholders is often subtler.

3 Tunneling Way of the Substantial Shareholders

Domestic and foreign study find that the substantial shareholders use control, information right and other advantages to carry out tunneling behavior. They often have the following forms:

Use connected transactions to transfer profits. The substantial shareholders have the advantage of control. They usually take buying low and selling high with associated enterprises and trading activities, illegal guarantee, capital occupying, paying salary to executives and other mean to transfer profit between the substantial shareholders and companies freely, so as to seek their own interests. The connected transactions have various forms and concealment, therefore, it has become the most convenient and common means for the substantial shareholders to tunnel.

Use false statement of earnings management. Taking the advantage of information right in the company, the substantial shareholders shall not make decisions according to false statements. While due to the inferior position of information, minority shareholders can only make decisions based on the statements of earnings management. This unequal information provides the possibility for the substantial shareholders to occupy the interests of minority shareholders.

Use dividend policy to make a profit. Under the situation of controlled shifting resources, the substantial shareholders will take non benign cash dividend policy, to plunder the interests of minority shareholders for their own profit.

4 Analysis of the Relationship Between the Tunneling Behavior and External Supervision

In the study of the relationship between governance structure and corporate value, La porta (2002) et. al. propose the LLSV model, pointing out that when separate control of the substantial shareholders and cash flow right, tunneling behavior may occur. But the model ignores the opportunity cost of tunneling behavior, namely the substantial shareholders may get the benefits not by tunneling but putting resources in the company. When private benefits from tunneling behavior is greater than the opportunity cost, the substantial shareholders have the motivation to tunnel. The opportunity cost is often due to the supervision to the capital market of the government departments. Under the assumption of the opportunity cost, the following models can be established to analyze and the parameters are set as follows:

a : cash flow right of the substantial shareholders to the company, $a > 0$;

S : the proportion of the substantial shareholders to occupy the company's cash, $0 < S < 1$;

I : the amount of cash that the company has at the beginning;

R : return on investment invested in the company, $1 + R > 0$;

$C(K, S)$: the cost function of expropriation, that is, when the substantial shareholders occupy S

ratio of funds, the cost required to pay. In it K stands for the protection degree of protection of shareholders;

The cash received by the substantial shareholders of occupying S proportion of the company's funds is $SI-C(K, S)$;

r : the return on reinvestment of the substantial shareholders, $1+r>0$;

b : the cash flow rights of the substantial shareholders' reinvestment.

Earnings of reinvestment of resources transferred by the substantial shareholders by tunneling behavior is $[SI-C(K, S)](1+r)b$, when the substantial shareholders don't tunnel and leave the resources in the company, earnings are $SI(1+r)a$, so, only when $[SI-C(K, S)](1+r)b > SI(1+r)a$, tunneling behavior occurs.

We can get the following after arranging the formula: $1-C(K, S)/S > (1+R)a/(1+r)b$

The left end of the formula indicates the supervision of the government department. Among them, $C(K, S)/S$ is the proportion of the cost of tunneling of the substantial shareholders, $1-C(K, S)/S$ is income ratio from tunneling of the substantial shareholders; and the right end of the formula indicates the company's characteristics. If the right end of is fixed, namely, the company characteristics are constant. The smaller $C(K, S)/S$, the bigger $1-C(K, S)/S$. It shows that the lower the cost of tunneling behavior of the substantial shareholders, the greater the tunneling behavior motivation.

To analyze combining with the case of Hualun Group tunneled Sichuan Jinding Group Co., Ltd. After becoming the largest shareholder of Sichuan Jinding Group Co., Ltd., Hualun Group withdraw cash from the original company's cement industry for investment in the real estate and other business, eventually because of poor management and led to capital chain rupture. We can analyze the strength of investor protection needed to restrain the substantial shareholders to put all of the funds into the investment in real estate projects, assuming that the expected return rate of the actual controller of the investment in Jinding Group Co., Ltd. is R , the expected return rate of the actual controller reinvest in projects is r , the cash flow rights of the actual controller in Sichuan Jinding Group Co., Ltd. is a , the cash flow rights of the actual controller to reinvest project is b .

According to the website data disclosure of China Financial Consulting Co., Ltd., after finishing we can obtain gross profit margin, total asset return, net asset yield and other data of the building materials industry, the real estate industry in 2009 as shown in Table 1.

Table 1 Profitability of the Building Materials Industry and the Real Estate Industry in 2009

Profitability	Industry	Numerical Value
Gross Margin	Building Materials Industry	0.1776
	Real Estate Industry	0.3551
Return on Total Assets	Building Materials Industry	0.0581
	Real Estate Industry	0.0626
Return on Net Assets	Building Materials Industry	0.1014
	Real Estate Industry	0.1045

Then according to the 2009 annual report of Sichuan Jinding Group Co., Ltd., we can get the data of the control and cash flow rights of the actual controller of the company as shown in Table 2.

Table 2 The Control and Cash Flow Rights of the Actual Controller of Sichuan Jinding Group Co., Ltd. in 2009

Sichuan Jinding Group Co., Ltd.			Hualun Group			Cash Flow Ratio of Weight
Control ($V1$)	Cash Flow Right ($C1$)	Relative Ratio ($V1/C1$)	Control ($V2$)	Cash Flow Right ($C2$)	Relative Ratio ($V2/C2$)	
17.33%	8.84%	1.9608	51.00%	51.00%	1	1.9608

After determining the two factors of the cash flow rights and the expected rate of return, according to the tunneling model of the substantial shareholders calculated as shown, we can calculate the investor protection efforts needed to achieve by the law to constraint the behavior of the actual controller to tunnel the listed companies, as shown in table 3.

Table 3 The Investor Protection Efforts Needed to Limit the Substantial Shareholders to Put All the Funds to Invest in Real Estate Projects

Profitability Index	R	r	a	b	$1-C(K, S) / S$	$C(K, S) / S$
Gross Margin	0.1776	0.3531	8.84%	51.00%	15.43%	84.57%
Return on Total Assets	0.5881	0.0626	8.84%	51.00%	17.65%	82.35%
Return on Net Assets	0.1014	0.1045	8.84%	51.00%	17.68%	82.32%

Calculation results show, the investor protection efforts needed to constrain the tunneling behavior of the actual controllers is over 82%, namely, if investors occupies resources of RMB100 yuan, he should pay the cost of over 82 yuan. Such protection in China's securities market should be very high. After Hualun Group tunneled Sichuan Jinding Group Co., Ltd. was disclosed in 2009, the China Securities Regulatory Commission gave warning to Sichuan Jinding and imposed RMB 30 million in fines. Only from the point of view of the amount of the fine, it is much lower than benefits obtained from the tunneling the listed company, so it is not enough to achieve the regulatory effect.

5 Conclusions

Through the above functions, we can draw a conclusion, the supervision of the government will influence of tunneling behavior. To reduce the tunneling motivation, we must plus greatly the cost of tunneling, namely to strengthen the supervision and punishment. The conclusion matches the status of the China's capital market. Although the legal environment of China's capital market has been improved, but due to the relatively light penalties, compared with the benefits gained from tunneling the company, the cost of tunneling behavior of the substantial shareholders is much less, so the substantial shareholders of many listed companies would prefer to run the risk of being punished to tunnel the listed company for personal gain.

In order to promote the healthy development of the capital market and protect the interests of minority investors, the relevant departments should strengthen the supervision and punishment, including increased administrative penalties for the securities regulatory departments, support civil litigation of minority investors and increase the criminal responsibility that the substantial shareholders should bear and other. So the regulatory measures can truly have a deterrent effect on the tunneling behavior of the substantial shareholders, raising their cost of tunneling, to decrease the tunneling behavior motivation.

Of course, to thoroughly check the tunneling of the substantial shareholders, it is far from enough solely relying on the external supervision mechanism, the company internal needs to improve its governance structure, establish the effective internal control mechanism, forming the monitoring system of independent directors, strengthen external information disclosure and other measures. Only within the company, external personnel and departments and make concerted efforts to adopt a variety of measures, to curb the tunneling of the substantial shareholders and to protect the interests of minority investors, can we promote the healthy development of the capital market.

Development of Analytical Framework for SME's Competitiveness Based on Competency Approach

Krishantha Wisenthige, Cheng Guoping
School of Management, Wuhan University of Technology, Wuhan, P.R. China, 430070
(E-mail: wpkrishantha@yahoo.com, chenggp@whut.edu.cn)

Abstract: The purpose of this paper is to provide a theoretical rationale for investigating the relationship between entrepreneurial characteristics and the SME's performance at the firm level through adopting the concept of competitiveness incorporated with entrepreneurial competencies. The model distinguishes between two dimensions of competitiveness, assets and process and six areas of competencies of an entrepreneur with the in creating competitiveness scope and capabilities of the firm. A major contribution of the theoretical framework is the organization of the existing theories and findings in entrepreneurial characteristics, and future theoretical development and empirical studies of SME competitiveness can be made based on this framework.

Key words: SMEs; Competitiveness; Entrepreneurial competencies; Competency approach

1 Introduction

The Small and Medium enterprises (SMEs) have given much attention in the recent entrepreneurship researches due to their vital contributions in the global economy. The role of SMEs is very important specially in all developing countries where SMEs assist economic growth; improve income distribution, productivity, efficiency and economic structure during the economic downturn (Abdullah & Manan, 2011). The review by Rasmussen et al., 2011 and Man, Lau, & Snape, 2008 has pointed out the use of sound theoretical frameworks in further investigating the relationships between a SME's competitiveness and its antecedents. The purpose of this paper is to develop a conceptual model linking the characteristics of SMEs' entrepreneur and firm performances based on the concept of competitiveness and the competency approach. The use of the concept of competitiveness therefore provides with a rationale for investigating the long term performance of SMEs. Following a review of the literature on SME competitiveness, three key aspects affecting an SME's competitiveness have been identified, including the internal firm factors, external environment and the influence of the entrepreneur. These factors in turn impact the performance of the firm. In particular, the influence of the entrepreneur is addressed by the competency approach from a process or behavioral perspective. Entrepreneurial competencies are considered a higher level characteristic encompassing personality traits, skills and knowledge and therefore can be seen as the total ability of the entrepreneur to perform his/her role successfully. This paper will conceptualize analytical framework to investigate the relationship of entrepreneurial competencies and firm level competitiveness of SMEs. In the proposed analytical framework, SME competitiveness dimensions are based on the world competitiveness formula introduced by Institute of Management Development and World Economic Forum in 1993.

2 SME Competitiveness

2.1 Competitiveness as a concept

Concept of competitiveness is applied in various level of studies including individual firm level, microeconomic level for industry and macroeconomic level for the national economies (Nelson, 2012). A review by Waheeduzzaman and Ryans (2006) also pointed out that the competitiveness concept involves different disciplines, such as comparative advantage, price competitiveness, the strategy and management perspective as well as the historical and sociocultural perspectives. Competitiveness can also be treated as a dependent, independent, or intermediary variable, depending on the perspectives from which we approach the issue (Mulatu, 2016). Competitiveness is a multidimensional concept, in simple terms, it is the ability to compete. It has become the name of the game today to describe economic strength of a country or industry or firm with respect to its competitors in the global market economy in which goods, services, people, skills and ideas move freely across geographical borders (Murths, 2008). Whatever the level of focus, competitiveness is ultimately concerned with the long term performance of the subject related to its competitors, which is the result of being competitive.

2.2 Models of competitiveness

There has been inadequate research on such practical importance of these competitiveness related frameworks and models. Porter (1998) defined competitiveness as implementation of value creating

strategy by a firm which cannot simultaneously implemented by competitor and particular strategy cannot be easily duplicated. Moving away from the traditional Ricardo idea of comparative advantage, Porter's diamond model aims to explain the competitive advantages of the nations. The competitive position of a nation depends on the factor endowments, demand conditions, the support of related industries, and the firms' strategy, structure and rivalry, argues Porter. Over years there have been many new developments in the field of competition. According to the Mulatu (2016), there is a two dimensional approach; one is at the level of analysis (nation, industry and firm) and the other is the types of used variables. In the "world competitiveness formula", "competitiveness" is a combination of assets, which are inherited or created, as well as processes, which transform assets into economic results. When using the term competitiveness, we need to consider not only the resulting performance or the potential or asset to generate this performance, but also the process for doing so.

Out of these possible approaches, this paper is focused on the firm level analytical framework. The Porter's view is not the only way to examine the competitiveness of the businesses (Ambastha & Momaya, 2004) besides traditional theories such as the Structure Conduct Performance (SPC) and the competency theories which provides a useful alternative to Porter's argument. The competency theories include the Resource Based Theory (RBT), the Dynamic Capabilities Theory (DCT) and the Knowledge Based Theory (KBT). A common characteristic of these theories that they give a decisive importance "to the firm's internal rather than to its external conditions for understanding its competitive market position" (Ambastha & Momaya, 2004). It is proposed to use the framework of assets, process and performances as proposed by Ambastha and Momaya (2004) and tested empirical data by Patlan-perez and Lara in 2012. Man et al. (2002) suggests three key factors for competitiveness of small and medium firms that have direct influence on the firm's performance: 1) internal factors, 2) environmental factors and 3) the influence of the entrepreneur. According to Man et al., (2002); in this paper we consider the dimensions related to the influence of the entrepreneur on competitiveness. According to the Patlan-perez and Lara, (2012); assets and processes have a direct positive relationship with competitive performance of the firm based on which dimensions analytical framework is developed.

Table 1 Dimensions and Constructs

<i>Dimensions</i>	<i>Constructs</i>
Assesst	Financial, Operational, Human Resources, Technological, Image & reputation
Process	Strategic Management Processes (Competencies, Competitive strategy, Flexibility, Adaptability) Human Resources Process (Design and deploy talents) Technological Processes (Innovation, Systems, IT) Operational Processes (Manufacturing, Design, Quality) Marketing Processes (Marketing, Managing relationships, Persuading power)

Source: Ambastha & Momaya (2004) and Patlan-Perez & Lara (2012)

3 Entrepreneurial Competencies

3.1 Influence of the entrepreneur

More importantly, for an SME, the process of achieving competitiveness is strongly influenced by the key players, highlighted as entrepreneurship factors in the framework. Even in the literature emphasizing the internal or external sources of competitiveness, these entrepreneurial factors are also stressed. For example, according Man et al. (2002), "basic role played by the owner/manager" is one of the major determinants of SME competitiveness because of the concentration of decision-making power in the owner/manager in an SME environment, consequently affecting the firm's overall strategy. This emphasis on the human factor is the key distinctive competence of small firms is the experience, knowledge, and skills of the owners and workers. Two of the critical success factors highlighted in the study of Mitchelmore and Rowley, (2010), are the "experience" and "goal orientation" of the small business owners. Mitchelmore and Rowley, (2010), also suggested that the "total competitiveness" is positively influenced by a founder who can pay attention to the detailed operations of the business when the business is small. In sum, all of these studies imply the influential role of the entrepreneur particularly in affecting the performance of the firm.

3.2 Entrepreneurial competencies

Entrepreneurial competencies are considered a higher level characteristics encompassing personality traits, skills and knowledge. Therefore, it can be seen as the total ability of the entrepreneur

to perform a role successfully. Entrepreneurial competencies are related with the performance of the firm and its competitiveness (Man et al., 2002), growth and success of business (Colombo & Grilli, 2005). The competencies are learnable; therefore, it is crucial to recognize the importance of competencies. Colombo & Grilli (2005) referred entrepreneurial competencies to the underlying characteristics such as traits, self-images, specific knowledge, motives, social roles and skills that lead to venture birth, survival its growth whereas Man et al. (2002) defined them as the entrepreneur's ability to successfully perform a job role. Thus, there is a general consensus that the competencies of entrepreneurs are possessed by those individuals who start and further develop their businesses. The small and medium businesses require skills and entrepreneurial competencies that are very much different than from larger organizations.

3.3 Competencies and SME success

The competencies of entrepreneurs make a business more successful and may lead towards its sustainable competitive advantage as well. Entrepreneurial competencies are related with the performance of the firm and its competitiveness (Man et al., 2002), growth and success of business (Colombo & Grilli, 2005). According to Mitchelmore and Rowley, (2010); the literature emphasizes different approaches to reveal the impact of competencies on performance. For instance, the entrepreneurs seek for better opportunities for their ventures and management competencies of entrepreneurs are related to formulate venture strategy that better fit with their businesses. Man et al. (2002) indicated ten areas of competencies of entrepreneurs which are innovative, learning, opportunity, analytical, human, relationship & commitment, strategic, operational and personal competencies. In terms of a causal relationship, behavior is closer to performance than other entrepreneurial characteristics, such as personality traits, intentions or motivations (Colombo & Grilli, 2005). According to Ambastha and Momaya (2004), competencies are seen as behavioral and observable but only partly intra psychic characteristics of an entrepreneur. Consequently, competencies are changeable and learnable, allowing intervention in terms of the selection and teaching of entrepreneurship. These natures allow entrepreneurial competencies to indicate the controllability characteristic of competitiveness

According to Mitchelmore and Rowley (2010), the literature emphasizes different approaches to reveal the impact of competencies on competitiveness. For instance, the entrepreneurs seek for better opportunities for their ventures and management competencies of entrepreneurs are related to formulate venture strategy that better fit with their businesses. Ambastha and Momaya (2004) referred competency to the quality of entrepreneur's action that contributes to venture outcomes. Colombo & Grilli (2005), clustered the entrepreneur's competencies identified through the literature according to three basic roles such as technical skills, entrepreneurial skills and managerial role. They found that entrepreneur's competencies were related with venture performance. We have examined previous empirical studies in entrepreneurial competencies in an attempt to categorize all of the identified competencies into relevant activities or behavior in an SME context. Consequently, six competency areas are grouped together as opportunity competencies, relationship competencies, conceptual competencies, organizing competencies, strategic competencies and commitment competencies which are the independent variables in proposed analytical framework.

4 Analytical Framework

As per the framework, the characteristics of entrepreneurial competencies can be investigated from a process perspective, reflecting the actual behavior of the entrepreneur. These aspects are fit into the long term orientated, dynamic and controllable natures of SME competitiveness. They can be considered as higher level characteristics, representing the ability of the entrepreneur to perform a job role successfully and encompassing personality traits, skills and knowledge. Formwork is designed answer the primary question of how competencies impacting competitiveness by creating competitive scope and firm capabilities. The construct of competitive scope represents the perceived breadth for the firm to act. Previous studies have highlighted several measures to capture this construct, including technological sophistication, market heterogeneity, dynamism, market attractiveness, product/industry life cycle, environmental munificence, perceived opportunity, market demand, and competitive concentration (Colombo & Grilli, 2005; Ahmad, 2007, and Mitchelmore and Rowley, 2010). According to the Patlan-perez and Lara, (2012); business assets and processes have a direct positive relationship on competitive performance of the firm. According to the Mulatu, (2016), competitiveness can also be treated as a dependent, independent, or intermediary variable, depending on the perspectives from which

we approach the issue. Firm level competitiveness will be treated as dependent variable in this framework and asset competitiveness and process competitiveness will be the two major dimensions which will contribute to the overall firm level competitiveness. There are four measures have been identified to measure dimension of asset competitiveness as; Financial Assets, Technological Assets, HR Capabilities, Image and Reputation as well as four measures to assess the competitiveness of the processes as Strategic Management Processes, Human Resources Process, Technological & Operational Processes and Marketing Processes.

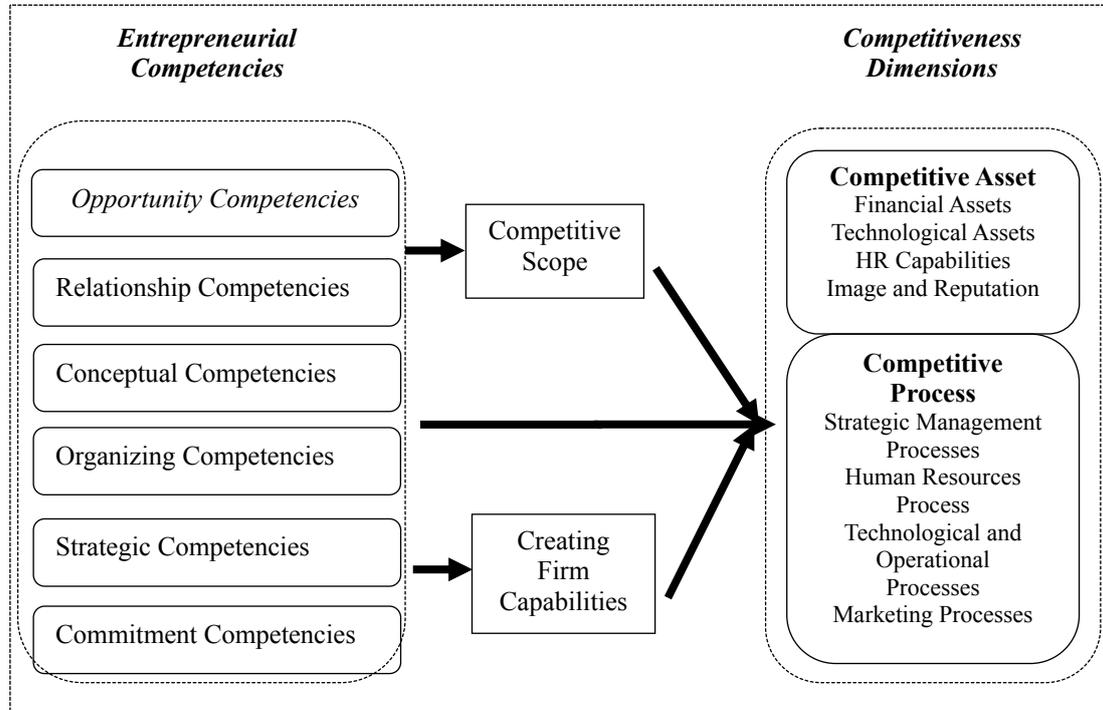

Figure 2 Conceptual Model (Source: Author Compiled,2016)

To investigate the relationship between entrepreneurial characteristics and SME’s long term performance, the concept of competitiveness has adopted and incorporated with entrepreneurial competencies to provide a theoretical rationale. The model distinguishes between two dimensions of competitiveness, assets and process, and six areas of competencies of an entrepreneur with the scopes of creating competitiveness scope and capabilities of the firm. The use of the competency approach in particular provides us with a means of studying entrepreneurial characteristics as a kind of variable, which is less operationalized yet higher level and closer to performance. This should provide us with a more significant relationship than by using easily operationalized but lower level variables such as the entrepreneur’s educational background, age, and experience.

As the theoretical framework focuses on the role of the entrepreneur in firm competitiveness, this will give better results with firms which are smaller in size and have a dominating entrepreneur, who is most likely to be the founder of the business. It is less readily applicable to SMEs without a dominating or founding entrepreneur, or to larger firms. This condition will have some limitations on the generalizability of the framework. However, upon modification, it can also be applied to the study of the strategic business unit for larger corporations. Another important factor of this framework is that an entrepreneur needs a balance between various competencies. Overemphasis on a few competency areas will not ensure the firm’s long-term performance, which could be seen as a result of the moderating or interactive relationships of competencies and descendants of competencies. To illustrate, the lack of organizing competencies hinders the development of organizational capabilities, which in turn limits the use of strategic and commitment competencies

5 Conclusions

A major contribution of this theoretical framework is the organization of the existing theories and findings in entrepreneurial characteristics and firm performance around three entrepreneurial tasks, so

that further theoretical development and empirical studies can be made based on this framework. For instance, in terms of theoretical considerations, as it focuses on the central role of the entrepreneurial competencies in entrepreneurial tasks, it highlights the importance of the role of the entrepreneur in determining the firm's performance. Another implication from the framework is that an entrepreneur needs a balance between various competencies. Overemphasis on a few competency areas cannot ensure the firm's long term performance, which can be seen as a result of the moderating or interactive relationships of competencies and descendants of competencies. To illustrate, the lack of organizing competencies hinders the development of organizational capabilities, which in turn limits the use of strategic and commitment competencies

The model also calls for several related directions for empirical studies. First of all, while we have distinguished between six competency areas and other major constructs, we still need to identify which individual competencies lie in each area, as well as the appropriate variables within each construct. Further empirical studies in the form of qualitative methods are appropriate for investigating the competency areas in detail. It would also be of great value to carry out interindustry or cross-cultural comparisons of different competency areas, and look at how they affect other constructs of SME competitiveness.

Non-Governmental Organizations' Responses to Street Children in China: A Case Study of Kunming City

Yu Yanping, Zhang Mingjie

College of Politics and Administration, Wuhan University of Technology, Wuhan, P. R. China, 430063
(E-mail: gabbiyu@live.cn, z.zmj@foxmail.com)

Abstract: In China, street children are a large group and the number is growing. In response to this issue, the government takes on the main responsibility of rescuing them from street life and reuniting them with their families. However, the needs of street children are diverse, and an innovative way of helping them is needed. Non-governmental organizations, which aim to help vulnerable groups of people, have gradually been taking more action to help street children in China. Through a case study of a non-governmental organization called 'Sweet Home Center' in Kunming, this paper aims to explore the non-governmental organization's responses to the problem of street children. The data are collected through in-depth interviews with nine street children and two workers at the Center. Findings indicate that the Center has a formalized service procedure of helping street children, as well as providing needs-oriented services to the street children.

Key words: Non-governmental organizations; Response; Street children; Case study

1 Introduction

The problem of children living on the street has already emerged as a common social phenomenon around the world and has elicited public concern. In China, the number of urban street children is growing: from an estimated 150,000 in 2000, in nearly a decade, the number increased to nearly a million. The recent national sample survey reveals the number of children living on the street has increased to 1 to 1.5 million (Ju, Zhang, & Chen, 2008).

In response to the problem of street children, Chinese government has taken action to solve this problem. A series of laws and regulations have been issued to protect children's rights, such as the Law of the People's Republic of China on the Protection of Minors, and a new policy towards street children implemented in 2003, transferring from a traditional compulsory repatriation system to a new social assistance system (Xue, 2009). Welfare services and organizational systems to protect and rescue street children groups are also established in China, called Protection and Education Centers (PECs), with the goal of protecting and educating street children and ultimately returning them to their own families and there were 130 PECs in China (Jiang, 2006). With the development of the problem of street children, the PEC system has received many criticisms. It is a working model in an administrative system from top to bottom and the service providers are in the role of the administrative authority for serving street children (Bi, 2008). PEC is described as having good hardware with cold management, a prison with no freedom (Lam & Cheng, 2008).

Non-governmental organizations have been gradually taking on responsibility for serving this needy population. Different from institutionalized rescue services provided by the government, non-governmental organizations provide community-based rescue services for street children, which means providing open, decentralized relief for children, based on their needs, in a community (Jiang, 2011). In Kunming, street children are easily found and the problems of street children are obvious. According to statistics from the Ministry of Affairs, Department of Yunnan Province, there are more than 20,000 children living on the street, and every year the government rescues, on average, more than 10,000 children from the streets of Kunming City. There is one non-governmental organization called 'Sweet Home Community Children Relief Service Center' (Sweet Home Center), which has been funded since 2004 with the goal of reaching out to all kinds of street children in Kunming and providing temporary shelter, counseling services, and family reunification to those who are willing.

In the current study, we are aiming to study how non-governmental organizations react to the social problem of street children. Taking Sweet Home Center as a case study, we want to explore how the Center is helping street children and what kinds of services are provided by the Center.

2 Methodology

This study explores the services of non-governmental organizations through a case study, which is helpful for a researcher to gain both a holistic and an in-depth understanding of the research in focus

(Baxter & Jack, 2008). The Sweet Home Center provides open and voluntary relief for all street children. There are no isolation mechanisms, such as an iron gate or a fence to restrain the street children, thus they have access to the services at the Center at any time, and they also can leave at any time. Reuniting the street children with their families is one goal, but not the only goal. Its ultimate goal is to re-integrate street children into society. There are two service sites visited during my fieldwork, one is the Outreach Site located in the urban area without sheltering services, and the other is the Children Village with sheltering, which is located in the rural area in Kunming. The Center also recruits couples to become the ‘parents’ of ‘Semi-families’, which are designed to operate as a real family. Usually, there are four to six adolescents in one Semi-family. The couples of the family act as parents of the family/house and the street children in the family treat each other as siblings.

The researcher spent six months staying in the Center and explored the responses of the Center in 2012. In the beginning, the researcher spent most of the time talking to and interviewing the workers, as well as reading some existing documents and files of the Center, to find out the history, background, and goals of the Center, and the profile of the service recipients. In the second stage, the workers invited the researcher to interact with all street children in the Center. Then, the researcher spent time building trust with all street children through playing with them, listening to their stories, etc. When sufficient trust had been built, the researcher invited a street child to attend an in-depth interview which aimed to find out about the lives of street children in the Center. Nine street children were recruited in the research. Interview questions were asked: How did you get access to the Center? What services did the worker of the Center provide to you? How do you feel? What have you experienced in the Center?

To make the results clear and easy to present, the researcher adopted coding to differentiate both samples. The coding is unique, denoted by one capital letter (C represents street children, W means a worker from the Center), and one Arabic number (which alters the sequence according to the time of the interview). Interviews were audio-taped on an electronic recorder for later transcription. Verbatim transcripts were typed out according to the interview recordings. The data were then coded according to themes and were analyzed for thematic strands emerging from what the respondents said.

3 Findings

Street children faced many difficulties in staying alive on their own over time on the street and sought help from all kinds of social resources; one of them is the Sweet Home Center. Findings indicate that the Center has a formalized service procedure in helping street children (See Figure 1).

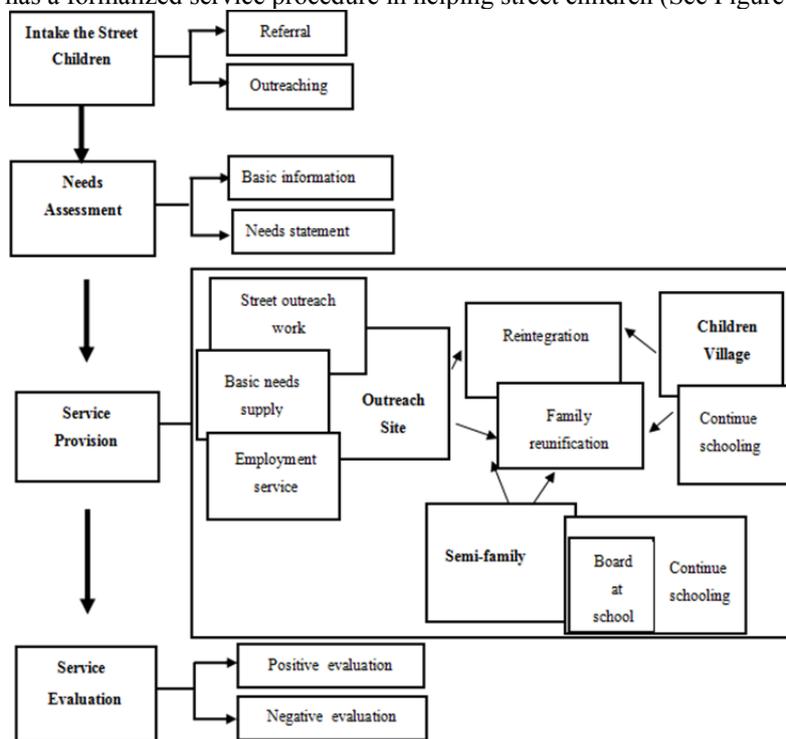

Figure 1 Service Procedure and Scope of the Sweet Home Center

3.1 Intake of street children

There are different ways for this group of children to leave life on the street and get access to the Center. The workers go to the streets themselves and put a lot of effort into outreach in order to help children get out of life on the street. Street children also seek or encounter other social resources, such as friends, police or others who help them to find a better alternative. All these social resources help this group of children get access to the Center. Of the nine respondents, C1, C4 and C5 met the youth outreach workers and were introduced to the shelter. Respondents C2, C8 and C9 were referred by their peers. The rest, respondents C3, C6 and C7, were referred by other sources, such as journalists.

Referred by law enforcement officials and other people. Local law enforcement officials were aware of the Center, and some of them preferred sending the street children there. Respondent C3 gave a typical example of his experience of being referred to the Center by the police: "I encountered the police near the railway station, and they asked me about my situation and family information. I was so afraid they would call my parents and that I would have to return home, so I lied to them saying I did not have parents. I thought they would let me go; however, they called the Center providing shelters to the street children, and a member of staff came to pick me up." The Center was also known in the community, and three respondents were referred by other people, such as journalists, scavengers, and others. For example, C6 recalled her experiences, saying: "I was sitting by the sidewalk, and one couple saw me. The man asked me if I wanted to go to school. They wanted to support me in taking me to school. The woman said there was a Center to help orphans and asked me whether I would like to go to the Center. I agreed. So later they sent me here." The street children know that if a child has parents, irrespective of their experiences, the authorities would send them back to parents. The Center was another community alternative and a buffer. Building a community reputation to mobilize all possible resources, such as police and media, is necessary to generate referrals of street children to the Center.

Outreach and building trust. Workers conduct outreach work on the street to identify possible street children and invite them to accept services. Trust is the first element that affects whether or not this group of children accept the services or not. Children do not trust outreach workers easily in the beginning, because of the self-protection mechanisms they have established. Certain techniques were helpful for the workers to build trust with the street children. Some street children went to the Center because outreach workers approached them and persuaded them to go to the Center for services related to getting a formal job. Respondent C4 gave a typical example of his experience of trusting the workers: "It was in November 2009 when I was distributing flyers on the street - two workers from the Center approached me and asked me whether I wanted to go the Center so they could help me to find a formal job. They told me that the job was washing cars, and I could be paid a certain amount of money each month. I wanted to have a try, so I came with them, assuming that the Center owned a car wash business of its own." Usually, friends were more easily trusted by the children, because they were familiar and trust had already had been built. Some children trusted the workers and agreed to accept services from their friends' suggestions. Respondent C1 gave a typical example of his experience: "That day I was wandering around the pedestrian street. There was a young woman who approached me and she said she was a worker for helping children, she asked me to go with her. I didn't trust her in the beginning, thinking she was a kidnapper. So I walked away. Later I knew from another child that she really was helping. So the second time I met her, I trusted her and came to the Center." Outreach to children instead of waiting for the children to approach the Center is helpful. There is a positive assessment of the community response from this group of street children, it helps other street children who live on the street become more likely to trust the workers and accept the services. Therefore, the community image has become a source of supporting information to the Center, especially when considering the effect of the street children's social networking.

3.2 Needs assessment

The newcomers, whether they were found by the outreach staff or referred by their peers or by law enforcement officials, initially stayed at the Outreach Site. They were first asked to take a bath. Then, one worker from the office invited the children to fill out a form, including basic information about name, age, education, hometown, family background, and family contact information. After entering the Center, a short time was given to all new entrants to adjust to the environment, as well as to getting along with peers and staff. During this adjustment period, all children were introduced by the worker to the rules of the Center and that their performance would be evaluated. The Center provides basic services, including three meals a day, a bed, daily recreation activities, and informal education. They also assign one staff member to follow up with each newcomer, providing counseling and case management. Behavior management is also a service. Through building trust between the children and

the staff member, the children are encouraged to indicate their willingness to discuss their developmental needs, to see if they want to attend school, return home, or find a job.

For most street children, the Center is a temporary place for transition. Respondent C7 provides a typical example of this situation: "The Center was a transitional place. Children were sent back home if the staff member had contacted their parents. If we do not want to go home, we could stay in the Center and learn something. In my mind the Center was a temporary place. I just wanted to give it a try."

3.3 Service provision

Those who do not want to return home or attend school, and who are not ready to work, are sent to the Children Village when the workers believe that they are ready, i.e., that their behavior and emotional status are stable. After a period of time, the Center arranges for contact, visits and mediation with the children's families, for those who want to return home. In most cases, however, the children do not want to return home. However, as the Center is not authorized to be a temporary guardian for the children, and they could not take on any legal liabilities for the street children's behavior, the Center has to contact the children's families and let them know that they are taking care of the children and try to mediate between the parents and their children. The workers of the Center successfully contacted four children's parents during the time period of this study, and they attempted to mediate between the parent-child relationships before reuniting them at their home. As introduced by the manager of the Center, W2: "The Center respects the diverse needs of the street children and provides them with more options. Its ultimate goal is to reunite street children with society". Thus, apart from providing basic life necessities, and reuniting street children with their homes, the Center also provides unique services for young adolescents, including setting up the semi-family care mode and developing independent living skills training services. The Center provides training to street children who neither want to return home nor to attend school under the semi-family care mode, but who hope to work in other firms (in our case, C4 and C6), helping them to seek jobs and to communicate with their managers.

The Semi-family is designed and operated as a real family. As introduced by W1 of the Center, there were three semi-families at the time of this study in 2012. She elaborated: "It is a unique care mode for those runaway young adolescents who do not have any intention of returning home but who want to attend school with the help of the Center. The Center recruits a middle-aged couple to become the 'parents' of a semi-family. The Center assigns street children who match certain criteria to join the semi-family. Usually, the Center conducts an assessment of children who want to join the Semi-family by observing their behavior and their emotional performance in their daily lives in the Center for two or three months, and by visiting their birth family and getting consent from their parents to the arrangement. Those who match the criteria - that is, those who are permitted by their parents and who are stable in their behavior and emotional state (such as not fighting with others, not leaving the Center without staff permission, etc.) - can join the semi-family. The children attend school in the daytime and return to the Semi-family at night. The Center provides financial support for their tuition fees and daily living expenses. The responsible staff member for each Semi-family visit the family once a week or twice a month, talking to both parents and to the young adolescents and conducting a follow-up assessment." Two of the research informants examined in this study have been part of a semi-family, C2 and C9. C2 treasured the education chances and studied hard. He completed his studies while living in the Semi-family and found a job with the help of the worker from the Center.

3.4 Service evaluation

At the time of interview, the respondents' positive experiences in the Center were reported; the help received, such as food, sleeping places, safe environment, outdoor activities, informal education, attending school, counseling, family mediation, assistance to seek jobs, etc. All these helped them stay in the Center and they expressed positive feelings about the Center; for example, C3 said, "The shelter is better than my home. I like to stay here. I can watch TV and play basketball." C4 added, "In the Center, the staff always organize outdoor activities for us, such as visiting a museum. Once they also took us to Lijiang City for camping. I really liked these kinds of activities." C9 said: "Here I can eat, I can sleep well and also some workers worry about me if I am still outside ... Anyway, the Center is better than my home. If my (step-)father can change to be like the first time I saw him, but now it's impossible he can change. He will not stop beating me if I go back home. So I will not go back home."

The positive comments of the children indicated the overall services of the Center were effective in the areas of supportive services for the children, specifically health and schooling. However, the Center needs to do more. The limitations of the Center were reflected in the street children's negative comments toward the services, focusing on the following complaints: often changing the locations of the office and the shelter sites, making it difficult for children to find them (C4); strict regulations and rules and

limited freedom (C2); being bored in the daily routine (C1); being bullied by other children (C3); fighting with other children (C9), and feeling maltreated by the staff (C4), etc. Here are some examples the children recalled. C1 said, “Sometimes I feel no freedom here, so I just go out to the street for a walk, to see the outside world.” C2 added, “The staff of the Center always ask too many things when I want to ask for leave and go out of the Center for something. I felt that they wanted to control me, so I don’t like to tell them.”

4 Conclusions

The findings indicate several important hints for future practice: outreach to children instead of waiting for the children to approach the Center is a more effective way to help street children. The Center makes efforts to build a community reputation – this is important and will help the general public refer the street children. From the street children’s perspective, the Center is positively evaluated in providing shelter and food, but negatively evaluated as it lacks further incentives to motivate them to stay or lacks developmental assistance for them. Overall, the non-governmental organizations responses to street children is a large step forward in children’s services in China. Different from the government’s work, the non-governmental organization does not directly send them to back to their home but, through outreach work, assessment, basic services provision, and case management, provides services for street children which are more effective and successful. More community-based non-governmental organizations are needed in China and more professional development of these organizations are also needed to put them on the agenda.

Abstract: We attempt to explore the impact of ownership structure on earnings management, specifically, institutional investor ownership and managerial ownership within the China background. We utilize the Modified Jones model for non-financial Chinese firms listed in the Shenzhen and Shanghai stock exchange market, and try to examine this relationship for the entire research period (2005-2013). Our empirical results provide evidence that during the whole research period there is a significantly negative relationship between institutional investor ownership and earnings management in state owned enterprises (SOEs) and non-state owned enterprises (non-SOEs). Moreover, this study has provided further suggestions, specifically that the Chinese government should speed up SOEs' ownership reforms in order to enhance the function of constraints in corporate governance.

Key words: Earnings management; Ownership structure; SOEs, Non-SOEs; Managerial ownership

1 Introduction

Through the economic reforms in China between the 1980s and the 21st century, the country's economy has grown from 10% of the size of the USA's economy to over 2/3rds currently, thus attracting investment interest from all across the world (Allen et al. 2010). Firth et al. (2007) mention that China implemented an opening policy and transitional market economy in order to improve governance effectiveness of state owned enterprises (SOEs) and raise capital from domestic and foreign investors (Farh, et al, 2004). Li and Xia (2008) stated that it is commonly accepted that the governance function of SOEs is weaker than for non-SOEs in Chin. Although there is a rising number of SOEs reforming to non-SOEs, the former still take a dominant position in the market, and state ownership stands in a decisively controlling role. Moreover, in SOEs the government takes over all operational activities, including the appointment of senior managers. At the present time, interest towards determinants of earnings management has accentuated with the lower quality of accounting information, thereby influence decision-making of investors (Fernandez and Garcia, 2007). Agency theory is concerned with the fact that separation of ownership and operation in organisations might stimulate managers to adopt behaviours which serve their own self-interests (Arnold & Lange, 2004). To mitigate such opportunistic behaviour, corporate governance deems ownership structure mechanisms as essential devices in monitoring, disciplining and influencing managerial opportunism (Mallin, 2007). A number of different arguments have been made regarding how a company requires a suitable ownership structure, involving monitoring and governance functions with an effect on earnings management. (Beasley, 1996; Arya et al.1998; Klein, 2002). Overall, previous studies have put forward the idea that ownership structure can affect earnings management in firms. Therefore, the primary purpose of this research is to find the impact of shareholding structures on managing earnings in the Chinese stock market and to address whether ownership structure provides incentives to reduce earnings management behaviors both in SOEs and non-SOEs.

2 Data and Methodology

Agency theory predicts that ownership structure monitoring mechanisms can effectively align the interests of managers with those of the shareholders. Previous studies on the topic have suggested that ownership structure is one of the most important factors impacting corporate earnings management (Chung et al. 2002; Dechow et al.1996). Prior research supports these predictions in developed markets. However, in emerging markets, institutional settings such as ownership structure and regulatory oversight bodies differ across the world. Thus, the feasibility and sustainability of agency theory predictions are varied as well. Furthermore, there is little research difference between SOEs and non-SOEs, for example in China where most of listed companies are reformed from state-owned enterprises, whereas the corporate governance role of ownership structure is different for the two types.

With the unique institutional background of China and because investor protection is weak and the capital market is still evolving, there are significant differences between state-owned companies and non-state-owned companies. Therefore, this study addresses these issues and investigates the effectiveness of ownership structure monitoring mechanisms in mitigating earnings management in China and provides a comparison between SOEs and non-SOEs.

In accordance with the agency theory, separation of shareholdings and operations causes a conflict between the benefits of shareholders and managerial interest (Jensen & Meckling, 1976). Therefore, it is important that the decisions of managers should be monitored in order to protect the interests of the shareholders, which can also enhance the reliability and completeness of financial reporting (Iturriague & Hoffmann, 2005). The primary purpose of this research is to find the impact of shareholding structures on managing earnings in the Chinese stock market. The objectives of this study are to address whether ownership structure provides incentives to reduce earnings management behaviors both in SOEs and non-SOEs. Previous research by Jian and Wong (2004), Yang et al. (2008), and Liu and Lu (2007) compare several models and examine the effective of the Modified Jones model in China. Thus, the writers use the Modified Jones model for calculating discretionary accruals and multiple linear regressions utilizing data from China's stock market over a period from 2005 to 2013.

2.1 Sample selection

This study examined A-share firms listed on the Shanghai and Shenzhen stock market from 2005 to 2013. The reason for choosing this specific period is because 2007 is when Chinese accounting standards started to introduce IFRS convergence. Then, in order to control for potential industry effects, this study further introduces industry dummy variables and classifies 1109 sample firms into 14 categories in line with CSMAR industry code A. Since the main aim of this study is to compare how the effect of ownership structure differs between SOEs and NON-SOEs. Finally, sampling selection obtained 9963 observations during the period of 2005 -2013, including 6576 on SOEs and 3387 on NON-SOEs.

Table 1 Distribution of Final Sample Firms by Year and Type

YEAR	SOE	NON-SOE	Total Samples
2005	747	360	1107
2006	739	368	1107
2007	728	379	1107
2008	730	377	1107
2009	731	376	1107
2010	733	374	1107
2011	724	383	1107
2012	722	385	1107
2013	722	385	1107
Total	6576	3387	9963

Notes: SOEs are state owned enterprises, while NON-SOEs are non-state owned enterprises. In line with the Chinese market factors reviewed earlier, this table shows that there are mainly firms controlled by the government in the Chinese stock market.

2.2 Measuring of earnings management

The Jones model (1991) is the most popular model used in studies of accounting accruals, and is the most widely used model in earning management research and established significant market effects (Liu & Lu 2007, Jaggii & Leung 2007). Total accruals are used to measure earnings management, and can be categorised firstly into uncontrollable accruals (non-discretionary accruals, represented by NDA). Jones argues that uncontrolled accrued profit is the function of the company's operating income and fixed assets. Namely, there is a linear relationship between a company's operating income change and fixed assets, while NDA is calculated through regression analysis.

Firstly, total accruals (TA) are defined as the difference between net income before extraordinary items (NI) and cash flow from operating activities (CFO): $TA=NI-CFO$.

Then, following ordinary least squares (OLS) regressions to estimate the coefficients α_1 , α_2 , α_3 for

the sample period from 2005 to 2013, the regression equation is as follows:

$$TA_{it}/A_{it} - 1 = \alpha_{1t}[1/A_{it} - 1] + \alpha_{2t}[(\Delta REV_{it} - \Delta REC_{it})/A_{it} - 1] + \alpha_{3t}[PPE_{it}/A_{it} - 1] + \varepsilon_{it} \quad (1)$$

Where: TA stands for total accruals, NDA means the non-discretionary accruals, ΔREV_{it} are the changes in operating revenues, ΔREC_{it} is the change in net receivables, PPE is gross property, plants and equipment, t and t-1 are time, i is the firm. A_{it-1} is prior year total assets that are used to scaled variables in order to control for heteroscedasticity.

Following the calculation of non-discretionary accruals (NDA) as total accruals less discretionary accruals (DA), using TA_{it} the regression equation and $TA=IN-CFO$ to estimate the coefficient values, $\alpha_1\alpha_2\alpha_3$ are inserted into the NDA_{it} equation to find NDA.

$$NDA_{it}/A_{it} - 1 = \alpha_{1t}[1/A_{it} - 1] + \alpha_{2t}[(\Delta REV_{it} - \Delta REC_{it})/A_{it} - 1] + \alpha_{3t}[PPE_{it}/A_{it} - 1] \quad (2)$$

Finally, DA is equal to total accruals less NDA, producing the equation below:

$$DA_{it} = TA_{it}/A_{it} - 1 - \alpha_1[1/A_{it} - 1] + \alpha_2[(\Delta REV_{it} - \Delta REC_{it})/A_{it} - 1] + \alpha_3[PPE_{it}/A_{it} - 1] \quad (3)$$

Where, DA_{it} is the discretionary accruals, A is the total accruals, NDA is the non-discretionary accruals, ΔREV_{it} is the changes in operating revenues, ΔREC_{it} is the change in net receivables, PPE is gross property, plants and equipment, t and t-1 are time, i is the firm. A_{it-1} represents the previous year's total accruals, which are used to scaled variables in order to control for heterosexuality.

3 Empirical Results and Discussions

3.1 Descriptive statistics

As can be known from the descriptive statistics (as shown on table 2), the averages of DA during 2005 to 2013 are very close. Specifically, the DA of the state-owned firms are slightly larger than those of non-state firms. Thus, it can be concluded that the amount of earnings management in state-owned companies is slightly larger than what is present in non-state-owned companies. Additionally, standard deviation of DA is relatively small in most cases, indicating that fluctuations of DA are not frequent or significant. Overall, there is no obvious trend, and DA have minor decrease volatility.

Table 2 Descriptive Statistics of Discretionary Accruals

Year	SOE				NON-SOE			
	Mean	Min	Max	Sd	Mean	Min	Max	Sd
2005	0.2583	0.0010	0.5989	0.0981	0.2328	0.0022	0.5285	0.0778
2006	0.2628	0.0031	1.1917	0.1271	0.2268	0.0133	0.6244	0.0844
2007	0.2548	0.0032	1.3829	0.1100	0.2319	0.0072	4.3047	0.2330
2008	0.2488	0.0052	1.1816	0.1101	0.2201	0.0002	0.9550	0.0894
2009	0.2503	0.0114	3.9222	0.1756	0.2183	0.0058	3.3847	0.1833
2010	0.2391	0.0021	1.9896	0.1284	0.2184	0.0018	4.3294	0.2384
2011	0.2372	0.0032	3.0822	0.1652	0.2136	0.0157	2.8100	0.1913
2012	0.2260	0.0033	1.5271	0.1213	0.2200	0.0021	2.6849	0.2365
2013	0.2273	0.0011	1.6517	0.1188	0.2047	0.0056	1.3465	0.1112
OBS	6576	6576	6576	6576	3387	3387	3387	3387

3.2 Correlation matrix

The data correlations for non-SOEs show that managerial ownership is negatively correlated with DA, meaning that earnings management are less frequent in firms with greater managerial ownership. In addition, institutional investor ownership and size present a positive correlation with discretionary accruals in SOEs. However, the research further shows that institution investor ownership is negatively correlated with discretionary accruals both in SOEs and NON-SOEs after the adoption of IFRS in 2007(as shown on table 2and table 3). Also, there is a significantly positive correlation between SIZE and DA, which shows that large firms tend to undertake earnings management behaviour both in SOEs and NON-SOEs. All in all, the highest correlation coefficient is 0.37673, and so the overall results show that there is a weak correlation among the variables, indicating that the variables do not have multi

co-linearity problems (Tabachnick & Fidell, 2001).

Table 3 Correlation of Variables from 2007 to 2013 in Soes

	DA	MAN	INST	SIZE
DA	1			
MAN	-0.0289 (0.7027)	1		
INST	-0.0796 (0.0000)	0.00949 (0.0034)	1	
SIZE	0.01780 (0.0000)	-0.01823 (0.0022)	0.30255 (0.0000)	1

Table 4 Correlation of Variables from 2007 to 2013 in NON-SOEs

	DA	MAN	INST	SIZE
DA	1			
MAN	-0.01121(0.0653)	1		
INST	-0.05803(0.0000)	-0.07939(0.0009)	1	
SIZE	0.017980(0.0000)	0.070801(0.0001)	0.37673(0.0000)	1

3.3 Regression results

From above data, it is clear that there are statistically adverse effects for institutional investor ownership when it comes to earnings management, for both SOEs and non-SOEs. This negative relationship conforms to past research conducted by Iturriaga and Hoffman (2005) and Ali, Salleh and Hassan (2008). Earnings management may be fundamentally diminished by companies with higher institutional ownership. Thus, increments in institutional ownership will diminish discretionary accounting accruals and institutional investors could efficiently supervise a company's earnings management behaviours both in private and state owned Chinese firms.

The results show that, following IFRS adoption, institutional investor ownership becomes negatively associated with earning management in SOEs, whilst there is still no association relationship between earning management and managerial ownership in SOEs. The results also find that before IFRS was adopted in non-SOEs, institutional investor ownership and managerial ownership both have a significantly negative effect on earnings management. However, after introducing IFRS into Chinese accounting standards, the results show that there is a negative, but not significant, association relationship between managerial ownership and earnings management. The possible reason for this is that IFRS adoption reduces the effect of ownership structure on earning management behaviors. Institutional investor ownership remains unaltered in its impact on earnings management in non-SOEs.

3.4 Summary of the regressions results

In short, it can be concluded that the findings of the regression show a negative but significant relationship at the 1% confidence level between the level of the value of discretionary accruals and institutional investor ownership for SOEs and non-SOEs between the years 2005-2013. However, at 10% significance level this relationship becomes significant, and is in line with earlier results established by Warfield et al. (1995) who noted a negative correlation between manager ownership and incidents of earnings management. Furthermore, the findings of regression also show that the IFRS adoption in 2007 had a negative significant effect on institutional investor ownership. This puts forward the idea that the level of discretionary accruals is expected to be lower in times of IFRS adoption, for both SOEs and non-SOEs.

4 Conclusions

This study measures earnings management through the modified Jones models of Dechow et al. (1995). As a result, empirical models are constructed in which the estimated earnings management measures represent the dependent variables. Independent variables in the empirical model ownership structure include institutional ownership and managerial ownership. These models are tested using the population of all firms listed on the A-shares of the Shenzhen and Shanghai Stock Exchange. Moreover, in order to examine the effect of IFRS adoption in China, data from 2005 to 2013 was used.

The results reveal that institutional investors appear effective in constraining accruals manipulations. From this, this study offers a different view of the agency theory literature, which focuses more on earnings management in general, and emerging market in particular. It highlights challenges to the applicability of the agency theory in emerging markets where corporate governance

mechanisms are supposed to mitigate the practice of earnings management. Moreover, when it comes to non-SOEs, the findings present that the adoption of IFRS has significantly affected the level of earnings management in the presence of ownership structure. Additionally, the results provide evidence that the level of institutional investor ownership in times of IFRS adoption changes a positive effect into a negative association relationship with earnings management in SOEs. This result means that IFRS adoption in the state-owned company achieves an effective inhibition of earnings management, and especially helps improve the governance effect of the institutional investors in the case of state-owned enterprises.

A Study on the Influencing Factors of Income Disparity among the Elderly in China

Gao Yunjiao, Shi Fengyuan

Academy of Sociology, Wuhan University of Technology, Wuhan, P. R. China, 430070

(E-mail: yunjiaogao@whut.edu.cn, Edwinwhut@yahoo.com)

Abstract: China has stepped into the aging society since the beginning of the 21st century. With the population of the elderly on the increase, the aging quickening trend, supporting for the elderly has become the focus of the concern of the whole society. Income of the elderly, the economic source to sustain their daily life, plays an irreplaceable role in satisfying the demand of the elderly, while there are large gaps among different groups. Based on the baseline data of Chinese Health and Retirement Longitudinal Survey (CHARLS) (2011), this essay analyses the income level of the nationwide elderly and studies the determinants of income differences, and finds that apart from urban-rural disparity, the income level is also variable to gender, occupational background and educational background etc.

Key words: The elderly; China; Income disparity; Influencing factors

1 Introduction

China has been facing increasing pressure on the aging population in recent years, especially since it entered the aging society: the large population base of the elderly and the high speed of increase. Statistics of China Research Center on Aging in 2014 shows that till the end of 2013, the number of people above 60 in China is 202,430,000, accounting for 14.9% of the total population; and the number of people above 65 is 131,610,000, accounting for 9.7% of the total population. As is forecasted by China National Committee on Aging, the number may exceed 400,000,000 when it comes to 2030, which aggregates the worries of scholars on China's greying (Hu Hongshu, Lu Yuanping, 2012). Aging of population with the national conditions of being at the primary stage of socialism, the country is facing the problem of "aging comes before getting wealthy", making the aging problem more prominent.

In nature supporting problem is an economic issue, and the core is income guarantee of the elderly, which is directly related to the quality of life of the elderly (Song Jian, 2006; Wei Pu, 2012). Though the endowment insurance system is increasingly improved, expanding coverage and providing better treatment gradually etc., and the government has issued relevant policies and regulations to guarantee the interests of the elderly, in reality, we may still perceive intuitively that a general income disparity exists among the elderly. Furthermore, among various aging problems, poverty and income disparity is the most basic and common one. Before most elderly people achieve common prosperity in material life, generally the level of income plays a determinant role in their living conditions, life satisfaction and quality of life (Wei Pu, 2012).

A certain gap between the rich and the poor is inevitable in market economy, but the gap in our country is much too large, which is close to 0.5 in the measurement of Gini coefficient (Li et al, 2013); income inequality deteriorates health conditions of the elderly, increases the probability of unhealthy elderly, thus affects their well-being (Hu Hongshu, Lu Yuanping, 2012). Therefore, increasing the income of the elderly and improving the fairness of income are beneficial to relieving or eliminating the concern of elderly over future economic conditions, improving their well-being and guaranteeing they could go through the last years of their life healthily with dignity.

2 Literature Review

Significant differences exist in income of the elderly. Based on the statistics of "one-time sampling survey on urban and rural aging population in China" (2000) published by China Research Center on Aging, to study on income disparity of the elderly in China, Wu Xiaolan (2008) makes analysis by using quinquepartite method, and finds out that significant income disparity exists among the elderly, more than half of the total income belong to 20% of the elderly who gain highest income (Wu Xiaolan, 2008; Liang Hong, 2011), indicating distinct imbalance of income among the elderly.

First, take urban-rural disparity as start point to study income disparity of the elderly. In the past, we have followed the strategic policy of "lay stress on city not countryside, on industry not agriculture" in social economic development, shaping typical urban-rural dualistic social structure characteristics,

resulting in the different social economic development level of the city and countryside; and endowment security system construction shows distinct urban-rural dualistic structure characteristics (Wei Pu, 2006). Wei Pu (2006) makes a thorough study on urban-rural disparity based on income level and constitution of income sources, and finds out the urban-rural income disparity of the elderly is large; income levels of the elderly in rural areas is far lower than those in city or town; and the independence and stability of income of the elderly in rural areas is far lower than those in city or town (Wei Pu, 2012).

Second, take gender disparity as start point to study income disparity of the elderly. From two dimensions, namely absence of necessary legislation to ensure equality of men and women in doing household chores and the present retirement system in which it is stipulated that female shall retire from work five or ten years earlier than male, Cai Lin (2007) explores the causes for the general inferior position of income level of female elderly to that of male elderly. Both in city and countryside, the income level of female elderly is obviously lower than male elderly; female elderly's self-supporting ability and independence in economic life are far weaker than male elderly, and the degree of their economic dependence on other family members is much higher than male elderly of the same region (Zhu Xuhong, 2011; Wei Pu, 2012).

Third, take occupational background as start point to study income disparity of the elderly. Generally, income level of the elderly will decrease to some extent after they retire or lose ability to work; therefore savings are important supplementary guarantee in their later life. Disparity also exists among different strata of society on the index of savings: those enjoy high level of income used to be cadres, the ratio of people with savings among science, education, culture and health occupation is higher than the ratio of those among workers and commercial services occupation, while the ratio of those among peasants is the lowest (Li Ruojian, 2007). In "Analysis on Income Disparity Status of the Elderly in Guangzhou", Liang Hong (2011) stresses the impact of urban-rural difference and occupational background on income disparity of the elderly, and suggests taking them as reference for policy making on solving the problem of economic support to the elderly. Occupational background plays an important role in living conditions and selection of supporting mode in the elderly, and the study further proves that different occupational backgrounds result in income disparity among the elderly.

Fourth, take educational background as start point to study income disparity of the elderly. No matter in city or countryside, the more education one attains, the higher is his/her income (Wu Xiaolan, 2008; Qian Xuefei, 2011). Wei Pu (2012) further points out that the elderly with higher educational background enjoy higher level of income, as well as independence and stability. The largest income disparity exists among three educational levels: primary school, junior middle school and high school. The income disparity between illiterate people and primary school graduates, high school graduates and university or above graduates is not large.

3 Study Design

3.1 Definitions

3.1.1 The elderly

As per international provisions, people above the age of 65 are defined as the elderly; in China, those above the age of 60 are the elderly, therefore, the subject of this essay is people above 60 years old.

3.1.2 Income of the elderly

The income of the elderly studied in this essay is shown as self-evaluated living standard of the elderly, which is divided into five levels: very high, above the middle, at the middle, below the middle and quite low; "1" represents very high, meaning the best income status, and "5" represents quite low, indicating the worst income status.

3.1.3 Occupational background

Since there is quite big difference in retirement system between city and countryside, this paper defines one's occupational background as his/her occupation before retirement or before 60 years old, more specifically, in city area, it refers to as the elderly's occupation before retirement, and in rural areas, it mainly refers to the last occupation the elderly undertakes before he/she gets 60.

3.1.4 Educational background

This paper takes the highest diploma one gets as his/her educational background, which is divided into 11 categories: 1) didn't attain formal education (illiterate); 2) didn't finish primary school, but capable of reading and writing; 3) went to old-style private school; 4) graduated from primary school; 5)

graduated from junior middle school; 6) graduated from high school; 7) graduated from technical secondary school (including secondary normal education and vocational high school); 8) graduated from junior college; 9) graduated with bachelor's degree; 10) graduated with master's degree; and 11) graduated with doctor's degree.

3.2 Data

The analysis of this study is based on the baseline data of China Health and Retirement Longitudinal Survey (CHARLS) in 2011. The respondents of CHARLS are middle-aged and elderly people above age 45, and the survey content is mainly family and personal status of them, which provides information about middle-aged and elderly people's health, employment and family relations status under the background of aging of population in China from a multi-disciplinary perspective. 17,000 respondents from about 10,000 families of 450 village/neighborhood committees of 150 counties are involved; the sample is relatively highly representative, which is significant to nationwide study. Data is collected through multi-stage sampling, and PPS sampling is conducted at county/district and village/neighborhood sampling stage.

Since the respondents of CHARSL are people above 45 and the subjects of this study are elderly people, therefore samples at and below 59 are eliminated. After selection, 10,539 samples data are acquired, ages of samples distribute between 60 and 105 years old, among which elderly of 60 to 69 account for 62.36% of the sample size; elderly of 70 to 79 account for 26.87% of the sample size; and elderly at and above 80 account for 10.77% of the sample size (Hu Shiyong, Nan Shunxia, 2016). The gender ratio of the sample is 0.9857, male taking up 49.64%, and female 50.36%. Rural elderly account for 75.47% and urban elderly 24.53%. The education level of the sample is: 1) didn't attain formal education (illiterate), those make up 34.91% of the sample; 2) didn't finish primary school, but capable of reading and writing, 19.65%; 3) went to old-style private school, 0.80%; 4) graduated from primary school, 22.61%; 5) graduated from junior middle school, 13.96%; 6) graduated from high school, 3.39%; 7) graduated from technical secondary school (including secondary normal education and vocational high school), 2.67%; 8) graduated from junior college, 1.22%; 9) graduated with bachelor's degree, 0.75%; 10) graduated with master's degree, 0.03%; and 11) graduated with doctor's degree, none. Self-evaluated income is divided into five levels, "very high" occupies 0.23%, "above the middle" 3.09%, "at the middle" 58.23%, "below the middle" 30.53%, and "quite low" 12.93%.

4 Results

As is compared in urban and rural areas, the income level of rural elderly is 3.586, and the urban elderly 3.439, generally the income level of rural elderly is lower than that of urban elderly.

Table 1 The Interaction between Each Variable and Income

Each Variable	Number of obs	Prob > F	R-squared	Adj R-squared	Root MSE
Urban-rural Difference	6028	0.0000	0.0065	0.0063	.777327
Gender Difference	9665	0.2084	0.0002	0.0001	.76382
Background Difference	1492	0.0000	0.0312	0.0306	.68018
Educational Background	9664	0.0000	0.0135	0.0314	.75847

Under the condition of significance level being 5%, urban-rural difference shows effect of significance level to income disparity of the elderly ($P=0.00$). Under the condition of significance level being 5%, gender difference shows no effect of significance level to income disparity of the elderly ($P=0.208$). Under the condition of significance level being 5%, work unit difference shows effect of significance level to income disparity of the elderly ($P=0.000$). Under the condition of significance level being 5%, education difference shows effect of significance level to income disparity of the elderly ($P=0.000$). In a word, urban-rural difference, work unit difference and education difference have an impact on income. The person who has the higher level of occupation background and education with urban hukou has a higher income.

As is compared in urban and rural areas, the income level of rural elderly is 3.586, and the urban elderly 3.439, generally the income level of rural elderly is lower than that of urban elderly.

Table 2 Urban-rural Difference in Income Disparity among the Elderly

Rate Your Standard Of living	Area Type Taken Down by EWER		Total
	1 Rural	2 Urben	
1 Very high	9	6	15
2 Relatively high	127	62	189
3 Average	2333	778	3111
4 Relatively poor	1425	454	1879
5 Poor	711	123	834
Total	4605	1423	6028

Table 3 Gender Difference in Income Disparity among the Elderly

Rate Your Standard Of living	Gender		Total
	Male	Female	
1 Very high	10	12	22
2 Relatively high	164	135	299
3 Average	2506	2639	5144
4 Relatively poor	1536	1414	2950
5 Poor	563	687	1250
Total	4779	4886	9665

As is compared in gender, the average income level of male elderly is 3.518, female elderly 3.538, the income level of female elderly is relatively lower. Under the condition of significance level being 5%, gender difference shows no effect of significance level to income disparity of the elderly (P=0.208)

Table 4 Occupational Background Difference in Income Disparity among the Elderly

Rate Your Standard Of living	Gove rnme nt	institu	NGO	Firm	Invidual firm	Invidual farmer	Individual household	other	total
1 Very high	1	1	1	1	0	0	0	0	4
2 Relatively high	25	26	2	20	1	0	0	1	75
3 Average	103	227	5	478	29	3	3	17	865
4 Relatively poor	39	92	5	267	32	6	3	10	454
5 Poor	8	17	1	48	12	3	2	3	94
Total	176	363	14	814	74	12	6	31	1492

As far as occupational background is concerned, the income level of elderly who retired from government sectors is 3.159, public institutions 3.269, non-profit organizations 3.214, enterprises 3.418, individual household 3.743, peasant household 4.000, household 3.875, others 3.483. Through comparison it is observed that the income status of elderly who retired from government sectors is highest, and that of peasant household is lowest. Under the condition of significance level being 5%, work unit difference shows no effect of significance level to income disparity of the elderly (P=0.000).

Table 5 Educational Background Distribution in Income Disparity among the Elderly

Rate Your Standard Of living	No form	Did not finish primary	Sishu	Eleme ntary	Middle	High	vacational	Associate	Bachelor	Master	Doct oral	Total
Very high	11	4	0	4	2	1	0	0	0	0	0	22
Relatively high	95	31	3	63	49	13	19	15	10	0	0	298
Average	1663	1031	47	1181	752	173	174	79	44	2	0	5146
Relatively poor	974	600	16	707	444	106	59	29	13	1	0	2949
Poor	581	262	6	253	106	28	9	0	4	0	0	1249
Total	3324	1928	72	2208	1353	321	261	123	71	3	0	9664

As far as educational background is concerned, the income level of elderly who didn't attain formal education is 3.607, those who didn't finish primary school 3.562, those who went to old-style private

school 3.347, those who graduated from primary school 3.517, those who graduated from junior middle school 3.445, those who graduated from high school 3.457, those who graduated from technical secondary school 3.222, those who graduated from junior college 3.113, those who graduated with bachelor's degree 3.154, those who graduated with master's degree 3.333. Generally, the higher is the educational level, the higher is the income level of the elderly. For each higher level of educational background, the income level increases 0.046.

5 Conclusions

Based on the analysis on baseline data of CHARLS2011, this paper explores the factors that influence income level of the elderly, and makes a concrete analysis on the influence of urban-rural difference, gender difference, occupational background and educational background to income level of the elderly.

The result is in consistence with previous ones (Dong Fang, 2014; Wei Pu 2006&2012; Wu Xiaolan, 2008; Liang Hong, 2011): urban-rural difference has greater impact on income level of the elderly; income level of rural elderly is low generally; compared with in the city, social assistance to rural elderly with low income from the government is far from enough. Urban-rural household registration system and the unbalance of urban-rural economic development result in the significant difference in urban and rural elderly's income. To narrow urban-rural income disparity, first we should take rural areas as the focal point, improve income level of rural residents, and pay close attention to those live in rural areas with agricultural registered permanent residence, since this group of people gain low level of income and are prone to poverty. In addition, the ratio of fiscal transfer payment should be improved, to tackle the problem of insufficiency of rural social endowment insurance funds, improve the welfare level, make changes to the urban-rural dual-division situation, and promote free and proper flow of labor force.

Most previous studies indicate that gender difference show significant influence to income level of the elderly, the come level of male elderly is much higher than that of female elderly (Wei Pu, 2012; Qian Xuhong, 2011; Cai Lin, 2007); while this paper shows that gender difference has no significant impact on income level of the elderly, which is quite unexpected.

Previous studies have found that occupational background has significant impact on income level of the elderly (Liang Hong, 2011; Li Ruojian, 2007), and it is further proved in this study that different backgrounds result in income disparity among the elderly. As the symbol of an elderly's social status at middle age, occupational background has great impact on income of the elderly, which means the higher is one's occupational status before he/she retires, the higher is his/her income level at old age.

Most studies show educational background has significant impact on income level of the elderly (Qian Xuefei, 2011; Wei Pu, 2012; Dong Fang, 2014; Wu Xiaolan, 2008): the higher is one's educational background, the higher is his/her income level, and the higher is the independence and stability of his/her income.

As the population of the elderly is continuously on the increase, and the aging of population is more and more serious, besides institutional supply from the national level, we shall also take initiative to make use of the main guarantee function of family, individual and the market, to establish a multi-pillar elderly security system, realize the combination of social supporting and family supporting for the elderly, make the two ways complement each other and promote development of each other; we should make sure social supporting for the elderly develops with economic development while consolidating and strengthening the beneficial traditional family supporting way, so as to ensure the elderly enjoy effective guarantee in later life, their income level actually improved, stability of their income secured, and their quality of life improved continuously; we should prevent poverty in old age, narrow income disparity, and realize social equity.

(E-mail: mengpei2005@163.com, steven_64@163.com)

Abstract: The study carries out an empirical analysis on the relationship between sports industry and three industries in China by adopting econometric methods including correlation test, ADF test, cointegration test and Granger causality test. The study confirms the presence of cointegration, implying the long-run equilibrium relationship between the development of sports industry and three industries in China. Granger causality test confirmed the existence of bidirectional causality between the development of sports industry and tertiary industry in China. The major implication of the study is to clarify the status of sports industry in the national economy and to correctly understand the coordinated development between sports industry and three industries in China.

Key words: Sports industry; Three industries; Cointegration; Granger causality

1 Introduction

Since the 1980s, the sports industry has been emerging as a new industry worldwide. In the developed market economy countries, the sports industry has already begun to play an important role in the national economy. In America, the sports industry has ranked among the top ten pillar industries of its economy, the value-added of which accounts for about 3% of GDP. In 2014, the value-added of China's sports industry only account for 0.64% of GDP, but the development potential of China's sports industry is huge. In October 2014, the State Council of China issued the "Opinions on accelerating the development of sports industry and promoting sports consumption," which clearly puts forward that sports industry should be promoted to become China's new economic growth point and an important strength to promote economic structural transformation and upgrading.

Some scholars have studied the relationship between sports industry and economic growth. Molitor (1996) predicted that the leisure-oriented businesses would be the major driving force of the American economy. Meek (1997) put forward that since national output is measured by Gross Domestic Product (GDP), the output of the national sports industry should be measured by Gross Domestic Sports Product (GDSP). Michael and Pachianathan (2011) attempted at estimating the economic value of the sport industry in the United States in 2005 with a view of verifying the optimistic forecasts of the growth of the sport industry. Preuss (2004) analyzed some important economic aspects of holding the Olympic Games, such as tourism, exports, investments, revenues and expenditures of the Organizing Committee, and economic legacies. Fedderson and Manennig (2013) analyzed the economic impact of a mega-sporting event and found significant positive employment effects exclusively during the Olympic Games. Ren and Xia (2016) established the assessment indicator system of Chinese sports industry and proved a long-term equilibrium relationship between China's sports industry competitiveness and the level of economic development. Although extensive research has generally documented a positive relationship between sports industry and economic growth, the relationship between sports industry and three industries has received less attention. Sports industry is considered as an industry with long industrial chain and strong industrial relevance. Therefore, it is imperative to examine the linkage between sports industry and three industries, namely, primary industry, secondary industry and tertiary industry. Based on time series data from 2006-2014, this paper explores the interactive relationship between Chinese sports industry and three industries by adopting econometric methods including correlation test, ADF test, cointegration test and Granger causality test. This research is of great significance to clarify the status of sports industry in the national economy and correctly understand the coordinated development between sports industry and three industries in China.

2 Data and Methodology

GDP is defined as the market value of goods and services produced by labor and property within a country (Michael and Pachianathan, 2011). The value-added approach calculates the GDP through the subtraction of intermediate inputs from total sales at each stage in the production process. Sports

industry is a collection of economic activities which aims to provide sports services and products for the public (Chinese association of Sport industry, 2011). In accordance with the principles of economic computation, value-added approach was selected to measure the development of the sports industry in China. Data from 2006-2014 were taken from the “Statistical bulletin on sports and related industries” published by China’s General Administration of Sport. Value-added approach was also selected to measure the development of primary industry, secondary industry, and tertiary industry in China. Data from 2006-2014 were taken from national statistical yearbook of China. All the series were transformed into natural log-form to eliminate the heteroscedasticity problem of time series. The variables are denoted as lnS, lnPI, lnSI, lnTI for natural log-form of the value-added series of sports industry, primary industry, secondary industry and tertiary industry respectively. The analytical techniques used in the study are described below.

2.1 Augmented Dickey-Fuller (ADF) unit root test

Many economic and financial time series exhibit trending behavior or non-stationarity in the mean. The task of the unit root test is to test whether a time series variable is stationary and possesses a unit root. The null hypothesis is generally defined as the presence of a unit root. A commonly used test is the Augmented Dickey-Fuller test (ADF test). The ADF test is utilized to check the order of integration by using the model (1):

$$\Delta y_t = \alpha + \delta T + \beta_1 y_{t-1} + \sum_{i=1}^l \beta_i \Delta y_{t-i} + \varepsilon_t \tag{1}$$

where, $\Delta y_t = y_t - y_{t-1}$, ε_t is pure white noise term, α is the constant-term, T is the time trend effect, and l is the optimal lag value which is selected on the basis of Schwartz information criterion(SIC). The null hypothesis is that β_1 , the coefficient of y_{t-1} is zero. A non-rejection of the null hypothesis suggests that the time series under consideration is non-stationary (Gujarati, 2010).

2.2 Cointegration test

Cointegration test can be divided into two types: cointegration test based on regression coefficient and cointegration test based on regression residuals. This study adopted the latter method, which aims to test the regression residuals for stationarity. Regression equations are established between the sports industry variable and the three industries variables respectively by using ordinary least squares (OLS) estimation:

$$\ln PI = \alpha_1 + \beta_1 \ln S + \varepsilon_1 \tag{2}$$

$$\ln SI = \alpha_2 + \beta_2 \ln S + \varepsilon_2 \tag{3}$$

$$\ln TI = \alpha_3 + \beta_3 \ln S + \varepsilon_3 \tag{4}$$

where, lnPI, lnSI, lnTI are the log-form of the value-added series of primary industry, secondary industry and tertiary industry; α_1, α_2 and α_3 are the constant-term, β_1, β_2 and β_3 are the estimated coefficient, $\varepsilon_1, \varepsilon_2$ and ε_3 are the error term.

2.3 Granger causality test

The Granger causality test is a statistical hypothesis test for determining whether one time series is useful in forecasting another. A time series X is said to Granger-cause Y if it can be shown, usually through a series of t-tests and F-tests on lagged values of X (and with lagged values of Y also included), that those X values provide statistically significant information about future values of Y. Granger causality is performed by the following regression equation:

$$Y_t = \sum_{i=1}^m \alpha_i X_{t-i} + \sum_{j=1}^m \beta_j Y_{t-j} + \mu_t \tag{5}$$

$$X_t = \sum_{i=1}^m \lambda_i X_{t-i} + \sum_{j=1}^m \delta_j Y_{t-j} + v_t \tag{6}$$

where, assume the random error μ_t is not related to v_t . The null hypothesis of Granger causality test is “X does not Granger Cause Y” or “Y does not Granger Cause X”. In each case, a rejection of the null hypothesis will imply that there is Granger causality between the variables (Gujarati, 2010).

3 Results and Discussion

3.1 Correlation analysis results

The correlation analysis was conducted between value-added of sports industry and three industries in China by using SPSS 19.0. Table 1 shows that the sports industry series and three industries series are highly correlated ($P < 0.01$). There may be mutual promotion between sports industry and three industries because of their significant correlation. Judging from the correlation coefficient, the sports industry has the highest correlation coefficient with tertiary industry, which shows that the relationship between sports industry development and the tertiary industry growth is the most closely related.

Table 1 Correlations Matrix of the Study Variables

variables	sports industry	primary industry	secondary industry	tertiary industry
sports industry				
primary industry	.995**			
secondary industry	.990**	.998**		
tertiary industry	1.000**	.996**	.991**	

Note. **. significant at $P < 0.01$ (two-tailed test)

3.2 Unit root test results

The results of the Augumented Dickey-Fuller (ADF) unit root test applied at level, first difference and second difference to the logarithmically transformed value-added are given in Table 2. The empirical evidence suggests that the series of lnS, lnPI, lnSI, lnTI have unit root problem at their level and 1st difference form. Thus, it is concluded that all the series are non-stationary at their level and 1st difference forms. The data became stationary after 2nd difference as absolute values of the ADF statistics are now greater than the 5 percent critical values of the test statistics. With the proof that all the series are non-stationary and integrated of the order $I(2)$, then test for cointegration can be used to model the long-run relations.

Table 2 ADF Unit Root Test Results (including intercept and trend as exogenous)

variables	(c, t, k)	t-Statistic	Test critical values	Prob./%	remarks
lnS	(c, t, 2)	3.691949	-3.877714	10	non-stationary
Δ lnS	(c, t, 0)	-2.346296	-6.292057	10	non-stationary
Δ^2 lnS	(c, t, 1)	-18.69370	-8.235570	1	stationary
lnPI	(c, t, 0)	-1.625025	-3.590496	10	non-stationary
Δ lnPI	(c, t, 1)	-2.665414	-3.877714	10	non-stationary
Δ^2 lnPI	(c, t, 1)	-126.1954	-8.235570	1	stationary
lnSI	(c, t, 2)	1.402134	-3.877714	10	non-stationary
Δ lnSI	(c, t, 1)	-2.386618	-3.877714	10	non-stationary
Δ^2 lnSI	(c, t, 1)	-11.36265	-8.235570	1	stationary
lnTI	(c, t, 2)	1.532879	-3.877714	10	non-stationary
Δ lnTI	(c, t, 1)	-3.648632	-3.877714	10	non-stationary
Δ^2 lnTI	(c, 0, 1)	-4.186479	-3.694851	5	stationary

Note. c denotes intercept ;t denotes trend; k denotes lag length , which is determined by SIC minimum; “ln” denotes added-value in logarithmic form; Δ denotes 1st difference; Δ^2 denotes 2nd difference.

3.3 Cointegration test results

Cointegration test was carried out to test the variables by using Eview 6.0, yield:

$$\ln PI = 0.657184 \ln S + 5.534301 \quad (7)$$

$$t \quad (40.38299) \quad (44.25755)$$

$$p \quad (0.0000) \quad (0.0000)$$

$$R^2 = 0.995726 \quad D.W. = 2.222898$$

$$\ln SI = 0.700725 \ln S + 6.733980 \quad (8)$$

$$t \quad (31.95528) \quad (39.96521)$$

$$p \quad (0.0000) \quad (0.0000)$$

$$R^2 = 0.993192 \quad D.W. = 1.525815$$

$$\ln TI = 0.848961 \ln S + 5.574419 \quad (9)$$

$$t \quad (111.3143) \quad (95.12139)$$

$$p \quad (0.0000) \quad (0.0000)$$

$$R^2 = 0.999435 \quad D.W. = 1.609138$$

From the said equation (7-9), R^2 is close to 1 and the coefficients are statistically significant ($P < 0.01$). The fit of the model is adequate. And then run out stationarity test on the estimated residual series. Table 3 presents the results of residual unit root test. The results indicate that the null hypothesis is rejected, that is, the residual series are stationary. According to the principle of cointegration, it can be

concluded that there is a cointegration relationship between the development of sports industry and three industries. 1% increase of Chinese sports industry will promote the primary industry, the secondary industry and the tertiary industry increases by 0.6572%, 0.7007% and 0.8490% respectively, which implies the development of sports industry exerts greater influence on tertiary industry than primary industry and secondary industry.

Table 3 ADF Unit Root Test Results for Residual ε_t

variables	(c, t, k)	t-Statistic	Test critical values	Prob./%	remarks
ε_1	(0, 0, 1)	-3.140178	-2.937216	1	stationary
ε_2	(0, 0, 0)	-2.094211	-2.886101	1	stationary
ε_3	(0, 0, 0)	-2.187386	-2.886101	1	stationary

Note. c represents intercept; t represents trend; k represents lag length, which is determined by SIC minimum

3.4 Granger causality test

Based on correlation analysis and cointegration test, there's a more significant relationship between sports industry and tertiary industry. Thus, Granger Causality test was conducted between lnS and lnTI. Table 4 presents the results of Granger causality test.

Table 4 Granger Causality Test Results

Null Hypothesis	Lags	F-Statistic	Prob.	Granger cause	Direction
lnS does not Granger Cause lnTI	2	12.1834	0.0759	Yes	Bidirectional
lnTI does not Granger Cause lnS	2	67.1429	0.0147	Yes	

The results indicate that there exists bidirectional causality between the development of sports industry and tertiary industry in China. The sports industry granger causes the tertiary industry which in turn provides the feedback to the former as well. Sports industry can effectively stimulate the development of related industries such as cultural industry, tourism industry, financial and insurance industry which belong to the tertiary industry, thus promoting the optimization of industrial structure. At the same time, the upgrading of industrial structure can promote people's demand for sports consumption, thus promoting the development of sports industry.

4 Conclusions

The objectives of this study were to examine how the development of sports industry relates to the three industries in China. To achieve the objective, this paper carries out empirical analysis on time series data of the sports industry and three industries in China during 2006-2014 by employing econometric methods. Conclusion can be drawn as follows:

1) Chinese sports industry is closely related to three industries, which indicates that the sports industry, with its long industrial chain and strong industrial relevance, play an important role in stimulating the national economy development. The relationship between sports industry development and the tertiary industry growth is the most closely related.

2) The results of cointegration test have indicated that there is a cointegration relationship between Chinese sports industry and the three industries, which suggests the existence of a long-term equilibrium association across them. The development of sports industry exerts greater influence on tertiary industry than primary industry and secondary industry. In the long run, 1% increase of Chinese sports industry will promote the tertiary industry increases by 0.8490%. Sports industry is supposed to be the leading role of the development of tertiary industry even the national economy, which will be the remarkable feature of the next phase of Chinese economic development.

3) Granger Causality tests have indicated that there's a bidirectional Granger causality between the development of sports industry and tertiary industry in China, which implies the mutual promotion between sports industry and tertiary industry. During the period of economic restructuring and vigorously developing the tertiary industry, the sports industry should be supported as strategic pillar industry of national economy. It is, therefore, suggested that the sports industry should constitute an important force promoting the optimization of industrial structure, transformation of the economic development mode and sustainable development of economy and society.

A Research on the Relationship Between Corporate Culture and Management Performance Based on a Fuzzy Evaluation Model

Xiang Fan

International Office, Wuhan University of Technology, Wuhan, P. R. China, 430070
(E-mail: xiangfan@whut.edu.cn)

Abstract: This paper has made a research on the relationship between corporate culture and management performance based on a fuzzy evaluation model. Corporate culture includes five dimensions, such as entrepreneurship, corporate values, business philosophy, business environment and corporate culture network. Management performance includes task performance and peripheral performance. The conclusion is that corporate culture has a greater impact on task performance, while it has a deeper great impact on peripheral performance. In comparison, corporate culture has a more significant impact on peripheral performance.

Key words: Corporate culture; Management performance; Task performance; Peripheral performance

1 Introduction

The corporate culture concerns with the rise and fall of the corporate. Once established, it will exert a huge influence on the management performance. The success model of every corporate differs but the failure of some corporates in essence results from the failure of the corporate culture. At present, the research on the corporate culture has attracted great attention of the academic and theoretical circle. Corporate culture as a modern corporate management theory supported by the approach, the function and the power of the culture relies on the infusion of the corporate value in every aspects, every level and all processes of the corporate management to promote the development of the comprehensive quality, level of management and the economic benefit (Chen Guangjin, 2009). The spirit of the entrepreneurs, the value of the corporate, the philosophy of the corporate, the corporate environment and cultural network in some way influence the operation and the development of the corporate, which also influence the task performance and peripheral performance. The paper on the basis of the extension of Fuzzy Evaluation Model analyzes the influence of the five dimension of the corporate culture on the task performance and peripheral performance.

2 Brief Review of Related Researches

2.1 Research on the corporate culture and corporate performance

Via the survey method, Denison has found that there is an obvious correlation between the culture characteristics and performance of the corporate (Denison D.R, Mishra A.K, 1995). Besanko and some other people have put forward three approaches for the corporate culture to create value: first, to optimize the information processing of the corporate; second, to reduce the cost for security; third, to enhance the activity of corporate members (Besanko D., Dranove D. & Shanley M, 1996). Zhang Yirong analyzes the influence of the corporate culture on corporate performance from the perspective of transaction cost (Zhang Yirong, 2004). Ni Zhen and Wu Zhixia elaborated on the connection between the corporate culture and corporate performance from the perspective of stakeholders (Ni Zhen, Wu Zhixia, 2006). Li Ning and Yang Huixin believe that the effects of the corporate culture are reflected through its influence on the activities of corporate members and further the performance and made an argument analysis on the relationship between corporate culture and corporate performance via the use of the Game Theory (Li Ning, Yang Huixin, 2006).

2.2 Research on the corporate culture and performance management

Yu Shizhong points out that the mutual relationship of corporate culture and performance management: (1) corporate culture is the basis of the performance management which is the foothold of the corporate culture. (2) the enforceability and operability in the real practice should be fully taken into consideration in building the corporate culture and the operation of the corporate culture should be highly connected with the development direction of the corporate set by the corporate culture, which would lay a solid foundation for the strategic goal of the corporate culture. (3) Both are highly dependent. The corporate culture has been put into practice via the performance management and the later upgrades its operation approach via the former (Yu Shizhong, 2007). Li Bin has pointed out in the paper *The Research on Performance Management Based on the Corporate Culture* that the corporate culture plays

the leading,connective,intangible standard and inner-and-outer coordinated role in performance management and the latter actively secures the corporate culture(Li Bin ,2007).

2.3 Research on the corporate culture and performance management

Compared with the researches on the relationship between corporate culture and management performance, research fruits of corporate culture and performance management are less. Kotter and Heskett have selected corporates from 22 different fields and carried out the research on the connection between individual culture and management performance and pointed out that the cultural influence is more than any other factors(John P. Kotter, James L. Heskett, 1997). In the paper *the example research on the private corporate culture building and its relation with the management performance*, Jiang Tainting carried out the research on the relation between the corporate culture and management performance and on the basis of the task performance and peripheral performance, he made the innovative research on the management performance and put forward the relation between corporate culture and innovation performance(Jiang Tianying, 2004).

All in all, scholars home and abroad have carried out researches on the relationship between corporate culture and corporate performance from different aspects, but researches on the corporate culture and performance management are insufficient which is the turning point of the research of this paper. The paper based on the vogue comprehensive evaluation model, elaborates on the effects of five elements of the corporate culture including the entrepreneurs spirit, values, management philosophy, corporate environment and culture networking on the management performance (task performance and peripheral performance).

3 Research Method and Research Tool

3.1 Research method

It is impossible to quantify the research on the relationship between the corporate culture and management performance and thus the fuzzy comprehensive evaluation model is adopted in the paper.

The application processes of the fuzzy comprehensive evaluation model are as follow(ShaoChunyan, Liu Xuesheng, 2007):

1)Make sure of the establish evaluate factors. According to the characteristics of the first grade factor in the evaluation index system, evaluate factors are made as $U = \{u_1, u_2, u_3, \dots, u_n\}$.

2)Determine the evaluate factors. Suppose the establish evaluate factors are $V = \{v_1, v_2, v_3, \dots, v_n\}$

3)Set the singlefactorevaluationmatrix R from U to V. To make evaluation of the single factors towards every single factor $u_i (i \leq n)$. However there m kinds of evaluation catogories(comments), the evaluation results towards every single uiand the vogue vectors are written as $R = \{r_{i1}, r_{i2}, r_{i3}, \dots, r_{im}\} ((i=1, 2, \dots, n), R_i \in U (V))$. The above evaluation results are suitable for the normalization and all components sum up to 1 in another word that for every i, there is $r_{i1} + r_{i2} + \dots + r_{im} = 1$. The evaluation of all single factors consist the vogue relationship from U to V $R : R = (r_{ij})_{nm}$ i.e. B set.

4)Set the indicator weight. Weight is the amount every measurement accounts in measurement system according to its importance. The influence of every single factor on the judged matter differs. Given every single factor u_i a weight a_i , the weight-distributed set A will be regarded as a fuzzy set on establish evaluate factors U, and therefore recorded as $A = \{a_1, a_2, \dots, a_n\}$

It is requested to satisfy the normalization condition: $\sum_{i=1}^n a_i = 1$, and meanwhile $0 < a_i < 1$

5)Make the judgement. The judgement results can be made through the index weight vector multiplying the single factor evaluation matrix R: $B = A \times R = \{b_1, b_2, \dots, b_m\}$.

$A = \{a_1, a_2, \dots, a_n\}$. Satisfy the assimilation: $\sum_{i=1}^n a_i = 1$, and meanwhile $0 < a_i < 1$.

6)Get the judgement. Assimilate the B set, i.e the sum of all components in B divides every single

factor in B set.

3.2 Research tool

3.2.1 Corporate culture

American managerialist William Ouchi pointed out in his work *Z theory—How American Company Deal with Japanese Challenges*, published in 1981 that the main factor that Japanese corporate succeed is their unique corporate culture (Liu Xinhong, 2008). The corporate culture is the certain cultural concept, value normalization, moral norm, ceremonial customs, traditional customs and the related production concepts etc. Corporates rely on the culture to organize all sorts of power and units the power under one guiding thoughts and economic philosophy (Lv Jun,2009).

Scholars home and abroad uphold different views on the components of the corporate culture. Professor Quinn and Professor Cameron developed OCAI on the basis of view of competition value and divides the corporate culture into four main types including patriarchalclan , vigor, market and level(Cameron K.S., Quinn R.E.,1998). The TMCT (Theoretical Model of Culture Traits) set up by Professor Denison divides the culture characters into four types, including the flexibility, mission, compatibility and engagement. OCP scale put forward by Professor Chatman includes innovative, stability, respect for the members, result-oriented, details focus, initiative and team-oriented. Chinese scholars have also carried out the research on the elements of the corporate culture, and all in all interpersonal harmony, innovation-orientation, entrepreneur spirit and member development have been added. Because the paper focuses on the research on the relationship between the corporate culture and performance management and there is a close connection between the performance management and high-level managers,therefore the elements this paper selects are entrepreneur spirit,corporate value,economic philosophy,corporate environment and corporate network.

3.2.2 Performance management

Motowidlo and Scotter (1994) have divided the performance management into task performance and periphery management. The measurement of the task performance is the real work related to the detailed work content. But the periphery performance focuses on the interpersonal improvement and work input less connected with the core task of the organization and more directly connected with the long-term development of the corporate. Most scholars conclude the periphery as two aspects: interpersonal development and work devotion. Interpersonal development is a kind of action to secure the interpersonal relationship in the organization and help others get sufficient working performance. It has been shown in the research that interpersonal improvement is a part of periphery performance, and the working contribution is another part of the task management. Therefore, in defining the performance, task management should include task proficiency and the work efficiency. Periphery should include interpersonal skills, good working relationship and the motive to help others finish the work.

The paper having drawn the conclusion from Motowidlo and Scotter, divides the performance management into task performance and periphery performance and tried to analyze which kind of performance the corporate culture has a better influence on.

3.2.3 Evaluation of estimate

Ten experts are invited to give their ideas about how much effect on the task performance and contextual performance from such five factors as entrepreneurial spirit, enterprise values, enterprise operation philosophy, enterprise environment, enterprise culture network. The results are show in the Figure1.

Figure 1 The Entrepreneurs' Evaluation Statistical Table

	effect on the task performance (number of experts)					effect on the contextual performance (number of experts)				
	Huge influence	Much influence	Some influence	little influence	No influence	Huge influence	Much influence	Some influence	Little influence	No influence
entrepreneurial spirit	2	5	2	1	0	5	3	1	1	0
enterprise values	1	6	1	2	0	6	2	0	2	0
enterprise operation philosophy	3	5	1	0	1	5	3	1	0	1
enterprise environment	2	5	3	0	0	6	2	2	0	0
enterprise culture network	2	4	2	1	1	4	3	1	1	1

4 Results and Analysis

There are three basic elements of the fuzzy evaluation model including the evaluation on the factor set, evaluation set and single factor. On the basis of the three elements, the paper has extended the fuzzy evaluation model. First, the paper analyzes the influence of the corporate culture on task performance; second, it analyzes the influence on the periphery performance and finally it determines which kind of performance it has the most influence via the use of the maximum membership principle.

4.1 The research on the relationship between corporate culture and task

Performance:

1) Determine the establish evaluate factors U . According to five elements of the judgement indicator system, the establish evaluate factors are determined as $U = \{u_1, u_2, u_3, u_4, u_5\}$, i.e $U = \{\text{entrepreneur spirit, corporate value, corporate operation philosophy, corporate environment and corporate culture networking}\}$

2) Determine the evaluation set V . Suppose the evaluation characteristic of the corporate culture on task performance is huge, more, a little, not very much and no, and then the set V is defined as $V = \{v_1, v_2, v_3, v_4, v_5\}$, i.e $V = \{\text{huge, more, a little, not very much and no}\}$

3) Set the single factor evaluation matrix R from U to V . As it shows in the Fig1, the expert team (10 people) made the fuzzy evaluation. Fuzzy vector $R_1 = \{0.2, 0.5, 0.2, 0.1, 0\}$ means that according to the entrepreneur spirit, there are two experts believe that it has huge influence, five much influence, two some influence, one a little influence and none of scholars think it has influence. Also, fuzzy vector $R_2 = \{0.1, 0.6, 0.1, 0.2, 0\}$, $R_3 = \{0.3, 0.5, 0.1, 0, 0.1\}$, $R_4 = \{0.2, 0.5, 0.3, 0, 0\}$, $R_5 = \{0.2, 0.4, 0.2, 0.1, 0.1\}$, i.e. the single factor judgement matrix is:

$$R = (r_{ij})_{nm} = \begin{bmatrix} 0.2 & 0.5 & 0.2 & 0.1 & 0 \\ 0.1 & 0.6 & 0.1 & 0.2 & 0 \\ 0.3 & 0.5 & 0.1 & 0 & 0.1 \\ 0.2 & 0.5 & 0.3 & 0 & 0 \\ 0.2 & 0.4 & 0.2 & 0.1 & 0.1 \end{bmatrix}$$

4) Determine the indicator weight. According to the influence of the corporate culture on task performance, the entrepreneur spirit, corporate value, corporate operation philosophy, corporate environment, corporate culture network are given the weight 0.2, 0.25, 0.2, 0.15 and 0.2 relatively, i.e $A = \{a_1, a_2, a_3, a_4, a_5\} = \{0.2, 0.25, 0.2, 0.15, 0.2\}$

5) Calculate the comprehensive evaluation result. The evaluation result is, i.e

$$B = A \times \overline{R} = (0.2, 0.25, 0.2, 0.15, 0.2) \times \begin{bmatrix} 0.2 & 0.5 & 0.2 & 0.1 & 0 \\ 0.1 & 0.6 & 0.1 & 0.2 & 0 \\ 0.3 & 0.5 & 0.1 & 0 & 0.1 \\ 0.2 & 0.5 & 0.3 & 0 & 0 \\ 0.2 & 0.4 & 0.2 & 0.1 & 0.1 \end{bmatrix} = (0.195, 0.505, 0.17, 0.09, 0.04)$$

It can be shown that 19.5% of experts think it has a huge influence, 50.5% think a much huge influence, 17% think only a little influence and 9% think only little influence and 4% think no influence.

6) Draw the conclusion. Vectors of B set sum up to 1 which satisfies the assimilation condition. According to the maximum membership principle, the maximum number 0.505 in the set B corresponding to the “most influence” should be the comprehensive evaluation conclusion of the corporate culture to the task performance, i.e the corporate culture has the most influence on the task performance.

4.2 Researches on the relationship between the corporate culture and periphery

Performance:

1) Determine the establish evaluate factors U . The paper selects the same part of the corporate culture for comparison, i.e $U = \{\text{entrepreneur spirit, corporate value, corporate operation philosophy, corporate environment and corporate culture networking}\}$

2) Determine the evaluation set V . Suppose the evaluation characteristic of the corporate culture on task performance is huge, more, a little, not very much and no, and then the set V is defined as $V = \{v_1, v_2, v_3, v_4, v_5\}$, i.e $V = \{\text{huge, more, a little, not very much and no}\}$

3) Set the single factor evaluation matrix R from U to V . As it shows in the Fig1, the expert team (10 people) made the fuzzy evaluation. $R_1 = \{0.5, 0.3, 0.1, 0.1, 0\}$ means that according to the entrepreneur spirit, there are two experts believe that it has huge influence, five much influence, two some influence, two a little influence and none of scholars think it has influence. Also, fuzzy vector $R_2 = \{0.6, 0.2, 0, 0.2, 0\}$, $R_3 = \{0.5, 0.3, 0.1, 0, 0.1\}$, $R_4 = \{0.6, 0.2, 0.2, 0, 0\}$, $R_5 = \{0.4, 0.3, 0.1, 0.1, 0.1\}$, i.e. the single factor judgement matrix is:

$$R = (r_{ij})_{nm} = \begin{bmatrix} 0.5 & 0.3 & 0.1 & 0.1 & 0 \\ 0.6 & 0.2 & 0 & 0.2 & 0 \\ 0.5 & 0.3 & 0.1 & 0 & 0.1 \\ 0.6 & 0.2 & 0.2 & 0 & 0 \\ 0.4 & 0.3 & 0.1 & 0.1 & 0.1 \end{bmatrix}$$

4) Determine the indicator weight. According to the influence of the corporate culture on task performance, the entrepreneur spirit, corporate value, corporate operation philosophy, corporate environment, corporate culture network are given the weight 0.35, 0.2, 0.1, 0.15 and 0.2 relatively, i.e. $A = \{a_1, a_2, a_3, a_4, a_5\} = \{0.35, 0.2, 0.1, 0.15, 0.2\}$

5) Calculate the comprehensive evaluation result. The evaluation result is, i.e

$$B = A \times \overline{R} = (0.35, 0.2, 0.1, 0.15, 0.2) \times \begin{bmatrix} 0.5 & 0.3 & 0.1 & 0.1 & 0 \\ 0.6 & 0.2 & 0 & 0.2 & 0 \\ 0.5 & 0.3 & 0.1 & 0 & 0.1 \\ 0.6 & 0.2 & 0.2 & 0 & 0 \\ 0.4 & 0.3 & 0.1 & 0.1 & 0.1 \end{bmatrix} = (0.515, 0.265, 0.095, 0.095, 0.03)$$

It can be shown that 51.5% of experts think it has a huge influence, 26.5% think a much huge influence, 9.5% think only a little influence and 9.5% think only little influence and 3% think no influence.

6) Draw the conclusion. Vectors of B set sum up to 1 which satisfies the assimilation condition. According to the maximum membership principle, the maximum number 0.505 in the set B corresponding to the “most influence” should be the comprehensive evaluation conclusion of the corporate culture to the task performance, i.e the corporate culture has the most influence on the periphery performance.

5 Conclusions

It can be demonstrated above that 50.5% of experts think that the corporate culture has much influence on the task performance, 51.5% experts think the corporate culture has a huge influence on the periphery performance. According to the maximum membership principle and through the comparison of both: the corporate culture has a more obvious influence on the periphery performance. It is also shown that in building the corporate culture system, corporates should understand the system plays the active role in improving the impersonal relationship, enhancing the teamwork spirit and periphery spirit. Therefore the corporate should attach great importance to the entrepreneur spirit, corporate value, corporate philosophy, corporate environment and corporate culture network.

The innovative point of this paper is that it carries out the example research of the relationship between corporate culture and management performance via the use of the fuzzy evaluation model. And it breaks the limitation of related researches and makes the comparison on the influence of the corporate culture on the management performance and recognizes that the corporate culture has a more notable influence on the periphery performance.

Research on the Relationship of Young Employees' Extroversion and Achievement Motivation: The Moderating Effect of Perceptions of Organizational Politics

Zhan Bei, Lu Shaohua

School of Management, Wuhan University of Technology, Wuhan, P.R.China, 430070
(E-mail: zhanbei0115@163.com, lu_shaoua@163.com)

Abstract: This paper establishes a model to interpret the relationship between extroversion and achievement motivation in young workers, empirically analyzes the impact mechanism of extroversion on achievement motivation, and introduces perceptions of organizational politics to moderate the relationship. Through the questionnaire survey of 189 employees, regression analysis is used to test the hypotheses. The results show that extroversion could predict achievement motivation well in young employees of organization; salary and promotion and colleague relationship in perceptions of organizational politics moderate the relation of extroversion and achievement motivation of avoiding failure. Suggestions on employee recruitment and containment of organizational political behavior in research are proposed.

Key words: Extroversion; Achievement motivation; Perceptions of organizational politics

1 Introduction

Personality is a kind of special and persistent individual psychological behavior patterns, and is one of the favorable indicators to predict individual subjective feelings. Tomas (2004) believes extroversion in the big five personality model refers to self-confidence and vigor of higher level in favor of social behavior, which means that the individual is more optimistic, positive, loving communication. And achievement motivation is a desire to overcome obstacles, display their talents, strive to complete a task as soon as possible in some specific areas. Atkinson's achievement motivation theory is that individual's achievement motivation has two tendencies, achievement motivation of pursuing success and avoiding failure. Throughout the related research, research on extroversion predicting positive emotion is still the mainstream, but research on individual achievement motivation is lesser. The achievement motivation research mainly focuses on its incentive effect for individuals, such as achievement motivation on subjective well-being, innovation ability (Yang Jie, 2010) and work performance. Part of the study involves the impact of achievement motivation on job burnout, turnover intention and other factors. Extroversion and achievement motivation are two important fields in psychology research, whether extroversion personality traits can predict individual's achievement motivation needs to be verified.

Currently, many workplaces like a political arena, where individuals may damage the interests of others for their own interests, or they can not properly hand it and suffer the consequences. Employees' perceptions of organizational politics (pop) of high degree will affect the formation of their achievement motivation? Most research takes pop as antecedent variable, such as pop on employee job satisfaction, affective commitment, job burnout (Zhang Juncheng, 2013), work performance (Miller, 2008), voluntary turnover, organizational citizenship behavior. And antecedent variable of weakening or strengthening pop, such as the frequency of using political behavior, group performance, moderate negative impacts of pop. This paper intends to introduce pop to explore the mechanism of extroversion effect on achievement motivation.

The research object about achievement motivation focus on college students, seldom involve young workers (young workers in this paper refer to someone who graduate from college for a short time and have fewer work experience in their 20s or 30s). This article takes young workers as the research object, explores the impact mechanism of extroversion on achievement motivation, investigates the moderating role of pop, provides useful suggestions for staff management and organizational culture construction.

2 Theoretical Review and Research Hypothesis

2.1 Effects of extroversion on achievement motivation

Each individual has own goals, but want to achieve their goals, achievement motivation varies from person to person. Individual achievement motivation has obvious individual difference under different personality traits. Individuals with extroversion are more likely to experience positive emotions, high level of confidence in the pursuit of success, have strong desire to obtain success and rarely make

avoiding failure behavior. Because of these positive qualities early research mostly focuses on the relationship between extroversion and positive emotion. He Yuanyuan's research shows individuals with extroversion experience more positive emotion in daily life, some people increase the opportunity to experience positive emotion by obtaining success. Gan Lu (2006) thinks extroversion and social oriented achievement motivation have a relatively high positive correlation. Liu Jinhong (2008) thinks extroversion has a significant correlation with achievement motivation. Two kinds of intention to pursue success and avoid failure exist simultaneously and act on the inner psychology of the individual, but they drive the opposite mental function, the size of the achievement motivation mainly depends on the result of the conflict. Individuals who have a strong tendency to pursue success are more confident and tend to have a higher subjective probability of success. Above all, this study will take extroversion as one of the factors of achievement motivation, study the relationship between them. Based on the above theoretical basis, this study put forward the following hypotheses:

H1: extroversion and achievement motivation of young employees have the correlation

H1a: extroversion on the motivation of pursuing success has a positive predictive effect

H1b: extroversion on the motivation of avoiding failure has a negative predictive effect

2.2 The moderating effect of perceptions of organizational politics

The perception of organizational politics is the subjective feeling and evaluation of the political degree of work environment for staffs. The response of individual is often based on their own subjective perception of reality, different members also have different subjective pop. However, most researchers hold a negative attitude for the emergence of organizational politics, believe it will have a negative impact on employee attitudes and behavior (Chang, 2009). If employees perceive organization with politics, which means that he lacks confidence in the pay system (Rosen, 2006), believe reward decision is based on power basis, nepotism and other factors, not their hard work's results. Once employees lose confidence in the organizational environment, believe their work will not exchange the desired results (Chang, 2012), employees' motivation of pursuing success is likely to weaken. When employee has higher pop, which means he subjectively think self-interest suffer possible loss because of self-interest behavior or unfair internal decision, whether to continue to pursue what they believe to be more meaningful things is in doubt. Even for individual with higher extraversion it is difficult to form a higher achievement motivation, their own subjective feelings and evaluation about pop may reduce the desire of realizing their own value, so the impact of extroversion on achievement motivation further reduce. Ma Chao discuss the dimensions of pop, the dimensions include self-interested behavior, salary and promotion, colleague relationship, and it is verified. Above all, pop may play a role in between extroversion and achievement motivation. Based on the above theoretical basis, this study put forward the following hypotheses:

H2: perceptions of organizational politics have a negative moderating effect on the relationship of extroversion and achievement motivation, the stronger of perceptions of organizational politics employees feel, the smaller the impact of extroversion on achievement motivation is

H2a: employee's perceptions of self-interested behavior in organization has a moderating effect

H2b: employee's perceptions of salary and promotion in organization has a moderating effect

H2c: employee's perceptions of colleague relationship in organization has a moderating effect

Above all, this study mainly analyzes the impact mechanism of extroversion on achievement motivation among young employees, and introduces perceptions of organizational politics to moderate the relationship. The conceptual model shows in Figure 1.

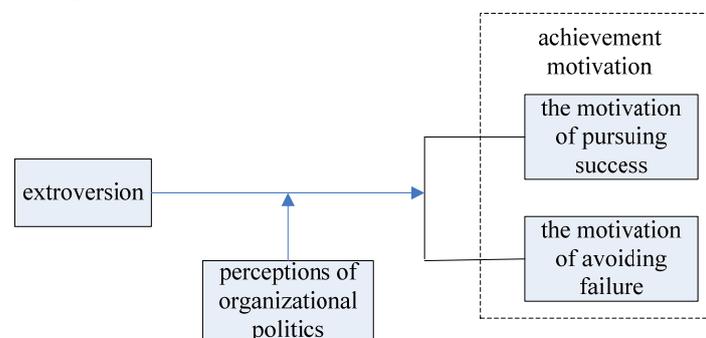

Figure 1 Mechanism Model of Extroversion on Achievement Motivation among Young Employees

3 Research Methods

3.1 Research object and data collection

This study conducted a questionnaire survey in Shanghai, Beijing, Guangzhou, Shenzhen, Wuhan, Hangzhou, Changsha and other cities. A total of 200 questionnaires were issued, 189 questionnaires were returned, 169 questionnaires were valid. The effective rate is 89.4%. Investigation object's features are as follows: the proportion of women (63.3%) is bigger than men (36.7%); survey is mainly for young workers, under the age of 25 account for 60.9%, 25-30 years old account for 35.5%; years of working focus on 1-5 years (65.7%); main duties are ordinary staff (78.7%) and low-level managers (17.8%); 71.6% receive undergraduate education, 17.8% is college degree.

3.2 Measuring tool

Extroversion's measurement uses the big five inventory revised by Zhang Jianxin. The dimension of extroversion contains 12 items, "yes" and "no" answer the question, "yes" for 1 point and "No" for 0 point. The higher the score is, the higher the degree of extroversion is. The internal consistency reliability of extraversion scale is 0.792. Extraversion scale's KMO value is 0.783, the validity is good.

Achievement motivation's measurement uses the scale revised by Ye Renmin in 1988. The scale's items are about the motivation of pursuing success (Ms) and the motivation of avoiding failure(Maf). The scale uses a 4-point score, the situation entirely consistent with oneself gets 4 points, the situation completely inconsistent with oneself gets 1 point. The total score is Ms minus Maf. The higher the score is, the stronger achievement motivation is. The internal consistency reliability of Ms is 0.781 and Maf is 0.831. Achievement motivation scale's KMO value is 0.797, the validity is good.

Measurement of perceptions of organizational politics uses the scale developed by Ma Chao et al. in 2006. The scale contains three dimensions, self-interested behavior, salary and promotion, colleague relationship. The scale uses a 6-point score, the situation entirely consistent with oneself gets 6 points, the situation completely inconsistent with oneself gets 1 point. The internal consistency reliability of self-interested behavior is 0.748, salary and promotion is 0.8 and relationship between colleagues is 0.791. Perceptions of organizational politics scale's KMO value is 0.809, the validity is good.

4 Data Analysis

4.1 Descriptive statistical analysis and correlation analysis of the study variables

Table 1 Descriptive Statistical Analysis and Correlation Analysis of the Study Variables(N=169)

Study variable	Mean	SD	1	2	3	4
Extroversion	0.68	0.239	1			
The motivation of pursuing success	2.74	0.473	0.125	1		
The motivation of avoiding failure	2.49	0.494	-0.204**	-0.244**	1	
Pop	9.66	2.218	-0.089	-0.035	0.265**	1

Note: * represents $p < 0.05$, ** represents $p < 0.01$ (Two-Tailed)

Descriptive statistical results of study variables are shown in the table 1. Correlation analysis results of variables show that extroversion is positively related to motivation of pursuing success, has significantly negative correlation with motivation of avoiding failure, and is negatively related to pop; the motivation of pursuing success has significantly negative correlation with motivation of avoiding failure, is negatively related to pop; motivation of avoiding failure has significantly positive correlation with pop. These results provide a necessary precondition for the subsequent statistical analysis.

4.2 Regression analysis

4.2.1 Regression analysis of extroversion on achievement motivation

Firstly, in order to test the impact of extroversion on the motivation of pursuing success, the paper takes the motivation of pursuing success as dependent variable, on the basis of the control of demographic variables, adding extroversion into independent variable to do regression analysis. Results are shown in Table 2. In the model 1(a), the regression equation is significant, F value is 2.638 ($P = 0.025$). R^2 value is 0.075, suggesting that demographic variables can explain 7.5% variation of the motivation of pursuing success. On the basis of benchmark model, model 2 (a) adds extroversion into independent variable, F value is 2.449 ($P = 0.027$), the regression equation is significant, R^2 value in model 2 (a) increases 0.008, indicating that extroversion can explain 0.8% variation and it has a positive impact, but very weak ($\beta = 0.092$). The above description shows extroversion has a positive predictive role for the motivation of pursuing success, but not significantly, H1a is not verified.

Then, with regard to the motivation of avoiding failure, steps are shown above. In the model 1(b), the regression equation is significant, F value is 4.053 ($P = 0.002$). R^2 value is 0.111, suggesting that

demographic variables can explain 11.1% variation. On the basis of benchmark model, model 2(b) adds extroversion into independent variable, F value is 4.645($p=0.000$), the regression equation is significant, R^2 value in model 2(b) increases 0.036, indicating that extroversion can explain 3.6% variation and it has a significantly negative impact ($\beta=-0.193$, $P=0.010$). The above description shows extroversion has a significantly negative predictive role for the motivation of avoiding failure, H1b is verified.

Table 2 Regression Analysis Results of Extroversion on Achievement Motivation

	The motivation of pursuing success		The motivation of avoiding failure		Achievement motivation	
	Model1(a)	Model 2(a)	Model 1(b)	Model 2(b)	Model 1(c)	Model 2(c)
Sex	-0.111	-0.114	0.190*	0.197**	-0.192*	-0.198**
Age	-0.016	-0.011	-0.019	-0.030	0.002	0.012
Education	-0.072	-0.064	-0.144	-0.160*	0.049	0.064
Working year	0.128	0.124	0.024	0.034	0.064	0.055
Position	0.145	0.133	-0.242**	-0.218**	0.247**	0.224**
Extroversion		0.092		-0.193**		0.182*
R^2	0.075	0.083	0.111	0.147	0.120	0.152
F	2.638*	2.449*	4.053**	4.645***	4.438***	4.844***
ΔR^2		0.008		0.036		0.032
ΔF		1.464		6.873**		6.170*

Lastly, as for achievement motivation, steps are shown above. In the model 1(c), the regression equation is significant, F value is 4.438($P=0.001$), R^2 value is 0.12, suggesting that demographic variables can explain 12% variation. On the basis of benchmark model, model 2(c) adds extroversion into independent variable, F value is 4.844($p=0.000$), the regression equation is significant, R^2 value in model 2(c) increases 0.032, indicating that extroversion can explain 3.2% variation and it has a significantly positive impact ($\beta=0.182$, $P=0.014$). The above description shows extroversion has a significantly positive predictive role for achievement motivation, H1 is verified.

4.2.2 The moderating effect of perceptions of organizational politics on the relationship between extroversion and achievement motivation

In order to test the moderating effect of pop on the relationship between extroversion and achievement motivation, the paper adds interaction variable of extraversion and pop, using stepwise regression method to carry on regression analysis. Partial results are shown in Table 3. When the motivation of avoiding failure is considered as dependent variable, interaction terms of extroversion and salary and promotion ($\beta=-0.171*$) and extroversion and relationship between colleagues ($\beta=-0.201**$) are significant. Model 6(b) with respect to Model 5(b) has been significantly improved ($\Delta F=5.300*$), F value is 4.244($p=0.000$), regression equation is significant, R^2 value increases 0.027. Model 8(b) is also significantly improved ($\Delta F=7.401**$), F value is 5.508($p=0.000$), regression equation is significant, R^2 value increases 0.036. The above description shows the moderating effect of pop (salary and promotion, colleague relationship) on the relationship between extroversion and motivation of avoiding failure is negative and significant. H2 is partly verified.

Table 3 The Moderating Effect of Perceptions of Organizational Politics on the Relationship Between Extroversion and the Motivation of Pursuing Success and Avoiding Failure

	The motivation of pursuing success			The motivation of avoiding failure		
	Model 4(a)	Model 6(a)	Model8(a)	Model 4(b)	Model 6(b)	Model8(b)
Extroversion	0.103	0.094	0.094	-0.174*	-0.188*	-0.213**
Self-interested behavior	0.097			0.317***		
Extroversion * Sb	-0.035			0.074		
Salary and promotion		-0.133			0.047	
Extroversion * Sp		-0.106			-0.171*	
Colleague relationship			0.011			0.175*
Extroversion * Cr			-0.009			-0.201**

ΔF	0.209	1.875	0.013	1.097	5.300*	7.401**

5 Conclusions

5.1 Research conclusion and discussion

The statistical analysis results reveal that young employee's extroversion has a significant effect on achievement motivation. Individuals with high extroversion to pursue success motivation is not significant, but avoid failure motivation is significant. Individuals with obvious extroversion personality have stable emotion, tend to be lively, easy to accept new things, conducive to the formation of individual-oriented high achievement motivation level, motivation of pursuing success is greater than motivation of avoiding failure, choose challenging tasks, exert their achievement potential. When extroversion is taken as antecedent variable, which predicts positive emotion in the mainstream, this study takes achievement motivation as dependent variable, enriching related research.

Meanwhile, the study also confirms pop has a certain moderating effect on the relationship between extroversion and achievement motivation. And the results show salary and promotion and colleague relationship moderate the relation of extroversion and motivation of avoiding failure. When pop is in a higher degree, the effect of extroversion on the motivation of avoiding failure decreases, reflecting pop has brought some side effects. However, the overall moderating effect is not obvious. Young employees' work experience may be not rich enough compared with old employees, feelings about pop are not profound, they have smaller reaction, thus the effect on their achievement motivation is also smaller.

5.2 Recommendations for management practices

According to the research results, we put forward the following specific recommendations to the organization's management practices. Firstly, extroversion on achievement motivation has positive prediction, which enlightens human resource managers in the selection of younger workers pay attention to individuals with obvious extroversion personality except for the case of the post with special requirements, so it is easy to stimulate employee's motivation and make full use of it, enabling employees to not only display their talents and realize their own value, but also improve work performance. Secondly, study results show that pop has a certain moderating effect, confirm pop has certain negative effects on the formation of achievement motivation, so we should curb the occurrence and contagion of organizational political behavior. Managers can guide employees' behaviors properly in cultural construction, actively monitor self-interested behaviors, establish an open, just and fair salary promotion system and the scientific and reasonable evaluation and incentive mechanism. Organization also should actively improve internal communication, timely answer feedback problems, improve organizational behavior's transparency, wash away the living space of self-interested behavior, form a good working atmosphere, which can reduce professional belief deviation behavior.

5.3 Research limitations and future research directions

Because of the emphasis of this study and objective condition of the empirical study, the research has some limitations. Firstly, in terms of research method, this study adopts a cross-sectional study, survey data are obtained in the same time period and the number of samples is not enough to fully reveal the impact mechanism of extroversion on achievement motivation. Secondly, the source of study sample is wide, whether the moderating effect is restricted by industry, organization nature, job post and other factors should be considered in the future research. Thirdly, the article only tests the moderating effect of pop, and it does not explore possible mediating or moderating effects of other variables. Therefore, future research should expand the sampling range, improve the representativeness of sample, conduct a follow-up study, and also need to study other factors of achievement motivation in order to provide a more accurate explanation for the problem, as well as valuable insight for management practices.

A Study on the Interaction among Learners' Affective, Personality Variables and Their Recasting

Jiang Yan

School of Foreign Languages, Wuhan University of Technology, Wuhan, P.R. China, 430070
(E-mail: jiangyanwut@126.com)

Abstract: Based on the relevant theories of Cognitive Psychology and Second Language Acquisition, the current study explores the interaction between individual learners' affective and personality variables and three types of recasts by means of questionnaires, task-based dialogues and stimulated recall. The results show no clear-cut relationship of affective variables to feedback types, whereas some correlations between personality and feedback types are found. Field dependent and extroverted learners choose recasts; field independent and introverted learners like the combination of recasts and metalinguistic clues; the combination of recasts and explicit correction is not preferred.

Key words: Recast; Affective variables; Personality variables; Interaction

1 Introduction

Recast, proposed by Lyster and Ranta (1997), is a reformulation of students' expression, which does not explicitly point out students' mistakes, but the form of feedback to provide students with the correct input, and hope that the students are able to compare their wrong input with the teacher's right input in order to realize their mistakes. Since its inception, recast has drawn much attention in applied linguistics due to the great theoretical significance and the wide practical value as well. In the previous five years, many foreign researchers (e.g., Rassaei Ehsan & Moinzadeh Ahmad, 2011; Jaemyung Goo, 2012; Ehsan Rassaei, 2013; Ana Llinares & Roy Lyster, 2014) have conducted empirical studies to explore the relative efficacy of recasts over other types of feedback on the learning of the English and examine the relationship between the effects of recasts and explicit corrections on the second language development and learners' perceptions of corrective feedback. At the same time, the researches on recast in China go from the descriptive study to introduce the controversy over the corrective nature of recast and the factors influencing the role that recasts play in the second language development (Li Zaihui, 2011; Liu Xiaoyu, 2012; Zhao Wei & Wang Junju, 2013; Li Danmei & Zou Degang, 2014), to the experimental study on whether learners' differential perceptions of recasts will result in different learning (Zhang Shanshan & Li Guohong, 2012). However, no researches were concerned with the interaction between individual learners' affective and personality variables and recasts. Therefore, in accordance with the characteristics of Chinese learners, the current study intends to conduct theoretical discussion and empirical research on the relationship between the three recast types and the four cognitive models, combined with the cognitive mechanisms and psychological factors.

2 Experiment Design

2.1 Focus

The experiment focused on the interaction between individual learners' affective and personality variables and three types of recasts, namely, recasts, combination of recasts and metalinguistic clues, combination of recasts and explicit correction.

2.2 Subjects

The subjects were 48 first-year English majors in a university, including 8 boys and 40 girls. None of the subjects knew the purpose of this study in advance.

2.3 Procedure

The experiment was composed of questionnaires, task-based dialogues and stimulated recall.

All the subjects were engaged in the questionnaires on motivation and attitude, field dependence/independence, extroversion/introversion. The results from the four questionnaires divided the subjects into 12 groups participating in the task-based dialogues the next day.

The 145-minute task-based dialogues took into consideration the four factors contributing to the expected recasts by Han (2002). Firstly, the experiment was concerned with object clause; secondly, the subjects had some ideas of object clause, but failed to arrange a correct clause order, indicating the developmental readiness; thirdly, the teacher-student interaction occurred in the task-based dialogues where the reporter acted by each student interviewed the singer acted by the teacher in the way the

object clause was applied. For example, “Could you tell me where you were born?”; “I’d like to know how you become interested in singing.”; “I wonder when you will sing songs in a foreign country.”; “Many of your fans want to know why you will try to play a role in a movie.”; Fourthly, the teacher was preoccupied with the students’ errors in the object clause, and offered the relevant corrective feedback. Based on the theory proposed by Gass and Mackey (2000), all the subjects were engaged in the stimulated recall three days later. The teacher urged the students to recall their experiences concerning the task-based dialogues.

3 Data Analysis and Discussion

3.1 Results from questionnaires

In order to assess the subjects’ affective factors, the results from motivation and attitude questionnaires are shown in Table 1 and Table 2.

Table 1 The Results from Questionnaire on Motivation (n=48)

Items	Number of students	Percentage (%)
1. be more at ease with native speakers	43	89.58
2. understand western culture better	39	81.25
3. have an academic exchange with foreigners	38	79.17
4. make me a more knowledgeable person	39	81.25
5. be useful in getting a good job	46	95.83
6. receive more respect from other people	33	68.75
7. be helpful in going abroad	40	83.33

Among the seven items, the first three belonged to integrative motivation. The average number of students who chose the first three items was 40. The rest items could be called instrumental motivation, which were selected by 39.5 students. So, nearly no significant difference existed in terms of choice between these two kinds of motivation, thus a majority of students were highly-motivated.

Table 2 The Results from Questionnaire on Attitude (n=48)

Items	Number of students	Percentage (%)
1. I really enjoy leaning English.	43	89.58
3. I plan to learn as much English as possible.	40	83.33
5. They are a very sociable, warm-hearted and creative people.	38	79.17
6. I would like to know more native speakers of English.	39	81.25
13. My English has been improved by the application of what I learned into practice.	36	75
16. I get a sense of satisfaction from feeling more confident in situations that I found difficult before.	38	79.17

Attitude analyses fell into three categories. As for the attitude towards learning English, 43 (89.58%) of the 48 subjects really enjoyed learning English, while 40 (83.33%) students planned to learn as much English as possible. Considering the attitude towards people in English-speaking countries, 38 (79.17%) of the 48 subjects regarded native speakers of English as a very sociable, warm-hearted and creative people, and 39 (81.25%) students intended to know more about them. With respect to the attitude towards success in learning English, 36 (75%) subjects liked to find out improvements by seeing if they could apply what they had learned in real-life situations. In addition, 38 (79.17%) students got a sense of satisfaction as they could feel more confident in situations that they had found difficult before. The questionnaire results suggest that the subjects in this study had, overall, a positive view of the target language and of the people in English-speaking countries.

Meanwhile, all the subjects responded to the questionnaires on field dependence /independence and extroversion /introversion to explore the personality types of the students. The results are shown in Table 3.

Table 3 The Results from Questionnaires on Field Dependence /Independence and Extroversion /Introversion (n=48)

Items	Number of students	Percentage (%)
field dependence	32	66.67
field independence	16	33.33
extroversion	33	68.75
introversion	15	31.25

All the subjects completed the questionnaires, and meanwhile they identified their personality types in the light of tally criteria printed on the questionnaires. There were 32 (66.67%) field-dependent learners and 16 (33.33%) field-independent learners. Moreover, 33 (68.75%) subjects were extroverts, while 15(31.25%) subjects belonged to introverts.

The overall results from the four questionnaires are shown in Table 4.

Table 4 The Results from Questionnaires (n=48)

Items	Number of students	Percentage (%)
high motivation	40	83.33
low motivation	8	16.67
positive attitude	39	81.25
negative attitude	9	18.75
field dependence	32	66.67
field independence	16	33.33
extroversion	33	68.75
introversion	15	31.25

According to the results from the questionnaires, the subjects were classified into four types: 27 field-dependent and extroverted students with high motivation and positive attitude; 12 field-independent and introverted students with high motivation and positive attitude; 6 field-dependent and extroverted students with low motivation and negative attitude; 3 field-independent and introverted students with low motivation and negative attitude.

3.2 Results from task-based dialogues

The experiment was designed by 3×4 variables. The feedback types fell into three categories: recasts (A1), combination of recasts and metalinguistic clues (A2), combination of recasts and explicit correction (A3). The students were classified into four types: field-dependent and extroverted students with high motivation and positive attitude (B1); field-independent and introverted students with high motivation and positive attitude (B2); field-dependent and extroverted students with low motivation and negative attitude (B3); field-independent and introverted students with low motivation and negative attitude (B4). Then the twelve groups were formed to complete the task-based dialogues in turn. The current study referred to the classifications by Lyster (1998) and Braidı (2002) and classified learner uptake into the following four types.

The first type was a successful uptake. The student offered the feedback and brought the recast into their words. For example,

Student: Could you tell me where were you born?

Teacher: (A1) Could you tell me where you were born?

(A2) Could you tell me where you were born? We can't say "were you", because the object clause should be made in a normal order.

(A3) Could you tell me where you were born? It is wrong to use "were you", and it should be "you were".

Student: Could you tell me where you were born?

The second type was an unsuccessful uptake. The student offered the feedback, but failed to bring the recast into their words. For example,

Student: I'd like to know how do you become interested in singing.

Teacher: (A1) I'd like to know how you become interested in singing.

(A2) I'd like to know how you become interested in singing. We can't say "do you", because the

object clause should be made in a normal order.

(A3) I'd like to know how you become interested in singing. It is wrong to use "do you", and it should be "you become".

Student: how you become interested in singing.

The third type was zero uptake. The student avoided offering the feedback. For example,

Student: I wonder when will you sing songs in a foreign country.

Teacher: (A1) I wonder when you will sing songs in a foreign country.

(A2) I wonder when you will sing songs in a foreign country. We can't say "will you", because the object clause should be made in a normal order.

(A3) I wonder when you will sing songs in a foreign country. It is wrong to use "will you", and it should be "you will".

Student: Which country?

The fourth type was a confirmation. The student offered the feedback by approving of the recast. For example,

Student: Many of your fans want to know why will you try to play a role in a movie.

Teacher: (A1) Many of your fans want to know why you will try to play a role in a movie.

(A2) Many of your fans want to know why you will try to play a role in a movie. We can't say "will you", because the object clause should be made in a normal order.

(A3) Many of your fans want to know why you will try to play a role in a movie. It is wrong to use "will you", and it should be "you will".

Student: OK.

Except the third type, the rest proved that the student had already been on the uptake. In the real task-based dialogues, the students had eight uptakes of the three types of recasts, on the average. The results are shown in Table 5, Table 6, and Table 7.

Table 5 Learner Uptake of Recasts (A1)

	B1 (9 subjects)	B2 (4 subjects)	B3 (2 subjects)	B4 (1 subject)
successful uptake	61 (84.72%)	6 (18.75%)	9 (56.25%)	0 (0%)
unsuccessful uptake	5 (6.94%)	4 (12.5%)	3 (18.75%)	1 (12.5%)
zero uptake	0 (0%)	18 (56.25%)	1 (6.25%)	6 (75%)
Confirmation	6 (8.34%)	4 (12.5%)	3 (18.75%)	1 (12.5%)
Total	72 (100%)	32 (100%)	16 (100%)	8 (100%)

Table 6 Learner Uptake of Combination of Recasts and Metalinguistic Clues (A2)

	B1 (9 subjects)	B2 (4 subjects)	B3 (2 subjects)	B4 (1 subject)
successful uptake	6 (8.33%)	17 (53.125%)	1 (6.25%)	3 (37.5%)
unsuccessful uptake	7 (9.72%)	6 (18.75%)	2 (12.5%)	2 (25%)
zero uptake	50 (69.45%)	2 (6.25%)	11 (68.75%)	1 (12.5%)
Confirmation	9 (12.5%)	7 (21.875%)	2 (12.5%)	2 (25%)
Total	72 (100%)	32 (100%)	16 (100%)	8 (100%)

Table 7 Learner Uptake of Combination of Recasts and Explicit Correction (A3)

	B1 (9 subjects)	B2 (4 subjects)	B3 (2 subjects)	B4 (1 subject)
successful uptake	0 (0%)	0 (0%)	0 (0%)	0 (0%)
unsuccessful uptake	4 (5.56%)	3 (9.375%)	1 (6.25%)	1 (12.5%)
zero uptake	65 (90.27%)	27 (84.375%)	13 (81.25%)	6 (75%)
Confirmation	3 (4.17%)	2 (6.25%)	2 (12.5%)	1 (12.5%)
Total	72 (100%)	32 (100%)	16 (100%)	8 (100%)

The results indicated that field dependent and extroverted learners (B1, B3) chose recasts (A1); field independent and introverted learners (B2, B4) liked the combination of recasts and metalinguistic

clues (A2); the combination of recasts and explicit correction (A3) was not preferred.

3.3 Results from stimulated recall

Concerning the subjects' perception and uptake of various recasts given by the teacher, the stimulated recall was decoded into four types: perception + uptake; perception + no uptake; no perception + uptake; no perception + no uptake. The results are shown in Table 8.

Table 8 The Results from Stimulated Recall

	B1			B2			B3			B4		
	A1	A2	A3									
perception + uptake	7 78%	2 22%	1 11%	0 0%	3 75%	1 25%	1 50%	0 0%	0 0%	0 0%	1 100%	0 0%
perception +no uptake	0 0%	6 67%	8 89%	1 25%	0 0%	3 75%	0 0%	1 50%	2 100%	0 0%	0 0%	1 100%
no perception + uptake	2 22%	1 11%	0 0%	1 25%	1 25%	0 0%	1 50%	0 0%	0 0%	0 0%	0 0%	0 0%
no perception + no uptake	0 0%	0 0%	0 0%	2 50%	0 0%	0 0%	0 0%	1 50%	0 0%	1 100%	0 0%	0 0%
total	9 100%	9 100%	9 100%	4 100%	4 100%	4 100%	2 100%	2 100%	2 100%	1 100%	1 100%	1 100%

The first type (perception + uptake) was regarded as the best interaction between the learner's type and the recast type. Table 8 informed that field dependent and extroverted learners (B1, B3) chose recasts (A1); field independent and introverted learners (B2, B4) liked the combination of recasts and metalinguistic clues (A2); the combination of recasts and explicit correction (A3) was not preferred. The results from stimulated recall were in agreement with those from task-based dialogues.

3.4 Discussion

The results can be justified by Noticing Hypothesis and Scaffolding theory.

Firstly, the teacher's output of the recast type gives rise to the learners' noticing about the target grammatical form. That is to say, in producing the target language vocally or sub vocally, learners may notice a gap between what they want to say and what they can say, leading them to recognize what they do not know, or know only partially. Under these circumstances, the recasts (A1) may prompt learners to consciously recognize some of their linguistic problems, in particular, the field dependent and extroverted learners (B1, B3). They are more inclined to empathy, more capable of knowing the teacher's intention, thus choosing the recasts (A1). In contrast, the recasts (A1) fail to achieve the noticing function for field independent and introverted learners (B2, B4). They are less sociable, resulting in their unrecognition of the teacher's intention. Yet, their thinking and analytical skills contribute to the preference for the combination of recasts and metalinguistic clues (A2) since metalinguistic clues offer the opportunity for them to modify the output.

Secondly, scaffolding theory denotes a person who helps students to accomplish what they cannot do by themselves. In the task-based dialogues, the teacher provides three types of recasts that were considered as scaffoldings. Comparatively, the combination of recasts and explicit correction (A3) is not preferred, mainly because the explicit correction of the learners' errors may harm self-esteem and self-confidence and fail to offer the effective cognition scaffolding.

4 Conclusions

Recast bears the corrective nature to second language acquisition and pedagogy. The current study explores the interaction between individual learners' affective and personality variables and three types of recasts. The results show no clear-cut relationship of affective variables to feedback types, whereas some correlations between personality and feedback types are found. Field dependent and extroverted learners choose recasts; field independent and introverted learners like the combination of recasts and metalinguistic clues; the combination of recasts and explicit correction is not preferred. The results are justified by Noticing Hypothesis and Scaffolding theory. Needless to say, the present study is far from perfect because of some objective and subjective limitations. Recast calls for the further study on the various speakers of English and different language forms.

Investigations on Strategies for Products and Services of Mobile Phone Companies in Congo Brazzaville

Ngomah Madgil Don Stenay Junior, Zhang Youtang
School of Management, Wuhan University of Technology, Wuhan, P.R. China, 430070
(E-mail: juniorngomah@gmail.com, zyt@whut.edu.cn)

Abstract: The notion of competition is taken with great interest and enthusiasm by mobile phone companies in Congo-Brazzaville. It requires such economic operators a minimum of vigilance, causing them to be more efficient on the market. 3 major companies discuss the Mp¹ market, thus seeking the largest market share. This study therefore examines the roles of corporate strategies in the sale of products and services offered by the companies which are AIRTEL and MTN Congo and its impact on their competitive positions. Thus, according to our investigation, 95% of the products and services of these mobile phone companies are sold through strategies of innovation of products and services. A literature search about operators and the ARPCE² has been conducted to determine the impact of these strategies on subscribers, market shares and turnover of the companies in the period 2014-2015. The results of the analysis have been recorded in the excel software.

Key words: Investigations; Products; Services; Mobile phone

1 Introduction

Since the deregulation of the telecommunications market of 1997 (Act No. 14/97 of 26 May 1997), Congo-Brazzaville faces a variety of company in the mobile telephony market. Several companies have emerged giving birth to an unprecedented and accentuated competition thus changing the market information, promoting new deeper competitive practices. We are witnessing a high and permanent research of new innovation strategies to differentiate themselves from the competition for the sole purpose of maintaining some customers and conquering others. A business orientation is two-folded: firstly, the implementation of a product or service and then its commercialization. Thus, the sales performance of each of these mobile phone companies in Congo-Brazzaville passes necessarily through the implementation of marketing strategies and innovation of products and services. It is then, that the mobile telephony market has become after some time the scene of fierce competition between different operators. This pushes so all mobile players to:

- 1) Innovate and create competitive advantages;
- 2) Identify the resources needed to achieve the objectives set;
- 3) Interested in a service offering reliable and cost-effective than the competition;
- 4) Evaluate its position relative to that of others;
- 5) Anticipate the evolutions of the competition, the market and regulation;
- 6) Maintain its activity in a competitive environment and opportunities;
- 7) Lower especially tariffs and expanding their networks.

Strategies differ from a company to the other, and differ from one operator to another. Mobile is one of the sectors which likely scored with a great shot the telecommunications industry in Congo-Brazzaville. The birth of several products and operators has not only boosted this sector but has also expanded its competitive environment. That is why, faced with competition and the permanent pursuit of market share gain, a company must develop methods and compelling marketing strategies to hope to maintain its position on the market and increase its turnover.

2 Objectives

It is in this perspective that this study has for objectives to:

- 1) Explain products and services strategies implemented by the Congolese of TM enterprises;
- 2) Measure the impact of these strategies on the competitive position of enterprises on the market of TM in Congo.

3 Problematic

Two major issues will constitute the backbone of our work:

¹ Mobile Phone

² Agence de régulation des postes et des communications électroniques

1) What are the products and services these companies offer they market Mp in Congo Brazzaville and their methods used to effectively achieve their goals?

2) What is the impact of these methods on the competitive position of these companies on the Congolese of Mp market?

4 Hypothesis

From the above two questions of the problematic fundamentally mentioned, we have following two assumptions:

- Phones modem and of promotion offers on the cost of call and message transmission may be products and services of the companies of Mp in Congo Brazzaville.

- Innovation of products, services and pricing strategies can explain the sale of products and services of Congolese companies on the Mp market.

Trade performance is sufficiently observed on the mobile telephony market in the Congo through a perpetual pace of strategic innovations renew and plays on the competitive positioning of operators of Mp in the Congo. And, according to our survey on the field; to better sell and remain competitive, Congolese mobile phone companies use business strategies. Therefore, our literature will focus on business competition strategies and on the field of the Mp.

5 Literature Review

The strategy is linked to the notion of performance i.e., the degree to which objectives are being met in an organization (GAMVOULA G, 2007). This performance translates into customer loyalty and customer satisfaction. It must therefore be able to resume all calls to all applications and satisfy till the end. It is also about a product positioning, the client should not return angry, he should be happy. It is keeping him and building his confidence. This performance is linked to the quality and quantity of the service to clients (Jaeger C, 2002). But the work of Nwamen F, (2006) adds that the performance can be managed in a functional perspective (sales and marketing, accounting and Finance, Production and human resources management) or process (management of the supply chain, innovation and communication). We quote Onge St S. and Magna M. L. (1994) who also quoted Lynch and Cross (1991) in these terms: “on a business vision, the performance allows the leader to explain the link between the company and its daily operation”. In this perspective, each function of the firm should therefore positively enhance the value provided by its activity. Thus, the competition very often affects sale. Thus, to obtain a benefit at the time of globalization there should be good marketing strategies or communication.

- **Strategies in the company and towards competition**

For Igor ANSOFF (1989), the strategy is not only borrowed from military or reserved this field only terminology, but applies to all competitive situations in which two or several companies are in the rivalry on a same field of activity. The strategy in this case is a necessity in any competitive universe. But in recent years, the term strategy into the everyday vocabulary of business leaders and strategic planning is now part of the functioning of large companies. HIAM. A and SCHWE. C (1994) also define strategy as the main lines of the action plan, the general pattern that helps the company achieve its goals. Thus, according to Demeure C (1997), the strategy is a set of decisions taken in advance by a business for a period of time to achieve its general objectives in a competitive world, economic, social etc. This is to say that actual strategic issues arising from the creation or the orientation of the new opportunities the need for strategy intervenes and allows business leaders to anticipate the satisfaction of customers. J.M LAUGINIE and his staff will focus on marketing strategy in the enterprise. This marketing strategy depends on the company's general policy and is concerned that of the coherence of the various policies (product, price, distribution, and communication) which compose it. Currently, the marketing strategy is a very extensive decision-making universe. Thus, P.L. DUBOIS and A. JOLIBERT (1980), confirm this hypothesis more clearly stating that the marketing strategy must focus on how the company works towards its competition. The need for a company that applies the policy marketing in the long term, is to use the information on all of the company for the implementation of this marketing strategy at the level of the organization or the strategic areas, hence the need for communications policy in the business.

Nowadays, the strategy remains to business leaders, the only way of remedies to deal with threats that may arise at every moment from the rapid and continuous changes posed environmentally. Igor ANSOFF (1989) adds that these changes can be caused by a situation of markets, technological

discoveries in and out of the company, or the sudden arrival and mass competitors. In these circumstances neither established traditions nor experience sufficient to deal with the opportunities and threats in absence of the strategy. Where, Don Stenay Junior MadgilNGOMAH includes this concept grassroots communication in any business strategy to minimize risks. He in his dissertation: "communication strategies to the Congolese of lottery (COGELO) management", assesses the place of communication and marketing in the activities of the COGELO in the CONGO. It shows with fitness that to promote its image, its activities to target populations and local authorities or to ensure the success and sustainability of business leaders of premiums on board, define the objectives of the company, identify the strategic axes and efficiently use all the potential for communication to achieve the objectives.

● Strategies in Mp

Mobile grows exponentially today resulting in a competition that obliges companies to be competitive on the market (Lerzan A, Alexander B, PelinAksoy, Bart L, Timothy L. K, 2012). This competitiveness therefore through a management system promotes the production of the company. Thus, (Le temps Décide Amour Prestige NGOMAH, 2012) shows that the sector of telephony knows an unprecedented development in Congo Brazzaville. This therefore imposes another system of management of the companies, who wish to prosper and make a place of choice in the current context of globalization of trade. It emphasizes a little more beyond the elements enabling the business to a place of choice are part of marketing and communication strategies. These two tools are surely the key to socio-economic development of any business. However, the dynamics of a market cannot be understood in its fullness without taking account of the environmental conditions that characterize it. The reason for this is that both firms already in place that potential entrants, the economic environment is an important source of strategic inspiration (Madala B, 2005). The author in this work shows that since the opening of the market in the Republic of the Congo, offering phone service is provided by four operators operating in all three different systems grouped into two types of networks: the wired and mobile networks. Telecommunications offers several services to businesses as well as consumers and asking today adequate tools of communication (image, voice, messaging etc.) (Olivier B, Giuseppe N, 2001). And the success and failure of the mobile phone companies therefore depend on the choice of strategies they undertake (Christine J, 2002). So speaking mobile phone and its development that entails competition (Rohit S, 2009) shows the phone as being one of the components of the range of the NICTs in the same way as internet and television and is a mixed object, because it is not only a tool for communication, but also and above all, an object of production manufactured, sold, consumed, maintained. It analyzes the circuits for the import of mobile phones and accessories, distribution of prepaid recharge cards and 'credit' and their sale. It addresses the issue of interactions that are played between different actors between themselves and between them and the population, market and Bamako road traffic users. In this same order of idea, the experience is that mobile phone today requires new techniques on the market, among current preferred techniques, is part the side innovation products and services. Companies in this sector must adopt innovation strategies to seize the competition. Analyzing mobile telecommunication Abdelillah Hamdouch, attests that the innovations of mobile telecommunications services are far from being marginal or correspond to simple artificial differentiation tools. As in many other areas of service in fast-growing (online services and electronic commerce on the internet, air transport, retail and specialty distribution, Audiovisual Council and recreation), they are now a 'must' and a central strategic axis for the firms. Because these are services and not industrial goods, innovate in the delivery (content and design of the service) and in close relationship to the customer involved in the realization of this benefit, is not only a variable to compete; It is, basically, the key variable on which depends competition.

6 Problem Statement

Beyond all notions of business strategy that different authors have mentioned, now builds on the performance and competition elements: customer relationship management. That is, after and before the sale of a product or service, a client file tracking must be established. This leads therefore to study potential or customer purchasing behavior to retain it. This notion is called jurisdiction of the HRM¹, for choice and the quality of the staff who will pilot this management of RCM² service. In the TM, we remember that elements such as marketing, communication are strengths for modern businesses, the

¹Human Resources Management

²Customer Relationship Management

success of the activities and the good position before all eventualities of the market. Thus, next to the strategies of the offer and other innovations on products and services (promotion of calls, messages, novelty phones...) we could insist on the quality of networks and high-speed Internet services from telephones (case of quality problems of network of companies of MP in Africa, particularly Congo Brazzaville).

7 Research Methodology

To complete this research work, we have to use documentary analysis methodology, which consist in finding with the operators and of the ARPCE documents on the characterization of MP market, to all current market statistics. We have also conducted informal and formal (no questionnaire) interviews with officials of the different operators of MP to obtain information regarding their products and services, as well as their service innovation strategies and their impact on their competitive positions. We have all resorted to comments about facts which have allowed us to see how customers would have more than one network and would benefit from the affordable market offerings. The internet tool also was a great remedy, because it allowed us to have on the site of the ARPCE and those of the operators of the new offers of products and services, as well as developments in the sector of the MP.

8 Results

This methodological approach allowed us to detect the strategies of the offer of products and services on the field; to know the Congolese market of the MP which currently consists of operators Mtn, Airtel and azur; after the effective takeover of the company Warid by Airtel, at the beginning of the fourth quarter 2014. • These three operators total more than 4.5 million subscribers in the third quarter of 2015 (T3-15)¹ and generated a total revenue of 69.3 billion CFA (turnover), whose nearly 55.8 billion on outbound traffic. • All operators generated in T3-15 traffic voice of 1, 1 million minutes in both directions (outbound and inbound); While the volume of SMS is 1.18 billion. Mobile phone outgoing weighted rates settled in T3-15, 63 F/min for voice, against 3 F² for SMS.

9 Companies Congolese Mp

There are currently three (3) mobile phone companies in the Congo after the effective takeover of the company WARID by AIRTEL. Among these companies, we can mention: the company MTN Congo; AIRTEL Congo and AZUR Congo. These three companies are lighthouses on the mobile telephony market Congolese firms. However, we present the number of companies having exercised market MP in the Congo.

Table 1 Evolution of the Congolese of MP Market

Companies	Date of creation or operating
ONPT	1964 June 25
Cyrus	1997
Celtel	1999 December 15th
Libertis Telecom	2000 may 19
Sotelco	2003february
MTN International	december 9
Warid Telecom Congo	2008january
Zain Congo	2008 August 1 rd
Airtel Congo	2010 April 24
Azur Congo	2011july 7

Source author: This chart traces the names and dates of formation of the national and private companies having exploited sector of MP in Congo Brazzaville, since its independence to the present day. However, Celtel had been bought by zain and zain by Airtel. Libertis was acquired by Mtn and the national company sotelco has been replaced by Azur.

10 Strategic Analysis of These Companies of MP in the Congo and Impact on Their Competitive Position.

The request represents the amount of a product that consumers are willing to buy at a price (in microeconomics). With respect to mobile phone, it comes to focusing on the behaviors and attitudes of consumers to mobile telephony services. Thus the area of Mp in the Congo the characteristics of supply and demand are factors that understanding competition that prevails. This allows understanding the strategies put in place by each operator. But we will talk about the characteristics of different offerings.

10.1 Companies and strategies of their offerings

Multiple strategies are used on the Mp market by these three companies, to get the largest share of the market, increase the number of subscribers and possibly face competition. The offer means the "volume of goods and services available to the market in order to be sold. These products or services are traded on the market for a price. Strategies for providing services of mobile operators are therefore based on the essential variables of offer of products, services and prices. For more information on the implementation of these strategies by the Congolese of Mp operators, we will discuss respectively the case of AZUR, AIRTEL and MTN.

10.2 Companyazur and his strategy of the offer of goods and services

The company offers a prepaid to these customers, which allows you to pass and receive calls from the purchase of a SIM card to its agencies and distributors. The prepaid package consists of a SIM card, priced non-promotion of 500 FCFA with 500 CFA FRANCS communication credit offered. Post services paid azure: to satisfy its professional clientele, Azur offers flexible and adapted to the needs of users, their allowing communication costs. These offers are: azurcorpo, commercially for post paid subscribers willing to pay at the end of the month and with a minimum of 10 lines guarantees access to this offer. Then there are azure flexi more which is a flat-rate offer for post paid subscribers eager to control their consumption. With each of these offers, customers benefit in addition to a broad range of services with value added such as: Voice mail and missed call notification, National and international text messages, Call waiting, Detailed invoice, Web, International Roaming

GFU offers either group farm user; enable the members of a society to communicate at unbeatable prices all competition. Regarding corpo more, a company having endorsed guidelines can from the same number: capping its consumption in national or international without slot, call at rates other internal lines of business (GFU), call account prepaid from the same SIM, benefit from all of the prepaid services.

Azure also provides services in the form of accounts:

A master account: this account allows the user to recharge his account from standard "refills" of azure. The user has access to all prepaid services, only from this account and allows access 24/24 for calls not GFU, electronic charging is possible or by prepaid cards, followed by consumption, consultation of balances and accessibility also 100% prepaid (recharge me, call me, transfer of credit, etc.);

GFU account: this account is dedicated to calls that the user issue within his company. Every month, the numbers are credited on the basis of the letter of request that companies send to Azur. This translates so access 24/24, to recharge balances and consumer consultation and finally unauthorized access unauthorized prepaid services, preferential tariff, except for calls to the closed loop of users. In addition, there is also another called account: (closed) capped company account. This account offers only the ability to issue national and a time slot can be configured on this account. His schedule is similar to prepaid. It is structured as follows:

Accessibility parameterized according to the customer (slot), unauthorized charge, consultation of the balance and consumption, accessibility unauthorized prepaid services, similar to Corporate first fee schedule, capped consumption, call on the national restrictions

A company account (unlimited): this account to call in national as in international, without any constraint. Similar to that of the prepaid fee schedule and this account provides: time range not configurable, unauthorized charge, consultation of the balance and consumption, Accessibility unauthorized prepaid services, similar to corporate first fee schedule, no ceiling

With regard to the flexi service more and more, it allows any postpaid user to use the postpaid offers 50, 100, 150 or 200 azur. The only prerequisites to ensure that users are qualified for this type of offering; they shall be post paid subscribers. This subscription includes offers of services like azurCorpo 50, 100, 150 and 200; it respectively gives customers the benefits of communication at the national and the international. Take for example Azur 50 corpo which applies as follows: 50-minute national call to a

Subscriber Azur to other azure, 50 minutes of calls to other operators, 50 minutes to the international then 50 sms from national to the international. This is valid for 30 days, anytime and even on other operators of the competition. Thus, this example applies in the same way with the suite of offerings mentioned. This strategy is winning, because it allows the company to build trust with its customers and keep coming them. And the monthly charges for these services during the subscription are divided as follows: 15.000FCFA for Azurcorpo 50, 25,000 fr azure corpo 100, 40,000 azurcorpo 150 and 50.000fr for azurcorpo 200. On the other hand, other services apply after consumption. We have inter alia national calls from azure to Azure: 60FCFA per minute (per-second billing). National calls to other operators: 75FCFA per minute (per-second billing). International calls: 75FCFA per minute (per-second billing). National SMS: 20FCFA per unit. International SMS: 50FCFA by SMS. There are also prepaid rates, azur offers calls to azur 1, 25f/SEC as well as to other operators. Calls to the international on 12 countries to 1f, other distributed calls in zone 1, 2, 3. Called at 1.25, 1.5, 2-3f/second. SMS to Azure 20f, 40E to other operators and 75 abroad. Azur recharge cards are varied. To meet multiple needs, Azur has various recharge cards: 5.00f, 1.000f, 2.000f, 5.000f, 10.000f and 40.000f.

10.3 Company Airtel and its strategy

● Offer products

Regarding products, AIRTEL offers different brands phones namely: Black Berry, Nokia, ZTE, Samsung, LG, Sony Erikson, and Sagem... These devices have several options ranging from the composition of ringtones, games, infrared, FM Radio, mp3 player, Bluetooft, in the integrated Web browser. The extent of the range of AIRTEL is very displayed. This range puts on types, series or the versions depending on the effect of mode. AIRTEL is thus aimed at a segment of different market attracting customers to taste and to need diverse; AIRTEL uses a line extension policy. The range of these products, only ZTE is promoted and is sold at a low price. The ZTE brand is accompanied by a logo of type AIRTEL enabling identification and differentiation over competitor's products. There's also a touch Tablet and phone smartphone African brand product of the VMK Company Airtel offers to its customers. AIRTEL opts for the multiple brand strategy.

The card SIM of AIRTEL was sold to 500 FRS with 400frs of credits included. The renewal of the SIM card in case of loss is done at customer service AIRTEL for a fee of 1000FCFA (500 FRS for renewal) and 500frs of credits. AIRTEL also makes available to consumers to the cards of seven kinds at varying rates. Prepaid cards are mobile telephony subscription offers, without being constrained to all minimum subscriptions over time. Calls are already paid in advance and the balance available decreases as and as communication is done. Offered by AIRTEL recharge cards are cards at the price of 200, 500, 1,000, 2,500, 5,000, and 10,000 to 45.000FCFA.

● Offres des services

Services offered by AIRTEL Congo are two types of clients: individual (men of affairs, traders, civil servants, students and students, artisans and housewives) and large enterprises. Individuals, in addition to basic (calls, text message, voicemail...) services, AIRTEL offers to individuals the Airtel money service that gives users the ability to transfer money using a phone and service is for you (Cpt) which allows the AIRTEL subscriber to send credit to another subscriber of the same network. It is also possible to the AIRTEL subscriber to use electronic recharge (Sap Sap) without using a card to cater her communication credit account. The AIRTEL Subscriber can access the Internet wirelessly from his phone, if it is compatible. This is done also via a computer using a PC card or a USB modem. In addition, AIRTEL has Roaming agreements with 72 countries in the world including 48 in Africa. AIRTEL has thus created unique network, the first network without borders in the world. Indeed, the unique network enables Airtel subscribers to use their phones everywhere where the AIRTEL network operates. This service allows all AIRTEL customers to use their phones across borders without having to pay Roaming fees or additional costs when they receive calls. Roaming services calls are set at the local rates and the cost of an SMS (domestic and international) to 149 FRS.

Business, the company offers prepaid service. The prepaid service is a service charged before consumption. On behalf of business customers of AIRTEL, it is still called top up offer payphone. This service is available to business customers through 45000frs. This allowed the emergence of telephone booths in abundance in most localities where AIRTEL is established. Top up is automatic reloading of the AIRTEL customer's account every first of the month. This quite flexible method also allows, in case of need to add communication credit. The offer is done without subscription fees. The daily life of the Congolese found somewhat simplified and enhanced through this service.

And finally postpaid. These are services which billing occurs after consumption. The postpaid offer consists of the following services: Eco, Business and First. Through the Eco service, in AIRTEL allows companies to access the Internet by phone (Wap), to acquire closed groups of users thus allowing company employees to communicate cheaply. Acquire the Eco service, requires a deposit of guarantee of 200.000F. Monthly subscription to the Eco service fees are set at 17835FCFA as in 2004.

Through the Business service, AIRTEL gives access to fixed rates of monthly subscription with discounts up to 30%. The company may also benefit from rates to fixed and mobile of the Democratic Republic of the Congo (RDC) networks. To acquire the Business service, it must also be a payable deposit of guarantee of 200.000FCFA and 5250FCFA at the beginning of each month.

With First, AIRTEL offers business subscribers to multiple subscriptions, to benefit from the preferential tariffs for local calls, and rates to all mobile and fixed the DRC's networks. The acquisition of this service requires a monthly consumption above or equal to 45000F. For calls, pricing is done in the minute following destinations. In 2005, there was the emergence of Eco, Business, First and Roaming services. Eco service is taxed between 125 FRS and 650frs, the Business service between 140frs and 650frs, and the First service between 120frs and 650frs. It turns out if pricing is identical to the international level, there is the Eco service is the least expensive follow-up of First and Business. SMS are taxed at the level of Eco, Business and First services to 83 FRS regardless of the time.

It appears that AIRTEL applied a strategy to lower tariffs to the level of transactions between AIRTEL subscribers. On the other hand, for operations to other networks, the drop in rates is not as important. AIRTEL is the loyalty of its customer base to maintain its position with its competitors.

10.4 Company MTN Congo and its strategy

● Offer products

MTN offers various branded phones: phone smartphone and touchpad African VMK company. Motorola ZTE, HUAWEI, at affordable prices. This strategy aims to put at the disposal of the consumer smart phones and others, with simple functions at low prices. This proved to be an effective way to sell SIM and thus increase the number of subscribers. Indeed, the promotion prices proposed by MTN are within the reach of all social strata. These prices remain low enough with regard to the income of the poor. It should be noted that the MTN SIM card is sold for 600 FRS with 500 FRS of credits included. The subscription is free. It is the same for the renewal of the SIM card.

The company also has a range of very varied cards exclusively for prepaid subscribers. These cards allow the account in appropriations for communication. MTN Congo is currently available to consumers' six types of cards at the price of: 500, 1000, 2000, 15000 and 40000 FCFA.

● Offer of services

The company started on two categories of clients, on the one hand individuals and on the other companies. Personal services, MTN Congo policy is to offer through its values: Can do, Leadership, innovation, Relationship and integrity, quality of services varied such as Mtn money involving the transfer of money through a phone. Thus MTN offers apart from services (calls, messaging etc.), services like Call Me, Libota, Flexibility, i-charging, Internet, MTN area. Call me, is a service that allows a MTN subscriber to be reminded by another when there is no credit by sending a free SMS. The LIBOTA service for its part allows subscribers to call their parents or friends at a lower cost. Any customer has the right to four numbers libota MTN. The registration number is charged at 500 FRS. For the mobile internet, subscriber's call 123 for activation and for 3 kilobytes, they pay 0.1 FCFA. 1 kilobyte is 1000 characters (including spaces and punctuation). As for Flexibility, it is a prepaid account-shaped and sub account. It enables the Subscriber to control consumption in terms of calls. This service is much more reserved to companies and, to lesser extent, individuals.

The "i-charging" is, meanwhile, an international transfer service of credit like service "Me2U". It allows a subscriber to transfer since, from France or Belgium for example, communication credit has a person in the Congo.

Finally, MTN zone, it is a mode of per-second billing. With this service, the second is invoiced at 0,12frs, the Subscriber will always benefit from reductions ranging from 10 to 95%. In a simpler way, we can say that MTN Zone is a service that enables the Subscriber to be charged according to the reduction or the percentage of geographic location. MTN Zone is reserved for subscribers of tariff plans for prepaid services namely Classik'Optima, Gold Allo and Allo first.

In fact, all subscribers consuming not similarly, differentiation with respect to pricing was made following their monthly consumption. It speaks of tariff plans. Classik'Optima is the tariff plan which is entitled any customer prepaid just after taking his subscription. The call is charged at 150frs per minute

toward the MTN numbers, other networks and international. The Subscriber is subject as long as it consumes less 40.000 FRS month. Access to Allo Gold is acquired when a customer consumes from 40.000frs credit in the interval of one month. Once in Gold, the Subscriber is granted a reduction on its calls to MTN. To keep himself in Gold, the Subscriber must reach the threshold of 40.000 FRS after a month, otherwise it is automatically downgraded on Classik' Optima.

However, to access Alo first, the Subscriber must consume a minimum of 100.000 FRS for Classik'Optima and 60.000frs if it is Allo gold. The principle of a month remains valid and the Subscriber is billed in increments of 15 seconds. On Allo first, the period of validity extends over two months renewable provided that they reach the threshold no later than the day of the anniversary date. The evolution of tariffs of prepaid services of MTN (calls, SMS) database (ex Libertis) shows that in 2004 Libertis used four tariff plans: Classic Allo, Allo Optima, Allo Gold and Allo first. In Allo Optima, the pricing was in hourly increments. While in Allo classic, Gold Allo and Allo first Libertis applied per-minute pricing.

Thus, calls between subscribers Libertis in optimum Allo were fixed 200 FRS in peak hours and 120 FRS in off-peak hours. In Gold and Allo first these calls were taxed at 120 FRS the minute however they were attached to 200 FRS in Allo classic. Calls between Libertis and other networks are fixed in 230 FRS the minute in Allo classic, 200 FRS in Allo Gold and 150frsAllo first. In optimum Allo these calls were taxed to 260 FRS in peak hours and 200 FRS in off-peak hours. Calls to the international level are set at 1000 FRS in Allo classic, 800 FRS in Allo Gold and 650F Allo first. These calls are taxed in Allo Optima 1200 FRS in peak hours and 800 FRS off-peak tariffs.

The cost of an SMS is fixed at 40 FRS at the national level and 250 FRS outdoors in Allo classic, Gold Allo and Allo first. In optimum Allo, Libertis keeps the same pricing, except for SMS to other national networks (intra) taxed at 80 FRS. Between 2005 and 2007, MTN maintains the 2004 classic Allo, Allo Optima and Allo Gold call rates. While in Allo Optima pricing does more in hourly increments as in 2004. Thus the rates for calls between subscribers MTN to other networks and international are 200frs, 230frs and 1000frs respectively. During this period, MTN drop by half (50%) the cost of an SMS between subscribers (20frs) and to the international (125frs). It should be noted that SMS to other national networks are maintained to 40frs while 100frs are attached to other MTN networks. MTN maintains tariffs of calls between its subscribers. In 2008, MTN will merge the optimum classic Allo and Allo-tariff plans into one so-called Classik'optima. In addition, MTN maintains tariffs of calls between its subscribers and in 2007 Gold Allo and Allo first. In AlloClassik' optimum, they are attached to 150frs a decrease of 25%. The level of calls to other networks there is a decrease in the rates of all of the terms of pricing. These rates are respectively set at 150frs in Alloclassik'optima and Allo gold either with decreases of 34.47% and 25% while Allo first attached to 145frs or a 3.33% decrease. Calls to the international pricing are identical to all tariff plans. It is set to 150frs a decrease of 85% in classik'optima, 81.25% in Allo Gold and 76.92% Allo first. The cost of SMS this year corresponds to those in 2007. It shows that in 2004, Libertis used a strategy of abandonment. This strategy was aimed at a gradual withdrawal from the market and not allowed him to review its tariffs downward. With the arrival of MTN in late 2005, there a diversification and innovations in the services on offer. In 2008, there was a decrease of tariffs fairly important; MTN is implementing its strategies for loyalty of its customers. They also attract other subscribers. With regard to the services of the companies, MTN also offers post services paid to companies. Currently the paid post services offered are five in number. It includes from: first Corporate, expert Corporate, flat Corporate and Corporate fleet and Procontrole. First corporate is the offering of the paid post database. Corporate first aims for its part companies that want access to 15 lines. The flat Corporate service is offered to companies that want their employees to be able to call at the same rates at the national level. Corporate fleet is the only post service paid for directing calls made to a group of customers or employees. The target companies of more than 9 lines. For companies wanting to grant monthly amount of consumer fixed to their employees and willing to cap their consumption an originally defined threshold, MTN offers them the Procontrole service.

Access to existing paid post services varies depending on conditions of subscription IE: monthly subscription, national surety, international deposit. It is the international surety which is most expensive followed by the national surety then monthly subscription. Apart from services corporate fleet and Procontrole, the billing is the same for the national security and the international bail set respectively at 30.000 FRS and 500.000 FRS. However the monthly subscription at the first Corporate, expert Corporate, flat Corporate and Corporate fleet services are fixed respectively at 35.000frs, 30.000frs, 45.000frs and 25. 000frs. For Corporate fleet, the national guarantor is 30.000 FRS by line and the

international guarantee is non-existent. Particular service Procontrole access requires monitoring of the following conditions: the warrants at least a line paid post, the detention of one or more lines in a prepaid solution, demand monthly charging of a credit from 15.000frs and the payment in advance of the amount of recharge.

Analysis of the fee schedule of post services paid by Libertis in 2004 shows that calls to the paid post service were taxed by slots at the same price. Billing ranged from 120frs to 800frs depending on the destination. Schedule of post payes¹⁵ first Corporate, expert Corporate, Corporate flat and corporate services fleet of MTN watch billing has remained the same for calls between subscribers MTN, to other national networks for the first corporate services and expert Corporate. For the flat corporate services and corporate fleet these rates increased to 150 FRS compared to 2004. There is a decrease in the rates of international calls which are currently fixed at 350 FRS. The rates of SMS at the level of the paid post services match those practiced at the level of the services prepaid since 2005.

A specificity of billing is made at the level of the Procontrole service. MTN uses for this service a billing system based on the value of the credit to Cap. Thus MTN takes into account three versions: Procontrole 1 (hourly rates) and Procontrole 2 which billing occurs through minute then Procontrole 3 for invoicing per second.

For business customers, MTN offers a prepaid service for the opening of a telephone booth from 44000frs. The call to MTN subscribers is taxed at 27, 5frs and 35frs to other national networks for 15 seconds. These calls are taxed at 50frs to individuals. From the foregoing, it appears that MTN has a tendency to practice a strategy to lower tariffs for all its services. By implementing these strategies, MTN wants in fact to retain its customers and attract other subscribers.

11 Impact of These Strategies on Their Competitive Position

It should be noted that this study analyses strategies for the supply of the products and services of 3 operators and their impact on the market of MP in the Congo. Thus, the impact of these strategies identify itself on the following market indicators: the number of subscribers that record these operators on the market, their turnover and market share. To this end, the expected results of the period 2014-2015 give us the following:

11.1 Subscribers of the MP

In the third quarter of 2015, the Congolese market registered more than 4.5 million subscribers spread between the three operators at during that period in the Republic of the Congo. The number of subscribers between T3-14 and T3 - 15 decreased by 2.5%. Compared to the T2-15, the number of subscribers to the T3-15 decreased by 1.6%. The Mpmarket is composed of 99.2% of prepaid subscribers versus 0.8% postpaid subscribers. The mobile telephony market penetration rate was 98.6% in the third quarter of 2015, compared with 100.9% in the second quarter of 2015. (Table 2)

Table 2 Subscribers of the MP and Penetration Rate

	T3-14	T4-14	T1-15	T2-15	T3-15
Total subscribers(000)	4633	4595	4503	4590	4515
Prepaid subscribers	4601	4560	4468	4555	4481
Postpaid subscribers	31	35	35	35	35

Sources: Operators and ARPCE

11.2 Subscribers by operator

T3-14-T3 - 15, the operator MTN subscribers increased by 12.4%, and those of Airtel's 44.1%. Furthermore, the Azur operator subscribers increased by 2, 0%. (Table 3)

Table 3 Distribution Subscribers by Operator

Subscribers by operator(000)	T3-14	T4-14	T1-15	T2-15	T3-15
MTN	1972	2012	2038	2128	2216
Airtel	1348	2220	2117	2113	1943
Azur	350	363	347	349	357

Source: Operators and author

11.3 Market share in volume of Operators

MTN and Airtel have respectively 49.1% and 43.0% of market share in the third quarter of 2015. Azur, with 357 000 subscribers, farm market with 7.9% of market share, as shown in figure 1 below.

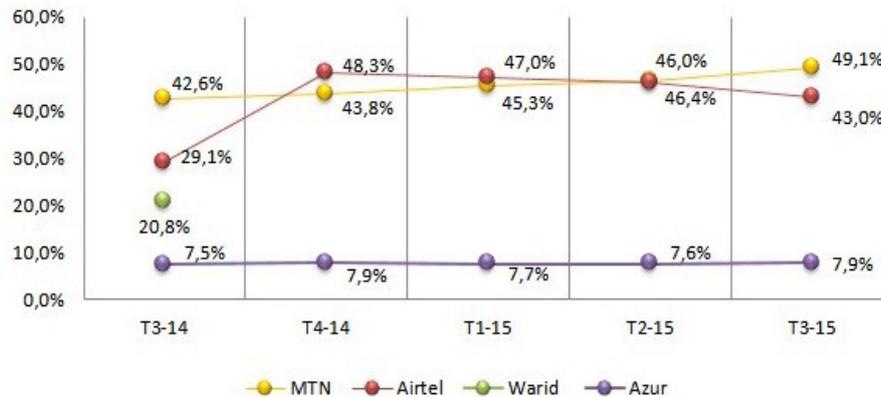

Figure 1 Presentation of Data of Market Share in a Figure
Sources: Operators, ARPCE and Author

12 Conclusions

This study explained in a first step the role played by strategies and their impacts in the Mp enterprises in Congo. On the other hand, it recounted how the Congolese mobile phone market of is characterized and analyzed the part of the business, the competitive battle or market even sales strategies. After analysing strategies used in the Mp market, we can therefore assert that each operator practices a watch known as informative and technological, to counter the total domination of its competitors. This is why we see a similarity on bids put in place by Azur, Airtel and Mtn operators. The strategy here aims at innovation offers, in order to differentiate itself from its competitors. Observation made, it is that the mobile market is approaching a level of saturation. 95% of the population aged 15 years and more is equipped with mobile, out of a population estimated at 3.900.000 habitants⁵⁶. 37% of mobile users have more than one line. This trend is justified by the multiplication of stakeholders and the competitive intensity on the market, searching for rates (essentially for the net off calls) and failure in terms of network coverage. Therefore, Congolese phone companies (Azur, Airtel, Mtn) try to enforce different policies for best performance as the competitive stakes are so huge oblige them to work to improve each time their reputation, conquer and retain their customers. So, it has to be mentioned that this sector of the MP, still enjoys a balanced economic health.

Abstract: Organizations are facing volatile environments compounded with strife competition, faster technological change, and globalization. This study aims at finding the potential predictors of organizational innovations. Stratified random sampling was used to collect data from 273 usable responses from 500 respondents. Empirical study shows that transformational leadership (TL), organizational learning (OL), and knowledge management (KM) significantly predict organizational innovation (OI). Contributions, limitations, and future research directions are also explained in the end.

Key words: Organizational innovation; Organizational performance; Knowledge management; Organizational learning; Transformational leadership

1 Introduction

Organizations are facing volatile environments compounded with acute competition, faster technological change, diverse workforce, explicit and tacit knowledge arrival, and globalization. The secret of successful organizations is to have distinctive resources which are rare, unique, inimitable, and valuable. These resources are unique technology, better work procedures, skilled human resource, better equipment, venture capital etc. To expedite innovation and continuous improvement or even expediting the corporate bottom-line, organizations need to foster those antecedents which are already inbuilt into it (Noruzi, Dalfard, Azhdari et al., 2013). OL seems to be a great source of greater competitive advantage in this knowledge economy. KM is a precursor to the organizational learning to be adopted for improving organizational sustainable performance. OL and KM instigate an organization to be innovative and profitable firm in the long run (Liao, Chang, Hu et al., 2012; Liao and Wu, 2009). A company's excellence is linked with the utilization of its knowledge capabilities, i.e. the knowledge of the organization and its employees. KM, an important element of OL, is a life blood of an organization that contributes to the OI. OI is a premium benefit to outweigh its counterpart. Innovation is the successful implementation of noble and useful creative ideas (Amabile, 1996). KM is a pre-requisite for creating, sharing, and storing creative ideas, and on the other hand, effective leadership plays a significant role to have a supportive climate for exposing knowledge and OL into OI. TL is presumed to be more effective form of leaderships to transcend employees drive into the innovative and long-term successful initiatives. Whereas literature exhibited that leadership plays a significant role to transform OL and KM into OI and also revitalize the OP (Noruzi et al., 2013), this study intends to figure out how TL, OL, KM, and OI directly influence OP rather than TL, KM, and OL affect OP through OI.

2 Conceptual Model and Hypotheses Development

2.1 Transformational leadership and its significance

TL creates positive change among followers. It is defined as the charismatic ability of the leader which elevates the followers' dedication and motivation and aligns them with the mission and vision of the team and the organization (Bass, 1991). TL contributes to the development of a learning organization. Besides, TL also influences a team performance who is involved in knowledge creation, sharing and implementation. Bass and Riggio (2006) reported that TL enhances creative effort in an organization and also contributes to the innovative goal. This TL is supportive to unconventional and out of the box things and work-process that fosters innovation and improve organizational performance. Empirical studies exhibited the effect of TL on OL (Abbasi and Zamani-Miandashti, 2013), KM (Birasnav, 2014; Bryant, 2003; Han, Seo, Yoon et al., 2016), OI (Chang, 2016; Tajasom, Hung, Nikbin et al., Hyun, 2015), and OP (Noruzi et al., 2013). The hypotheses of these relationships are:

H₁: Transformational leadership positively influences organizational learning

H₂: Transformational leadership positively influences knowledge management

* Corresponding author is reachable at sailluof@126.com

- H₃: Transformational leadership positively influences organizational innovation
- H₄: Transformational leadership positively influences organizational performance

2.2 Organizational learning and its effects

Kane and Alavi (2007, p.796) said that ‘OL as the dynamic process of creating new knowledge and transferring it to where it is needed and used, resulting in the creation of new knowledge for later transfer and use.’ OL is also concerned with KM and the difference lies in the way of treating knowledge. Unlike OL, KM is a static process of storing, creating, and transferring knowledge in the organization. There is a considerable debate on their relationship of who is the cause is and who is the effect (Noruzy et al., 2013; Shieh, 2011). The relative competitive position of an organization depends on how far innovative the organization is (Montes, Moreno, and Morales, 2005). Noruzy et al. (2013) reported that OL significantly affects OI and OP. The hypotheses of these relationships are:

- H₅: Organizational learning positively influences knowledge management
- H₆: Organizational learning positively influences organizational innovation
- H₇: Organizational learning positively influences organizational performance

2.3 Knowledge management and its influence

Knowledge and human capital act like antecedents to the organizational innovation and performance (Sánchez, Marín, and Morales, 2015). In this information and knowledge economy, KM is essential to keep the organization updated and stay it out of competitors’ reach. According to Nassuora (2011), knowledge management (KM) is all managerial activities which helps employee create new knowledge and share this knowledge to other employee for improve organizational and individual performance in an organization. Darroch (2005) found that a firm that can manage KM better is likely to be innovative and perform better. Plethora of research found that KM contributes to innovation effort and thus help ameliorate organizational performance (Darroch, 2005; Noruzy et al., 2013). The following hypotheses have been developed considering the above literature?

- H₈: Knowledge management positively influences organizational innovation
- H₉: Knowledge management positively influences organizational performance

2.4 Organizational innovation and organizational performance

Organizational innovation is the implementation of a new way to recruit personnel, allocate resources and structure tasks, authority and rewards. It comprises innovations in organizational structure and in the management of people (Damanpour, 1987). Continuously improving performance is the ultimate goal of an organization and the word ‘continuous’ senses nothing if there is no innovative effort. OI helps an organization to improve its performance. Empirical studies conducted by Huang, Wu, Lu et al. (2016) examined the impact of innovation of outcomes of the organization and found that OI affects OP significantly. Thus the following hypothesis is proposed for this study:

- H₁₀: Organizational innovation positively influences organizational performance

Supervisor supports, fair treatments from organization, and supportive organizational climate, preconditions to the perceived organizational supports (POSS) can create superior moral obligations to organizational performance by employees. Therefore, organization needs TL and fair climate to mould the KM and OL for fostering innovative performance leading to innovative organization in the long run. Like resource based views, knowledge based views exhibit that knowledge and organizational learning turns out to be the predictors of sustainable organizational performance. A conceptual model (figure 1) has been developed to exhibit relationships among TL, OL, KM, OI, and OP as follows:

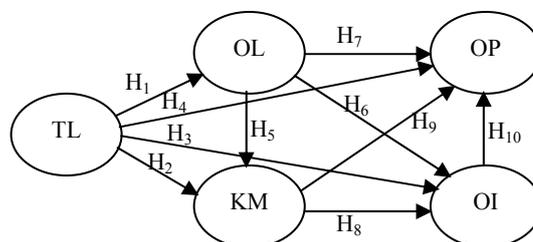

Figure 1 Hypothetical Model of OI

3 Research Methods and Survey Instrument

Using stratified random sampling, 300 responses from 500 questionnaires were collected. In screening tests, 47 responses were dropped to abate the common method bias, missing data, outliers, and data normality problems. Of the responses (273), 83 per cent were from male and 17 per cent were from

female. Respondents were serving different organizations at different levels, i.e., top level (6%), mid-level (68%), and lower level (26%). They have been serving their organizations for more than one year (25%), five years (51%), fifteen years (20%), and twenty years (4%). Survey shows that respondents were representing readymade garments (35%), finance (24%), telecommunication (20%), and others organizations (21%). Education profile shows that they completed bachelor, master and others by 14 per cent, 77 per cent, and 9 per cent respectively. Researchers adopted five (5) different instruments and used 5-point Likert scale to administer the survey. These five instruments are Transformational leadership (Podsakoff, MacKenzie, and Bommer, 1996), organizational learning (García-Morales, Lloréns-Montes, and Verdú-Jover, 2008), knowledge management (Gold, Malhotra, and Segars, 2001), organizational innovation (Miller and Friesen, 1983), and organizational performance (Cho, Ozment, and Sink, 2008). SmartPLS 2, and SPSS 20 software packages were used for generating the results.

3.1 Reliability and validity of the instrument

Table 1 reports the convergent validity and it shows that the factor loadings (all > 0.50), average variance extracted (AVE > 0.50) and composite reliability (>0.919) are within the rule of thumb. Discriminant validity analysis reports that the result within the cut off value, that is, the square root of the average variance extracted (AVE) of each construct is higher than the construct's highest correlation with any other construct in this study. Therefore, both validity and reliability analyses suggest that these constructs are valid and reliable for further advance (Hair Jr., Hult, Ringle et al., 2014).

Table 1 Convergent Validity and Discriminant Validity Tests

	AVE	Composite Reliability	R ²	Cronbachs Alpha	Communality		KM	OI	OL	OP	TL
TL	0.713	0.925	0	0.899	0.8440	KM	0.849				
KM	0.720	0.912	0.608	0.870	0.8487	OI	0.821	0.855			
OL	0.679	0.894	0.729	0.843	0.8241	OL	0.827	0.837	0.824		
OI	0.732	0.891	0.798	0.816	0.8553	OP	0.831	0.849	0.819	0.853	
OP	0.728	0.915	0.807	0.875	0.8531	TL	0.780	0.829	0.777	0.828	0.844

4 Findings and Discussion

Figure 2 (in next page) shows the path diagram in the structural equation model. It shows standardized coefficient (β), percentage of variance explained (R^2), and items' loading in the path model relationships. Hair Jr et al. (2014) reported that path coefficients with standardized values above 0.20 up to a sample size of 1000 are usually significant. Analysis along with bootstrapping results (**figure 1**) shows that standardized coefficients (β s) of TL \rightarrow KM is 0.345 (t -value=3.466; p <.00), TL \rightarrow OL is 0.777 (t -value=16.968; p <.00), TL \rightarrow OI is 0.364 (t -value=3.780; p <.00), TL \rightarrow OP is 0.273 (t -value=2.408; p <.02), OL \rightarrow KM is 0.559 (t -value=5.907; p <.00), OL \rightarrow OI is 0.348 (t -value=3.539; p <.00), OL \rightarrow OP is 0.169 (t -value=1.53; p <0.127), KM \rightarrow OI is 0.25 (t -value=2.703; p <.007), KM \rightarrow OP is 0.255 (t -value=2.439; p <.015), OI \rightarrow OP is 0.272 (t -value=2.439; p <.02). Therefore, all path relationships (excepting OL \rightarrow OP) were found significant. Furthermore, TL, KM, OL, and ON altogether explains 81% (R^2) variance in OP, TL, OL, and KM altogether explains 798% (R^2) variance in IN, TL and OL together explains KM by 73.2% (R^2) and TL alone explains OL by 60.4% (R^2).

These findings are also found consistent with the previous empirical findings that TL predicts OL (H_1) (Abbasi and Zamani-Miandashti, 2013; García-Morales et al., 2008), KM (H_2) (Birasnav, 2014; Bryant, 2003; Han et al., 2016), OI (H_3) (Afsar, F. Badir, and Bin Saeed, 2014; Chang, 2016; Tajasom et al., 2015), and OP (H_4) (Abbasi and Zamani-Miandashti, 2013; Noruzi et al., 2013) respectively. OL is also found consistent with previous findings that it effects KM (H_5) (Liao and Wu, 2009; Noruzi et al., 2013; Shieh, 2011), OI (H_6) and OP (H_7) (Liao and Wu, 2009; Noruzi et al., 2013; Shieh, 2011) respectively. Previous studies supported that KM influences OI (H_8) (Al-Hakim and Hassan, 2016; Noruzi et al., 2013) and OP (H_9) (Darroch, 2005; Noruzi et al., 2013). Finally OI is found affecting OP (H_{10}) like other previous empirical research (Huang et al., 2016; Walker, Chen and Aravind, 2015). TL sheds light on OL and KM of an organization and paves the path for OI and excels OP. TL facilitates OL by creating team, giving timely directions, and guiding the

processes of change. TL is essential for creation, transforming, and transferring of knowledge. Furthermore, TL revitalizes OI and OP by integrating OL and KM with employees' mindset towards organizational mission and vision.

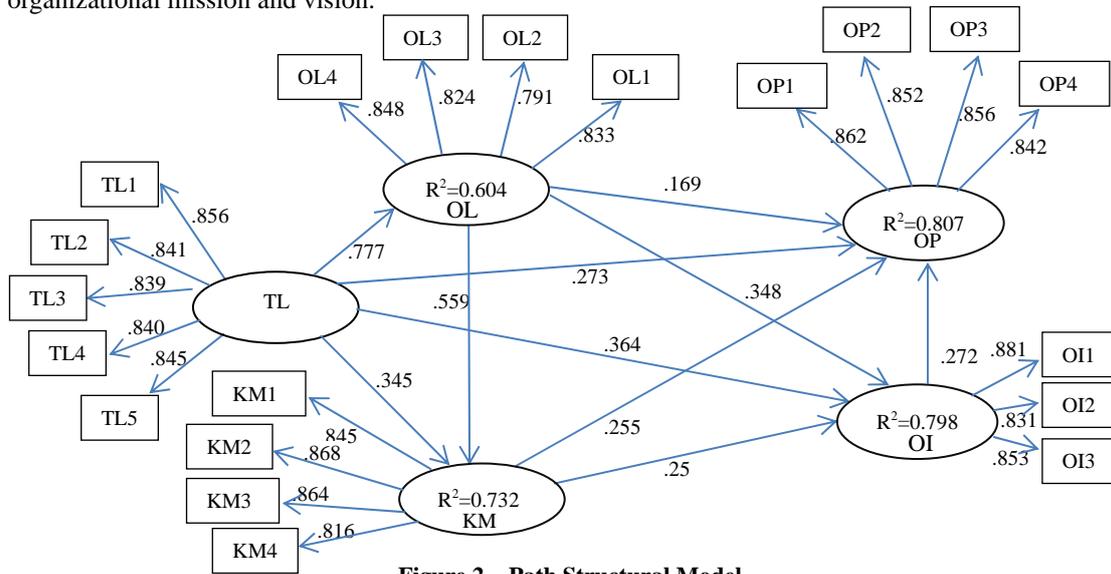

Figure 2 Path Structural Model

5 Conclusions, Implications, and Future Research Prospects

This study aims at finding the predictor variables of OI and OP in Bangladesh at different organizational units. Result shows that TL, OL, and KM significantly affect OI at different levels. Besides, TL, KM, and IN are also found to be significant predictors of OP. This result has some theoretical, academic and practical significance. Unlike many other studies, this study shows that OL is not significantly affecting OP which is a new direction of further research. Studies on KM and OL are relatively new; however, this study shows that they affect OI significantly. Therefore, professionals and practitioners require committing more resources on the proper KM and OL. Academics and researchers can do more research on KM practices, KM systems, and OL for further development. One of the limitations of this study is the sample size which is limited to generalize the universe. In addition, moderation effect of demographic factors and mediating effects of above considered variables mentioned in the structured model are clearly absent. Future studies suggested chalking out the mediating effect and moderating effect of third variables on the relationships between leadership and organizational innovation.

An Empirical Research on Customer Participation and Its Impacts on Customer Value

Yang Yiyi

School of Management, Wuhan University of Science and Technology, Wuhan, P.R. China, 430081
(E-mail: leeyangyang@tom.com)

Abstract: Customers participation is considered a new source of competitive advantage, but there are comparatively fewer studies which have considered the value outcomes of participation from the customers' perspective. In this study, the personal training industry is taken as an example to explore the effects of customer participation on customer perceived value and customer behavioral intentions. The Survey results suggest that customer participation and customer value are significantly positively correlated, in which, personal interaction has the most influential effect. But interestingly, utilitarian value perceived by customer was not found to be associated with customers' positive WOM, repurchasing and referral, whereas social value and hedonic value do have a significant effect. Finally, implications for managers are considered.

Key words: Customer participation; Customer value; Behavioral intentions; Service

1 Introduction

Nowadays growth and value creation have become the dominant themes for managers (Prahalad and Ramaswamy,2004). Companies are searching for new and better ways to create value and differentiate their service offerings in order to attract and keep customers, as well as make a profit. Customer participation is considered as a new source of value creation.

Characteristics of service often require customers to be actively involved in helping to creation the service value, either by serving themselves or by cooperating and often working collaboratively with service personnel (Claycomb,2001). Customer participation in service delivery, referred to as customer co-creation (Prahalad and Ramaswamy,2004; Witell et al.,2011), yields benefit for both service providers and customers. Through customer participation, service provider can generate some economic value. The service provider can increase productivity, decrease costs, facilitate service development and innovation activities (Lovelock and Young,1979; Mills et al.,1983; Mustak,2013). Participative customers can obtain personalized service, and then lower price sensitivity (Hsieh and Yen,2004), perceive the brand image more favorably (Woisetschläger et al.,2008). Participation leads to higher customer satisfaction and enhance customer loyalty (Ennew and Binks,1999; Chan et al.,2010; Cermak et al.,1994).

Recent studies have indicated the promise of studying the impact of customer participation on sellers' value outcome. Comparatively fewer studies have considered the value outcomes of participation from the customers' perspective (Mustak et al.,2013). The customers' perspective and their value outcomes deserve more research. In this study, based on the existing research, the personal training industry with a high degree of customer participation is taken as an example, to explore the relationship among customer participation, customer value and customer behavioral intentions.

2 Theoretical Background and Research Model

2.1 Customer participation

Customer participation refers to a customer's activities or provisions of tangible or intangible resources related to the development or creation of offering (Mustak et al., 2013). Customer participation is a multi-dimensional construct. Silpakit and Fisk (1985) argue that customer participation includes customers' mental effort, physical and emotional effort. According to the role of customer playing in the service delivery, Bettencourt (1997) developed three types of customer's voluntary performance: loyalty, information sharing and co-production. Ennew and Binks (1999) suggest that customer participation has three broad dimensions: information sharing, responsible behavior and personal interaction. Although some scholars have attempted to classify customer participation into different dimensions. But by comparison, we can find these dimensions have a lot of similarities in meaning. So three different dimensions of participation are proposed including information sharing, co-production and personal interaction in this study.

2.2 Customer value

Creation and offering customer value have become the new source of competitive advantage. Most authors agree that customer value involves some kind of trade-off between benefits and sacrifices(Zeithaml,1998). Customer value research has devoted significant effort to developing typologies of value. For example, Sheth et al. (1991) identify five types of value: functional, social, emotional, epistemic and conditional. Chandon, Wansink and Laurent (2000) further expand the content of customer utilitarian / hedonic value. The utilitarian value is divided into saving, higher quality and convenience, the hedonic value is divided into the chance of value expression, entertainment and exploration. Gursoy, Spangenberg and Rutherford (2006) classify value into two types in their study about festival activities and proposed hedonic dimension is more important. Sweeney and Soutar (2001) propose four distinct value dimensions that are termed emotional, social, functional value (quality/performance and price/value for money). Summarizing the different views about customer value, we also conceptualize value as a multi-dimensional construct, including utilitarian value, hedonic value and social value.

2.3 Customer behavioral intentions

Behavioral intention refers to “a person’s subjective probability that he will perform some behavior (González et al., 2007), is a predictor of future behavior. Bloemer et al. (1999) break up behavioral intention to WOM, purchase intention, price sensitivity and complaint behavior. The concept of behavioral intention proposed by Yang and Peterson (2004) refers to the intention to repurchase and recommend. In this study, we agree that customer behavioral intention consists of positive word of mouth (WOM), repurchase intentions and the intention to recommend the product to others.

2.4 Customer participation and customer value

Customer participative behavior should yield benefits. Customers who are more willing to share information and develop closer personal contacts might be expected to benefit in terms of a higher quality of service provision, because the provider will be more knowledgeable about their needs and expectations (Ennew and Binks, 1999). So participation is associated with improved perceived quality and greater perceived value by customer. Customer can also accrue economic value through participation, as they benefit from cost reduction and discounts when participating in the creation of offering. In addition to make service process more efficient and effective, customer participation can yield the emotional or spiritual pleasure (Firat, Dholakia and Venkatesh, 1995). Prahalad and Ramaswamy (2004) argue that value is co-created at multiple points of interaction. Basis of value is co-creation experience. Social value is derived from the product’s ability to enhance social self-concept (Sweeney and Soutar,2001). The communication and interaction between customers and employees or among customers can enhance the sociability experience, will be of great help to customer experience friendship, build good personal image, meet the inherent spiritual demand. Participative behavior will bring a sense of pleasure, curiosity, rigorousness and fulfillment to customers (Ennew and Binks,1999; Cermark et al.,1994). Therefore, we offer the following hypothesis:

H1: Customer participation -(a) information sharing(IS), (b) Co-production(CO), (c) personal interaction(PI)- will be positively associated with utilitarian value(UV).

H2: Customer participation - (a) information sharing(IS), (b) Co-production(CO), (c) personal interaction(PI)- will be positively associated with hedonic value(HV).

H3: Customer participation - (a)information sharing(IS), (b) Co-production(CO), (c) personal interaction(PI)- will be positively associated with Social value(SV).

2.5 Customer value and customer behavioral intention

Zeithaml (1998) argues that it is hard that high quality directly urges consumers’ purchasing behavior, the mediator of customer perceived value is the relevant factor that influence consumer behavior. Couchen Wu, San-san Hsing (2006) argue that the more value perceived by customer, the greater influential to customer subsequent conduct. Therefore it is hypothesized that:

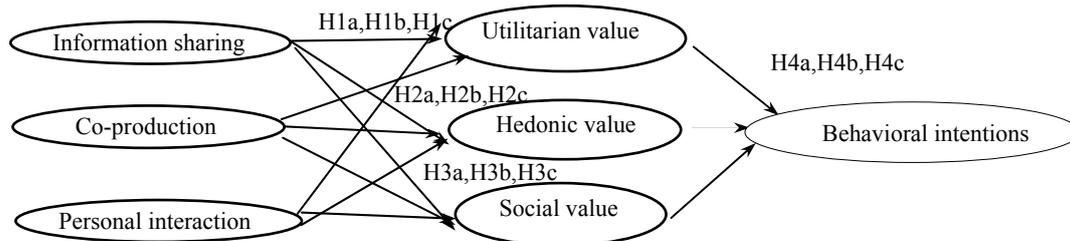

Figure 1 Research Model

H4: Customers value - (a)Utilitarian value(UV), (b) Hedonic value(HV), (c) Social value (SV) - will be positively associated with customer behavioral intentions(CBI).

3 Methodology

3.1 Sample and data collection

Our study took the training industry as research context, the object of study were people who had the personal train experience. A web-based questionnaire survey was used to collect data. Online questionnaire survey was generated and released. At the same time, we send the link of survey website to friends and invite them to participate in the survey.

We collected 382 usable responses for data analysis. Female accounted for 50.52%, Male accounted for 49.48. Most respondents in this study were the undergraduate college students. The most participated training is the driving school, which includes 139 people, accounting for 36.39%. The next larger ones are the qualification training including 79 people and accounting for 20.68%, and the foreign language training including 73 people and accounting for 19.11%, and so on.

3.2 Study measures

Reference to previous study, three dimensions of customer participation were assessed by measures designed to identify information sharing, co-production and personal interaction. This study proposed to examine customer value were measured from different dimensions: utilitarian value, hedonic value and social value. Three items (repurchasing intention, positive WOM and referral) were used to measure customer behavioral intentions. All measure items of our study were drawn from previous study and made some modifications according to the characteristics of the training industry. Table 1 provides the definition and measures of all constructs. All measures used in the present study were assessed on seven-point Likert scales, ranging from strongly disagree (1) to strongly agree (7).

Table 1 Operational Definition and Measurement of Constructs

Construct	Operation definition	Items	Source
Information sharing (IS)	share information between the two parties in order to ensure that they are provided with a service that meets their particular needs	IS1-IS5	Ennew & Binks (1999); Cermak,File & Prince (1994); Jia Wei(2010)
Co-production (CO)	discretionary customer behaviors indicating respect for the provision of quality service delivery	CP1-CP6	
personal interaction (PI)	personal interaction between customers and the staff delivering the service	PI1-PI5	
Utilitarian value (UV)	the utility derived from expected performance, perceived quality, costs, convenience	UV1-UV7	Sweeney & Soutar (2001)
Hedonic value (HV)	the utility derived from the feelings and affective state, e.g. Joyful, fantasy etc.	HV1-HV5	
Social value (SV)	the utility derived from the enhancement of social self-concept	SV1-SV9	
Customer Behavioral intentions (CBI)	customer's subjective probability that he will perform some behavior	CBI1-CBI3	Groth (2001)

3.3 Reliability and validity test

We tested the reliability and validity of the measurement model by Spss17.0 and Amos 17.0. The Cronbach's α of the variables are higher than 0.7, indicating a high scale reliability.

Table 2 Cronbach's α of Construct

Variable	Customer participation			Customer value			Behavioral intentions
	IS	CO	PI	UV	HV	SV	
Cronbach's α	0.720	0.728	0.822	0.909	0.912	0.907	0.808

A confirmatory factor analysis on the measurement model was conducted to check for the construct validity. The measurement model fit the data well ($\chi^2/df=2.52$, RMSEA=0.067, RMR=0.06, CFI=0.921, GFI=0.934, AGFI=0.87).

3.4 Data Analysis

Statistical Regression analysis was conducted to test the study hypotheses. Table3 and Table4 provided the results from the regression analysis.

H1 predicted that the three dimensions of Customer participation will be positively association with customer utilitarian value. The regression results indicated very support for this hypothesis. Information sharing (H1a: $\beta=0.201$, $p<0.001$). Co-production (H1b: $\beta=0.203$, $p<0.001$), personal interaction (H1c: $\beta= 0.479$, $p<0.001$) were all found to be positively associated with the customer utilitarian value. Similarly, H2 which predicted association between customer participation and hedonic value and H3 which predicted association between customer participation and Social value were also supported (H2a: $\beta=0.282$, $p<0.001$; H2b: $\beta=0.181$, $p<0.001$; H2c: $\beta=0.423$, $p<0.001$; H3a: $\beta=0.163$, $p<0.001$; H3b: $\beta=0.166$, $p<0.01$; H3c: $\beta=0.492$, $p<0.001$).

Table 3 Regression Results-Impact of Customer Participation

Variables	Utilitarian value	Hedonic value	Social value
	β	β	β
Information sharing	0.201***	0.282***	0.163***
Co-production	0.203***	0.181***	0.166**
Personal interaction	0.479***	0.423***	0.492***
R-squared	0.636	0.630	0.561
Adj. R-squared	0.633	0.627	0.557
F	220.105***	214.468***	160.844***

*** $p<0.001$; ** $p<0.01$; * $p<0.05$

H4 predicted positive association between the three dimensions of customer value and customer behavioral intentions. The regression results indicated that this held true for hedonic value (H4b: $\beta=0.314$, $p<0.001$) and social value (H4c: $\beta=0.530$, $p<0.001$), but utilitarian value(H4a) was not found to be associated with customer behavioral intentions (not entered into the regression equation of explaining behavioral intentions).

Table 4 Regression Results -Impact of Customer Value

Variables	Customer behavioral intentions
	β
Social value	0.530***
Hedonic value	0.314***
R-squared	0.653
Adj. R-squared	0.651
F	356.577***

*** $p<0.001$; ** $p<0.01$; * $p<0.05$

4 Conclusions

4.1 Study results

In the personal training industry environment, the hypotheses have been tested. As predicted, customer participation (information sharing, co-production and personal interaction) were all found to positively influence customer perceived value. Among them, personal interaction had the most influential effect on customer perceived value. The findings that were contrary to expectation related to the impact of customer perceived value on customer behavioral intentions. The study found the more the social and hedonic value perceived by customer, the more favorable behavioral intention (positive WOM, repurchasing and referral) and vice versa.

Social value had the most significant impact on customer behavioral intentions, hedonic value took the second place. But surprisingly, utilitarian value was not found to be associated with behavioral intentions. The reason of such a result was perhaps partly because of the samples, most of our samples are college students who received lower level training. Comparing with training result, these students value the training experience and social contact much more.

4.2 Managerial implications

The research model and study findings hold several important implications for managerial practice. Firstly, enterprises should encourage and expand the various forms of customer participation. The research results show that three dimensions of customer participation, such as information sharing, personal interaction and co-production, all have a significant positive impact on utilitarian value,

hedonic value, and social value. Among them, personal interaction has the maximum impact on customer value, because it involves in the emotional investment from both sides, and the higher level the interaction has, the deeper the emotional investment becomes. In addition, by the timely communication and human interaction, the customer can also cause social bonds, which providing themselves with an important psychological benefit. Therefore, service companies should take effective measures to encourage customer participation and expand the ways for customer participation, and at the end improve customer participation. Particularly it is important to provide customers with convenient and efficient participation channels for keeping the communication and exchanges with customers, in which the communication between customers and employees and the interaction between customers are included.

The second implication relates to the findings regarding the potential impact of customer value. For businesses, products and services not only should meet the most basic practical requirements of customers, but also should pay more attention to the psychological feelings which the customer has during the service process. In the service process, to make the customer feel happy and have the spirit of enjoyment, let the service become a new and interesting experience, which is reflected in the hedonic value. The social value mainly lies in the influence from the society and other consumers on him / her in the service process with customer participation. This make him/her improve his/her position through the service, and be admitted by more people.

4.3 Limitations and future research

Relevant conclusions of this study are only drawn by the survey data, and the studied industry is limited to the personal training industry. Therefore, whether the results of this study can be applied to other industries and other situations as well needs to be further verified. In addition, most respondents in this study were the undergraduate college students, so the training involved was mostly in middle and low-level training programs, which also affected the universality of the conclusions.

The focus of the study was to examine impact of customer participation on the perceived value and customer behavioral intentions. However, other factors should be considered, for instance, whether there are some factors moderating the relationship between customer participation and customer perceived value. Future research should address the limitations of this study.

A Research on Management Innovation of State-Owned Enterprises under the New Situation of Comprehensively Strengthening the Discipline of the Communist Party of China

Lin Kai

Party Committee Office, Wuhan University of Technology, Wuhan, P.R. China, 430070
(E-mail: 601428805@qq.com)

Abstract: This paper using methods of literature research, qualitative analysis, interdisciplinary research, according to the report of domestic scholars about the Chinese enterprise management innovation in recent years, proposes that the State-owned enterprise how to act, maintain development and open-minded thinking way under new situation of Comprehensively Strengthening the Discipline of the Communist Party of China. It is considered that state-owned enterprises need to adapt to changes in internal and external environment as soon as possible, search a new way of management and innovation, comprehensively understand the characteristics of the management innovation in order to build a theoretical system of preliminary construction for state-owned enterprise management innovation. This paper concludes that the state-owned enterprise management innovation will be based on integration of strengthening the Party's construction, institutional innovation and culture innovation, which provide related subjects especially Chinese management theoretical research for a reference.

Key words: State-owned enterprise innovation management; New situation of comprehensively strengthening the discipline of the communist party of china; The necessity of management innovation; Basic way

1 Introduction

The strategic management expert from Unite State proposed that, as the result of internal and external environment with resource adaptation and integration, the management innovation in overcoming the organizational inertia and rigidity, eradicating the deep operation problem of organization, enhancing organizational performance and other aspects has an irreplaceable role. It is an important way for enterprises to have sustainable competitive advantages(Gary Hamel.2009). State-owned enterprises as the first main part of socialist market economy, the initiative to adapt to China's New Normal and carry forward management innovation has become the most important issue that needs to be solved urgently. For enterprise management innovation research, because related research of early domestic academia was mainly staying on the summary of experience or general information of innovation rather than a deep theoretical research, so the theoretical research of Chinese enterprise management innovation mainly came from abroad. Dr. Lin Haifen from Dalian University of Technology summarized the foreign related research as process research, effectiveness research, impact research, spread research, influence factors and other interrelated perspectives (Lin Haifen.2012), which laid the important theoretical foundation for Chinese management innovation. Compare to most researches based on the previous studies in a particular context of organization abroad, this paper according to the new situation in China and the emergency of the Chinese enterprise to carry out the innovation management research, discusses the necessary of innovation management for the state-owned enterprise under the new Situation of Comprehensively Strengthening the Discipline of the Communist Party of China, and research the basic way and characteristic of enterprise management innovation.

2 The Necessity of Management Innovation of State-owned Enterprise under New Situation of Comprehensively Strengthening the Discipline of the Communist Party of China

2.1 The necessity of implementing about comprehensively strengthening the discipline of the communist party of china

The responsibility system of strengthening the construction of the Party's working style should be strictly implemented by the leadership of the Party committees and leading cadres in the Party in order to build a clean and honest government. Especially for state-owned enterprises, according to the request of Comprehensively Strengthening the Discipline of the Communist Party of China, constantly push

forward the construction of a clean and honest government, establish and improve the honest working mechanism, from top to down strengthen implementation of responsibility system, perfect examination of responsibility and accountability, strengthen supervision and management, innovative working methods, improve the risk prevention mechanism, deepen the internal control system construction, promote the Party to build a clean and honest government, promote enterprise stable, healthy and sustainable development. Secretary of the Party committee of the state-owned enterprise should be the first responsibility for construction of a clean and honest administration and anti-corruption work, who need to set an example to the other, from the top to control the below, layer upon layer transmit pressure. Enterprise should insist to combine the construction of a clean and honest government with every key work together, combine responsibility appraisal of a clean and honest administration with assessment of cadres, give full play to the functions of commission for discipline inspection, improve the work efficiency through construction of a clean and honest administration.

2.2 The necessity of management innovation for state-owned enterprises

The new situation of Comprehensively Strengthening the Discipline of the Communist Party of China makes the external environment of the stated-owned enterprise change, and the external environment of enterprise influences the internal environment deeply. So the enterprise must continuously improve internal factors to adapt to the external environment, and generate non-replaceable effects for enterprise developing. Therefore, the changing internal environment require state-owned enterprises to take the initiative of management innovation actively. At present, state-owned enterprises not only face the new situation of Comprehensively Strengthening the Discipline of the Communist Party of China, but also face intensive competitions in the market which presents new characteristics. Firstly, with the sustained openness of market, it's formed a unity of the worldwide market, each of industries have some large competitive enterprise with top obvious advantage, which are the pilot and vane to others. Secondly, cutting-edge ideas, innovative technology, advanced management appeared continuously which were different from the traditional enterprise, have highly competitive and dynamic, promoting the competition between enterprises more serious. Thirdly, the competition between enterprises in the international market always involves the interests between countries, so it might be transferred as the interest or the power between countries and regions. the government behavior will further intervene into the enterprise competition, making the enterprise competition situation more complicated. Therefore, as an important part of the national economy, state-owned enterprises should take initiative to adapt to the new characteristic of changing market actively, make the management innovation of enterprise development as the first important work.

3 The General Information of the Basic Method for State-owned Enterprise Management Innovation

3.1 Strictly strengthen the management in accordance with the law

To Strengthening the Discipline of the Enterprise strictly must rely on the rule of law on the overall architecture of strict process management, make management and operation scientification, achieve the maximum benefit of the enterprise under the tight legal system, make enterprise share bonus through legal system in market economy; strengthen the system construction and propaganda construction of enterprise, improve and perfect system, standard, revise according to the new situation, new requirement and new regulations regularly. Further increase the impact of the Commission for Discipline Inspection, through function of the Commission for Discipline Inspection for people, the supervision of the matter, the audit of the financial, The Trinity embedded each link of enterprise production and marketing chain, to achieve the whole process monitoring and supervision. Intensify the propaganda, making employees know and use to defend their rights and interests of law or system; Enterprise leaders must take the leadership in this system, play a positive example for employees, give full play to the role of corporate counsel.

3.2 Strengthen the idea of management innovation

Innovation is a creative thinking activity, is the soul and guideline to promote the enterprise management. State-owned enterprises have to strengthen this concept of Comprehensively Strengthening the Discipline of the Communist Party of China, resolutely resist the abuse of power, abusing power for personal gain and other issues. to hold, construct, tighten the Party constitution, Party rules, and Party discipline, have overall situation inside, make the state-owned enterprises better and stronger unswervingly: Strengthen the detailed management idea, use this idea in the whole process of the management, realize the transition from experience management, extensive management to

scientific management and detailed management, further to subdivide position responsibility, subdivide target, subdivide system process, creating the enterprise culture of constantly perfecting. Strengthen the consciousness of innovation, implementation of the national idea that innovation promotes development, build strong innovation atmosphere, share management innovation experience, popularize excellent management achievements and application experience, promote transformation of management innovation achievements and application.

3.3 Stand out management institutional innovation

Institutional innovation provides a guarantee to strengthen enterprise management and promote enterprise innovation. State-owned enterprises have to give full play to the role of case study method, mainly through the combination of three methods of extensive collection of second-hand cases, study and research the field case, second-hand data and field investigation to obtain other business management system innovation cases, comprehensive understanding and using the innovation of management system and relevant experience for reference. In order to innovate management system according to the Comprehensively Strengthening the Discipline of the Communist Party of China under the new situation and the future development of enterprise needs, institutionalize and standardize the thinking innovation, technological innovation, organizational innovation and other kinds of activities, improve performance incentive constraint mechanism, fully arouse the enthusiasm of the staff; innovate decision-making mechanism, allow employees to develop their own interests, encourage employees to innovation, import excellence performance management model, create a more favorable environment for the enterprise and staff; Innovation mechanism encourages talents in science and technology innovation activities, changes the model of incentive for material, pays attention to the synchronization of the improvement of employees' EQ and IQ, Actively create a harmonious and warm working environment, makes the staff take the initiative to consider the development of the enterprise, arouses the enthusiasm of science and technology talents.

3.4 Optimize the process management

Optimize the process management is to emphasis operation, innovation, the problem solution and pushing forward the construction of the quality management system and realize enterprise process management. State-owned enterprises should take process management as the core implementation of process reengineering, break departmental boundaries functions, establish a process oriented management system, stable core business processes, realize the key point, cross-sectoral, cross-functional process interface management, comprehensively improve the process efficiency; Stated-owned enterprises should accelerate the deep integration of information and management, enhance the information construction of office automation, human resources management, statistical analysis, financial management, performance appraisal work etc. Stated-owned enterprise should set up the business process management platform to strengthen the core management processes and business process stable and online monitoring, realize the application can check, management can view, process can control, performance can evaluate, ensure accurate and efficient information transmission; Stated-owned enterprise should reduce costs through reasonable management innovation, improve quality, increase enterprise's interests, improve enterprise management level, enhance the market competitiveness of the enterprise, adapt the new situation and the change of economic market.

4 The Characteristics of the State-Owned Enterprise Management Innovation

4.1 Ecological

The state-owned enterprise's ecology refers to looking for the key points of enterprise management innovation, and the evaluation of management innovation achievements should be taken according to enterprise's whole ecosystem. At the macro level, the enterprise's ecosystem is a complex system, elements in this system connect and interact each other, and vary when the internal and external environment changed. The enterprise's ecology provides a possibility for management innovation, meanwhile give a suitable opportunity for the enterprise to adapt to new situation of Comprehensively Strengthening the Discipline of the Communist Party of China.

4.2 Integrality

The extent of management innovation in state-owned enterprises are different, each department or staff can be considered as the subject of innovation management. People-oriented, that relying on staff to solve the problem, has been considered as an innovation of modern management. Fundamentally, enterprise innovation management involves each employee, their intuitive feelings and opinion suggestion are the best voice for management innovation. Therefore, every employee can and should

become the main subject of innovation management, they form a strong overall management innovation integrality, and lay a solid foundation for the enterprise reform and development.

4.3 Transformative

Transformative means the management innovation usually refers to the adjustment of the relationship between rights and interests inside the enterprise, thus, many management innovation, especially the deep management innovation, is essentially a profound management reform. State-owned enterprises which seek survival and development in the new era must break the old development pattern and the old mindset, take the enterprise's reform and innovation in a large environment, have an initiative to adapt to the changed situation. The leadership of enterprise can't simply use the profit for enterprise's developing goals, but should stand at the higher level thinking the direction of enterprise development, make the revitalization of national industry as the historical responsibility for state-owned enterprises.

5 Conclusions

Innovation is the root and motivation of enterprise's survival and development. This paper has made some considerations under the new situation of Comprehensively Strengthening the Discipline of the Communist Party of China, that state-owned enterprises should seize opportunities and adapt to the change of internal and external environment as soon as possible. Through the management innovation the state-owned enterprises should play the Party's construction as an important role in enterprise management, cultivate and implement advanced enterprise culture, establish and perfect the advanced management system, achieve optimal allocation of resources, comprehensively improve the enterprise's capability and competitiveness in all aspects. In this research we found the complexity of the management innovation, the culture with Chinese characteristics and the embeddedness of Comprehensively Strengthening the Discipline of the Communist Party of China, which make the research on Chinese enterprise management innovation become a continuous task. Further studies need to increase the exploratory case studies, and use other methods to research the problem of the implementation management innovation, high-level leadership issues, the comparison problem of domestic and foreign research issues.

Abstract: The current paper is aimed to explore the importance of marketing capabilities in formulating global marketing strategy by reviewing the existing literature. A research model is proposed after critical analysis of different studies conducted in the same sphere. The important dimensions of marketing capabilities including market sensing, customer engagement and partner linking have been defined as contributing elements of firms' competitive advantage. Therefore, current paper proposed positive relationship between strong marketing capabilities and competitive advantage. The main reason to scrutinize competitive advantage is that it helps companies to formulate marketing strategy. Pursuing thoughtful global marketing strategy is the key element of firms' success in international market. This paper contributes to the marketing innovation literature as it analyzes marketing capabilities in relation to competitive advantage. Therefore, expected outcomes of the paper are to provide useful suggestions for marketers and scholars in terms of formulating global marketing strategy.

Key words: Market sensing; Customer engagement; Partner linking; Global marketing strategy; International performance

1 Introduction

For the last three decades, the role of marketing has been extensively studied by marketing scholars to shed more light in its contribution to form a global strategy. Precisely, during the 20th century, most of the companies witnessed decreasing number of international trade barriers which led to increasing trade levels among many nations. In this regard, firms started utilizing global strategies as a means of gaining competitive advantage (Teece, 2007). It is worth to mention that due to the intense impact of globalization most of the countries are still becoming richer whereas the consecutive force of globalization made most countries to stay without any progress. The same principle can be applied in order to understand the position of many companies in different industries. That is to say, some companies possess a strong competitive advantage over the other companies in certain industries (Yim et al., 2008). Therefore, there is strong need for most companies to understand the importance of factors which contribute to the formulation of successful global strategies in local as well as in international market. Additionally, the creation of strong global strategy requires from firms good understanding of industry environment, the essence of internal and external forces, the influence of competitive rivalry, bargaining power of suppliers and buyers, the nature of changing technology and much more (Porter, 1985). It has been stated that well-designed global strategy helps firms to achieve competitive advantage. Therefore, understanding the market environment and exploiting new marketing opportunities has been discussed as the main important requirements of the firm that can determine their successful operations in the market (Du & Kamakura, 2012). Therefore, this paper aims to explain the increasing importance of marketing capabilities and how marketing capabilities can help firms to build strong global marketing strategy which is considered as a critical success factor of their expansion in international markets. Based on the review of the previous literature in the area of marketing and global strategy formulation, this paper builds conceptual framework which helps firms to understand the underlying importance of marketing capabilities including market sensing, customer engagement, partner linking and how these capabilities can contribute to the global strategy formulation through moderating role of international experience and international entrepreneurship.

2 Literature Review

Most of the marketing professionals and business practitioners have been analyzing the significant importance of marketing capabilities (Lockrey, 2015; Morgan, 2009, Mariadoss, 2015). The reason for increasing attention towards studying the characteristics of marketing skills is that they are directly

related to formulating strong marketing strategies of companies (Sok, 2013, Morgan, 2005, Du, 2012). Formulating right marketing strategies is found to be crucial in maximizing the chances of success of firms as they continuously develop and maintain their strong positions in the foreign market (Teece, 2007). It is believed that marketing capabilities help firms to create strong competitive advantages for the firms which are not easily copied by their competitors. Achieving strong competitive advantage requires the usage of different generic strategies proposed by Porter (1995). These strategies include cost leadership, differentiation, and focus. Formulation and successful implementation of these strategies require from firms strong capabilities in marketing. Scholars debated for a long period of time over different skills which constitute strong marketing capabilities. As a result of long discussions and debates between the main scholars of marketing, a certain type of capabilities was proposed such as market sensing, customer engagement, and partner linking (Du & Kamakura, 2012). Marketing capabilities allow firms to establish and formulate timely and efficient reactions towards changes in market environment. Ongoing changes in market environment involve changes in customer preferences, exploitation of new marketing opportunities and creation and usage of new technologies that will result in the creation of new product and service. Therefore, most marketers strongly argue that marketing capabilities are the essential assets of any company that aims for successful positioning of their products in the foreign market.

As it was stated in the previous literature, market sensing is regarded as one of the important elements marketing capability. The relative importance of market sensing becomes even significant when companies are provided with the right type of information at the right time at the right amount. In this regard, market sensing enables firms to formulate their strong strategies which are more likely to allow them to exploit new market opportunities (Teece, 2007). Customer engagement is another crucial element of contributing to the effective formulation of marketing capabilities. From the marketing perspective, firms producing their products and services according to the needs and wants of customers are more likely to win in the long term (Ghazi, 2015). Despite this widespread phenomenon, many businesses nowadays aim to increase the number of their existing customers as well as attracting new ones (Morgan, 2005). Therefore, customer engagement is gaining popularity in the field of marketing capability. Previous studies defined marketing capabilities as the integrative process which allows the firm to produce a product to meet consumer demand by using their tangible and intangible resources (Du & Kamakura, 2012) Marketing capabilities are also reported to create better value for customers through effective usage of market sensing. This integrated process is the example which shows those main elements of marketing capabilities including customer engagement and market sensing that interrelated with each other. Most of the previous studies suggested showed the positive link among companies' partnership capability and marketing capability (Weick, 2005, Miller, 1988). Studies conducted by (Day, 1994, Mu, 2012, Park, 2010) stated that having strong marketing capabilities are essential in achieving competitive advantage. Companies with strong competitive advantage are believed to achieve success in the long term through their operation both in local as well as international market. In general, it can be concluded from the review of previous literature, companies with strong marketing capabilities are more likely to achieve success compared to those without capabilities.

The following propositions are deduced from the critical literature review:

Proposition 1 – Marketing capabilities consisting of market sensing, partner linking and customer engagement lead to competitive advantage of firms on global markets

Proposition 2 – Competitive advantage is a mediating variable linking marketing capabilities and firm performance

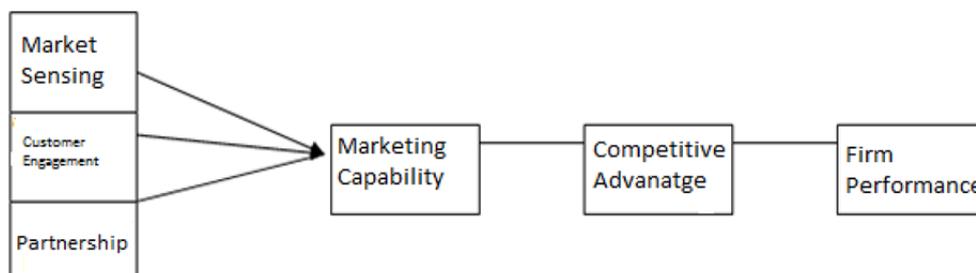

Figure 1 Proposed Research Model (Relationship of Marketing Capabilities With Marketing Strategy to Achieve Firm Success)

3 Recommendations and Implications

The current proposed model has been formulated based on the review of the previous literature and can be well suited to be applied in the case of the companies that are aiming at cultivating their marketing capabilities. For companies, which are trying to become global, such as many of Chinese producers, adding value to the existing product through marketing efforts presents a challenge. Despite the fact that marketing capabilities of many businesses operating in China are quite strong, they do not translate well to success on global markets. The marketing drawbacks of Chinese firms reflect in the inferior results and unfavorable reputation. Such companies can use the current framework and focus specifically on the variables of market sensing, customer engagement and partner linking on a global level. The conceptual framework proposed in this model is not targeted to explain all the important variables that can connect marketing department activities to operations of business. Considering the specific nature of marketing operations and their relation to global strategy formulation, it would be very challenging to propose such model. However, proposed framework gives the underlying characteristics of marketing which will help the firm to achieve success in international market operation. Therefore, our model proposes some significant implications for business managers and marketers. Proposed conceptual framework is useful in understanding the importance of market sensing capability, customer engagement capability and partner linking capability and their relative importance in formulating the global strategy of the firm. For example, customer engagement capability and market sensing capability can be developed by producing and offering an innovative product to the market which will help to create customer value, which is the cornerstone of achieving competitive advantage. Moreover, this study shows the critical role of international experience in moderating the role between market sensing and global strategy formulation, emphasizing the possession of international experience and how it can be beneficial in achieving market sensing capability. Moreover, the critical role of international entrepreneurship has been controlled for partner linking capability and strategy formulation.

Despite the significance of the proposed framework, this model has some limitations. For instance, the relative importance of marketing capabilities such as human resources and financial resources of the firm should be considered to a certain extent to understand their influence on firm performance. Moreover, specific marketing capabilities including brand management, marketing communications management, and channel management should be studied well enough to produce some empirical evidence to support the formulation of global strategy. As a suggestion for future research, it can be mentioned that other important characteristics maintaining the sustainability of marketing capability should be studied in relation to global marketing strategy.

4 Conclusions

The development of a conceptual framework to explain the influence of marketing capabilities to form global marketing strategy is crucial for both marketing scholars and international business people. Pursuing right global strategy in the international market helps firms to achieve competitive advantage which is critical to their success. A comprehensive review of the previous literature implies that there is no single study that can explain the importance of marketing capabilities to formulate the right global strategy that will help the firm to achieve global strategy. Therefore, this study developed a conceptual framework which explains the relative importance of marketing capabilities including market sensing, customer engagement, and partner linking and their role to formulate a global marketing strategy that will help the firms to pursue their operations internationally in foreign markets. Some useful implications and recommendations are expected to be derived from the results of the study. Therefore, business practitioners and marketing professionals are advised to pay more attention in strengthening the role of marketing capabilities.

Abstract: Research on top management team (TMT) began in the “upper Echelons Theory” which was proposed by Hambrick and Mason. The “upper Echelons Theory” is based on the opinion that TMT provides the impetus for the organization innovation and the strategic decision. The relationship between TMT and innovations has been highly concerned by the scholars. By reviewing literature, this paper summarizes the relationship between TMT and innovations into three aspects: 1) the direct relationship between the TMT characteristic and innovations; 2) the direct relationship between the TMT operation and innovations; 3) the intermediary effect and adjustment variable effect between TMT and innovations. On the basis of the review, this paper analyzes the limitations of existing research, and discusses the direction of future research.

Key words: Top management team; The characteristics of TMT; The team operating; Innovation

1 Introduction

In the 21st century, innovation is the key factor of enterprise survival and the key means to maintain the sustainable competitive advantage. The innovation is a high risk investment. The enterprise whether makes innovations or not depends on the TMT's values, characteristic and the organization innovation. The research about TMT began when the *Upper Echelons Theory* was proposed by Hambrick and Mason in 1984. The *Upper Echelons Theory* has two chief viewpoints: (1) organization outcomes include strategic choices and performance depends on the value of top manager(TM); (2) the demographic characteristics such as TM's ages, tenures in the organization, educational background, social and economic status are the explicit variable. Hambrick and Mason's Upper Echelons Theory has been further broadened and deepened by many scholars. Ultimately come to this conclusion that TMT can be defined as top managers, including CEOs, general managers, vice-general managers and senior managers, who work on corporate strategic decision-making and are responsible for enterprise's business activities and economic benefits. Reviewing literature for more than 20 years, the relationship between the TMT and the innovation is divided into two stages: the first stage mainly studies the TMT's demographic characteristics and heterogeneity's impact on strategic choices and organization performance; the second stage is further, the research extended to TMT's operation and its situational variables.

However, in this field, the review of the research is relatively blank, so that there is a lack of effective integration of the existing literature. Based on literature review, this paper summarizes the research on the relationship of the TMT and innovations from three aspects, the direct relationship between the TMT characteristic and innovations, the direct relationship between the TMT operating and innovation and the mesmeric effect, the mediating effect and moderating effect.

2 The Direct Effect of the TMT Characteristics on Innovation

There are two main aspects of the research on the characteristics and innovation of the TMT. One is the research on demographic characteristics (ages, tenures, education level, education specialty, career backgrounds), psychological features, social characteristics; another is the research on influence the TMT's heterogeneity and diversity of the characteristic have on innovations.

2.1 Demographic characteristics and innovation

The discrete distribution of the TMT's demographic characteristics of has a great influence on organizational innovation (Yan Jiang&Tiqing Zhang, 2008). Most researches indicate that there is a negative correlation between ages, tenures and innovations. (Barker & Mueller, 2002; Yanling Kang, 2011; West & Anderson,1996; Carmen& Ana,2010). Tenures will bring organizations tangible or intangible risks and restrict the information process. The long-tenure top managers who attain the existing achievement through years of efforts would choose simulation strategies conforming to present situation of industry development rather than innovating. (Finkelstein & Hambrick, 1990) But there is a positive correlation between education levels, career backgrounds and innovations. The top

managements who are more educated own more knowledge reserve and greater cognitive competence which can improve their competence of absorbing knowledge and solving complex problems; the education level also has influence on the risk perception and bearing that the highly-educated TMs accept reform and bear risk more easily, (Hui Lei & Peng Liu ,2013) thus are more willing to innovate (Schoenecker & Daelloibach, &McCarthy); In 2009, Fang Wen and Yuming Hu empirically studied China's listed companies between 1999 and 2006, finding there is a positive correlation between the whole TMT's education levels and research input. In 1991, Thomas found enterprises which support the innovation strategies about market and product are mostly led by TMs who have the background of R&D function; the more technology-oriented TMs who pay more attention to the strength of R&D, the more beneficial to organization innovations. The research made by Barker and Mueller also indicated that the CEOs from production, engineering or R&D department care more about technology development and product innovation.

2.2 Psychological features of the TMT and innovations

Based on their cognitive, TMTs consider many factors when deciding whether to invest in innovation. Partial researches have confirmed that the TMT members' personality, cognitive styles and other psychological characteristics, has an important impact on innovation. In 2011, dividing the TMT cognitive styles into analysis and creative two types, Shenglin Shi, Qi Chen and Jing Zhang found they have significant influence respectively on process innovation and product innovation. In 2009, people like Qisheng Shi studied the TMT's shared mental model from its sharing accuracy and breadth, and thought that the cognitive and sharing between members can effectively affect the efficiency and process of decision making.

2.3 Social characteristics and innovation of TMT

TMT's social characteristics mainly refer to TMT's social networks and social capitals. TMT members' social network is a powerful tool for enterprise's resource dependence. TMT gets different information resources through the integration of internal and external social networks, which is conducive to the whole organization strategy (Keegan, 1984), effectively improve strategic flexibility (Shuming Zhao, 2013), then affect innovation.

TMT's social network is divided into two types: internal social network to promote team members' experience diversity and the enterprise's effective decision making and innovation (BURKE,1998) and external social network to obtain external resources, enhance the enterprise competitiveness and innovation performance (Bing Ren, Liqun Wei 14, 2011).For team network how to access and exchange resource, the structuralism network theory emphasizes social relationship or connection configuration brings available resources to individuals or teams. Min geng based on the network analysis method of social center view to explore the relationship between TMT social network structural characteristics, team cohesion and decision quality. People like Qianwen Li and Shuming Zhao (2012) found that the TMT social network affects enterprise performance through internal innovation, risk investment, strategic update and other internal entrepreneurial mechanism. In addition, the HR practice of constructing TMT social network significantly improving the enterprise performance (Collins and Clark, 2003) is significantly positively related to the TMT's social network which is the channel for TMT to obtain and promote the accumulation of social capital. TMT's social capital is constituted together by external relationship which gets the interests of economic, resources, information and control and internal relationship contributing to the full-effective cooperation. (Weimin Chen within the team, 2007) Fuping Ma and Yanping Li (2011) studied from three dimensions: political social capital, business social capital and public social capital, indicating that TMT social capital is conducive to obtain innovation resources and then promote technological innovation.

2.4 The TMT heterogeneity and innovation

Team heterogeneity is difference which can broaden the team's vision in the decision-making process, bring organization diverse information resources and may also contribute to the gap between the members and aggravate conflicts.

Some empirical studies confirmed that TMT age heterogeneity, tenure heterogeneity, career background heterogeneity, education level heterogeneity has significantly positive influence on innovation. The TMT's characteristics heterogeneity which means the diversity of information resources and ideas in the information decision-making process, prompts the TMT to be more creative and innovative. The TMT's education background heterogeneity plays a negative regulatory role between political connections and entrepreneurial enterprise's innovation capability (P Zhang, Z Huang, X Gao,2014); and the greater the difference in tenure, the more inclined the enterprise is to competition and product innovation (Srivastava &Lee, 2005). Zahra and Wiklund (2010) found the positive

correlation between TMT's awareness of the market, the functioning heterogeneous and product innovation; Lyon and Ferrier (2002) thought that TMT with high heterogeneity can make better tactics or strategic innovation compared to teams with homogeneity. However, not all scholars agree that team heterogeneity promotes organization innovation. Minming Xie (2011) found age heterogeneity is negatively related to innovation performance; selecting technology-based SMEs as objects, Huajing Li and Yuli Zhang proposed negative correlation existing between TMT functional management experience heterogeneity and enterprise innovation. Third studies suggest that heterogeneity is nothing to do with innovation. Selecting 100 manufacturing firms as samples, the result was TMT's ages, tenures, and education backgrounds have no impact on strategic change. (Wiersema & Bantel, 1992)

3 The Direct Effect of TMT's Operation on Innovation

West & Anderson (1996) built a TMT innovation output model showing that innovation support, task orientation, decision-making participation and other team operation effect organization innovation differently. Researchers from process perspective think TMT operation mainly including team conflict, communication, task oriented, decision-making, behavior, behavior integration, incentives and other acts, and team members' interaction, as team characteristics do, will affect team's innovation decision-making. This paper summarizes the direct effects of the TMT's operation on innovation from the three aspects: team conflict, compensation incentive and behavior integration.

3.1 The conflict of TMT and innovation

TMT conflict is defined as an interdependent interaction between TMT members and the resulting competition and cooperation relationship between core team members in strategy making and implementing level, and also the opposite or inconsistent interaction process caused by factors existing between members such as goals, cognition and feelings which are incompatible and difficult to coordinate. (Chen Yun, 2007) Different perspectives can divide TMT conflict into different types: cognitive and affective conflict, according to a condition precedent; destructive conflict and constructive conflict, according to effects of conflict. Conflict which is inevitable in the TMT's decision-making process is considered to be the prevailing condition for effective decision making. However, conflict is a double-edged sword. Sometimes it can find defect, improve decision quality and promote understanding of decision theory; and under some circumstances it will delay the decision making process, destroy team members' satisfaction and hinder their interaction.

There are many reasons for the conflict in TMT, such as group norms, team values and effectiveness of team interaction. Carmen and Ana (2005) consider the heterogeneity of TMT characteristics that causes cognitive conflict which promotes team innovation and emotional conflict which inhibits team innovation to be the main factor. And the latest research shows that, unless there is an appropriate mechanism to manage the conflict between the top management team, the high correlation between the dimensions of conflict will cover the potential benefits of task conflict, is not conducive to team innovation(C Camelo-Ordaz,J García-Cruz,E Sousa-Ginel,2016).So TMT's problem is to encourage cognitive conflict and restrain emotional conflict in decision making. Different types of conflict have different impact on innovation, and the key is to carry out effective conflict management(Chen et al, 2005).Guoquan Chen and Chunhong Liu suggested that only cooperative conflict management can promote high-quality constructive conflict which makes high-energy teams which guide more creative organizations. Simth, Olian, Sims, O'Bannon and Scully (1994) found high frequency of team communication can reduce conflict, solve and consider different opinions, which contributes to team decision-making and enterprise performance improvement.

3.2 TMT's compensation incentive and innovation

Now mostly enterprises separate ownership from managerial, and incentives of which affect the direction of TMs' decision making and innovation can effectively change TM's behavior. Lerner and Wulf (2007) found a significant positive correlation between TMs' long-term incentive contract and the technological innovation output by analyzing the panel data of 300 Usa Inc between 1987 and 1998. Yu Zhiliang and Zhang (2009) took China's listed companies as research objects to study the relationship between TMT incentives and enterprises' innovation, finding the positive correlation between annual salary and enterprise independent innovation. People like Yuan Gu (2013) measured TMs' incentive mechanism from two aspects: compensation and share proportion, knowing that different incentive methods have different effects on enterprises' innovative input, on which TMs' shareholding ratio have greater influence. Ning Xu and Xiangyi Xu (2013) redefined and remeasured TMs' incentive effect in the framework of innovation economics and they found that the influence of equity incentive, incentive

compensation and control power incentive on technological innovation has 3D interaction effect. Barros and Lazzarini (2012) found that promotion incentives can do more to promote organization innovation than compensation incentive, and the two forms a complementary relationship that promotion incentive works with the support of compensation incentive.

3.3 The TMT'S behavior integration and innovation

The TMT's behavior integration is a new trend of team process researches. TMT behavior integration's essence is to achieve the effect that "two heads are better than one" and contribute to the harmony without uniformity of team members' information sharing, decision-making and resource. Hambrick (1994) firstly put forward the concept of TMT behavior integration and come it down to: the quantity and quality of information exchange (including the richness, timeliness, and accuracy), cooperation and collective decision-making. Based on Hambrick's study, Simsek (2005) expand the research of TMT behavior integration, and developed the scale to measure three dimensions of behavior integration. Then the foreign formed two types of empirical research paradigm represented by people like Siemsek whose researches attached importance to the consistent behavior of integration and cared more about the content of the "harmony" in the team operation while people like Li whose researches attached importance to the inconsistent behavior of integration and cared more about the act of the" different opinions "in the team operation. China's scholars named Zhenhua yao and HaifaSun (2009) divided behavior integration into three dimensions: decision-making participation, open communication and team cooperation, considering the dialectical process of "harmony without uniformity" and "difference but harmony" is essence of TMT behavior integration. TMT behavior integration helps TMs integrate knowledge and insight, and contributes to enterprises' decision making of developing new products, and improvement of product innovation strength (Li&Zhang2002). Lubatkin (2006) thought TMT behavior integration is the key factor for enterprises to succeed in dual innovation, and improving the level of which can promote innovative behavior, contribute to carry out exploratory innovation and using innovation, and then enhance innovation capability (Anna Ding and Jingjiang Liu 2012). Ling Shang's (2011) study also confirmed that the higher the level of TMT behavior integration is the more conducive to entrepreneurial enterprises to carry out dual innovation can be.

4 Mediating Effects and Moderating Effects

4.1 Internal mediating effects

TMT's innovation strategy decision-making is not only affected by TMT's composition, but also factors such as the team process or team members' interrelation. Some scholars believed TMT's characteristics diversity may lead to conflict within the team or the internal heterogeneity (Amason and Mooney, 1999; Li and Hambrick, 2005), and then effect innovation. Some others believed team members' interaction is an intermediate variable between TMT's composition and organization performance (Jackson, 1992; Etal. Knight, 1999; Olson and Parayitam Olson, 2006). So TMT's research changes from the direct effect to the mediating effect.

TMT characteristics affect innovation by effecting team operation. As intermediary variables, the team process mainly includes task orientation, decision-making participation, conflict management, strategic identity and so on. West and Anderson (1996) built a framework of TMT characteristics, team operation and innovation, explore the relationship between TMT heterogeneity and organization innovation, and indicate that task orientation and decision-making participation are the intermediary variables. Heterogeneity can not only enrich the team view, but also lead to team conflict, which is not conducive to innovation. Task orientation and decision-making participation contributes to team members' full exchange of different views and information, changing team conflict into a constructive debate and improving the level of organizational innovation. Some scholars pay more attention to the mediating role of conflict and consistency. Chen et al (2005) found that cooperative conflict management is the most effective way, which can produce high-quality constructive conflict and contribute to organization innovative. People like Chen Lu constructed a theoretical framework of the relationship between social capital, team conflict and the effect of decision making, which is mediated by cognitive conflict and affective conflict. Taking science and technology enterprises as samples, Carmen and Ana found that only in the mediation of strategic identity can TMT's functional diversity promote innovation.

Some scholars carry out exploratory researches, regarding social capital, social networks and other team characteristics as intermediary variables. People like Bing Re (2011) proved that the organization obtain the resources needed to promote enterprises' innovation through the management of external

social networks between enterprises.

Some scholars pay attention to the mediation between the TMT operation and innovation. Et al Wu (2002) studies the relationship between the TMT's management style and organization innovation, finding that TMT with a focus on empowerment and consensus management style is easy to promote organization learning, and thus promotes technological innovation. People like Lu Chen (2013) found that psychological empowerment plays a mediation role between paternalistic leadership and creativity. Abraham et al (2009) discussed the influence of TMT members on decision-making effectiveness and draw a conclusion that decision-making participation contributes to decision-making effectiveness which plays a partial mediation role between TMT decision-making participation and organization performance. Guoquan Chen, Dean Tjosvold and Chunhong Liu believe that the two kinds of leadership styles, the human-orientation and the production-orientation, play a mediation role between team cooperation and innovation, which can help team members gain two basic elements of creativity: firstly, strategies to complete a series of tasks; secondly, strengthening team members' coordination to achieve strategic objectives. The choice TMT leaders make from the two kinds does affect the effectiveness of leadership and innovation.

4.2 The external situational effect

Upper Echelons Theory agrees that the TMT operation and TMT members' performance are different in different situations, thus the impact on innovation is different. So there are scholars studying the relationship between TMT and innovation in allusion to different management situations.

Functional synergies, strategic consensus, team behavior integration, product novelty and other moderator variables are well studied. Regarding functional synergies as moderator variables, Seigyoung and Mengue (2005) studied the relationship between TMT heterogeneity and organization innovation and knew the relationship used to have no correlation between TMT's education level heterogeneity, tenure heterogeneity and organization innovation turns into a significantly positive correlation at a quite high level of functional coordination, which shows the addition of contextual factors can reflect the positive role of the TMT heterogeneity on organization innovation. Fu Ping Ma and Xiaochuan Guo (2010) found that the method of TMT conflict management plays a moderation role between TMT heterogeneity and technological innovation performance, and cooperative conflict processing mode has a positive moderating effect while competitive conflict processing mode has a negative moderating effect. In the same year, people like Fuping Ma (2010) found the heterogeneity of tenure, education level and professional, career background has a more significantly positive effect on technological innovation performance under the quite high behavior integration, because the behavior integration is more conducive to share and utilize the decision-making information. Selecting 174 new ventures in high potential as research objects, Amason and Shrader (2006) found that the TMT heterogeneity (including education level, professional heterogeneity and functional heterogeneity) is negatively related to entrepreneurial performance under the condition of high product, but the negative correlation disappears in the case of the new degree of the product novelty. With 97 innovative firms in Spain selected as objects, Carmen et al (2010) discussed the moderation effect of strategic consensus between TMT and innovation performance, and the study shows that the relationship between TMT functional diversity, tenure diversity and innovation performance is a significant negative correlation, but the relationship between the diversity function and innovation performance changes from a negative correlation to a positive correlation when under the moderation of strategic consensus. Yong et al^[1](2011) built a theoretical model between TMT and strategic reforms and discussed the moderating role of salary inequality and resource abundance. The results show that the relationship between TMT's tenure heterogeneity, the education background heterogeneity and strategic reform is significantly positively related but weakens when salary inequality existing. While the relationship between age heterogeneity and strategic changing is a significant negative correlation but weakens when wage inequality existing. Li (2013) considered organization innovation studies the relationship between the TMT diversity and organization flexibility from an information processing view, and results showed that the social capital of the TMT plays a moderating role, and when it is in high level, the relationship between TMT diversity and multiple organization innovation is a significantly positive correlation. Because TMT with diversity promotes the information exchange and the knowledge accumulation within the team through a high level of social capital, and then realizes dual innovation.

It is worth noting that environment, culture, industry and other external factors are also scholars' focus of attention. Seigyoung and Mengue (2005) found that the direct effect of TMT's career background heterogeneity and innovation strategy is negatively related, and the negative impact is large when it is in the high dynamic complexity of the environment, while the negative correlation becomes

positive when it is in the high dynamic complexity of the environment and functional synergies. The company’s ownership form and industrial environment plays a moderating role between TMT characteristics and enterprise strategic positioning, and the TMT heterogeneity promotes the enterprise’s strategic direction, of which the effect is more significant if the environment is stable and especially when the enterprises are state-owned. Johnson and Rasheed (2008) found the TMT’s demographic characteristics have no effect on the differentiation strategy in a controlled environment, while the TMT’s age, tenure and differentiation strategy form a significant negative correlation in the unregulated environment. Based on the perspective of literature review, Ning Xu (2013) argued that industry characteristics, corporate equity structure, corporate profitability and other contextual factors play a moderating role in studying the relationship between TMT incentive and technology innovation.

5 Conclusions

Through the analysis and review of the literature, we can see that scholars have made abundant research results on the relationship between TMT and innovation. The framework of the existing research is roughly shown in Figure 1. There are three aspects of the main research contents: firstly, the direct relationship between TMT characteristics and innovation; secondly, the direct relationship between TMT operation and innovation; thirdly, the focus on the mediating effect and moderating effect between TMT and innovation.

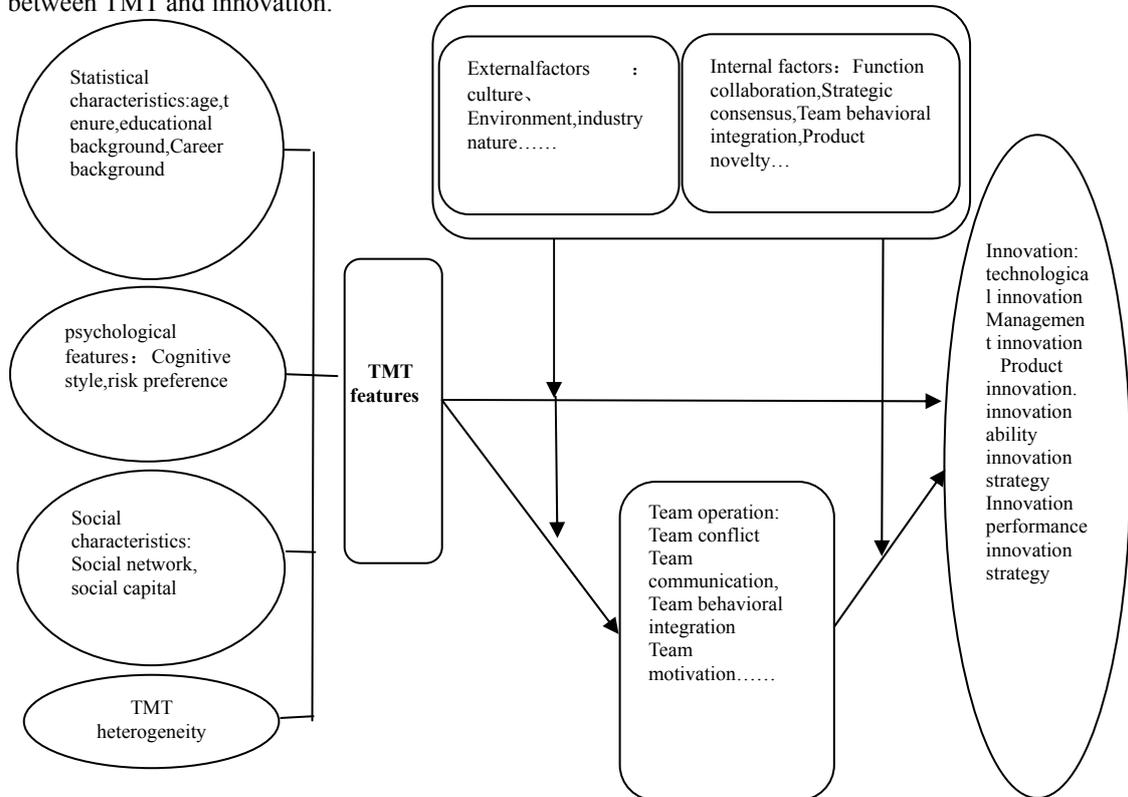

Figure 1 The Executive Team and Innovative Research Framework

Academia has confirmed that the TMT characteristics and operation have an impact on innovation, but there is no consensus it is positive or negative. So as a branch of the TMT theory tree, the researches on relationship between TMT and innovation still continue growing. For future research, we propose the following recommendations:

- 1) Expanding the scope of the TMT characteristics

Upper Echelons Theory regards TMT’s demographic characteristics as measurable indicators of values, the cognitive basis and so on, follow-up studies mostly select demographic characteristics, diversity or heterogeneity as dependent variables, and a few literatures relate to TMT’s psychological characteristics which are difficult to measure such as psychological motivation, risk perception, cognitive style and so on, or social features such as social capitals and social networks, etc. Future researches can pay more attention to the TMT's psychological characteristics and social characteristics,

such as the TMT's risk preference of perception, cognitive difference, psychological contract and so on, because innovation is a kind of risk investment, different ability of risk perception, cognitive differences and others will all affect innovation.

2) Researches in different situations

Among existing empirical researches, many of the results are not consistent, and even some are completely contrary, maybe because of differentiation in samples selecting, calculation errors or other factors in the technical level, and maybe it did not consider the impact of situational factors. From the contingency theory perspective, the influence of TMT characteristics on innovation is likely to be different in different internal and external situation. Future researches can consider the moderating effects of environmental factors, cultural factors, organization factors, and so on.

3) Strengthening researches on the impact mechanism of the TMT operation

The existing researches study more about the correlation between the TMT and organization output, and the researches on the internal team operation is still lack of systematization, and there is no clear distinction on the impact mechanism of team operation. The influence mechanism of TMT operation has two modes which have different explaining process and level on the impact of innovation, one is the TMT operation directly affects innovation as the antecedent variables, another is that TMT operation is a mediating or moderating variable between TMT characteristics and innovation. Future researches should consider how does the TMT operation affect innovation when leading it in.

The Interpretation and Orientation of Inducing the Enterprise Institution Innovation: Based on the Vision of Emergency Governance

Zhao Meilin, Yang Yingjia

School of Economics and Business Administration, Central China Normal University, Wuhan, P.R. China, 430079

(E-mail: zhml20040101@126.com, yingjia1112@126.com)

Abstract: Emergency governance dominated and exercised by the business managers, is a typical form of business management governance practices. From the perspective of institutional-ism, emergency governance not only has the rationality for business managers to dominate mandatory supply within institution demand, but also has the necessity for the authorization to respect the staff's wishes to enhance the inevitability of public governance structure under the background of humane system. However, there are some drawbacks of the corporate governance practices based on emergency governance. It could strengthen the centralize management of infrequent events, and the closed, forced institution innovation may increase the cost of implementation, reduce the efficiency, and shorten the life cycle of the system. Only with an open mind, detailed implementation mechanisms, and multiple power sources, can we extend the vitality of enterprise system, and minimize the ills of institution innovation based on the emergency governance.

Key Words: Event management; Institution innovation; Emergency governance; Enterprise management system

1 Introduction

There are four main kinds of enterprise system innovation: organization innovation, property system innovation, corporate culture innovation and enterprise management innovation (Fang Shijiao, 2002). To sum up, domestic research on enterprise management innovation focuses on the following areas: the definition of management innovation connotation, the main content of management innovation, the case studies on management innovation, the features of management innovation, and the dynamic mechanism of management innovation, etc (Wang Yong ,2012). Since 2000, case studies and simple theoretical analysis have become the two main ways to conduct practical research on enterprise management innovation (The Report on Management Innovation of Chinese Enterprises,2007). Compared with theoretical research, practical research focuses more on the main points of management or revealing laws of management and operation within the competition and cooperation. Wang Yihua and others researched the strategic reorganization of Dong Feng Motor Corporation and transnational corporations (Citroen, Honda Motor Co., Ltd.) Their findings have directed guidance and inspiration on enterprise management innovation.

Emergency governance is a kind of common governance model in process of actual business management. Analyzing its causes, operating mechanism and influences has both theoretical significances in system innovation and practical significance in implementation of system innovation. However, from the perspective of institutional-ism to observe the phenomenon can only explain merely focus of this issue. This article does not follow the single theoretical category of the so-called Political Science Institutional-ism, Sociological Institutional-ism, Economic Institutional-ism or Rational Choice Institutional-ism (He Junzhi, 2007). It is based on a macro view, harnessing the theory of institutional-ism, and analyzing it with the background of the innovation case of emergency governance. And we will discuss its internal mechanism, and then put it into the frame of emergency governance to explain and predict, finally to give the suggestions.

2 From the Emergency Treatment to the Normalized Management

In The Comet Factory's workshop, a machine operator spilled a large amount of liquid on the floor around the machine. The director let the operator clean the liquid, but the operator refused, claiming that the job specifications did not include the cleaning clause. Then, the director called a temporary worker to do the job, but he also refused, for his service specification not including this type of work, and he thought it's the handyman's duty. The director threatened the cleaning man by firing him, because he is assigned to do the chores at the workshop. The temporary worker reluctantly agreed, but immediately

after the work, he complained to the company about this.

After getting the complaint, the staff checked these three kinds of workers' service specifications: the machine operator, the temporary worker and the handyman. The service specification of the machine operator says, machine operator is responsible for keeping the lathe clean to make it available, but doesn't refer to the cleaning job. The service specification of the temporary worker says, they are responsible for helping the machine operators in many ways such as getting the materials and tools, and should be on service every time when called, but the cleaning job is still not mentioned. The service specifications of handyman do claim that he should do some kinds of cleaning job, but his working time is after the regular workers.

So, if you are the HR manager who is responsible for dealing this complaint, what would you do?

From the perspective of the sensitivity of management and enterprise governance, the managers should realize the inner problem of the enterprise: the loss of sense of ownership and the "none of my business" thought really does harm to the teamwork and cooperation. It is emergent to boost the sense of management, which is to build the sense of ownership and the awareness of teamwork. First we should make a discussion on "who is responsible for the cleaning job". Then, let all staff generally realize the importance of teamwork and the sense of ownership during the discussion and debate so that it can internalize into every worker's mind. Besides, under the threatening situation, the cleaning man could still finish the job which is out of his service. The manager should praise him publicly with a bunch of material rewards, for his great attitude and the way he dealt this problem, and set positive examples for the managers. By dealing this kind of emergency, we should be all prepared for cultivating and innovating the formal institutions and so on.

In this case, we could find that it is not a new topic of the process about emergency governance, including the occurrence, management and inducing enterprise system innovation. It has its background of the enterprise institutions. Besides, the similar cases in dealing with emergencies is not just event governance for an enterprise, it has become a tendency. Although this has not become a kind of institution, it is still the manager-oriented governance, so it should be called as the emergency governance method.

3 The Institutional-ism Explanation of Emergency Governance

Emergency governance is not like the ordinary governance; it is different from the ordinary style which depends on institutions. Emergency governance is manager-oriented, it is a dynamic formal institution arrangement, we could explain its necessity and rationality in the view of institutional-ism.

3.1 The choice which satisfies the arrangement of efficiency

The innovation of enterprise's institution system which under the emergency governance is mostly originated from the spirit of the managers and staff. Then it could be seen from the system and the whole enterprise. The possibilities of innovation and the progress of arrangement lie in the staff, and they can boost the innovation in some aspects. These managers, who promote the institution transition and innovation, put forward the idea and they are responsible for discussion, compromising and solving the problem. They play very important role in applying the spirit of innovation to implement enterprise resource optimization. However, this kind of option is limited by the entrepreneur tenure. To achieve the goal, the managers must do well in the system design to emphasize the ability of assigning resources in a short period of time. So this would cause the obvious short-term and dynamic character of institution transition or innovation. The new successor would replace it when it is out of effect. So that, only by establishing the institution system and emphasizing the same topic, could it keep the effect of this system. So emergency governance is sure to be a routine option.

3.2 The choice which is a strong institution migration powered by single engine

The engine of emergency governance could come from the enterprise system itself, or from the demand of staff or the inspiration of emergency, even from both ways. But just consider the emergency governance, it is more like manager-leadership. The "careless, laziness, indolence" phenomenon is the performance about the lack of internal motivation mechanism. Before realizing the institution transition and innovation based on emergency governance, the enterprise itself has formed a stability state, which could be called as the institutional inertia. If the manager wants to break the pattern, the only way is relying on the internal power of management to do away with the path dependence and behavioral inertia of old system, when the enterprise lacks openness, competition of external institutions and sufficient constraints of corporate forces.

3.3 The choice which could realize the equilibrium of institutions

The institution transition of enterprise is a balance of demanding and supplying. The demand of institutions could come from the enterprise itself, such as some sectors competing for the precious resources. It could also come from the outside of the enterprise, such as higher level of service, better investment environment, etc. Emergency governance behavior, under the guidance of dynamic goal, is an implementation mode of intermittent balance. Although this kind of transition is compulsory, it is shown as a passive, adaptive way. It relies not only on a sensitive manager to realize management value propositions with entrepreneurship, but also the inspiration of conflicts or pressure. However, the manager will change along with the term of service, and the conflicts always come and go with different topics in the logic of occurrence, development and regression, so, "every emergency governance provides an opportunity for the next similar action - when the seriousness of the problem accumulates to a certain extent, the next dynamic governance act will come (Tang Xianxing,2009)." Thus, such kind of system equilibrium can only be dynamic and adaptive.

4 The Underlying Demerits of System Innovation about the Emergency Governance

The reason why enterprises want to conduct institution transition is to get the "potential profit" of the system, namely is to maximize the utility. However, it doesn't mean that all the transition or innovation could improve the efficiency and boost the utility. There are also some underlying demerits of system innovation about the emergency governance.

4.1 The institutional friction may add the cost of institutions

When it comes to the transition or innovation of institutions, it also means that it is based on the specialized environment. The existence of institutions is to improve the efficiency of coordination and depress the transaction cost and the risk of the internal and external complexity the enterprise may face. But if we don't get rid of the old institutions totally, the set of old and new institutions may cause the multiple influences to the staff behaviors, so that they cannot follow the speed of the transition of institutions and it may cause the conflict. Especially emergency governance may cause a series of behaviors which may let all the institutions lose its control, so it won't be efficient anymore. "Improper system transformation can lead to bias of institutional change supply (Coase,1992)." The institutional friction arises. Besides, the arrangement of emergency governance actually denies the procedure of trials and tribulation. So the underlying risk is, as the model of imitating, if the institution itself has some problems, then the cost would be a great burden when it spreads into the enterprise.

4.2 The received innovation of institution may shorten the life cycle of the system

Discontinuous innovation is one of the ways to realize the intermittent balance. But whether it could be balanced depends on the life cycle of this system, because the realization needs some stabilization to keep the productivity. As a kind of pragmatic governance, emergency governance has its inevitable shortsighted character. It usually refers to the problem concerning the operation of the enterprise, or the problem may exist. The need could come from the manager's mind, or the staff's need. The lack of demand expressing could let some institutions be put on ice before it really works. This kind of renovation also lacks of leadership and accommodation, because it ignores the concern of society or the environment, and it makes reaction only when the enterprise has problems. So, facing to the complicated problems, this kind of institution should be strategic, and aims at periodic goals. With the changes of problems or demands, the institution itself surely won't last long.

4.3 The sealed institution innovation may depress the efficacy

Many institutions in enterprises designed are obviously sealed, which means its design is originated in the enterprise itself. The option has its repellency naturally on the value, content and implementation of the institution. The information of system implementation is from bottom to top and in one-dimensional. Also it could cause the negative accommodation to the environment. To sum up, it does not last long and is does harm to the self-renovation.

The emergency governance always comes with the resources support by great power. After the dynamic storm, the mobilization of resources depresses, so its efficacy also depresses. In addition, emergency governance is not a stable expectation, its complement is also hard to ensure. Not only could it not reflect on the manager's thoughts, but also could not satisfy the demand of staff.

5 Emergency Governance is not Accidental Any More

The emergency governance is trying to boost the efficacy of system management. So in order to avoid these incidents, we should ensure it with institutions. As Huntington put it, "the institutionalization is a

process of the organization and procedures to obtain the values and stability (Walter Dimateo ,2008)."which switch the "moral behavior" into "reality behavior". It means switching how to conduct certain behavior to conduct certain behavior simply. An act institutionalized process is also an act by an institution of the Statute of "moral behavior" to "the fact that the behavior" of the process, from how to implement an act should be converted to a simple implementation of an act process. The result is not to deny the manager, but try to improve the structure and consequence of emergency governance. When it is truly the norm of governance, the nature of its instability will disappear.

5.1 Open the institution system to avoid the functional disorder

An advanced perspective is so much better than a received way to design the institution. It could also boost the leadership of the institution and avoid functional disorder. Only an open institution could allow the manager to make some advanced reaction by innovation. In the reality aspect, the internal openness is easy to be repelled by authorities. Only when the institution is approved by all the staff, could it be conducted by itself and internalized into a kind of behavior. Meanwhile, human based institution arrangement could make the managers take the responsibility and accomplish equivalence of rights and responsibilities. By arranging some motivating mechanism, it could boost the multiple institution innovations. To achieve this goal, we must realize the release of entrepreneurs' power by emphasizing the responsibility and assessing every part of the management. In addition, the evaluation and measurement of the management institution must be the combination of inner and outside of the enterprise. This could make the managers avoid the functional disorder. So right now, boosting the manager's ability and concerning the behavior of the emergency, is a mechanism which could realize the equilibrium and avoid functional disorder.

5.2 Detail implementation mechanisms to extend efficacy

The system implementation mechanism is an operable specific method that makes system can work effectively. Mechanism is the middle variety which connects the system expectations and system results (John Campbell ,2010). We cannot expect that the system can work automatically and reach expected in a functionalism attitude. It needs supports and transformation of mechanism to achieve, including system transformation mechanism, system spread mechanism, system update mechanism and system evaluation mechanism etc. System is a kind of content advocated. After coming out, it becomes a fact, which has the standard meanings of normative and symbol. However, realizing the value effectively cannot only rely on system text itself, but need the supports of detailed mechanism design and managements' technological means. Especially, system arrangement is a lengthways multi-level and transverse multi-apartment system aggregation. There are detailed requirements for every level and apartment, which promises the operability of it. At the same time, emergency governing, to some extent, is mainly about releasing the potential abilities of the system we already had. Before the institution innovation, we already had many systems and specific implementation measure, strategy and so on. Therefore, detailing implementation mechanism and intensifying the space and time scales of the executing efficacy system now is one of the ways to reducing dynamic system circulation as well.

5.3 Rely on multiple power sources to accelerate system updating itself

The changes and innovations of system are the results of entrepreneurs, enterprise managers and employee cooperation and interaction with others. Even if under mandatory system changes, system efficacy working effectively still needs other subjects to work together. The environment that the system facing is fickle, if the incentive source is only, the adaptive capacity of system is limited in front of the complicated needs of system. On the one hand, power sources are limited, entrepreneurs cannot be omniscient. On the other hand, continual provide efficiency of power sources is facing challenge. The attentions or responsibilities of entrepreneurs cannot be only; they cannot put all power to keep the emergency governing system going. Keeping the vitality of system needs unceasingly sources updating, which relies on the sources provide of the diversified subjects (Zhou Yuhua 2010). Polybasic subjects keep motivating, especially with the participation of the enterprise managers, prevent the formation of system inertia, achieve updating itself, correct the malfunction of the system, realize system repairing, and avoid punctuated by the replacement of the expiration of the enterprise senior management, to realize the institutional change or reform. This kind of self-update system is a normal system set, and the requirements and reflections in enterprise life.

6 Conclusions

Enterprise institution Innovation, based on emergency governance, has its inevitability and reasonability of enterprise management practice. And from the point of achieving the goal of enterprise,

it seems like an inevitable periodic option. The practice of enterprise's reformation and achieving enterprise's goals needs a process spreading from a single responsibility-building entrepreneur himself to a group of enterprise managers and employees. Dynamic process is a mechanism choice of motivating the awareness of responsibility, which can be regarded as a necessary stage of emergency-governance enterprises. But we cannot ignore its underlying demerits and refuse to improve it.

Abstract: The auto racing industry is accompanied by the development of the automobile industry, which is one of the signs of the developed automobile industry. The pulling effect of the auto racing industry to the automobile industry is the wings that help automobile industry takes off. China is treated as the world's largest car market, the development of whose car auto industry has close relations with the development of automobile industry. They are interdependent and closely connected. A complete auto racing industry chain is conducive to the promotion of economic development in different regions, the promotion of the automobile industry development and the establishment of the city brand image. However, there is a large gap in the auto racing industry between China and the developed countries. This paper introduces the present situations of domestic and foreign auto racing industry, analyzes the gap and the deficiencies between China's auto racing industry and other developed countries, and puts forward the relevant countermeasures, in order to promote the development of China's auto racing industry.

Key words: Auto racing industry; Situation analysis; Deficiency; Strategies

1 Introduction

The auto racing refers to the related industrial chains, including the racing car's research and development, manufacturing, modification, event organization, racing drivers training, racing venue operations, and the car derivative products (auto racing forum, media, tourism, apparel, information systems, big data, racing car supplies, etc). According to statistics from China Automobile Industry Association, China's annual total car production was 24.5033 million in 2015 and the total car sales was 24.5976 million, which ranked first for seven consecutive years in the world (Liu Chunxiao, 2016). On May 8th, 2015, the Chinese government proposed the strategic plan of "2025 China manufacturing", which aims to improve China's international competitiveness as well as the transformation and upgrading of the manufacturing industry. Whether the independent brand car can occupy a space in the world is one of the important signs to measure the global competitiveness of the manufacturing industry. The auto racing industry is accompanied by the development of the automobile industry, which is one of the signs of the developed automobile industry; they are interdependent and closely connected. The auto racing industry has also played a significant role in boosting the automotive industry. The racing car market will also boost in China as the world's largest car market. The auto racing industry, which brings together top technology and manufacturing process of the car movement, is not only a sports culture movement and an economy phenomenon, but also a social cultural phenomenon. The auto racing sports not only provides a competitive platform for people to drive, but also entertains people. It has become an important topic in the development of the auto racing industry to study how to integrate advantages of the automotive industry with the capital advantage, the industry resources of the car market and the sports culture, enhance the upgrading of China's auto racing industry, guide the Chinese auto racing to rapidly and healthily develop in a civilian, popular and entertained manner.

2 Analysis of Current Situations and the Deficiencies of the Auto Racing

According to the forecast of foreign media data, the global racing car market will reach \$5.6 billion in 2020. At present, F1, WEC, WTCC and other events are held respectively at home, focusing on mentioning the national fitness promotion to the national strategic objectives, emphasizing to create a contest performance items with the consumption characteristics according to *13th Five-Year Plan for the Development of Sports* proposed by China General Administration of Sport. By now, the racing sports have a history of more than 100 years, while China has merely 20 years of history. With the development of China's automobile industry and the improvement of people's living standard, auto racing is no longer far away from people. After several years of development, the domestic auto racing industry has developed to a certain scale. However, in the world-class events, China still lags behind the world racing teams, and the auto racing industry does not match the huge consumption ability in China. Along with the development of the automobile industry and the increasing number of people in the

higher and the more abundant pursuit of the car cultural products, it is an inevitable trend of the gradually emerging auto racing sports. At present, China's auto racing industry is stepping into the stage of rapid development, with racing venues established respectively in Shanghai, Beijing, Chengdu, Zhuhai, Changchun, Shenzhen, etc. In 1996, the first China international speedway was founded in line with the International Automobile Federation Formula One Standards International Speedway — Zhuhai International Speedway. In 2004, Shanghai International Speedway was completed with the racing field, commercial Expo area, culture and entertainment etc. China has formed a certain scale of racing sports culture company, which has begun to take shape in these aspects of the racing event organization, racing media, racing event, racing car online business, racing car theme park, racing car travel, racing car outdoor camping by using the Internet and big data, which have a large number of consumers to participate in. Nevertheless, there are still a lot of deficiencies in the auto racing industry, such as how to copy the operation mode of auto racing and existing domestic racing business from developed countries to China and how to shorten the gap with racing teams of developed countries.

2.1 Higher threshold of auto racing

Taking F1 as an example, the racing cars themselves are expensive, the costs of taking part in F1 auto racing are more expensive and the cost of mechanical engineer is amazing. The length, width and road environment of F1 car racing site requirements are extremely strict. F1 track in Shanghai Audi international car park costs 2 billion 600 million Yuan. So for most people, the auto racing is far away from them. Owing to limited auto racing space, ordinary people can hardly experience it and have little knowledge about it. It is impossible to narrow the gap between the mass and the auto racing, not alone spreading the auto racing culture in a personal way.

2.2 Less auto racing talents and complex career planning

As the auto racing industry involves a long chain, it needs various aspects of talents, such as the automotive R & D talents, senior technicians, automotive marketing talents, including the most popular racers, track referees, car maintenance personnel, service personnel, etc. These demands are presented in the less of personnel in quantity and quality. Taking the racer as an example, "the racing car population" is very important for the automobile movement, and the racers in the developed automobile industry countries generally begin to take part in karting at about 4~5 years old and then gradually promote to the entry-level racing car, so the developed countries has a relatively mature and perfect training system. This enables wide participation, get more training and competition opportunities lay a solid foundation for building up the talent pool. However, it is impossible to reserve auto racing talents aged from 4~5 years old in China. The current situation of China's racing industry has restricted the career choice of racing drivers, so the majority of operators and drivers choose the types of auto racing sports from the commercial interests.

2.3 Lower science and technology abilities in independent research

The development of global automobile industry has a rather fierce competition. There is a large gap between China's auto industry and the developed countries. China's auto parts are the weakness of China's auto industry, which is limited in the independent development. According to incomplete statistics, 90% of Chinese parts enterprises are in lower level. the advanced foreign manufacturers monopolies the core field of technology components, such as automotive electronics, engine EFI system, turbocharger, transmission solenoid valve and drive shaft. In the engine management system (including the EFI), ABS and other core components, the proportion of foreign-funded enterprises was as high as 95% and more than 90%. Investigation shows that currently R & D investment in China's auto parts enterprises accounts for only 1.4% of sales revenue, much less than the average of 5% in multinational companies (Zhang Xiaohu, 2015). Domestic auto enterprises are lack of investments in independent research and development, and key and core technology and high-end technology, which are relatively weaker than that in the more developed countries in the innovation ability. As for the materials of the racing car, high-tech car seat, IT system of racing cars, and auto racing power system, including the balance of friction, the hybrid and aerodynamics, domestic brand auto racing industry needs to catch up with the auto racing R & D technology of developed countries.

2.4 Weak racing car cultural atmosphere

Auto racing sports are also called a "money-burning" movement. On the one hand, in the case that people with low overall living standards do not have cars, the possibility of vehicle movements involved is low; on the other hand, as racing car industry is associated with the automobile industry, the industrial civilization in China is less developed, so there is less attention for auto racing; the regional motorsport development is not balanced, some underdeveloped areas rarely carry out such races. Most Chinese people' understanding of auto racing still remains in the impression of some negative images, such as"

wealth". In China, CCTV-5 as the only one national free sports channel, but it does not live auto racing sports out of the broadcast copyright costs or the conflicts with other sports events. Competitive automobile manufacturers lack the knowledge on the auto racing industry, such as unawareness of the problem in the auto racing industrialization, no overall understanding of auto racing industry from the aspect of property, culture and market. People are not concerned about the auto racing industry, or they just race a car for the car, but they do not make the development of auto racing industry together with that of automobile industry.

3 Strategies for the Development of Auto Racing Industry in China

3.1 Playing the role of chinese government

The core role of the government is not only reflected in the capital and land but also in the policy supports, management and coordination. As a developing country, the Chinese auto racing is just in the trial stage, the government can guide the financing rather than investment, formulate relevant preferential policies, build financing platform for the auto racing industry, implement macroeconomic control, create a low-cost and high-efficiency investment and financing environment for the auto racing industry, use domestic car as leading racing models, and increasingly popularize auto racing sports. In addition, since it requires a lot of lands to build the racing field, the government, the society and the racing organizations should select the site cautiously, plan reasonably, and make good use of it. Before the selection of new tracks, the risk evaluation and the feasibility reports should be accomplished. The government should plan the development of Chinese auto racing industry cluster scientifically, make all the members in the cluster produce enormous cluster effect by the common development, increase the competitive strength of industry cluster rapidly, and gradually cultivate the core competitiveness of the Chinese auto racing industry.

3.2 Establishing auto racing training system

Based on the features of the talents of auto racing industry, it is essential to establish and promote the training system of multi-level racing talents. The training of auto racing talents can enable people to make full use of the cooperation of the schools and enterprises, utilize disciplinary advantages from domestic and foreign universities, carry out a wide range of international cooperation and exchanges in automotive-related professions, jointly train talents in the car design and manufacturing, competition management, auto racing, the referee, car maintenance, event services and other fields. It also needs to make full use of the cooperation with colleges and universities, use FSAW motorsport as the starting point, and promote the cultivation of talents and development of automobile independent core technology, so as to bring automobile talents and advanced technology to the enterprise. To develop the research, manufacturing and service industry chain with FSAE motorsport as the center, the relevant authorities can make good use of commercial operation, fully develop the business value of the FSAE sports car and make enterprises willing to participate in FSAE racing, and thus promote China's FSAE racing to develop in a sustained and healthy way. Besides, the relevant authorities should also make full use of clubs in colleges and universities, create unique campus auto racing culture atmosphere with motorsport as a link and develop professional racing clubs and comprehensive clubs for members and students. The study of theoretical knowledge and practice of auto racing will enrich the relevant knowledge in auto racing and enable to accumulate some experience for guiding students to join the enterprise. Meanwhile, the youth should be guided to join the racing business. The entertaining way is adopted to cultivate interests since they are still children. In this way, more people will love this business and pass it on. To cultivate various racing cultures and interests on auto racing will be an important part of the industrial development. The training plan can be developed at the early age and economic and training supports should be given.

3.3 Perfecting market operation mechanism of auto racing industry

It is necessary to learn the successful management and development experience from foreign auto racing clubs, and constantly improve and standardize the club management, and improve the healthy and sustainable development of motor racing. Furthermore, the industry shall learn from advanced foreign experience and follow the market rules, and then find the mechanism in China's development of the auto racing. In addition, the industry shall make use of industry associations, provide services, reflect the demands, regulate behaviors and build a platform; make full use of the social auto racing organizations and market operation to promote the development of China's auto racing industry. At the same time, it is essential to take full advantage of all kinds of non-profit sports organizations to reduce the risk of the event and keep the event in a safe environment; attract famous industrial funds and investments from

listed companies and integrate the capital market to expand the auto racing industry resources. Finally, the industry shall focus on developing the potential locations for auto racing sports and strive to achieve the strategic layout of the auto racing market.

3.4 Cultivating auto racing culture

The auto racing sports in China is in the initial stage, it is vital to combine Chinese tradition and wisdom and learn from the advanced experience from other countries and regions. The media with responsibilities of auto racing culture transmission should also give up pursuing only the profit; but instead, it shall present more exciting racing events and programs to the audience. The more people are interested in the event, the more they are willing to transmit it to the public. The Internet information technology and data should be used to dig the potential value of the auto racing market. Moreover, it shall cultivate this industry as a unique one, evaluating the culture and finding the main factors of why Chinese auto racing industry is very important. To publicize auto racing industry, China can also make full use of the sport column of television, radio and magazine and websites and videos to introduce the relevant history and culture; vigorously promote sports that are easy to carry out, such as car leisure travel, camping cars, car entertainment show, recreation experience, theme amusement, auto racing exhibition, museum, theme park to reduce barriers to entry.

3.5 Improving independent R&D ability of domestic brands cars

With the emergence of a large number of domestic brands, domestic brand cars and especially independent brand cars shall be encouraged to participate in the auto racing sports, so as to form a positive interaction with automobile industry. The auto racing industry must base on the development level of Chinese automobile industry and use domestic cars as models to gradually increase the popularity of auto racing sports. Meanwhile, more investments should be made in positive independent researches and development, in order to improve the independent innovation ability and narrow the gap of investment in research and development between the developed countries and China. Racing cars are special in that the system is upgraded, the engine, derailleur, electrical system, luxury decoration, body weight are all designed for racing, and even the steering wheel, door handle and car seat are different. Meanwhile, IT system is not only the key factor in the success of the auto racing sports, but also a driving factor in the innovation of the auto racing. In order to meet the needs of the market development and competition, only continuous innovation in product and market can China adapt to the change of market demand. With the development of the automobile and auto racing industry, there will be more and more auto racing enterprises and relevant supporting services enterprises. Constantly acquiring new knowledge and technology will promote the spreading of the technology and knowledge within the auto racing industry. Improving the design skills is conducive to enhancing the innovation ability and competition ability. Besides, China should give full play to the role of auto racing industry associations and provide effective platform for basic research, in order to make enterprises better carry out basic researches and enhance the innovation capacity and competitive edge of China's auto racing industry.

3.6 Integrating auto racing industry and other industries

In the horizontal level, innovation should be taken as the driving force to integrate the auto racing industry with the automobile industry and stimulate the industrial transformation and upgrading; in the vertical level, the tourism industry should be integrated with the auto racing industry to develop the tourism resources, the surrounding industries, customer resources, festival activities and derivative products, and improve the attractiveness of auto racing industry. A large number of enterprises with both auto racing industries and tourism development functions should be cultivated by relying on the developed tourism market. According to the rules of industry development, China may form the value chain, service chain and supply chain with the integration of auto racing industry and tourism, adapt to the intensive, intelligent and ecological development trend of international metropolis, effectively integrate layout of the auto racing industry and the tourism functional area. Combined with training and education industry is the way to carry out the training of motor racing driver's license, maintenance training, management of auto racing field, etc. Finally, China may involve the cultural creative industries to develop a large number of auto racing industry products, including automotive Museum, automotive Science Museum (R&D), transportation education theme pavilion, film, animation, games and visual art, so as to promote the development of the auto racing industry.

4 Conclusions and Prospects

This paper analyzes the status of China's auto racing industry, deeply explores its shortcomings, learns successful experience from developed countries, and puts forward relevant countermeasures and

suggestions from the perspective of governmental policy supports, auto racing culture, training system of industry talents, operation system, the enhancing of the local auto brands and its competitiveness, and integration with other industries and so on. The auto racing industry is both an opportunity and a challenge for China. Therefore, China should seize the opportunity, make breakthroughs in the key technology of domestic cars, promote the sustainable development of China's automobile industry, and enhance the international competitiveness. In the future, further researches should be done on the post-service market, the industry cluster, talent management, event management, leading roles of the auto racing industry in the development of regional economy and its evaluation system.

Theorizing a Boundary Condition of the Relationship Between Human Resource Management Practices and Turnover Intention: A Proposed Model

Kabiru Maitama Kura

Department of Business Administration and Management
Federal Polytechnic Kaura-Namoda, Kaura-Namoda, Zamfara State, Nigeria, 882231
(E-mail: kmkura@gmail.com)

Abstract: Following a comprehensive review of the extant literature on human resource management (HRM) and organizational behaviour, this paper proposes a conceptual model that highlights the role of contextual factor in affecting HRM practices-turnover intention relationships. More specifically, we propose that perceived organisational politics may play a moderating role between HRM practices and employees' turnover intention. Propositions and directions for future research on employees' turnover decisions are also offered.

Key words: HRM practices; Organisational politics; Turnover intention; Social exchange theory; Proposed model

1 Introduction

Employee turnover has become a major concern for academics and practitioners alike (Deery, Nath, & Walsh, 2013; Korunka, Hoonakker, & Carayon, 2008; Popoola, Nnadozie, & Moses, 2013). To understand the underlying causes of employee turnover, researchers have suggested several factors from a number of theoretical perspectives. To date, some of the factors that have been advanced include, ethical climate (Mulki, Jaramillo, & Locander, 2008), job satisfaction (Kuo, Lin, & Li, 2014), quality of work life (Suriyent, Ramayah, Lo, & Tarmizi, 2014), work related stress (Jones, Chonko, Rangarajan, & Roberts, 2007; Yun, Hwang, & Lynch, 2015), work group (Kruzich, Mienko, & Courtney, 2014), work-family conflict (Nohe & Sonntag, 2014), perceived external prestige (Ciftcioglu, 2010), job embeddedness (Mitchell, Holtom, Lee, Sablinski, & Erez, 2001; Yang, Ma, & Hu, 2011), leadership styles, (Peachey, Burton, & Wells, 2014), and organizational justice, among others (DeConinck & Stilwell, 2004).

Additionally, research suggests that HRM practices, which is characterized by promotion, compensation, and evaluation practices, among others play an important role in understanding employees' turnover decision (e.g., Ahmad & Schroeder, 2003; Demo, Neiva, Nunes, & Rozzett, 2012; Fey & Björkman, 2001; Huselid, 1995; Ngo, Turban, Lau, & Lui, 1998; Pfeffer, 1998; Thang & Quang, 2005). Despite such accumulating research evidence supporting the link between HRM practices and employee's turnover intention, little is known regarding the conditions that determine when and how HRM practices affect individual attitudes' and behaviours (Joarder, Sharif, & Ahmmed, 2011). Hence, this gap in the literature suggests that more studies are needed to understand the role of moderating variables on the link between HRM practices and employee's turnover intention. The purpose of this paper was to propose a model on whether perceived organisational politics play a moderating role on the relationship between human resource management practices and turnover intention.

2 Literature Review

2.1 Human resource management practices and turnover intentions

Human resource management Practices refer to "all practices (e.g. annual performance appraisals), specific policies (e.g. equal opportunities), tools (e.g. employee surveys) or techniques (e.g. management by objectives) that contribute to managing human resources in an organisation" (Petersitzke, 2009, p. 1). Literature suggests that HRM Practices is a multi-dimensional construct consisting of several dimensions, ranging from two dimensions (e.g., Baughn, Ward, & Buchanan, 2004) to eight dimensions, or even more (e.g., Beechler, Najjar, Stucker, & Bird, 1996; Gavino, Wayne, & Erdogan, 2012; Theriou & Chatzoglou, 2009). Previous studies have found mixed results in the relation between HRM practices and employees' turnover intention. For example, with two samples comprising of department store salespeople and insurance agents, respectively, Allen, Shore, and Griffeth (2003) examined the role of supportive HRM practices (participation in decision making, fairness of rewards,

and growth opportunities) in explaining turnover intention. Using structural equation modeling, they found that HRM practices were negatively correlated with voluntary turnover in both samples of employees. In the same vein, Paré and Tremblay (2007) showed that high-involvement human resources practices were found to be significant determinant of Information Technology Professionals' turnover intention. Chew and Chan (2008) reported a significant and negative relationship between HRM practices (i.e., remuneration, recognition, training and career development) and intention to stay among 457 employees across nine Australian organizations.

In a sample of 412 employees in Netherlands, Boon, Den Hartog, Boselie, and Paauwe (2011) linked employee perceptions of a broad set of HRM practices, such as training and development, performance appraisal, and employment security with employee outcomes. They found significant and negative relationship between HRM practices and intention to leave. Relatedly, with a sample of 457 employees working in various sectors in Malaysia, Juhdi, Pa'wan, and Hansaram (2013) tested whether HRM practices (career management, performance appraisal, and compensation) have any significant influence on turnover intention. While performance appraisal and compensation were found to be significantly related to turnover intention, however, multiple regression analyses indicated that career management does not have any significant effect on turnover intention. In a cross-sectional study, Watty-Benjamin and Udechukwu (2014) examined whether HRM practices were related to intentions to leave among Virgin Island's public sector employees. Unexpectedly, the results of multiple regression analysis indicated that HRM practices were not significant predictors of turnover intention. To replicate previous findings, we advanced the following proposition:

Proposition 1: Human resource management practices are negatively related to employees' turnover intention.

2.2 Perceived organisational politics as a moderator

As noted in the preceding section, previous studies examining the relationship between HRM practices and employees' turnover intention have reported mixed findings. These inconsistencies suggest the need for moderator variables to affect HRM practices - turnover intention relationships. Hence, we suggest perceived organisational politics as a moderating variable worthy of incorporation into our proposed model. Perceived organisational politics represent "an individual's subjective evaluation about the extent to which the work environment is characterized by co-workers and supervisors who demonstrate self-serving behaviour" (Ferris, Harrell-Cook, & Dulebohn, 2000, p. 90). Several studies have examined the effect of organisational politics on employees' turnover intention. Vigoda (2000) examined the relationship between perception of organizational politics and work outcomes in a survey of 303 public sector employees in Israel. The study established a significant and positive relationship between perception of organizational politics and intention of exit. In a similar vein, Huang, Chuang and Lin (2003) found that perceived organizational politics was inversely related to turnover intention. Organizational politics has also been shown to relate negatively to turnover intention (Harris, Andrews, & Kacmar, 2007). A recent meta-analytic study by Bedi and Schat (2013) has confirmed a significant and negative relationship between perceived organizational politics and turnover intention.

While extant research has demonstrated negative relationship between perceived organizational politics and employees' turnover intention, very few studies have theorized the boundary condition of the relationship between HRM practices and employees' turnover intention. We suggest that perceived organisational politics might play a moderating role between HRM practices and employees' turnover intention. Social exchange theory (Blau, 1964) provides the theoretical basis for identifying the boundary condition that determine when and how HRM practices affect employees' turnover intention. Social exchange theory (1964) posits that perception of high levels of organizational politics may attenuate the effects of HRM practices on employees' turnover intention. For example, perceptions of HRM practices are distinguishing factors in decreasing employees' turnover intention when the level of perceived organizational politics is low. In contrast, when individuals perceive high levels of organizational politics, HRM practices may be less important in decreasing employees' turnover intention (Hochwarter, Witt, & Kacmar, 2000).

Furthermore, while we suggest perceived organizational politics as a boundary condition that determine when and how HRM practices affect employees' turnover intention, one cannot rule out the possibility that HRM practices may play a moderating role between perceived organizational politics and employees' turnover intention. Thus, it is possible that perceptions of organizational politics are more likely to predict turnover intention for individuals who perceive unfavourable HRM practices as compared to those who perceive such practices to be favourable. Based on the aforementioned theoretical and empirical contributions, the following proposition is advanced:

Proposition 2: Perceived organisational politics moderate the relationship between HRM practices and employees' turnover intention. This relationship is stronger (i.e., more negative) when individuals perceive low levels of organizational politics than when the level of organizational politics is high.

Based on theory and extant research (Allen et al., 2003; Blau, 1964; Boon et al., 2011; Harris et al., 2007; Huang et al., 2003; Juhdi et al., 2013; Paré & Tremblay, 2007), a conceptual model (Figure 1) has been developed. The proposed conceptual model depicts the role of perceived organizational politics in affecting HRM practices-turnover intention relationships.

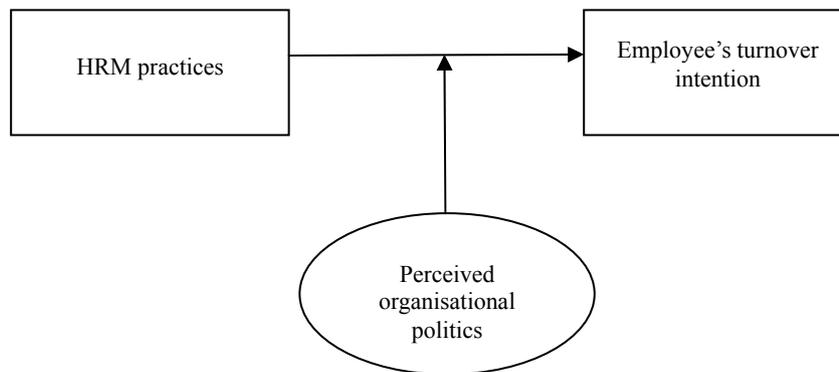

Figure 1 Conceptual Model

3 Conclusions and Directions for Future Research

The main objective of this paper was to propose a conceptual model that highlights the potential moderating role of perceived organisational politics on the relationships between HRM practices and employees' turnover intention. While extant research has examined the direct effect of HRM practices on employees' turnover intention, the findings from these studies were conflicting and inconclusive. To address this gap in the literature, the present paper suggests the need to identify a moderator variable. Thus, the overall contribution of this paper lies in the identification and incorporation of perceived organisational politics as a moderating variable between HRM practices and employees' turnover intention.

The proposed conceptual model (Figure 1) suggests some avenues for possible future research agenda. First, research could propose and test theoretical mechanisms for the postulated effects of HRM practices on employees' turnover intention. On second thought, research could develop and test a mediated moderation model in which perceived organisational politics reflect the moderator and its role may be mediated by other psychological variable (Hayes, 2013; Muller, Judd, & Yzerbyt, 2005). Finally, future research could consider the effects of HRM practices on employees' turnover intention across cultures. For example, Future studies could examine whether the effect of HRM practices on employees' turnover intention is stronger in cultures that are characterized by collectivism rather than individualistic.

Research on the Upgrading Path of Government Management Mechanism Through Public Participation in Network Environment

Yang Aijie, Yu Jiejie

Hubei Collaboration Innovation Center for Early Warning and Emergency Response Technology,
School of Marxism, Wuhan University of Technology, Wuhan, P. R. China, 430070
(E-mail: ajiang@whut.edu.cn, 2393031890@qq.com)

Abstract: With unique advantages, the Internet has rapidly developed and popularized through the globe, which is not only profoundly changing the lives of ordinary people, but also gradually changing the management of government. This paper analyzes the opportunities and challenges of the government management because of the people participation in the network environment, proposes the path of mechanism innovation of government management based on popular participation in the network environment: to enhance the openness of government network to strengthen the positive network interaction with the public; to strengthen government network response mechanisms based on concerning the network hotspot of public participation; to continuously improve the response mechanism to copy emergencies; to improve the capacity of standardize network order; to accelerate the transformation of the concept of social management of government departments; to strengthen administrative accountability system of government management.

Key words: Network media; Public participation; Government management; Innovation

1 Introduction

With the rapid development of information technology, the network has gradually penetrated into all aspects of social life. It not only affects people's lifestyles, but also government agencies can form open public space for public participation through websites, forums and other forms of interactive network. The network provides a platform for government administration. The public participation in the network environment is treated as a new way to increase government management science level and improve the public satisfaction, at the same time it plays an important role in promoting democratic decision-making process of government administration. Puluoge (1998) stated that internet joins people together who never participate in any group and is the web of social relations. David Miller (2002) believed that Internet is such a great political invention that no clear central authority can single-handedly magnificent structure. Currently, the studies on the public participation the network environments are mostly in the view of government to explore how the government can enhance its management mechanism through the public network participation.

2 The Opportunities of Government Management Innovation Brought by the Public Network Participation

2.1 The public network participation can help to transform the ways of government govern

Because Internet has changed the channels of information access, the information acquisition and transmission has become quick and convenient. The government makes use of network media instead of the traditional "face to face" government service, whereas the development of public network participation make some traditional functions of the government weaken. Some people and organizations work together by network participation to solve many affairs which manage and control by the government in traditional society, and makes government management more scientific and democratic, which will improve administrative agencies more efficiency and accelerate the construction speed from "management-oriented government" to "service-oriented government". It is foundation of government management innovation that how to establish the focus of the government management and timely complete to transfer "omnipotent government" to "limited government". Therefore, the government management needs to meet the needs of economic and social development and adjusts the management range from "service-oriented government," to "control government".

2.2 The public network participation will help to improve scientific and democracy in the course of government decision-making

Administrative decision refers to that the government makes analysis, judgments, choices and decision of state official affairs for executing administrative functions. (Wang Aihong, 2004) The information is the foundation of scientific administrative decision-making, but due to the limitations of

various factors, the information is not complete and truly enters the system of government, which impacts scientific and administrative of decision-making. The development of the Internet makes information diversifying, the traditional government makes decisions behind closed doors, and rarely seek public comments or suggestions. In today's information era, the government initiatives will publish to the Internet to seek public opinions before the decision making, the public can make use a variety of network channels to issue and express their views and opinions on public affairs and feedback to the Internet, which makes up for the lack of government information gathering, and the government will amend and improve timely and effectively the decisions by feeding back information through public network, which promotes the democratization level of executive decision to achieve the public participation in the management.

2.3 The public network participation will promote the transparency of government management process

From the general point of view of the government information disclosure, the transparent government refers to that the activities and results of the country's legislative, administrative, judicial making and decision documents, data and information should be in accordance with the provisions and procedures of the law, have an obligation to open to the public and society within a certain range (Yang Jianguo,2010). The transparent government is not the individual behavior of the government, but bi-directional behaviors between the government and citizens. In order to be truly transparent, the public must be participation in these processes. The public can keep abreast of government-related information through the network media, grasp the latest government dynamic to better understand the views and attitudes of government officials to policy, express their requirements to public management activities and timely feedback on satisfaction with government services. The government also breaks the traditional letters and other ways, makes use of the Internet to quickly respond to the demands of the public interest, which improves the government's administrative efficiency and transparency, achieves the information exchange between the government and the public, so enhance social service capabilities of the government management.

2.4 The public network participation will help to improve the ability of government management staff

As the number of Internet users is increasing, the requirements of governments and staff at all levels are also rising, they should learn to deal with the network, maintaining the good image of the government, which is the important source of government authority and legitimate, is the foundation of political consensus and political stability of society; is a key factor of the implementation of government policies and policy effects; is the indispensable support forces of economic development and improves the moral standards of society and social construction of spiritual civilization force. Since the network monitoring is fewer restrictions and the network's entrance threshold is low, the Internet network can reduce the space of "black-box operation", which makes government officials not easily deviate from the policy in the course of implementing public policy and adhere to the correct concept of governance which causes more equitable and orderly adjustment in the distribution of benefits (Zhong Dongsheng,2011). To a certain extent, it makes up for the lack of effective control of public power and helps to improve the government's credibility.

3 The Challenges of Government Management Innovation Brought by the Public Network Participation

3.1 The public network participation impacts on government authority

Network media is interactive propagation of "many to many". The public can participate by issuing, comments, reproduced and copy, etc., so they all-round involve in the course of government management. Because the network has the advantage of openness, freedom of expression, every people can become a reporter to spread his opinions of new social events or his individual experience, and provide more information. At the same time, because the network has virtual and anonymity, some criminals on the Internet can spread rumors, which seriously impacts on social stability and economic development and brings the government a serious challenge. Therefore, the network media has two sides: on the one hand, the network can effectively maintain a good image of the government and the government's authority; on the other hand, the network will bring some impact to the government network image. The spreading content of network has diversity, which requires the government network construction should make great progresses in accordance with the times. The checks in the traditional sense make little use for the network, because the news once in a network just like ink drop into water

quickly spread, cannot be completely blocked or blocked, which this feature determines that the image of the government crisis in the event of negative news will be widely spread quickly on the Internet to damage the government's image, and the tarnished image in a short time is difficult to repair.

3.2 The public network participation requires enhance the interaction of government management

While the government holds a lot of information, most government websites have been set up contained very little information and the content is just a provision from the paper moved to the network, such as the settings, functions and leadership information of institutional departments, the list of staff, policies and regulations. Although some government websites set up relatively complete, they more emphasis on their static presentation features of the web page, the online information update is not timely, the feedback of public issues is not in place, only to answer and reply, so the disjointing between online and offline is quite serious. Even after the event of a crisis, some government's departments may take delete network posts and seal website stations and other means to suppress the people's speech. Once the government conceals the truth, it is not conducive to resolve the matter, but makes the mistrust between the public and the government, which reduces the government's credibility and makes these events beyond the control. There are some government's websites make use of the online survey, but most of survey questions are a mere formality and lack of the depth investigation, therefore, the close relationship between public life and government's websites should be improved.

3.3 The public network participation influences the social mainstream ideology

Nowadays, with the devolvement of economic globalization, the increasing of international exchanges and increasingly developed communication technology, various cultural ideologies collide with each other. Some of the western countries tend to use the network to delivery their own ideology and values to all corners of the world in order to strengthen cultural aggression. The culture is a concentrated expression of the nation full of wisdom and civilization and maintains a state and national spiritual bond. There are distinct features between foreign countries and China, such as cultural customs, public's behaviors and values. The entry of foreign culture make the Chinese know a lot of western social philosophy, but these ideas are not always consistent with our traditional value system, which inevitable penetrates into the native culture and impacts of the public's way of thinking. These ideas may make the public to form inappropriate values, which brings adverse impact on the government management.

4 The Innovation of Government Management Mechanism in Respective of Public Network Participation

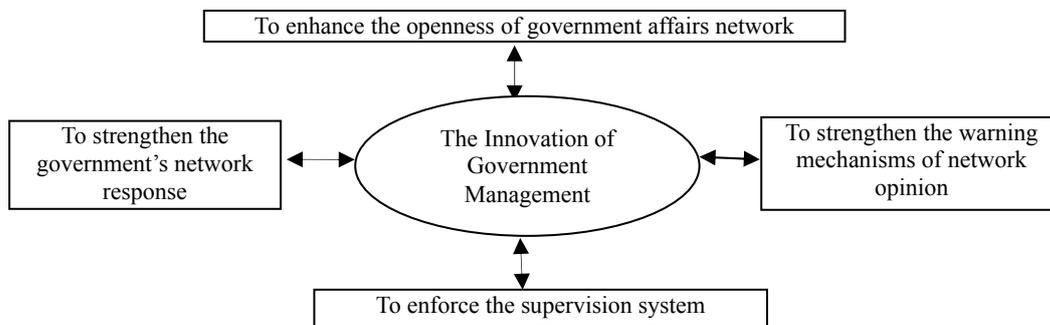

Figure 1 The Innovation of Government Management Mechanism in Network Environment

4.1 To enhance positive network interaction with the public by strengthening the openness of government affairs network

In some extend, the Internet between the government and the public play an important interactive role, the publically discussions gradually condense into a social force, which will improve the ability of public to participate in politics. The local officials use the network language to interact, understand public opinion through the network platform, which helps them to rational treat and accept the views of the masses and livelihood of hot spots. For events and issues of great concern to the public, the government officials should actively respond in order to reach the real two-way communication. Because of the unbalanced social development, there are a number of relatively backward areas of economic and cultural level in China, where information infrastructure is not complete, relevant social

information cannot be communicated in a timely manner to result in that the corresponding social problems cannot be solved effectively. Therefore, the government in future network construction should increase fund and technology investment in central and western areas, fully make use of the network platform to promote the nation's line, principles and policies to minimize the impact of asymmetric information brought to government, keep abreast of the needs of different public in the region so that the public can better supervise the government and limit the scope of the exercise of government power and the government's ability centralized control in order to lay a solid foundation of the future "national politics".(Bai Ranran ,2010)

4.2 To strengthen the network response mechanisms of the government by focusing on network hotspot of popular participation

The government portal websites are the government's face. From the relations between the government and public, the understanding speed and breadth of public policy for the public through the network is much larger than tradition governmental documents. The public know the government decision-making by the government website without paper copies, which make the understanding very low cost and the public is more willing to accept. First, as the main platform for public in politics, the government portal websites let each ordinary public to express opinions as possible as freedom and can be heard by other people to the concern their interest demands of different groups. Second, the network interaction can make normalization of the public network political participation. The governments at all levels will know the network politics as a routine, regularly communicate with the public in Internet. Finally, the governments set up the special management agency of mass political participation to improve information collection, screening, sorting and reporting, strengthen the government websites to enhance their influence in guiding public opinions, timely and accurately release authoritative news and clarify false news. (Jiang Shengyao,2012) The network development of government management depends largely on the quality structure of the officials and strengthens the online service to interpret national policies and explain social hot topics so as to make public work more quickly and appreciate the service-oriented government to bring their own benefits.

4.3 To strengthen warning mechanisms by improve the ability to copy emergencies and guideline the network order

Because the development of network government can make more uncertainties, the government will face more interest demands of pluralistic communities and coordinate more and more conflicts between different groups, which increase the difficulty of the government administration. It is necessary to be aware rationally of two sides of public network politics participation. The authenticity and objectivity of network public opinion should be known, and the opacity and deceptive also be found. In particular, many network "navy" in the online statement may make chaos, spread rumors and malicious speculation in the Internet world to seriously affect the social stability. When the network information deviate from the public's wills, it is necessary to network monitoring effectively. First of all, the network media should improve the self-management capacity and strengthen the moral and ethical standards. Secondly, it is necessary to guide the public to analyze information to determine the authenticity, improve their ability to resist false information and treat seriously the spreaders of bad information. In order to protect public's privacy and legitimate rights and interests, the relative network should implement the real-name register system to help to improve the authenticity of network information, at the same time, the Internet laws and regulations should be improved through legislation in order to inhibit effectively the negative effects of online speeches and maintain the legitimacy of the network order.

4.4 To enhance uncorrupted government building by enforce the supervision to network

The content focused by public in the network is rich and varied, including social events, social problems, social conflicts, of which the most important is the integrity of leading cadres. For a long time, our public strong depends on the government. The public usually think that the government should help public solve problems, as long as there is one thing the government did not do well, the public will think it is the government's dereliction of duty. The Internet has given the public the right way to express dissatisfaction with the government. Faced with corruption of government officials, the original supervisory system under government control lacks the regulatory effectiveness. The public take advantage of network to monitor the officials and build a new social atmosphere. At the same time, because the public can supervise government officials through the network, the executive power of the government and the efficiency of the regulation will be increased, so that the social forces will format which is any organization or individual cannot be ignored, so that government offices will be sunlight, transparent and truly.

4.5 To accelerate the transformation of government social management concept

The primary condition of strengthening social management innovation is to accelerate the transformation of social management philosophy; especially the government organs should actively change ideas from diet management and human management to legal management in order to be fair and impartial public administration. The government managers should make the society manage from an ordinary working to developing into a true serve work for the public. The government's way should be changed from the traditional single system management to integrate social resources and social forces by means of the development of social organizations and citizen force to increase community participation in social management; and then make benign supervision of the society, public opinion to prevent crises and control the problem from the start so as to avoid the adverse impact on the stability of the society. The traditional management means of rigid target, hard requirements and ways become real diversified applications and macro-control of legal, moral, economic, technical and other means to deal with the full range of issues. Only by accelerating the transformation of the concept of social management and promote social management innovation, can avoid wasting of social resources and overlapping administrative management and blind spots, which help to comply scientific governance in all aspects of current society.

4.6 To improve the administrative supervision accountability system of government management

At present, with the development of laws, the system of administrative accountability and the normal of the public network participation will be more strengthened. It requires supervision system and various supervision measures to improve and implement, so the relevant functions departments can administrate according to laws to promote the formation of law departments and government. The key of administrative accountability system under public network political participation is to strengthen the administrative supervision of the government's ability to authority and improve the fairness and credibility of the government's execution by means of law enforcement tools. First, the decisions of social management innovation should be based on relevant laws and regulations to implement the law responsibility system, and the managers should actively listen to the public opinions and assume the responsibility of the social management and correct the error. Second, the administrative supervision and accountability system need change and innovation in accordance with existing social conditions because the traditional management means cannot completely solve the practical problems occurring in contemporary society, at the same time, need to educate the government officials to change traditions views. In short, from the perspective of social management innovation system to strengthen the administrative supervision accountability, it requires to clear and specific responsibilities of each administration and to refine the implementation requirements and the management range. By means of combining executive management with social accountability, it is like to strengthen the feasibility and effectiveness of the administrative supervision accountability and social management, which is more conducive to the development of political participation under the network environment.

5 Conclusions

Because of the development and increasingly perfect of the network technology, more and more public participate in the government management through the network, which not only provides the opportunities to improve the decision's democratization and transparency, but also faces the challenges of authoritative, interactivity and social mainstream consciousness. Faced with these opportunities and challenges, the government needs to strengthen the network openness, improve political participation and enthusiasm of the public while building an uncorrupted government and better supervision. To strengthen early warning systems and network monitoring will prevent endless disinformation to disturb social order and adopt reasonable response of public's real proposals.

Performance Measurement in Halal Industry: An Initial Proposed Concept Based on Maqasid Shariah

Faried Kurnia Rahman, M. Ali Tareq, Akbariah Mahdzir

Malaysia – Japan International Institute of Technology

(E-mail: fariedkr@gmail.com; tareq.mjiit@gmail.com; akbariah.kl@utm.my)

Abstract: Halal industry is one of the most growing industries in the world. Halal industry refers to the industry which is in line with Islamic principles and requirements. The emergence of this industry aims to fulfill the need of Islamic compliance products and services. Surprisingly, the industry has been growing in both muslim and non-muslim countries. Assessing the performance of the industry would be notable to ensure that it obtains its objectives. The proper performance measurement should highlight both business perspective and religious aspects. This is a conceptual paper aiming to propose an initial performance measurement concept based on Islamic objectives (Maqashid Al-Shariah). Referring to some previous studies, this paper proposed twelve ratios as performance proxies for halal industry.

Key words: Performance; Maqasid; Halal industry; Measurement; Firm

1 Introduction

The development of Islamic compliant industries has been increasing significantly nowadays. Starting from financial industry, the interest in Islamic economy is getting broad into other industries including food industry, pharmaceutical, and tourism industry. The terminology of “halal industries” defines the industries which comply with Islamic law and requirements. Halal industries are not only aimed for Muslim, but also for the non-Muslims (Laldin and Furqani, 2013). Halal does not only concern on the product itself, but it encompasses many aspects. It has already become a new paradigm in a business where it concerns more on sustainability, not merely a religious ritual (Shariff, et al, 2014).

Performance of halal industry should be measured using appropriate method focusing on business perspective and religious perspective as well. Economic condition always changes and all firms must adapt with the changing environment, including “halal” firms. The “halal” firms refer to the firms which do not only produce halal product and service, but also does not violate Islamic law in all aspects, especially its financial aspect. Islam assists the firms to adapt with the changes which urges creativity, dynamism, and flexibility (T. Al-mubarak and N. M. Osmani, 2010). The adaptation should be aimed to reach the objectives of life in Islam called as Maqasid Al-Shariah (Ascarya, et al, 2014). Maqasid Al-Shariah depicts the the holistic view of Islam as a guidance of life for the individual and society (Dusuki and Abozaid, 2007), including business entities (Abdullah, 2012). In recent years, the discussions on the objectives of maqasid al-shariah has been increasing significantly in Islamic finance.

The term of Maqasid comes from arabic word means a principle, purpose, objective, intent, or goal (Kasri and Ahmed, 2015). Combined with the term “al shariah”, Abdul Aziz and Mohamad (2013) defines it as “..the goals and objectives for the legislation of the rules of Islam or simply The Objectives of the Islamic Law..” (Abdul Aziz and Mohamad, 2013). Dusuki and Bouheraoua (2011) explained two most prominent definition of maqasid al-shariah, which are from Abu Hamid al-Ghazali and Al-Satibi (Dusuki and Bouheraoua, 2011). According to Al-Ghazali, maqasid al-shariah is defined as a concern with safeguarding faith (dien), lives (nafs), intellect (‘aql), posterity (nasl), and wealth (maal). And, Al-Satibi defines maqasid al-shariah as “..The primary goal of the sharīah is to free man from the grip of his own whims and fancies, so that he may be the servant of Allah by choice, just as he is one without it..”.

The development of *maqasid* can be divided into three phases (Kasri, 2016). First phase is the formation period where the foundation of *maqasid* was built by the jurists. Second phase is the major development period. In this phase, many scholars paid more their attention to develop the fundamental of *maqasid* theory. Kasri (2015) stated that the last phase as “the extention period” where its theory was developed to compromise with the complexities of life.

Imam Al-Ghazali divided maqasid al-shariah into five important elements, which are (Ascarya,et al, 2014):

- a. Safeguarding the faith
- b. Safeguarding the life
- c. Safeguarding the intellect
- d. Safeguarding the lineage

e. Safeguarding the wealth

Al-Satibi is the most prominent scholar in developing the theory of maqasid where he could combine the theory of ushl fiqh and maqasid al-shariah (Ismail, 2014). Al-Satibi classified maqasid al-shariah into two categories, which are shariah objectives and human objectives(Ascarya,et al, 2014; Ismail, 2014). Shariah objectives consist of three parts, such as necessities, complements, and embellishments.

Other prominent scholar on maqasid al-shariah theory is Abu Zahra. He classified the objectives of maqasid into three broad objectives, such as:

- a. Educating the individual
- b. Establishing justice
- c. Promoting Welfare

A number of previous studies use these objectives to develop the performance indicators. Mohammed, Razak, & Taib (2008) tries to generate Abu Zahra's theory into more measurable indicators (Mohammed, et al, 2008). Their framework was developed to measure the performance of Islamic bank. Since then, their model has been used by many researchers to measure Islamic bank's performance in many countries.

This conceptual paper attempts to develop Islamic performance measurement concept for shariah compliant firms by adopting Mohammed, Razak, and Taib's framework. It will propose new approach in performance measurement which is applicable for non-banking institutions as part of halal industry. The remainder of this paper is divided into four sections. Firstly, the paper discusses on the *maqasid* and performance in ideal condition and the practice. The following section discusses the current performance measurement in halal industry which is followed by the authors' proposed concept of performance measurement. The last section concludes the overall discussion.

2 Maqashid and Performance Measurement: Ideal Versus Reality

In general, the firm performance is measured using financial indicators or market value if it is listed in the capital market. The firms which are implementing the Islamic economic system is also measured in the same way. Financial indicators become the main benchmark to evaluate the firm performance. Nevertheless, the financial indicators alone are not sufficient to measure firm performance.

Since the last decade, the awareness on "religious" performance has been increasing significantly. Many researchers attempt to use *maqasid al-shariah* framework to develop firm performance measurement. This measurement aims to evaluate the level of firm performance in upholding Islamic values and objectives. Unfortunately, most of the past studies focus on how to measure the performance in Islamic banking sector. The most referred research in this area is a research that was done by Mohamed, Razak, and Taib in 2008. Mohammed *et al* proposed the performance measurement using Abu Zahra's theory on maqasid (Mohammed, et al, 2008).

Table 1 Framework on Islamic Banking Performance Measurement

Objectives	Dimension	Elements	Performance Ratios
Educating Individual	Advancement Of Knowledge	Education grant	Education grant/total income
		Research	Research expense/total expense
	Instilling new skills and improvements	training	Training Expense/total expense
	Creating Awareness of Islamic banking	Publicity	Publicity expense/total expense
Establishing Justice	Fair dealings	Fair Returns	profit/ total income
	Affordable products and services	Affordable price	Bad debt/ total investment services
	Elimination of injustices	Interest free product	Interest free income/ total income
Maslahah	Profitability	Profit ratios	Net profit/ total asset
	Redistribution of income & wealth	personal income	Zakah/ Net Income
	Investment in vital real sector	Investment ratios in real sector	Investment deposit/total deposit

Source: Mohammed *et al* (2008)

The work of Mohammed et al (2008) was adopted by numerous researchers to measure the performance of Islamic banks, microcredits, *baitul maal wa tamwil*, social performance, and soundness of the Islamic banks (Jazil and Syahrudin, 2013; Antonio, 2012; Asutay, 2015; Abdillah, 2013; Syahputra, 2011). Instead of to measure organization or business entities, the other frameworks that explore the *maqasid al shariah* are dominantly used to measure the individual performance or to measure non-performance aspect, such as biotechnology, education system, financing model, and corporate social responsibility (Md Dali, 2016; Arafah, et al, 2016; Budiman, 2015; Dikko and A. Abdul Ghani, 2015; Sulayman, 2014; ohd Saifuddeen, 2014).

It is crucial to the understand *maqasid al-shariah* in business organization, especially firms producing halal products and services. It should be underlined that halal industry disseminates a new paradigm for the stakeholders where maximum profit is not the sole objective in business. It must also be followed by the initiatives ensuring spiritual achievements.

3 Performance Measurement in Halal Industry

Having a great understanding and implementation on halal concept is the duty for every muslims (Wilson and Liu, 2010). There should be appropriate paradigm when we define "halal industry". Islam does not only consider the end-product, but also considers the process. We should define "halal industry" as the industry which is fully managed in shariah framework, including how they finance their operation. Halal also can be defined as non-haram product and services. There are two types of haram (Ali, Hussain, 2013). First, *haram li dzatihi* means haram in its essence. Halal industry is prohibited to produce non-halal products or services. Second, *haram li ghayrihi* means prohibition due to external factors. This also can refer to how a firm obtains its sources in producing the products or services. In this matter, this is including on how the firm finances itself. Halal industry as part of Islamic economic system should be free from usuary, speculation and excessive uncertainty in its operation (Ascarya, et al, 2014). Therefore, the firms in "halal industry" must be the firms which do not only produce non-haram products or services but also free from usuary, speculation, and uncertainty. It is called as "shariah compliant" firms.

As a business organization, shariah compliant firms are expected to promote Islamic values in their operation. Performance measurement for shariah compliant firms have not been developed yet. Generally, performance measurement of the firms in halal industries are measured by common performance measurement, which focus on financial aspects. Financial ratios (ROA, ROE, P/S ratio, etc) are commonly used to measure the performance. For shariah compliant firms, there is an urge to developed the performance measurement which does not only use financial ratios, but also considers a new paradigm where it encompasses economic, environmental, and social indicators (Antonio, 2012).

4 Proposing Performance Measurement in Halal Industry

It is an urge to have appropriate measurement which indicate the performance of shariah compliant firms. The measurement will serve as a benchmark which indicates the level of firm persistency sustaining Islamic values. It is important for the firm to have a performance measurement which is developed from Islamic principles approach. The measurement below proposed by adopting previous the Performance Measurement based on *Maqasid al-Shariah* (PMMS) model in Islamic banking.

The first objective of *maqasid al-shariah* is educating individual which refers to the firm's effort to improve the quality of human resources by maintaining their knowledge and educating their stakeholders. There are three dimensions in this objective, which are advancement of knowledge, skill improvement, and creating awareness of shariah comply firms. To measure these dimensions, there are four pecuniary indicators. Education and external research grant and internal research activities measure the advancement of knowledge dimension. The advancement of knowledge indicators shows the level of firm interest in internal and external human resources quality. Employee training indicator explains the skill improvement dimension. It represents the firm concern on the quality of their employees individually. Awareness of shariah compliant firm will be measured by publicity activities. This indicator shows the firm effort to educate the stakeholders regarding firm's objective and products or services.

Second part of the index is to reach the objective of establishing justice. Justice in this paper refers to justice in term of economy. To measure this objective, there are two dimensions which are measured using three indicators. The dimensions are "fulfill the obligation" and "elimination of negative element". The "fulfill the obligation" dimension is measured using the contribution to the government and the

contribution to the employee. The “low non-halal income” indicator indicates firm’s effort to eliminate the negative element.

Table 2 Proposed Performance Measurement

Objectives	Dimension for Non-Banking “Shariah Comply” Firms	Elements	Performance Ratios	Reference
Educating Individual	Advancement of Knowledge	Education and research grant	Scholarship + research grant/ Total Expenses	Author’s recommendation
		research	R & D Expense/Total Expenses	(Mohammed & Taib, 2009; Antonio, Sanrego, & Taufiq, 2012)
	skills improvement	Training	Training Expense/Total Expenses	(Mostafa & Taib, 2009; Antonio, Sanrego, & Taufiq, 2012)
	Awareness of Shariah comply firms	Publicity	Publicity Expense/Total expenses	(Mostafa & Taib, 2009; Antonio, Sanrego, & Taufiq, 2012)
Establishing Justice	Fulfill the obligation	Contribution to the government	Income Tax/Operational Income	(Ascarya, Sukmana, Rahmawati, & Anwar, 2014)
		Contribution to the employee	(Personnel Expense + Tantiem + Pension Expense)/Total Expenses	(Ascarya, Sukmana, Rahmawati, & Anwar, 2014)
	Elimination of Negative element	Low non-halal income	Non-halal income / Total Income	Author’s recommendation
Maslahah	Financial return	Profitability	Net Income/Total Assets	(Mostafa & Taib, 2009; Antonio, Sanrego, & Taufiq, 2012)
	Social Return	Personal distribution	Zakah/Net Income	(Mostafa & Taib, 2009; Antonio, Sanrego, & Taufiq, 2012)
		Internal welfare	Avg. employee remun-Avg. directors remun/Personnel Expenses	(Ascarya, Sukmana, Rahmawati, & Anwar, 2014)
		Community Support	(Total Education Expenses + CSR fund)/Total Expenses	(Ascarya, Sukmana, Rahmawati, & Anwar, 2014) modified by author
Mutual Trust	Investment to other party	(Investment in Subsidiaries + associates) / Total investment	Author’s recommendation	

The last part of the index will measure the level of maslaha (welfare). The three dimensions are financial return, social return, and mutual trust. Financial return will be measured using profitability. As business entity, the firm should earn maximum profit to sustain in the competitive market (Ibrahim, 2014). It also shows the firm’s effort to achieve the objective of its shareholders. Social return will be measured using personal distribution, internal welfare, and community support. Social element indicates the firm’s concern on the relationship to surrounding communities. Lastly, the mutual trust dimension will be measured using investment to other party indicator. This indicator represents the firm’s trust in the ability of its stakeholders which are the subsidiaries and associates companies. In maqasid al-shariah, investment activities also play an important role (Barom, 2013). It also shows to the public the firm’s participation in real sector economy which has direct impact to the wider community.

5 Conclusions

This significance of this conceptual paper is that it proposes a new performance measurement for shariah compliant firms in halal industry. This measurement aims to assist halal industry stakeholders in

evaluating the achievement of Islamic objectives in each firm. Maqasid al-shariah framework is useful to provide a guidance consisting of economic and social perspectives. Referring to numerous studies conducted in maqasid al-shariah field, this study comes up with twelve proposed measurements for non-banking industries.

Measuring the Impact of Business Strategy in Management of Change: A Study on Causes of Psychological Contract Violation

Catherine Muthu

LIGS University LLC, 810, Honolulu, HI 96813, USA

(E-mail: cathy0935.cb@gmail.com)

Abstract: The aspect of employees' performance in an organization is pivotal. Identifying critical reasons for employees' absenteeism, resignation, theft, negative word of mouth and lack of motivation is the first level of strategy to overcome challenges. The most important asset of an organization is its employees. Diverting more focus on customers might blur the organization to identify the key areas that leads to ultimate customer satisfaction. Hence, the satisfaction initially derives from employees and thereafter transferred to customers gain and loyalty. This comes in line with intense competition in the era of technology. As many organizations are competing with each other and want to become the most preferred choice for customers. Moreover, cost of operating a business has also in a rise. The objective of every firm is to increase profit and reduce cost. Organization has opted for change management in order to overcome environmental challenges in sustaining their growth. But organizations are now facing internal challenges that focus on employees' behaviour as psychological contract are deemed to be violated by the changes. These challenges need to be addressed in order to sustain internal growth and integration, as a new game plan need to be installed to overcome challenges in change management and maintain growth.

Key words: Psychological contract violation; Employees'satisfaction; Customers'satisfaction; Communication; Leadership; Change management; Challenges

1 Introduction

In this new era of globalization, organizations have no choice but to adapt and make necessary changes in order to survive. Organizations especially multinational companies have been struggling to survive due to increased global competitors, advancement of new technological implications, rapid growth and economic downturns. Consequently, organizations have to adapt and make necessary changes and likely, employees will have to go through big changes and may have significant impacts on their psychological contract.

Organization change defined as one of the very important problem confronting organizations and has little doubt in a fast-moving and unanticipated world in organization change (Burnes, 2004). Organization change can occur based on transformational, restructuring, merger and acquisition to improve the organization's performance and effectiveness. Moreover, organizational change can also have a negative impact on individuals' perceptions of the psychological contract and this caused the psychological contract violation. Nowadays, psychological contract has been accepted as a part of the norm in Human Resources practitioners (CIPD, 2016). Psychological contract violation is defined as the realization of each organization's failure to meet its responsibility to manage ones feelings of anger, distress, injustice and mistrust (Arshad & Sparrow, 2010). The psychological contract is the foundation of the employer and employee relationship as well as it comprised belief about reciprocal obligation between these organization and employees. Psychological contract violation may occur when the organization failed to fulfil the expectations of an individual's psychological contract.

Employers and staffs have set up a systematized relationships defined constrained by such documents as terms of employment, organizational human resources policies as well as contracts (McCoy& Elwood, n.d.). Psychological contract concept has achieved noticeable attention in important texts which linked to organizational psychology, organizational behaviour as well as human resource management discourse (Akhtar& Long, 2015). Due to the difficulty of handling organization and staff relationship in existing large companies, this had progressively become more essential consideration of construct. The psychological contract appears when staffs trust on their employer which had made promises to their commitments consequently for future advantages (Akhtar& Long, 2015). Yet, these expectations commitments and perceptions of promises amongst staff as well as employer are depended on exchange relationship. However, the organisational change could cause psychological contract violation. In the era of competitive businesses, organizations expect more towards their employees whether early recruits or seniors. Early recruits also experience psychological contract violation if they

already experience impactful breaches in the psychological contract. It gets worse when the early recruits perceived the breach as a significant breach in their psychological contract such as lack or no career development, additional training and education were not provided, no support from the organization, broken impactful promises and withholding promises.

Psychological contract can be described as an unwritten assumption between organization and employees as well as it is about the content of the social exchange between both of the parties. However, these unwritten assumptions are not necessarily to share since most of the time organization and employees hold the different assumption endangers the psychological contract. In other words, the concept of the psychological contract focuses on the role of the employees' emotions and attitudes as well since both of these elements drive the employee performance and behaviour toward the work. Based on previous research, there are two types of psychological contracts, transactional and relational. Transactional contracts describe the area of monetizable exchange in which employees receives competitive wage rates, commissions, allowances and any sort of monetary promises. Relational contracts on the other hand is open-indeed, less specific terms of agreement that establish and relatively maintain relationship, such as career development and career opportunities. Both, transactional and relational referred to implicit promises that subject to change over time. Since it is termed as promises, employers are perceived to be obligated in fulfilling them generally.

The atmosphere in the organization changes can be an inadvertent effect of the change process and these might cause a violation of the psychological contract. For example, an organization with a relaxed working atmosphere could be one of the selling points since this may no longer be the case when come to the organization implementation phase. Furthermore, employees might feel insure about their career and future since employees starts wondering about more expectations that will be violated. The implementation process of organization changes such as communication, support or participation might lead to some consequences for the psychological contract. Other than that, the way that the organization agree with the change process need to concern on who should be involved in the planning of the change, what information should be provided and which support need to be given for the change. Those factors considered as the potential violations of psychological contract.

Employers are also victims of psychological contract violation based on disruptions caused by affected employees. Theft, employees exit and refusal to carry out duties are some of the major impact on employers (Nadin & Williams, 2012). The nature of psychological contracts and organisational attachments for both permanent employees and forced temporary workers is complex. Permanent employees generally continue to exhibit relational forms of attachment to the organisation. These, they believe, are reciprocated by the organisation. Reactions from forced temporary workers are more varied. After a period of denial, some develop a more calculative approach to their interactions so as to focus only on temporary payment of wages and not in long term growth or loyalty as the temporary workers appear to recognise that their future direction is no longer a concern of the organisation. However, forced temporary workers experience violations of psychological contract.

Therefore, the purpose of the paper is to find out how and why the organizational change cause to psychological contract violation and ways to overcome these organizational challenges.

2 Psychological Contract Violation

There are two types of psychological contract, transactional contracts and relational contracts. Transactional contracts focus on short term, narrow, specific and limited promises and obligations. Individuals focus primarily on extrinsic outcomes such as pay. Contingent workers have transactional psychological contract. Whereas, relational contracts focus on long term, general and evolving, extensive and broad promises and obligations. Relational contract implies a mutual commitment on the part of both parties. Extrinsic outcomes are still important but there are also intrinsic factors involved.

Consequences of broken contract leads to poor motivation and performance, negative moods and emotions, job dissatisfaction and the intention to quit. The larger the perceived violation of the psychological contract, the more intense the potential negative reactions.

There are several notions that related to psychological violation such as technology, communication, downsizing, organisational structure and recognition on performance, job security, lack of support, rewards and pay system, frequency, type and impact, lack of information, fear of losing power, lack of leadership intervention and top-down change.

2.1 Technology

The changes in every organizational setting had the objectives included working smarter and

streamline, cost reduction, increase efficiency, faster turnaround times. For example, the upgraded technology is introduced to the organisation to increase the speed of doing things. Organisations needed latest technologies to adapt the market requirements in order to grow in fast moving environment today. The evolving technologies would violate the psychological contract due to the lack of adaptation. This is because employees are worked in their conform zone and used to their method of doing things, thereby unwillingness to learn new skills and know-how. However, they are forced to learn and to accept the changes announced because they want to achieve organisation's expectation and to avoid replacement by new comers. Besides that, the machinery would replace human capital due to cost savings in long term and increase productivity. When employees feel threatened and scared of losing the job, the psychological contract is violated.

Organizational change can be defined as the adaptation of an organization when the environment is changing such as the introduction of new technologies (Marshall, 2010). Therefore, when the organization is introducing new technologies into the system, it can cause violation to employees' psychological contract. The change in technology may need to increase the contribution of employees to their organization such as learning with new technology and increase the working hours. For example, the employees working in their comfort zone, but when the organization introducing new technology into their system and the employees had to learn to work with the new system and this does not expect from the employees so the psychological contract violated. Besides employees see change is difficult, they will feel threatened and this can cause the psychological contract violation.

Organization change defined as an introduction of new technology of the comfortable of an organization when the surrounding is changing. In addition, the employee led to psychological contract violation when there is an introduction of new technology in the organization. In addition, the introduction of new technology lead to psychological contract violation because the employee had to learn the new technology from the beginning but some of the employee never expect to learn new things and they expect to stay at comfort zone. Thus, this behavior leads to psychological contract violation and they feel like menace due to their perception that change is difficult (Dick & Nadin, 2011).

When an organization is experiencing change such as new technological implementation, they need high expertise to handle the implementation. Some organization do not prefer to invest and train their own employees, instead, they hire other expertise to handle the implementation. This act will severely affect its own employees because some of them will be demoted or terminated due to the change. Therefore, affected employees will face psychological contract violation.

2.2 Communication

The cause of misunderstanding the psychological contract is lack of communication yet the influence of understanding their psychological contract is an actual communication. Thus, leader communication skill is the forceful impacts among the organization (Senior & Swailes, 2010). The organizational outcomes which are employees' performance, job satisfaction, motivation, attendance and loyalty to the organization influence by leader communication. For example, performance appraisal as an effective tool for manager evaluate employee job performance such as provide feedback and communicate to the employee how to improve their performance (Addae, Parboteeah & Davis, 2006). Therefore, it is based on the result of performance appraisal to distribute task to the employee, pay level of the employee and promotions.

Furthermore, the performance appraisal can cause psychological contract violation because the employees fear of change of salary, increase workload and no promotion which has huge impact on the performance. This is derived from lack of two-way communication. Employees who are not given the opportunity to evaluate themselves and express their contribution to the organization and their intended career growth would experience psychological contract violation and the sense of bias will be perceived. In addition, employers who do not make clear communication to the condition of their firm, reasons for change and justifying the proposed change plan would be the contributor for the violation.

Psychological contracts had emphasized that "they are based on perceived promises, where a promise is defined as any communication of future intent". This intent can be conveyed by different ways such as written document, oral conversation and organizational practice and policy. Psychological contract can be formed before a prospective employee even joins an organization. Managers will share information about the organization during recruitment and they should provide a realistic preview during interview process to inform both the advantages and disadvantages of a particular job and working in a particular organization. Employees will notice the aspects of given from and taken to the organization. If there are unpleasantly surprised on any aspects of their job, the psychological contract will violate. For example, they are not supposed to work in weekends but their

superior scheduled for Saturday, it undermines trust and lead to psychological contract breached.

An effective communication can affect the employees to understand their psychological contract and lack of communication can cause to misunderstanding of the term of the contract. One of the powerful influences in the organization is the leader communication skill. Leader communication can affect the organizational outcomes, such as job satisfaction, employees' performance, motivation, attendance and loyalty to the organization. For example, manager evaluated employees' job performance by using performance appraisal. The performance appraisal can be a useful tool for communication with the employees, such as provide the feedback of their job performance and how they can improve. However, manager will make the changes decision based on the information from the performance appraisals, such as how to assign tasks to individual employees, how to set pay levels and deciding whom to promote. Yet, most of the employees dislike the performance appraisal, it is because the employees fear of changes in their salaries and promotions and these changes can cause psychological contract violation.

In addition, distrust between managers and their subordinates may occur when there is a lack of communication. When there is organisational change such as the merger, a communication is needed to outline the employees' requirements and expectations to reduce the uncertainty they faced by confirming the non-sustainability and synergy of retained staff with new culture. When management implemented the changes without informing the effect of the change to the employees, employees are oblivious to the cost of success. Yet, when employees realised the changes themselves, they will not trust their managers because employees do not like the sudden change or the change affects their comfort zone. Therefore, when the managers choose not to tell the truth, it may lead to distrust.

A company ought to make sure that they have effective channels of communication. Open communication is one of the main key to a successful development of equal beneficial psychological contracts. Honesty and clear discussion will enable the understanding of organizational culture, expectations, compensation, benefits and employee development. The employee's credibility and trust will be increased if the firm gives satisfactory justification and clarification to the employees, then psychological contract violation will not occur.

2.3 Downsizing

Downsizing could lead to psychology contract violation. When the organization making change by downsizing the workforce, those employees who remain in the organization would feel insecure with their job. This change has been moved from relational psychological contract to transitional psychological contract.

Organisations have initiated downsizing or restructuring to improve operational efficiencies and reduce costs (Graetz, 2000). However, downsizing violated the remaining employees' psychological contract by eliminating job security from the employment relationship. Furthermore, the organizational changes create the state of turbulence and uncertainty which make it difficult for organizations to fulfil all of the obligations that they make to employees.

With the existing insecurity and ambiguity, those survivors with a high negative affectivity characteristic will focus more on the negative impacts of layoffs. In turn, the perceived violation of the psychological contract will influence the survivors to behave in the potential negative reactions such as poor motivation and performance, job dissatisfaction and high turnover.

3 Conclusions

Employers concern to limit the damage and disruption caused by psychological contract violation to operate their business with smoothly and instil a credible image as a good employer in the eyes of all of their employees. Employees' dissatisfaction from this violation could affect customer relationship and company's image if the problem wasn't dealt with swiftly and effectively. Dealing with this problem on a case to case basis will only consume more time and energy. Moreover, other areas of violation would probe out because once case could be solved. Hence, employers proactively involve other employees in dealing with the incident and simultaneously making explicit norms so as to reaffirm the state of authority. Psychological contract violation not only brings dissatisfaction to employees, however, it also impacts employers' credibility as it affects company's image. Hence, this leads to the end result of company's performance and profitability.

A strategic business strategy is required to overcome all these challenges. Hence, the ultimate goal is to provide value. This value is not only directed to customers, but employees and the organization as whole. Value is derived by quality that is generated from product, services, people, processes, and the

environment. And the objective of every organization is to produce superior value for customers (Goetsch & Davis, 2014). Inadequate Human Resource development is an important part of quality driven organization. This inadequacy would lead to lack of planning, leadership, resources and finally results to lack of customer focus. Therefore effective and strategic human resource planning is essential.

In today's advanced technology environment, business processes can be designed and implemented to employ business solutions. Moreover, it can improve business relationships with enhanced communication approach. Hence, the key concept of Business Process Management (BPM) is the convergence of technologies with process management theories (Chang, 2016).

Failure, change and chaos are all around us. It is the choice of the organization to avoid, ignore or take initiative to redefine it. Employees dissatisfaction is limitless, however, take the necessary measures and steps to overcome, goes a long way and the results are usually positive. Hence, new forms of awareness and understanding are necessary when change is too fast and uncontrollable violation which could also be viral based on sharing and exposure. Moreover, new skills and abilities are also necessary when the crisis is towards focusing on sensitive or emotional issues. Therefore, sensitive analysis, creative thinking and contingency plans are equally important as decisive decision making and clear, detailed communication. There is no fix set of procedure to solve sensitive crisis. As such, crisis management strategy is essential and this need relevant training and supports (Booth, 2015).

Strategic planning is difficult as it demands time, attention and capabilities. However, without proper planning it would result it will worsen the performance of an organization. Despite the importance, very often organization do not implement it properly, this also leads to negative result. Planning and implementation are interrelated. It cannot be separated for better results. Successful strategic outcomes are best achieved when those responsible of executing the planned approach, are also part of planning and formulating the plan (Hrebiniak, 2013).

Any strategic plan should be measurable to evaluate. This comes in the line of Activity-based Costing (ABC). The ability to utilize the resources and generate competitive advantage requires good knowledge of costing (Jeston & Nelis, 2014).

Preliminary Safety Climate: A Case at Pulp and Paper Industry in East Coast Malaysia

Ahmad S., Roslina M., Hayati @ Habibah Abdul Talib

UTM Razak School of Engineering and Advanced Technology, University Teknologi Malaysia, Jalan Sultan Yahya Petra, Kuala Lumpur, Malaysia, 54100

(E-mail: ahmadsalleh101@gmail.com, mroslina.kl@utm.my and hayati@utm.my)

Abstract: The purpose of this study is to identify the level of safety climate in Pulp and Paper Industries. In addition, the relationship between safety climate and investigated the accident rate in this study. According to Zohar (1980), safety climate perceptions are shared between employees on performance and commitment of management in terms of procedures, practices and security policies. Researchers believe that the level of safety climate has a relationship with the accident rate. Therefore, this study was undertaken to identify the level of safety climate in Pulp and Paper Industries. The study was conducted using questionnaires where the questionnaire was distributed to 100 respondents consisting of managers, executives, engineers, clerical and technicians in the organization. To support the result findings, Statistical Package for Social Science (SPSS), version 16.0 was used to analyze the result. The result was shown that, climate use a high level of safety. Safety climate was practicing in the organization with the value at 3.86. Thus it shows that, workers in Pulp and Paper Industries have a good awareness, have a positive attitude and behavior on issues related to safety practice. The result was supported that safety climate has relationship with the accident rate among workers at Pulp and Paper Industry.

Key words: Pulp and paper; Safety climate; Positive attitude; Safety

1 Introduction

Nowadays, safe practices are concerning by the organization in order to reduce and practice the best of safety practices. Thus to ensure safety climate practices this study will explore the level of the of safety climate at Pulp and Paper Industry. Safety climate is important to practice by the organization especially to reduce the rate of accidents at workplace. Employees should always be in a safe working condition that provided by employer. Thus, this study is aiming to investigate.

Furthermore, employer shall to ensure the employee a safe work environment and healthy. Not so survivor lives but also company property can be saved. Therefore, researchers thought it was necessary to study the safety climate. The relationship on safety climate and the level of accident rates at Pulp and Paper Industries.

2 Safety Concern in Malaysian

Department of Occupational Safety and Health (DOSH) in Malaysia is government body are in charge on safety awareness on working environment for employees and employers in the workplace (Hughes and Ferret, 2010). According Yusof (2008), enhanced security can be seen with the enforcement of the Occupational Health and Safety Act of 1994. Act 1994 created is intended to overcome the disadvantages of Machine Ordinance 1953.

Based of Occupational Health and Safety Act 1994 was intended to foster and promote safety and health awareness among workers and employers. In addition, it also creates security measures and effective health organizations. This is done through self-regulation schemes tailored to industry or related organizations.

DOSH 2014, The Act contains fifteen and sixty-seven parts of that section is a step in the enablement of overlapping laws existing safety and health such as the Factories and Machinery Act 1967. The provisions of the Occupational Safety and Health Act 1994 is complementary to the provisions of existing laws and if there is no conflict of Occupational Safety and Health Act 1994 shall prevail. Under the Occupational Safety and Health Act 1994, Section 15, the general duties of employers and self-employed persons to their employees.

In Malaysia, the concern for workplace safety started from the enforcement of the Factory and Machinery Act (FMA) in 1967. The FMA 1967 was enacted to protect employees in factory, quarry mining and construction sectors. By operating under this act, industries were more concerned about the physical aspects of safety, such as equipment safety and injuries practices in the workplace. (Bakar, 2006), the accident investigation report revealed that the building of this manufacturing plant was not

constructed according to the standard specification. (Shaluf et al, 2002). The incident has also triggered many parties to think about soft issues in safety matters and many industries have started to realize that the traditional approach which focused on technical aspects of safety suffers from major limitations and is inadequate in managing safety-related matters within organizations.

2.1 Case study pulp and paper industry east coast

Pulp and Paper Industry East Coast was established in 1996. Throughout the history of newspaper publishing in Malaysia and Singapore the supply of newsprint has been wholly dependent on availability and dictated by the global demand of larger countries. Thus, Pulp and Paper Industry East Coast was established to meet local demands and provide world-class, premium grade newsprint primarily for newspaper publishers in Malaysia, Singapore and the region. Pulp and Paper Industry East Coast vision is to be a competitive newsprint provider in terms of cost, efficiencies, quality and service thus creating prime value for their stakeholders.

Pulp and Paper Industry East Coast produces newsprint from old newspapers (ONP), old magazines (OMG) and telephone directories. The mill site is located in East Coast Malaysia. There are total 67 hectares of mill areas and the build-up areas is 15 hectares. The plant finished construction and first ran in year 1999. Pulp and Paper Industry East Coast was co-owned by private company from Malaysian. There was total investment of RM 2 billion in this company.

Pulp and Paper Industry East Coast was the largest and the only local supplier of newsprint which holds 70% of local newsprint market. Pulp and Paper Industry East Coast also become the largest collector of old newspaper and old magazines in Malaysia.

Pulp and Paper Industry East Coast used deinking-bleaching techniques to produce superior pulp without use of chlorine. The mill produces 270000 tons per year of mixed waste and 280000 tons per year of newsprint. Pulp and Paper Industry East Coast receives and treats up to 19000 m³/day of water from the Sg. Pahang. The pipe is connected 10km away from the mill to the Sg. Pahang. All the effluent would be treated and return to the river.

The technology of paper machine and stock preparation is from Voith Germany and the raw water and effluent treatment plant is supported by Ahlstormaquaflo, Finland. All the electrical and automation system is from ABB. Pulp and Paper Industry East Coast is a 100% recycling Newsprint Mill and has achieved EMS ISO 14001. All the waste produced from the plant has to be treated properly before disposed and scheduled waste disposal policy has strictly applied to all worker and plant operation. This is to ensure the environment safety and reduce hazardous chemical release to the environment.

However, all the practicing well in the company, they are still a few recorded injury. Thus, it shown there is the quantities arise to avoid this serious happen. It is become there are weak relationship.

2.2 Safety climate

Zohar (1980), safety climate is a summary of the perception by employees share about their work environment. Furthermore, the Zohar (2000) stated that their perception about the organization's security policy, procedures as a practice also known as climate security. Based on descriptions by scholars and trigger the security climate, the researchers found that safety climate is a key pillar to the safety and health at work. Based on the safety and health policies and procedures in the workplace easier for employees to understand and work with the right workers also will feel they are in safe working condition. Byrom and Corbridge (1997) assert that the security climate is sharing the perception of workers and the implementation of safety management within the organization. In the field of worker safety climate can share your thoughts and opinions with employers to ensure that workplaces and work activities they are in a safe condition.

According to Clarke (2006), there are three key factors in climate security. First is the manager of safety. The second is the employee's responsibility to safety. The third is the conflict between production and safety. Climate security can not predict accidents in the industry. Employees are responsible for safe work and the conflict between production and safety are significant to unsafe behavior. However, communication failures will cause the difficulty of predicting the results of safety Table 1.0 is the survey of all related construct as proposed by Clarke (2006)

Indicator, Siti Fatimah Bahari (2011), said that safety training affects the safety climate or cultural improvement. Security training is a powerful mechanism that shows a positive impact on the climate at the workplace. Thus, organizations need to give priority to safety training as it can influence the individual behavior towards safe work practices. However, safety training and safety climate showed a negative correlation with accident rates (Siti Fatimah, 2011). Therefore it is important for the organization to improve the safety performance. It is believing that safety training is the crucial element

in avoiding any accident at workplace.

Table 1 Correlation Between Safety Training and Safety Climate

Correlations between Safety Training Impacts and Safety Climate Factors in Time 1 and Time 2						
Factors	Time 1			Time 2		
	Mgt Action	Mgt Attitude	Safety Priority	Mgt Action	Mgt Attitude	Safety Priority
Knowledge and Skill Transfer	0.745**	0.777**	-0.227**	0.824**	0.876**	-0.562**
Safe Work Practices	0.703**	0.722**	-0.227**	0.568**	0.411**	-0.548**
Safety and Risk Understanding	0.656**	0.718**	-0.170**	0.062	0.135**	-0.141**
** Correlation is significant at the 0.01 level						
Note: Mgt refers to Management						

Source: Siti Fatimah Bahari (2011)

According to Michael (2002), management recognizes that employee attitudes and perceptions can help to change behaviour. The finding shown that training sessions and education can influence the attitudes and perceptions. There are six practices in the safety program was used bt previous study. There is commitment from management, rewards, communication feedback, selection, training and participation (Alison G. Vredenburgh, 2000).

In addition, Cheyne et. al (2002), also mentioned in this study that have six dimensions of safety climate, consist of security management, personal involvement, communication, individual responsibility, safety standards and goals in the work environment.

Jong Bae Back *et al* (2007), studied on safety climate on one Korean manufacturing plants, the result indicate manager and workers showed generally high level of safety climate awareness. Due to explore the length of employment was tha a significant contributing factor to the level of safety climate. Managers' commitment to comply safety rules, procedures and effective safety education and training are recommended

Then, problem faced by management firm this study is significant and important to conduct. Because of the gap identify and the researchers feel that safety climate is very important to study because safety is a major factor in the manufacturing industry. Therefore, the organization needs to take a serious concern to avoid any kind of untoward accidents occur. It involves physical lives of workers and employees in the organization.

3 Methodology

The methodology also means science or discipline methods used when conducting certain studies to achieve certain goals. Research is defined as the act of researching, examining, carefully and careful research (Tengku Iskandar, 1996). Methods for collecting data and get the right information, researchers use appropriate research methodology. This study focused on quantitative methods of content analysis. Therefore the research methodology chapter, the researcher uses elements of discussion in this chapter include study design, study population, research instruments, pilot study, data collection and data analysis.

Table 2 Construct Development

Construct	Number of Question	Scores
Safety Management	15	Occupational Safety Health Act 1994
Personnel Involvement	5	
Communication	5	
Responsibility of Individual	2	
Safety standards and goals	3	

3.1 Safety management (15 questions)

In this study, a total of 15 questions about safety management by the Pulp and Paper Industries. Occupational Safety and Health Act 1994 states that any employer, whether public, private and statutory authority necessary to protect as far as practicable the health, safety and welfare of the

people working for them. It relates in particular to aspects of the preparation and maintenance of plant and systems of work that are safe. Where the safety aspects cannot be underestimated by employers, rather it should focus on the safety of workers. If the number of accidents can be reduced, thus saving the cost can be reduced as well.

3.2 Personal involvement (5 questions)

In the Pulp and Paper Industries, a safe workplace is priority for the staff. Therefore, every worker should have the responsibility, attitudes and willingness to work safely in order to ensure their health and safety is assured. Personal involvement by employees is necessary to ensure that the work they do is safe from any hazards and prevent accidents. According Satapah (1995), the Occupational Safety Health Act 1994 provides for the responsibility of employee with employers in dealing with injuries.

3.3 Communication (5 questions)

Communication is essential to convey information. Communications jobs, safety and health through communication vertically and horizontally is to avoid accidents and occupational diseases so that the production process can be done safely.

3.4 Responsibility of individuals (2 questions)

Section 25 AKKP 1994, the obligation to state employees not to interfere with or misuse anything provided or done in the interest of safety, health and welfare of worker.

3.5 Safety standards and goals (3 questions)

According to section 16, Safety and Health Act 1994 (Act 514), the employer must provide a safe working environment and healthy for all workers and individual under its area of control in accordance with the provisions of law relating to occupational safety and health during, industry codes of practice, standards and other requirements relevant.

4 Result and Discussion

Table 3 Reliability Statistics -Cronbach's Alpha

Cronbach's Alpha	Cronbach's Alpha Based on Standardized Items	N of Items
.891	.891	30

Table 3 is reliability statistic – cronbach alpha. According DeVellis (2003), Cronbach Alpha, which reached 0.7 points and above is calculated reliability. Overall instrument has a value of reliability (Cronbach's alpha) high ($\alpha = 0.891$). This shows the appropriate instruments used to assess safety climate. According Nunnally and Bernstein (1994), the value of 0.80 and above is sufficient for the new instrument built or first used while George & Mallery (2003). Thus, for this study the indicator is reality to test the study.

Table 4 Summary Result Safety Climate

No	Constructs	Mean	Percentage
1	Safety management (15 questions)	3.96	13.20
2	Personnel Involvement (5 question)	3.85	12.83
3	Communication (5 question)	3.77	12.56
4	Personnel Involvement (2 questions)	3.87	12.90
5	Safety Standard and Goals (3 questions)	3.86	12.86
	Total Mean	3.86	

Table 4 is the summary result safety climate. The result safety management is indicating that have a mean of 3.96. This is because safety is a matter for the management of important in ensuring safety in the workplace. With the good management and effective, accidents can be avoided. The management of the company's management began in the Pulp and Paper Industry East Coast to subordinates. They have generated policy and safety policy in the workplace. Whereas communication and 12:56 min acquires 3.77 percent for all policy and police have been prepared by management. The important issue regards

communication to be carried out from top management to subordinates. Min and the percentage was the lowest when compared with 5 of the above.

5 Conclusions

Based on the mean score of 3.86 indicates that safety climate is a highest score that practicing in Pulp and Paper Industries. Results from the analysis shown the safety management reached the highest mean score of 3.96. The mean score is high due to the company Pulp and paper Industries very concerned about the safety aspects and always encourage employees to work in a safe environment. In accordance with the slogan "Safety Begins with Me", workers need to think first before action is taken. Communication while achieving the lowest mean score of 3.77 because of a lack of information on safety aspects presented by the management to the employees. Safety climate is an important factor influencing the rate of accidents in organization. Workers are an important asset of any organization. Hence, integrated cooperation between employer, employees, government and non-governmental crucial need to ensure the occupational, safety and health at work are safe at work and guaranteed safely. Occupational, safety and health strategy is important not only to ensure the health of workers and the salvation maintained and preserved but also contributes to increased productivity, product quality, employee motivation, job satisfaction and can improve quality of life of an individual and society. In OSHA 1994, section 15. General duties of employer and self-employed persons to their employees. It shall be the duty of every employer and every self-employed person to ensure, so far as practicable, the safety, health and welfare at work of all his employees. This awareness is also supported safety culture and can help reduce the rate of accident at work.

Acknowledgement

The authors wish to express the greatest appreciation and utmost gratitude to the Ministry of Higher Education, MyBrain15 MyPhD Ministry of Higher Education, UTM Razak School of Engineering & Advanced Technology and Universiti Teknologi Malaysia (UTM) for all the support given in making the study a success.

Roots of Diversity in the Academics Institutions: How HR Manager Can Encounter the Challenges of Workplace Diversity

Abdul Ghafar Khan, Xu Hongyi

School of Management, Wuhan University of Technology, Wuhan, P.R. China, 430070

(E-mail: khanhamiya@yahoo.com, steven_64@163.com)

Abstract: Purpose-The purpose of this paper is to look at the way higher-education institutions' respond to the challenges of an increasingly diverse students pressure and the degree at which the organizational culture welcome and value diversity, thus allowing the university to benefit from talented people with diverse backgrounds. Most of the researcher only linked the human resource management with global business activities. The author also tried to identify those issues which are facing by the HR workforce due to learning (Academics) globalization in various educational organizations. The study found that diversity management is now more than legal and moral importance for sustainable development of the organization. This paper will highlight on how an HR manager can meet the challenges of workplace diversity. Findings- It is a fact that the globalization in every field became now unwanted challenge, especially in global educational sectors. Due to a large number of student's migration for long and short time to the search of better education worldwide, it increased a lot of challenges to the institution especially interim of human resources. These challenges can be converted into the opportunities if depute trained human resource to handle these global assignments wisely.

Key words: Cultural dimensions; Diversity; Environment; Human resource management diversification; Globalization; Academics; Organizational culture; Diverse workplace challenges

1 Introduction

Globalization of firm's operations or an increased level of firm's involvement in exchanging goods and services, information, personnel across national boundaries create puzzling for its human resource management (Rugman and Verbeke 2004). Due to cultural variances, the way of communication is also changed. One of the biggest challenges is language (Marschan-Piekkari, Welch et al. 1999). Poor culture-fit has often been mentioned as one reason why Merger and Acquisition have not produced the outcomes as organizations hope for (Cartwright and Schoenberg 2006). Academic institutions are also affected by the rapid changes of culture result of globalization. Booming economic activities turn the world business scenario and it increased the level of exchange of goods and services, information, finance and personnel across national borders (Rugman & Verbeke, 2004). Significant changes in the global society and in the markets lead to growing workforce diversity. The globalization process force organization all over the world to deal with more international customers and suppliers (Cox and Blake 1991);(Milliken and Martins 1996). Rapid globalization is one of the most challenging factors in this changing world. Many researchers only linked this globalization with only business sectors. There is the various dimension of the modern globalization. Different observers identify different type of globalization, for example, globalization in the area of the economy, technology and cultural (Brown and Lauder 1996). Although this diversity is a strength(Ramiya, Maraist et al. 2000). Due to this, the demographic diversity is also rising in higher educational organizations. Students and staffs are an exchange and cross-border recruitment is increasing (Schapper* and Mayson 2004). According to the (Cheong Cheng 2004), there should be multiple globalization including technological globalization, economic globalization, social globalization, political globalization cultural globalization and learning globalization. The learning (academic) organizations are now globally inviting the students to enroll in their respective universities to increase their ranking among worldwide universities. As a result, the management of the universities deals two issues, first to deal the international students at host universities and at the same time to deal with the organization of origin countries of these international students. After the Bologna Declaration many Asian and African countries students starting moving around the world in search of quality higher education through scholarship and self-support basis. There are many challenging faces by these organizations. Inevitably, how educational institutions should be responsive to the trend and challenges of the globalization has become the major concern in policy-making in this era (Brown and Lauder 1996). The main obstacle faced by the policy maker is to an amalgamation of a local and global way of learning (Yin Cheong Cheng, 2004). In short in this modern era when learning environment is very rapidly globalized. There is also increased of traveling of students around the world going to different countries in searching for relevant and competitive

education. A new global scenario has emerged by students because sojourn in foreign countries by extending their period of stay not for settlement permanently as traditional immigrants would (Gavela, Hernández et al. 1994). Their mobility so extensive and high that the composition of the student bodies in universities all over the world has changed (Hartwell, Johnson et al. 2011), marked largely by increasing the number of international students. This is the biggest issue faced by the university management. To gain success of their international students programs, universities thus need an adequate intercultural understanding, manifested in an action of their staff and students. The staffs need to be properly trained and well aware the cross culture sense. The thing is that due to this trend the organizational environment totally changed. Now it is more important to manage HR strategically as a new source of competitive advantages in the global marketplace has been emphasized (Stroh and Caligiuri 1998). The academies in developed and transition countries will face new challenges divert from the increasingly diverse work environment because of increasing number of students moving from underdeveloped countries to developed or transition countries. In order to attract, integrate, motivate, and develop the full potential of academic diversity, European universities must become more international oriented and have an organizational culture that truly values and creatively manage such human diversity (Metcalf, of Hull Business School et al. 2007). The Diversity still remains under-researched in European higher education. To examine these issues, this conceptual paper is designed to highlight some core issue which directly affect the organization and indirectly affect human resource performance.

2 Literature Review

2.1 Sources of diversity in academic organization

The meaning of diversity within the organization is not limited to those attributes which are observed but also include invisible characteristics such as the difference in educational background, creativity, comprehension, learning style and problem-solving ability (Nafukho, Wawire et al. 2011). Multiple categories of diversity within the workplace may influence the individual, group and organizational performance and processes (Van Knippenberg and Schippers 2007). As we know that there are lot of sources of diversity, but in an academic environment following are the main source of diversity:

2.1.1 Studentship, exchange student's projects and international internship schemes.

In order to promote the mutual understanding, cooperation and exchanges in various fields between various countries, the various governments have set up a series of scholarships programs to sponsor international students, teachers, and scholars to study and conduct research in various countries. This policy of various countries also leads to globalization in the educational institutions. Student's interest in global education has been growing steadily over the past several years. From 2005 to 2011, the number of the students throughout the world pursuing higher education outside of their home countries few from 3 million to 4.3 million students, and the number of students outside countries in 2025 projected to reach 8 million (Farrugia 2014)

2.1.2 Granted the services of international faculty.

The source of diversity is due to hiring a teacher from foreign countries in the educational institutions. In this modern globalization every field of life are directly and indirectly facing the impacts of diversity. As we have already mentioned in this research paper that now educational services also act as export industries, to increase the revenue of educational institutions by inviting students all over the world. But due various reasons, like technical skills, educational skills and on the basis of professional background these educational institutions also invite or hiring the foreign teacher to benefitted the foreign students in their educational institution or to attract more international students. Current all over the world many countries are focusing on standardizing their education system, especially the education provided to their children must be up to the marked. For this reforms, only teachers can help (Garet, Porter et al. 2001). Thus, the success of ambitious education and high-quality education has a very positive link with the teachers (Cuban 1991). These reasons increase the tendency of teacher's migration globally. Now the supply of teachers increased internationally to fill the vacancies. And in this way many overseas teachers are employed to fulfill these vacancies (Barlin and Hallgarten 2002).

2.1.3 International conferences.

To enhance the revenue of various international educational institutions it conducts academics conferences in various countries to provide a platform where the researchers share their research findings. It also leads to increase the diversity in the organization. The aim of these multidisciplinary

international conferences is to bring together theoretical perspective that helps advance our understanding how the global research qualitative or quantitative empirical contribution to their local and global articulations. These conferences seek globally to delve into the shifting relationship between established and emerging art market through a series of paper presentation and keynote sessions as well as a panel discussion with global experts.

2.1.4 Cross-border investment by educational institutions.

In this modern globalization, the scenario of business changed. There has been rising interest in the business of global education. Most of the international educational institution attracting international students to increase their revenue (Cantwell 2015). This is the main reason due to this approach the educational institutions are turned into global educational institutions. Many countries including china (McCafferty 2013) have currently announced plans to attract more international students to increase the revenue of their educational institutions. If we evaluate this system of education where the educational institutions inviting the foreign students is some sort of export business. The reason is that if one industry exports their product the balance of payment will positive due to increasing in foreign exchange currency. Same in the educational business because they are selling their services to the foreign students (Ziguras 2011). That's why this kind of business also become the reason to bring diversity into the educational institution

2.1.5 Technology

Modern innovation is one of the biggest reasons to turn educational institution towards diverse organizations. Modern teaching techniques, accessing academics database, various lab and material science equipment and online courses and other training converts the organization into the diverse organization.

These sources of globalization changed the organizational environment from local oriented to global oriented. In short that now the stockholders and now globalized. In the modern era, most of the universities are linked with global stakeholders. This is not surprising that they are challenged. It means that if one university accepting the cross-border students then it automatically keeps in touch with the parent and the other related cross-border agencies. Another side for an effective management is some universities inviting cross-border faculty as well as professionals. No one can imagine that the university which is dealing globally with all aspects then the university's organizational environment will automatically change. The question is that how the organization will manage their Human resource in term of faculty and support staff effectively to deal the matters of cross-border stockholders in the changing environment. Many organizations need to change and facilitate diversity within structure due to increasing challenges of diversity (Van Ewijk 2011).

2.2 What are the challenging factors for the human resource management

2.2.1 Introduction

The role of the human resource manager is developing with the transform in a competitive market environment and the understanding that Human Resource Management must play a more strategic role in the success of an organization. An organization that does not put their emphasis on attracting and retaining talents may find themselves in dire consequences as their competitors may outplaying them on the strategic employment of their human resources. With the increase in completion, locally and globally, an organization must become adaptable, resilient, agile and customer-focused to succeed. And within in this changing environment, the HR professional has to develop to become a strategic partner and a change mentor within the organization. As we discussed above that due there are many sources which create diversity in the workplace. Due to these dimensions of the workplace also changes. These dimensions include but are not limited to age, ethnicity, ancestry, gender, physical abilities/qualities, race, sexual orientation, educational background, geographical locations, marital status, religious beliefs, working experience and professional approaches (Ely and Thomas 2001).

2.2.2 Challenges of workforce diversity.

The future success of any organizations depends on the ability to manage a diverse body of talent that can bring ideas, perspectives and views to their work. The challenge and problems faced of workplace diversity can be turned into a strategic organizational asset if an organization is able to capitalize on this melting jar of diverse talents. With the mixture of the talents of diverse culture backgrounds, gender, ages, and lifestyles, an organization can respond to business opportunities more rapidly and creatively, especial in global arena (Cox and Beale 1997). This is especially true for those academic organizations who have invited a large number of students and faculty from all over the world. Thus, the Human resource manager needs to be minding full and may employee 'think global, Act local' approach in most circumstances. Furthermore, the HR professional must assure the local professional

that these foreign talents are not a threat to their career advancement (Miyake, Friedman et al. 2000). In many ways, the effectiveness of workplace diversity management depends on a skillful balancing act of the HR manager. One of the main reasons of ineffective workplace diversity management is predisposition to pigeonhole employees, placing them in different silo based on their diversity profile (Thomas 1992)

2.3 How human resource manager can meet the challenges.

2.3.1 Style of management at diverse workplace.

In order to effectively manage workplace diversity, Human Resource manager need to change from an ethnocentric view (“our way is the best way”) to a culturally relative perspective (“let’s take the best of a variety of ways”) (Nkomo and Cox 1999). This shift in philosophy has to be ingrained in the managerial framework of the Human Resource Manager in his/her planning, organizing, leading and controlling of organizational resources (Thomas 1992). As suggested by Thomas (1992) and Cox (1999), there are several best practices that an HR Manager can adopt in ensuring effective management of workplace diversity in order to attain organizational goals. They are as follows:

2.3.2 Training and mentoring program

This is the one of the best ways to handle the workplace diversity issues is through initiation a diversity mentoring program. This could entail involving different departmental managers in a mentoring program to coach and provide feedback to employees who are different from them. In order to make this program more effectively, it is wise to provide practical training to the employees or through an expert in this field. The main purpose of this diversity mentoring program seeks to encourage members to move beyond their own cultural frame of references to recognize and take full advantages of the productively potential inherent in a diverse population. Training is the one of the main strategies by which the organization readies the management to handle the require tasks. Basically, training is same like war equipment which is necessary for the battlefield. Training is most important especially to handle the global tasks. Without training, the organizational cannot achieve their strategically objectives. Training is one of the most important strategies for the organizations to help employees gain proper knowledge and skills to meet the environmental challenges (Goldstein and Gilliam 1990). Basically training capable the individual to use their cognitive skills in the strategically way with motivating attitude and behavior. Training enhances the motivational level of the employee. (Colquitt, LePine et al. 2000) argued that because the effects of motivational variables on learning are stronger than that of cognitive ability.

2.3.3 Organizing talent strategically

Now many organizations realized the benefits of diversity at the workplace. Due to an expansion of market toward globally, now it is necessary to induce diverse workforce as well. To induce global talents in the local organization basically, strengthen the organizations to cater global issues related to organizations. So the thing is that the Human Resource manager must manage diverse talent strategically for the organization. The researcher found talent management implementation particularly in public sector management especially alignment with well –embedded diversity and equality policies and their perceptions of fair treatment in the workplace (Bleijenbergh, Peters et al. 2010). Most researchers argue that greater competitive advantages are achieved when all the available talent in a workforce is fully utilized (Bleijenbergh, Peters et al. 2010).

2.3.4 Leading the team effectively

Human resource manager needs to advocate a diverse workforce by making diversity evident at all organizational levels. Otherwise, some employees will quickly conclude that there is no future in the company. As the HR manager, it is pertinent to show respect for diversity issues and promote clear responses to them in the organization. The Manger also must show a high level of commitment and be able to resolve issues of workplace diversity in an ethical and responsible manner. Previous research has shown that the diversity is related to both task and relationship conflict in groups but the modern research rejected and according to their finding effective leadership reduced these negative effects to zero. Many another researcher (Jackson, Joshi et al. 2003) and (Martins, Milliken et al. 2003) in a view that the affecting the relationship between conflict among diverse teams and outcomes is leadership. Especially the team leaders tend to have greater authority than other team members (Edmondson 2003) while effective leaders are expected to have more knowledge, skills and abilities in the area of people management (Bell and Kozlowski 2002). For these reasons, the team members are likely to look to the leader to guide the group successfully when they become untidy in potentially critical conflict. That way the effect of conflict in diverse group partially depends upon the parties but particularly the group leader (Ayoko and Härtel 2006).

2.3.5 Managing diverse workforce through improves communication.

Day by day increasing in globalization, diversity has become more challenge for those organizations which are involving with diverse workforce. Many researchers' finding explains the various ways hoe to handle this issue. Anyhow some researcher finding says that the way of communication from upward to downward must be effective to manage diverse team members (Sadri and Tran 2002). In short the role of the HR manager must parallel the needs of the changing organization. Successful organization are becoming more adaptable, resilient, quick to change directions, and customer-centered. Within this environment, the HR professional must learn how to manage effectively through planning, organizing, leading and controlling the human resources and be knowledgeable of emerging trends in training and employment development.

3 Conclusions

The international and multicultural environment in which universities have to operate these days requires the management of an increasingly diverse workforce. In order to benefit from the potential of such diverse workforce, it is important to ensure that the entire individual is making full use of their skills, knowledge and work experiences. In that sense, an inclusive culture that values diversity and encourages the free debate of ideas would be a major asset. This study also reflects the personal experiences of a researcher. The researcher has done more than one year work as volunteer supporter to the international student office. The basic area of researcher working was to settle the new students came from various countries of Asia, Africa, and Europe to China for their higher education. I found some areas which must be more focus on the employees training before giving responsibility to deal with diverse students. The organizations must change the ethnocentrism thinking of the employees while dealing with foreign students. Most of the educational organization failed to deal with the diverse environment due to providing equal opportunities for all individual in management support staff regardless of their talents, skill and ability which is not fit to deal diverse base assignment. In other words, the academic institution must develop such kind of organizational culture which must be fit for all diverse elements in that organization.

Research on Steering Governance of Governments

Xu Chan

School of Marxism, Wuhan University of Technology, Wuhan, P.R. China, 430070
(E-mail: 253591338@qq.com)

Abstract: During the Third Plenary Session of the 18th Central Committee of the Communist Party of China, the modernization of the national governance system and government abilities were firstly proposed. Based on the introduction the “steering theory” and combined with the political system, special national conditions and social development of China, this paper pointed out that “steering” is still necessary for government governance with Chinese characteristics. Moreover, in accordance with the “Decision of the Central Committee of the Communist Party of China on Some Major Issues Concerning Comprehensively Deepening the Reform” adopted at the Third Plenary Session of the 18th Central Committee of the CPC, this paper discussed how to steer.

Key words: Governance; Government; Steering; Paddling

1 Introduction

The “governance” theory originated from Western countries. In 1980s, economic regression appeared in Western countries and provoked a serious social crisis. Therefore, people began to reflect on drawbacks of the existing management model. In the academic circle, governance theories were proposed originally for compensating for limitations of Keynesian-ism and Neo-conservatism. Meanwhile, a rise in research on social capital and new public management, and scholars’ post-modern reflection have provided rich academic resources and good academic atmosphere to research on governance theories. Western scholars have applied the governance theory to various fields, and developed the governance theory as a sociological research method. This also caters to the situation of the social development at that time. When the world entered the post industrial era, the western welfare state generally appeared management crisis. The government is unable to cope with the demand of the society and the public loses confidence in the government. Western countries began to administrative reform. The concept of “multi center”, “response”, “interactive”, “transparency”, “rule of law” and “effective” concept are included in the governance theory, which provides a feasible way for the reform. At present, western scholars have formed a systematic and comprehensive theoretical system for the study of governance, and have achieved fruitful results.

Chinese scholars made a later start in research of government theories and mostly began from the translation of Western classical literature, so they have not developed governance theories with Chinese characteristics. In mid and late 1990s, domestic scholars began to pay attention to the theory of governance from the perspective of government management. The governance theory and the background factors of the governance theory are also highly valued by researchers. “Government”, as a term, had not really entered into people’s social life and aroused much attention, until the Third Plenary Session of the 18th Central Committee of the CPC. According to the Third Plenary Session of the 18th Central Committee of the CPC, the overall goal of comprehensively deepening the reform is to “improve and develop the socialist system with Chinese characteristics and promote modernization of the national governance system and governance capabilities”. This was the first time when the CPC put forward the notion of “national governance system” and “governance capacity”. Prior to this, the CPC usually used the term “management”. A change from the use of “management” to “governance” reflects the CPC’s new concept of administration and started a reform of a transformation from management to governance in China.

2 The Rising of “Governance” Theory

“Governance” is to control, guide and manipulate someone or something. At present, the most authoritative definition to “government” was given by the Commission on Global Governance in its report “Our Global Neighborhood” in 1995. The Commission on Global Governance: The Report of the Commission on Global Governance” defined governance as “the sum of various approaches adopted by public or private individuals and institutions to manage their common affairs (Commission on Global Governance, 1995)”. It refers to a time-continuing process to reconcile conflicting or different interests and take joint action. Governance has the following 3 features. Governance is a process of continuous interaction; realization of governance goals mainly relies on reconciliation instead of control; subjects of

governance include both public and private sectors.

The term “social management” first appeared in the “Specification for the Program for the State Council Institutional Reform” in 1998. After that, the term “social management” had been frequently used in party and government documents. In the “Decision of the Central Committee of the CPC on Some Major Issues Concerning Comprehensively Deepening the Reform” adopted at the Third Plenary Session of the 18th Central Committee of the CPC, central leading groups proposed that the overall objective of comprehensively deepening the reform is to improve and develop socialism and promote the modernization of the national governance system and capacity. The notion of “governance” was put forward at the Third Plenary Session of the 18th Central Committee of the CPC. This indicates that modernized governance is different from traditional management modes, because it exhibits a new political analytical framework. China can learn from, but should not copy Western governance theories. China should achieve governance in line with socialism with Chinese characteristics, on the basis of considering special political systems, special national conditions and the social development status in China.

3 Government “Steering” Governance

3.1 The “steering” idea

“Steering” does not mean that the government ruling goes back to the original mode of management. In fact, the “steering” idea originated in the West. At the end of the 20th century, on the basis of profoundly pondering over government management crises in welfare states, Western countries initiated a new public management reform. The reform was launched to achieve a status change of governments from “paddling” to “steering”. The main principle of the reform is to “steer” instead of to “paddle”. “Steering” refers to the role of governments to guide directions, set macroscopic goals, design programs and fulfill functions of macro-control, instead of acting like “paddling” to do things all by governments themselves and launch specific operation and control.

Jessop believed that governance also bears risk of failure, because various subjects of governance are hard to reach a common goal in negotiations. Therefore, Jessop proposed the notion of “meta-governance”. “Meta-governance” is intended to make macroscopic planning, reorganization and integration of governance subjects such as states, markets and social organizations, in order to achieve relative balance between various governance mechanisms and cooperation-based joint governance of various governance subjects. Governments which play a role in meta-governance and governments which fulfill steering functions have the same responsibility. This means that governments should play a good role in institutional design, planning and development, so that the whole social system can achieve continuous improvement and development through proper institutional arrangement (He Ziyang, 2010).

3.2 Reasons of government “steering”

The government role in governance and the government relation with market and civil society have long been a hot topic in theoretical research and debates. Western “governance” theories emphasize that governance should have various subjects and centers, and advocate that governments should have an equal status to market and civil society. However, government “governance” with Chinese characteristics is inevitably different from governance in Western countries. Government “steering” governance is determined by factors in many aspects.

Firstly, civil society in China is still immature. Its immaturity is reflected mainly by following aspects. Firstly, the civic awareness of Chinese people is quite weak. Chinese citizens show poor legal awareness, lack consciousness of rights and have a low sense of responsibility for safeguarding public affairs and the public order. Secondly, civil organizations generally lack independence. In recent years, civil organizations have constantly increased in number in China, but most of them are small and weak in power, so many civil organizations still rely on government funding and show great dependence on governments (Zhang Weihua, 1997). Thirdly, civil social organizations are unjust. There are various interest groups in the civil society, and different interest groups usually provoke conflicts and frictions, because each of them strives to maximize its own interests. Lastly, China has not developed a set of perfect laws and regulations to oversee and guarantee the healthy and orderly development of civil organizations. Therefore, government “steering” governance is still required to cultivate and develop the Chinese civil society (Li Shenzhi, 1997).

Secondly, the basic political system in China is quite special. China has a political party system different from Western countries. Western countries generally pursue the multi-party system. To be specific, two or more countries have the right to have control over government offices. However, China

adopts a political system of multiparty cooperation and political consultation under the leadership of the Communist Party of China. Communist Party of China, as the sole ruling party, is the core of leadership in revolution and modernization construction of China.

As explicitly stated in the keynote report delivered at the 18th CPC National Congress, “we should pay more attention to improve the party’s leadership and ruling styles and ensure that the party can lead people to govern the country effectively”. “Governance without state” runs contrary to the basic political system of China, and does not match the basic conditions of China at the current stage. Governance with Chinese characteristics can never change the leadership of the CPC. Adhering to the leadership of the CPC, the Chinese government should gather various democratic parties together, develop a high degree of political identity, promote optimal allocation of political resources, mobilize the enthusiasm of all parties, guide and organize the continuous modernization of society, and promote the development of multiple subjects within a centralized political framework.

Thirdly, China faces complex situations in the transition period. At present, China is in a period of rapid social transformation, which results in an increase in social instability factors and frequent occurrence of social problems and conflicts. Faced with huge pressures arising from unreasonable social stratification and structural changes in the population and family, new challenges from reforms in the information-based and network society, continuously-increasing mass disturbance and highly competitive international environment, no organization or individual has the ability to handle them.

The ultimate goal of governance is to achieve “good governance”. The stability of social politics is an important indicator to measure whether a government achieves good governance. Yu Keping highlighted “stability” among several factors listed for good governance. A stable social environment is required to achieve good governance. As Deng Xiaoping said, “stability is overriding”. A stable and orderly environment is essential to cultivate civil society and develop market and social organizations. However, a powerful core of leadership is a precondition for guaranteeing a stable and orderly environment.

4 Government “Steering” in “Decision” of the 18th Central Committee of the CPC

As stipulated in the “Decision” of the 18th Central Committee of the CPC, “to make innovation in social government, we must focus on fundamental interests of the broadest masses, strive for a maximum increase in harmonious factors, enhance the social development vitality, improve skills of social governance, comprehensively promote the construction of A safe China, safeguard national security and ensure that people in peace and contentment and society develops in peace and order.” At a practical level, the “Decision” confirms the dominance of the CPC in governance, reflects the idea of government “steering” governance, and guide directions for specific practices of governments.

Firstly, the Chinese government should adhere to systematic steering governance. As stipulated in the “Decision”, “the party shall adhere to systematic governance, strengthen leadership by party committees, play a leading role, encourage and support participation of various social parties, and achieve sound interactions of government governance with social self-improvement and residents’ self-government. A precondition for pursuing systematic governance is to guarantee and strength the leadership by the party. Under the leadership of the party, the Chinese government should give full play to its leading function, encourage different parties to participate in governance, play a steering role in coordinating various parties, and create a stable and orderly governance environment. Meanwhile, it should also monitor movements of “paddlers”, build a comprehensive and effective evaluation mechanism, combine various kinds of administrative bodies, and implement the CPC’s policies and guidelines in governance practices. Lastly, the government should also listen attentively to demands to the people, and solve livelihood issues.

Secondly, the Chinese government should adhere to a proper separation between steering and paddling. The “Decision” stipulates that “China shall properly handle the relationship between the government and society, accelerate a separation of politics from society, and promote social organizations to specify their rights and responsibilities, achieve self-governance according to law, and fulfill their functions.” That is to say, requirements are put forward for law-based administrative capacities of governments, to achieve a transformation in government functions. To achieve a proper separation between steering and paddling, governments should launch systematic planning in governance, clearly determine the steering part and paddling part, make scientific positioning of government functions and return more rights to markets and social organizations, so that governments

can be more concentrated on decision-making and their decision-making can be more scientific and democratic. In addition, governments should not completely shake off their “paddling” functions in some fields. Due to imperfect laws and regulations, immature civil society and the incomplete community service system, government participation is still needed in many aspects.

Thirdly, the Chinese government should strive for more steering and less paddling. The “Decision” stresses that social governance is to encourage and support active participation of various parties in society, integrate various resources of social governance, create conditions for public participation, effectively mobilize the masses and develop a situation that all people participate in social governance. To achieve this, the government is required to launch more steering and less paddling. That is to say, the government should invest more efforts to develop policies instead of implementing policies. It should ease governance over microscopic things. To be specific, it can transfer some public services-providing or issue-solving power to social organizations and provide institutional specifications and resource support to the social organizations. In this way, the government assigns paddling tasks to the high-efficiency market, so that the government can be more concentrated on steering work. Therefore, China should build a governance model with the government as the leadership and profit-making enterprises, non-profit organizations or non-governmental organizations and the masses as participants.

5 Conclusions

Government “steering” governance with Chinese characteristics should conform to political attributes, social systems and social values of China. “Steering” governance is to govern against China-specific issues and solve practical difficulties exclusively for China. According to the report delivered at the 18th Party Congress, governance with Chinese governance is expected to achieve an overall planning of economic construction, political construction, cultural construction, social construction and ecological civilization construction, comprehensively build a moderately prosperous society, and achieve social modernization. However, Marx and Engel did not give an answer to the question how to achieve the overall planning. China should not completely follow Western governance theories. In a complex and ever-changing social environment, the Chinese government should fulfill functions of steering, launch overall planning and make practices in line with the Party’s policies and guidelines. In a complex and ever-changing social environment, the Chinese government should fulfill functions of steering, launch overall planning and make practices in line with the Party’s policies and guidelines; achieve a transformation in government functions, governments should launch systematic planning in governance; develop civic education, cultivate civil society and provide the ability of citizens to participate in governance(Joes S. Migdal,2001); encourage and support participation of various social spartie, create conditions for public participation, develop a situation that all people participate in social governance.

Abstract: Since the 21st century, with the fast development, Nano Science and Technology not only promoted the development of many related industries, but also provided more creative sources for environmental art design. This paper, firstly, analyzes and summarizes the characteristics and principles of nano-art inside the microstructure from electron microscope image based on an aesthetic point of view; Secondly, from two aspects of scientific and artistic inspiration, or/and each other on the design concepts as well as the interoperability methods of science language and art design, it reveals the way of fusion of nanotechnology and environmental art; Finally, the authors explore the design methods by the application of nanotechnology in environmental art design for an exhibition space design practice.

Key words: Nanotechnology; Environmental design; The pathway of fusion; The method of design

1 Introduction

In the 21st century, the revolution of nanotechnology sweeps the world, gradually exerting a great influence on human life and improving its quality day by day. Subsequently, this program gives a birth to nano-art. Artists are inspired by numerous nanotechnology achievements, creating a series of devices, photography, and related graphic designs. Until now the definition of "Nano Art" is unclear, the public usually regards "using nanotechnology to create art work in nano-scale". According to the definition strictly, the art work in this paper does not mean real nano art work, we expect to explore the possibility of nanotechnology's concepts and nano-structures to environmental design. Its aim is to expand nano art, which shows designers' understanding to the nano world.

Artistic characteristic of microscopic structure

Image builds symbol, the symbol builds information. Current society is flooded by media and image, the visual era results in a tendency, which cultural symbols tends to be the image. Environment is an integral part of human life, utilization of image to environment cannot be ignored. Illustrative science not only makes abstruse scientific theory as simple as possible so that the general public can understand, but also allow the architect to find inspiration from the field of science. Nano-/or micro-structure can only be seen by advanced scientific equipment and nanotechnology, nano-lithography and electronic scanning microscope technology are great instruments to visualize them. The nano images show the aesthetic law, which may provide a source of inspiration and a basis or concept for environmental design in the future. After careful study on the nano images, following aesthetic characteristics can be seen in them.

1.1 Array

Repetition and order

The figure 1 shows the microscopic images made by using the photolithography technique on integrated circuit boards. The fundamental of photolithography technique is based on using particles beam (electron beam or ion beam) to carve the pattern on the objects, which can produce these nano-scale graphics. These patterns amplified by the electron microscope show the beautiful and well-ordered linear arrays, which can further assemble to form a two-dimensional (2-D) plane pattern, giving balanced visual experience and providing aesthetic qualities of rhythm, repeat and order. This sort of patterns can be used to facade decorative design, architectural skin design, spatial layout, landscape planning, interior design and so on. These patterns can also be modified by artistic method, such as conversion, extraction, deconstruction, restructure to create other kinds of environmental design.

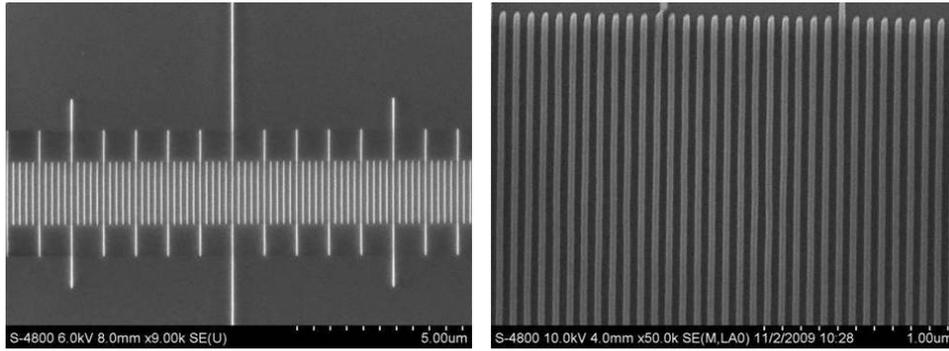

Figure 1 A Small Part of Integrated Circuit Board

1.2 Aggregation

Change and level. Nano-scale materials are able to form special structures during the chemical reaction, which can be recorded and controlled by electron microscopy and nanochemistry, respectively. This 3-D micro-structure shows irregular or random shape (figure 2). This 3-D micro-structure has the characteristics of complexity, softening, mobility, dynamic, light weight and non-linear process, which are strongly connected with modern architectural forms. Due to new science’s integrity and complexity, designers begin to pursue non-linear and non-rational in architectures. This kind of micro-structures’ diverse changes, flexible unit organization give designers inspiration on internal space and external morphology. Designers not only directly imitate the microscopic structures but also can extend or integrate these micro-structures, to create new architectural forms, seeking new developments and infinite possibilities of architectural forms.

Figure 2 Mesoporous Silica, Spindle-like Nanoparticles, Dendrimer-like Mesoporous Silica

1.3 Similarity

Contrast and unity. By adopting different technology, driven from experimental or themselves, materials may get self-assembly to form the much ordered or uniform regular patterns in the micro-scale or nano-scale (figure 3). More particularly, although the size of each structure is varied, the characteristic of each element is unified. For instance, the linear-based image shows obviously a linear random hash, containing the cone element, represents the same characteristics of the tapered hash. The image naturally illustrates the shape of point, line, surface, which are similar with basic element in art field. These images are widely used in architecture, landscape, indoor environmental design through a variety of design techniques.

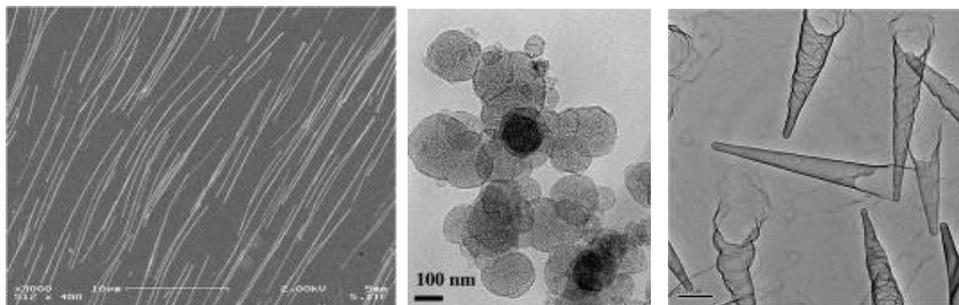

Figure 3 ZNO Nanorods, Mesoporous Silica Beads, Cone Shaped Nanoparticles

2 The Combination of Nanotechnology and Environmental Design

2.1 Mutual inspiration in concept of art design and scientific research

Science and art make progress together when they inspire each other mutually. Architect R Buckminster Fuller created a grid dome structure with high structural stability and light weight, which has been widely used in space covering large construction projects, such as the Montreal Expo Hall in 1967 (Figure 4). The scientist was inspired by the building structure, after testing, also proved the existence of C60 molecules, named "fullerene" (Figure 5). The new discovery of fullerenes exactly confirms that art inspires science in terms of the concept as it reveals the homology of Arts and Sciences. Moreover, the landscape planning of Zhongguancun Life Science Park (Figure 6) is designed by Yu Kongjian. Based on living cells, designer imitates the cells' structure and running mechanism to create more organic and ecological community. In-depth understanding of the living cells provokes designer to create the new landscape framework. It is an excellent example which is inspired by scientific research. Concept of science or art, as an indicator of essential attribute, objectively reflects human's recognition to science and art respectively. The mutual inspiration between science and art not only confirms the same attributes of them, but also enables them to be more systematical and complete.

Figure 4 U.S. Exhibition Hall of Montreal 1966 Expo

Figure 5 C60 Molecule Model Structure

Figure 6 Zhongguancun Life and Science Park Plans

2.2 The mutual utilization of technological language and design language

Science continues creating new technologies, which gives artists more imagination and expressiveness. For example, recently the rapid development of computer-aided architectural design (CAAD) has freed the designers completely from the drawing so that they entirely concentrate on the design itself. These advanced analysis technologies can dramatically improve the quality of architectural design. "Virtual building" design approaches become the mainstream of CAAD which can liberate the creativity and imagination of the architect, changing the way of thinking. In return, the language of art gives scientific imagination, helps shaping the physical world through law of beautiful. The China National Aquatics Center "Water Cube" (Figure 7) is built by the shape of water molecules as architectural surface, giving the building ice-like appearance. This architectural skin clearly demonstrates a unique visual effect on the contrary. Membrane structures, as well as high-tech structures, illustrate their utility value in architecture by using artistic language. It is apparent that design and art become more rational when using technological language, while science gets closer to human instinct and is easily acceptable when immersing in design and art.

Figure 7 China National Aquatics Center

3 Exploring the Application Method of Nanotechnology to the Field of Environmental Design

3.1 The reproduction of nanotechnology

Reproduction is a means of art. The reproduction art depicts a specific objective image or social life that an artist knows in his work. As an art form, environmental art cannot be separated from the means of reproduction to reflect the basic reality. The ways of achieving nanotechnology reproduction are i) Simulating nanotechnology concept: Making a deep understanding of a nanotechnology concept and selecting the appropriate design approach to simulate this technical concept. ii) Simulating nanotechnology methods: Being familiar with a nanotechnology operation, experiments and selecting the appropriate design to express in the form of this technical approach. iii) Simulating nanotechnology achievements: many nano products can give inspiration to artists, making them rethink to create new art work. Those three approaches cover concepts, methods and achievements of nanotechnology, helping reflect the various aspects of nanotechnology.

[Molecular sieve] The design of nanotechnology hall (Figure 8) is a good example for the reproduction of nanoscience research achievements. In the microscopic world, the nanoparticles can spontaneously grow into nano-structures which get together and form a unique morphology. The hall is inspired from the microscopic structure, using the molecular sieve structures as the basic elements of artistic processing. By transforming and assembling the outline of molecular sieves, the rudiment of this hall gradually reveals. Molecular sieves (Figure 9) have a unique highly ordered porous nanostructure, which can be used for screening different sizes of molecules and widely used in many industrial fields such as petrochemical engineering, electronics, metallurgy with a good catalysis and separation effect. The molecular sieves, zeolites as a cracking catalyst for petroleum chemical industry to produce gasoline, have created huge profits for human being. The method of architectural design also applies in Nanoscale Science and Quantum Information Centre (NSQI) Building in University of Bristol, UK (Figure 10), which is used fullerene structure as the top of the building atrium.

Figure 8 Design of "Molecular sieve" Exhibition Hall

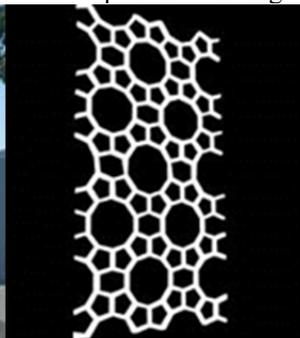

Figure 9 The Model of Mesoporous Structure

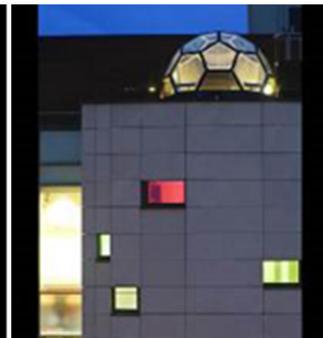

Figure 10 NSQI Building in UK

3.2 The performance of nano-science

Compared with reproduction, performance emphasizes more on self-expression of feelings and subjective emotion. It does not express the reality of life, but the spiritual reality. The ways to achieve performances of the nanotechnology involve in: A) Expressing artistically theoretical research on nanotechnology. It is related to understanding nanotechnology theory deeply and then selecting the proper artistic method to express this theory. And at the same time, we should lay to emphasize on pursuing the design creativity and innovation. B) Interoperating the method of nanotechnology. The designers should be familiar with its experimental method, operational procedure and re-interpret the experimental method or operational processes by appropriate art processing. C) Re-creating the nanotechnology. Achievements are widely used in many aspects of human life, which are probably well known by the masses. Converting nanotechnology achievements to art work is a good way to make people get to know about nanotechnology.

[Crystal-growth] Design of the nanotechnology hall (Figure 11) is the performance of nano-growth which confirms to the growth of nanowire typical patterns, the gas-liquid-solid (VLS) growth model. This VLS growth model proposed in 1964 has played an extensive guiding role on the future growth research of nanowires and their arrays. The VLS growth mechanism for the preparation of different and various nanomaterials are basically the same, the gas phase molecules can be deposited into liquid

catalyst phase, and integrated into the solid phase transition for the growth of nanowires. In simple terms, the gaseous state of a metal compound is mixed with a kind of liquid catalysts, when the conditions achieve a certain degree of saturation, the chemical decomposition reaction begins, the solid phase is grown along a direction from the catalytic sites of nanowires, which is VLS, the basic process of the growth mechanism. Understanding of scientific concepts and principles inspired the architectural design thinking. Designers use the concept of the nanowires' growth in building design. In the process of transformation, artistic interpretation of scientific concepts, scientific concepts and architectural design language can be inspired each other. The fusion between artistic thinking and scientific concepts ultimately forms into a nanotechnology connotation exhibition design.

Figure 11 The Design of “Crystal-growth” Exhibition Hall

3.3 The fusion of reproduction and performance

As two design art techniques, reproduction and performance cannot exist independently. They can be combined to achieve mutual tolerance and harmonious coexistence. The inspiration of Macro-nanotubes (Figure 12) is based on the understanding of nanostructures. Nano-Science & Technology is an interdisciplinary area combine science with technology. It researches the structure, characteristics and interactions of atoms and molecules on a scale of 0.1 to 100 nm. This concept of nanotechnology is widely recognized as Nanotechnology, which manipulation and process technology of atoms and molecules on the nanometer scale.

[Macro-nanotubes] The nano exhibition hall (Figure 12) design strives to a removable assembly building, which inspired by the operation of the science workers for microscopic particles in the laboratory. The entire hall is composed of 19 wall panels and 12 components that are built up by nanomaterials. One of these materials is the aerogel filler plates. The most important feature of this aerogel material is ultra-light with excellent noise and temperature insulation performance. This hall is calculated about 54 kg which can be moved by vehicle and easily installed and disassembled. The outline of the building is the hexagon array, which is a reproduction of the carbon nanotube structure (Figure 13). On the other hand, the function of building detachably assembled focuses on the performance of nanotechnology essence, which is particle manipulation processing. The concept of the two parts has achieved the harmony of the design ideas and practical function. [Macro-nanotubes] the nanotechnology hall design is combined with renewable and artistic expression, making this design both spirit and form, while demonstrating the concept of nanotechnology achievements.

Figure 12 The Design of “Macro-nanotubes” Exhibition Hall

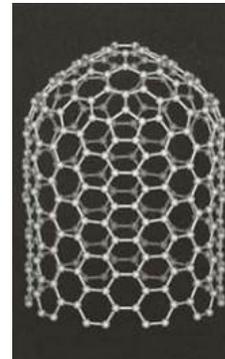

Figure 13 The Model of Carbon Cage Structure

These above three design practices try to demonstrate that applying the nanoscience to the environmental design through the technology of manipulating nanoparticles is feasible. Besides, this art form of environmental designs clearly helps to show the concept, technology and outcome of Nano-Science & Technology. The conceptual and methodological inspiration and borrowing could promote the development of discourse system, the symbolic forms and the thinking mode of environmental design and nanoscience. It will also promote innovation and progress of the arts and sciences.

4 Conclusions

The development of nanoscience and nanotechnology has opened the door for the creation of art and design thoughts. Design as a bridge links the public view and nanotechnology. This paper analyzes the principle of nano-/micro-structure aesthetics in several aspects of arrays, aggregation and similarity. In addition, it also explores the pathways of the integration between nanotechnology and environmental art in two aspects: mutual inspiration of design concept, reciprocal uses of technical and artistic language. Finally, the exhibition design, for example, can be revealed by the application of nanotechnology in environmental design. Although the related research and exploration are very preliminary, the attempt at this stage can be easily recognized that the microscopic world provides the environmental design with unlimited imagination. Nanotechnology would have much broaden applications in environmental design.

Finding inspiration from traditional culture is a remembrance and perception of history; looking for inspiration from the field of high-tech is a yearning for the future. With human life gradually approaching into the nanometer era, the exploration and the pursuit to nanotechnology will have more profound impact on our life.

Abstract: Although prior research has demonstrated that perceived organisational politics were positively related to employee turnover intention, however, little is known about possible causal explanations for the relationship between the two variables. To address this gap, a longitudinal design was employed to examine the relationship between perceived organisational politics and employee turnover intention with data collected over a two-year time period. Specifically, one hundred and seventy five Registered Nurses from government hospitals in Nigeria completed measures of perceived organisational politics and employee turnover intention at 2 times 16 months apart. There was empirical evidence, based on results of longitudinal regression analyses to support either the hypothesis that perceived organisational politics increases employee turnover intention or the hypothesis that employee turnover intention lead to organisational politics. However, employee turnover intention and perceived organisational politics were found to change instantaneously. Implications of the results are discussed.

Key words: Longitudinal design; Organisational politics; Turnover intention

1 Introduction

Employee turnover is prevalence and has become a major concern of every organization. For example, In the United States of America (U.S.A.), about 7.7% of the full time faculty members from various universities and colleges had left their posts for other institutions in 1997/1998 academic session. Of these faculty members, only 29% were retirees, while the remaining 71% have left their institutions for variety of reasons (Sanderson, Phua, & Herda, 2000). The survey further showed that more than 40% of the faculty members in the USA have made of their minds to change careers (Sanderson et al., 2000). In a similar survey, Waswa and Katana (2008) reported that in Kenya, qualified faculty members from various Kenyan public universities have quitted their job for a secured and better paying jobs abroad. Munzali and Obaje (2008) also reported that about 64% of the required number of teaching staff from various universities in Nigeria have left for western industrialized countries, such as USA, United Kingdom (UK), Southern Africa and Middle East countries, including Kuwait, Saudi Arabia and Oman, among others.

Records have also shown that about 500 employees from various organisations in Nigeria continue to leave annually, to western economies such as United States, Europe, Canada and other African countries for better condition of service (Bassi, 2004). A recent estimates have shown that that in the year 2012, more than 20,000 professionals, including medical personnel, teaching staff from various universities and colleges leave African continent annually to look for a greener pastures in Western countries such as United States, Canada, Germany and United kingdom, among others (Agency Reporter, 2012). Meanwhile, several studies have indicated that employee turnover is detrimental to both individuals and organisations (Glebbeck & Bax, 2004; Hellman, 1997). For instance, co-worker turnover, may be a “shock” to the remaining employees, which results in work disruption and also significantly reduce their job embeddedness, thereby triggering thoughts of quitting in them (Holtom, Mitchell, Lee, & Eberly, 2008). It is also estimated that employee turnover has a financial costs to organisations due to the separation costs; replacement costs of departed employees and training costs of new employees (Cascio, 2000; McKinney, Bartlett, & Mulvaney, 2007).

Given its prevalence and detrimental effects to both individuals and organisations, researchers have examined perceived organisational politics as an underlying factor explaining employee turnover. Perceived organisational politics “involves an individual’s attribution of behaviours of self-serving intent and is defined as an individual’s subjective evaluation about the extent to which the work environment is characterized by co-workers and supervisors who demonstrate such self-serving behavior” (Ferris, Harrell-Cook, & Dulebohn, 2000, p. 90). Specifically, Huang et al. (2003) showed that perceptions of organizational politics are significantly and positively related to turnover intentions

among 612 Tax employees from Taiwan Ministry of Finance. Likewise, in a study conducted among 198 full-time hospital employees in United States, Byrne (2005) found that employees who experience high levels of organizational politics at work are more likely to consider quitting their jobs. Recent evidences (e.g., Abbas, Raja, Darr, & Bouckennooghe, 2012; Bedi & Schat, 2013; Chinomona & Chinomona, 2013) also suggest that high levels of organizational politics are significantly and positively related to turnover intentions.

While the aforementioned empirical studies have contributed to theory and concept development, most of them employed a cross-sectional research design, which does not allow researchers to detect changes in the characteristics of the sample studied. However, notable exception is the work of Karatepe (2012). The present study is significantly different from Karatepe (2012), which mainly focused on full-time frontline hotel employees in Cameroon, while our concern in this study was to focus on Registered Nurses working in public hospital in Nigeria. Specifically, the purpose of this study was to employ a longitudinal research design in order to examine the influence of perceived organizational support on turnover intention among Registered Nurses working in public hospital located in Kaduna metropolis in Nigeria.

2 Methodology

2.1 Participants and procedure

Participants in this study were Registered Nurses employed by a large government hospital located in Kaduna metropolis, Nigeria. We collected the data in a two-wave panel study (Time 1 in September 2014) and the second wave of the study was sixteen months later (Time 2 in January 2016). One hundred and ninety four participants completed a survey at the second wave of the study. After deletion of multivariate outliers, the final sample included 185 Registered Nurses. On the other hand, 185 Registered Nurses participated in the second wave as well.

2.2 Measures

2.2.1 Perceived organisational politics

To measure employees' perception of organisational politics construct, we adapted seven items from perceived organizational politics scale developed by Kacmar and Ferris (1991). Sample items in this scale are: 1) "Employees in my hospital attempt to build themselves up by tearing others down", and 2) "Agreeing with powerful others is the best alternative in my hospital". Participants were asked to respond to questions in this scale using a 5-point Likert scale ranged from 1 (strongly disagree) to 5 (strongly agreed).

2.2.2 Turnover intention

We adapted three items to measure turnover intentions from prior research (e.g., Aryee & Yue Wah, 2001; Lam, Chen, & Takeuchi, 2009). Items in this scale are: 1) "There any likelihood that you would resign from the hospital?", and 2) "There is likelihood that you would not continue to be a staff of the hospital during your tenure of employment with your present hospital?". Participants were asked to respond to questions in the turnover intentions scale using a 5-point Likert scale ranged from 1 (strongly disagree) to 5 (strongly agreed).

3 Results

Table 1 presents the means and standard deviations of the variables employed in this study. The mean for perceived organisational Politics at Time 1 was found to be 4.362 with a standard deviation of 0.347. Relatedly, mean and standard deviation for perceived organisational Politics at Time 2 4.362 were 4.455 and 0.526, respectively. Regarding the turnover intention at Time 1, we found a mean and standard deviation of 3.463 and 0.914, respectively. On the other hand, the mean for turnover intention at Time 2 was found to be 3.400 with a standard deviation of 0.912. In terms of correlations, perceived organisational Politics at Time 1 was positively related to turnover Intention 2 ($r = 0.394$, $p < 0.01$), perceived organisational Politics at Time 2 was positively related to turnover Intention 1 ($r = 0.65$, $p < 0.01$). Perceived organisational Politics at Time 1 was positively related to Turnover Intention 1 ($r = 0.263$, $p < 0.01$), perceived organisational Politics at Time 2 was positively related to turnover Intention 2 ($r = 0.571$, $p < 0.01$).

Furthermore, following (Tekleab, Takeuchi, & Taylor, 2005), we used lagged hierarchical multiple regression to analyse the longitudinal data towards hypotheses testing. Specifically, we computed two block-wise multiple regression analyses with the turnover intention at Time 2 and perceived organisational politics at Time 2 as the dependent variables. In the first block, we regressed the turnover

intention 2 on perceived organisational politics 1. We then we regressed the perceived organisational politics 2 on turnover at Time 1 in the second block. Accordingly, in order to ascertain the longitudinal effects of perceived organisational politics on turnover intention, the incremental R^2 for the first block of regression analysis was examined. The results of the lagged hierarchical multiple regression analyses are reported in Table 2.

Table 1 Means, Standard Deviations and Correlations of Study Variables.

	Mean	SD	1	2	3	4
1. Organisational Politics 1	4.362	0.347	1			
2. Organisational Politics 2	4.455	0.526	.605**	1		
3. Turnover Intention 1	3.463	0.914	.021	.263**	1	
4. Turnover Intention 2	3.400	0.912	.394**	.437**	.571**	1

Note: * $p < 0.05$. ** $p < 0.01$ (two tailed).

Table 2 Results of the Lagged Hierarchical Multiple Regression Analyses

Predictors	Block 1	Block 2
Intercept	-2.93*** (0.64)	-0.01(0.39)
Organisational politics - Time 1	0.38***(0.14)	0.60***(0.08)
Turnover Intention - Time 1	0.56***(0.05)	0.25***(0.03)
R^2	0.47	0.43
Adj. R^2	0.47	0.42
ΔR^2	0.32	0.36

Note: * $p < 0.05$. ** $p < 0.01$; *** $p < 0.001$ (two tailed). The values in brackets are standard errors (SE) for corresponding estimates

Dependent Variables: Turnover intention at Time 2 (Block 1); Perceived Organisational Politics at Time 2 (Block 2).

As shown in Table 2, the first block accounted for a significant proportion of the Time 1 perceived organisational politics ($\Delta R^2 = 0.32$, $p < 0.001$). In the same vein, according to our expectation, Turnover Intention at Time 1 was related to higher levels of Perceived Organisational Politics at Time 2 ($\Delta R^2 = 0.36$, $p < 0.001$). Accordingly, the findings supported both Hypothesis and Hypothesis 2.

4 Discussion and Conclusion

The goal of the present study was to examine the relationship between perceived organisational politics and turnover intention. We examined longitudinal data from Registered Nurses employed by a large government hospital located in Kaduna metropolis, Nigeria in a two-wave self-administered survey 16 months apart. A longitudinal model was tested using a Lagged Hierarchical Multiple Regressions. The results largely supported our hypotheses that there would be reciprocal effect of perceived organisational politics on turnover intention. These results underline our postulation that the relation between perceived organisational politics and turnover intention is complex and reciprocal. This suggests that there is no simple one-directional effect of perceived organisational politics on turnover intention. Whereas perceived organisational politics influence turnover intention, employee turnover can also influence the perception of organisational politics in the work environment.

Despite its contributions, the present study, there few of its several limitations that should be discussed. First, the findings of the present study should be regarded as descriptive and preliminary given the low variance explained in the dependent variables. As reported earlier, our research model was able to explain 47% of the total variance in turnover intention at Time 2 (Block 1) and 43% of the total variance in perceived organisational politics at Time 2 (Block 2), which means there are other variables that could significantly explain the variance in dependent variables. In other words, the remaining 53% and 57% of the variance in in perceived organisational politics at Time 2 (Block 2) and perceived organisational politics at Time 2 (Block 2), respectively could be explained by other factors not incorporated in our longitudinal model. Thus, future research is needed to consider other possible factors that could help in minimizing tendency of turnover intention and organisational politics. For example, future research might examine the longitudinal effect of perceived organisational justice or organisational support on turnover intention.

Second, although perceived organisational politics and turnover intention were measured at the same point in time, as well as even at different points in time, however, we cannot interpret with confidence the causal effects of one variable on another. Hence, only an experimental research design can demonstrate causal effect of perceived organisational politics on turnover intention. This represents one of the limitations of longitudinal research design. Therefore, it has become imperative for future research to replicate the findings of the present study using a well-design experiment.

The final limitation that the data did not allow us to dependably distinguish between those Registered Nurses who have really changed their jobs voluntarily, and those who changed jobs involuntarily. It is likely that some of the Registered Nurses who involuntarily changed jobs may not have reflected such when answering the questionnaires, since there was no provision for that in the questionnaires that have been administered. Hence, this suggests an avenue for future research. Specifically, replication of the present study is needed by incorporating the questionnaires those Registered Nurses who have really changed their jobs voluntarily, and those who changed jobs involuntarily so as to understand the underlying reasons why the left.

In conclusion, the present study is one of the first empirical studies that provide comprehensive examination of the longitudinal effect of perceived organisational politics on turnover intention among Registered Nurses employed by a large government hospital located in Kaduna metropolis, Nigeria. This particular study showed provided empirical evidence based on results of longitudinal regression analyses to support either the hypothesis that perceived organisational politics increases employee turnover intention or the hypothesis that employee turnover intention lead to organisational politics. Finally, although the present study extends recent work on turnover intention, there is a need for further extension of the effect of perceived organisational politics on turnover intention using a well-design experiment.

Skilling Entrepreneurs on Innovations: A Key for Improving Competitiveness of Leather Products and Footwear Industry of Sri Lanka

P.P. Ajith Kusum, Song Yinghua

School of Management, Wuhan University of Technology, Wuhan, P.R. China, 430070

(E-mail: ajithpolwatta@hotmail.com, song6688c@163.com)

Abstract: This research paper explores the relationship among skills of entrepreneurs of leather products and footwear industry in Sri Lanka and entrepreneurs' involvement of innovations in product, process, raw material and market in the industry. Further, the survey investigates firms' competitiveness and innovativeness in the industry. Database of firms in the industry available in Sri Lanka Industrial Development Board was used to administer an expert reviewed and piloted questionnaire among the population of firms. Personal interviews and a mail survey were undertaken which jointly brought above-average response rate of completed questionnaires used for analysis. The research has found that there is a strong link between skills of entrepreneurs and their involvement in innovations. Research has found that entrepreneur focus on product innovations rather than process, raw material and market innovations due to their low level of general education and the main mode of acquiring skills remains on-the-job-training. Usage of technology has been found to be lower level which has a negative effect on innovations. However, the entrepreneurs have a positive attitude towards innovations the relevant agencies can capitalize-on for expansion of the industry and increase competitiveness. The research unearths an intelligent view that in an efficiency-driven economy, what matters is productivity where skilling of entrepreneurs will yield enormous results for harnessing the potential of this ever growing industry.

Key words: Innovations; Technology; Competitiveness; Innovativeness; Skills

1 Introduction

Small and medium scale enterprises (SMEs) play a crucial role in Sri Lanka economy by providing employment and income in order to push the economy forward (Thilakarathna & Jayasekera, 2013). Though there is large number of large scale and micro size firms operate in the economy of Sri Lanka, the main focus is on the SMEs of leather products and footwear industry in Sri Lanka for the purpose of this research paper.

This paper explores the levels of skills of entrepreneurs of the industry and the innovations in product, process, raw material and market as a whole. Economists mainly discuss about product and process innovations in enterprises (Fried, 2005) however, this particular research paper focused additional two innovation areas i.e raw material and new market as it particularly appropriate to leather products and footwear industry sector and the SME sector of Sri Lanka in general. On this backdrop, the research focused the level of new products, processes, raw material and market innovations which the entrepreneurs uncovered in their firms over the past 2 years (2015 and 2014). The paper inquires how the entrepreneurs view about innovations in a context where firms in contemporary business world increasingly recognize skills as one of the key determinants towards innovations which ultimately lead to business competitiveness (Smith, Courvisanos, Tuck, & McEachern, 2012).

1.1 Definitions of key terms

SMEs in general, are defined in variety of ways by various countries in terms of

- 1) Number of persons employed
- 2) Amount of capital invested
- 3) Amount of turnover of the business

In Sri Lanka, Department of Small Industries of Sri Lanka defines SMEs as enterprises with fewer than 50 people and capital investment of less than Rs. 5 million. The Export Development Board of Sri Lanka defines SMEs as enterprises with less than Rs. 8 million investments and less than Rs. 50 million annual turnovers. The World Bank defines SMEs as enterprises that employ less than 99 people (Thilakarathna & Jayasekera, 2013). Webster Dictionary defines the term "skills" as an ability that has been acquired by training. Entrepreneurs' skills is much complex proposition where it is defined as the ability of entrepreneurs to identify the industry trends and new technologies as well as acquire and exploit this knowledge and information for further improve the enterprise performances (Curtin, 2011).

The concept of innovation has been defined as the creative application of knowledge to increase the set of techniques and products commercially available in the economy (Smith et al., 2012). An enterprise is defined as an economic entity created by the entrepreneur, which may develop into a small or large business in time to come (Henry, Hill, & Leitch, 2005). The terms “firms” and “enterprises” are used interchangeably to denote small and medium scale companies operate in the leather products and footwear industry for the purpose of this research paper.

1.2 How skills and innovations apply to SMEs

SMEs are a crucial set of entities in an economy which contribute heavily for Gross Domestic Product (GDP) of a country. In Sri Lanka, SME sector contribution to GDP has increased to 52% in 2011 from 40% in 2010 (Thilakarathna & Jayasekera, 2013). The leather products and footwear industry in Sri Lanka, which is highly labor intensive, has a significant potential for being a key contributor to the economy of the Country with a value addition in the range of 40% - 50% (Gurusinghe, 2012). With this level of value addition, it is extremely vital the entrepreneurs demonstrate innovative skills in order to improve firm competitiveness. The ability of an enterprise to innovate depends on quality of its human resources and level of technology being used (Smith et al., 2012).

2 Research Problem

The research was undertaken to find an answer to following research problem:

“Does entrepreneurs’ skill matter for enterprise innovations in leather products and footwear industry of Sri Lanka”.

Enterprise innovation is referred to as product, process, raw material or new market innovations. In some enterprises innovations take place and entrepreneurs have ensured measures for innovations. However, in most other enterprises no innovations made and only the status-quo is maintained thus making enterprises inefficient, unproductive and monotonous thus leading to stagnation in doing business. So, what is matter? What prevent them not doing innovations?

2.1 Research objectives

The research expects to achieve following objectives on completion of the research:

- 1) To explain current level of skills of entrepreneurs and the type of skills they look for in order to make innovations
- 2) To describe the current level of technology that the entrepreneurs use including the use of information and communication technology tools and the machines they use for production purposes
- 3) To elaborate link between innovation and competencies, industry experience, location, and financing
- 4) To describe the entrepreneurs’ involvement on innovations, innovation target markets and status of enterprise competitiveness
- 5) To unearth and describe the constraints for innovations in the industry

2.2 Policy implications for implementation

The researcher will put forward responses for above research objectives with policy implications to address the issues for implementation by relevant agencies.

3 Literature Review and Theoretical Background

Enterprises care about innovations for improvement of productivity and capture new markets while being in competitive in the industry (Stanwick, 2011). What is really meant by innovation? It is much more about new product, processes and services development than research and development (Stanwick, 2011). If an entrepreneur intends to be competitive, he/she has to offer something different or do something differently which requires innovation (Caskey, 2015). Caskey (2015) further explains that use of different distribution channels and markets also make enterprises competitive in the market. What is inferred here is finding of different markets is also part of innovations. Beal (2000) discussed about different ways of being different where he stresses innovation differentiation and market differentiation as a strategy to be competitive in the market. As cited in Hatak, Kautonen, Fink, & Kansikas, (2016) Greve, Camps & Marque emphasized the need of product innovations for firms to be competitive in a globalized business world. Industries experience threats of new entrants and in order to face such threats product differentiation has been identified as a strategy (Porter, 1997). Parry et al. as cited in (Löfsten, 2014) explains that product innovation is the first stage of product-life-cycle management where determinants of product costs are identified and set determining the future success of the firm. Product innovation processes are different to work processes innovations where the former is strategically

important to firms (Löfsten, 2014). As explained in Sundarraj (2016) product innovation processes are different to work processes innovations where the former is strategically important to firms. In the western cultures, it has been found that there is positive relationship between innovations and enterprise performance (Hatak et al., 2016). There may be different results in developing countries similar to Sri Lanka as management and financing are differ from that of western world. As cited in Sandberg, Hurmerinta, & Zettinig (2013) Drucker and Schumpeter had argued that in order for firms to be sustainable and society and economies to be vibrant entrepreneurship and innovativeness are considered to be crucial. As cited in Sandberg et al. (2013) Beugelsdijk, Hisrich&Peters, Trott, Woo et al. unanimous on entrepreneurs' contribution for wealth creation, firm and economic competitiveness through innovations is enormous. Entrepreneurs, though doing innovations challengeable, find way out to engage in product and process innovations despite numerous issues (Sandberg et al., 2013). Scholars analyze firms' ethical behaviors and performances are positively relates where such climate paves the way for various innovations (Moon & Choi, 2014). Innovations take place within enterprises as a response to competitions' behavior (Porter, 1985). Damanpour, Hirst et al. as cited in (Moon & Choi, 2014) have explained distinctive competences or skills of employees and entrepreneurs determine product and process innovations. The view of Zhang & Bartol as cited in Wojtczuk-Turek & Turek (2015) innovativeness is significant for creating competitiveness in modern organizations has been commonly approved. As discussed by Dan (2015)¹ the world recognize the fact that innovations pave the way for business competitiveness while entrepreneurs have to be in the forefront of discourses on innovations to meet people's needs fully. Also, it has a great risk of failure of products that the enterprises innovate though there are successes (Stanwick, 2011). The scholars Yeh et al. Gonza 'lez& Palacios, Freeman, Hart, Urban & Hauser as cited in Graner & Mißler-Behr (2013) new product innovation is one of the most important determinants of sustained company performance and therefore represents a key challenge for firms to give attention to. Scholars give attention to numerous individual and organizational predictors which can later become a foundation for creative activities of an enterprise where competence of individuals is a key (Wojtczuk-Turek & Turek, 2015). It has been recognized the fact that giving the managers and employees more freedom, a sense of ownership and self-determination is essential for enterprise sustainability and dynamism in innovations (Muthusamy & Dass, 2014). Innovations help achieve enterprises greater efficiency, effectiveness, financial and firm performance (Toner, 2011). Bouwman et al., Den Hertog, Forfas as cited in Janssen et al. (2014) were of the view that businesses run in severe competition and use multitude of strategies to increase market share targeting increased profit margin where innovations considered to be a key. It is argued that there is no single kind of skills that foster innovation but rather there are a variety of skills that are required for innovation (Stanwick, 2011). The OECD (Organization for Economic Cooperation and Development) has been working in the sphere of innovations and they have put forward strategies for innovation among member countries. Empowering people to innovate and importance of unleashing the innovation potential in firms were given priority among OECD member states (Stanwick J. and Beddie F., 2011). Scholars are of the view that some entrepreneurship skills can be taught in order for them to be effective in doing businesses irrespective of the size of the firm (Henry et al., 2005). The responsibility of the entrepreneur is to revolutionize the production processes by innovation or invention of new products or processes (Dana, 2001). Scholars suggest to use competency based training (CBT) as an adult training mode for training of entrepreneurs in whatever the required areas which enables successful performance in enterprises (Hackett, 2001). Though Porter (1985) viewed that innovations take place as a result of competitors' behaviors, Hamel and Prahalad, Barney and Barney et al., as cited in Janssen et al. (2014) reiterate enterprise resources, skills and competence as key for product, process and new market innovations. The scholars Christensen and Raynor as cited in Janssen et al., (2014) argue that strategies that focus on cost-cutting due to financing limitations leave enterprises not engaging new innovations on product and processes and demoralize progressive discourses on ideas and concepts related to innovations.

Sri Lanka has been experiencing a growing informal sector over the years and as in 2014, a high 59.5% of labor force is engaged in employment in informal sector (Department of Census and Statistics, 2014²). Out of this, 47.5% of labor force is in non-agricultural sector in which the leather products and

¹ Dan, Z[I]. Retrieved on 14th March 2015 from <http://english.cntv.cn/2015/03/13/ARTI1426234682359564.html>, 2015

² Department of Census and Statistics is the Sri Lanka Government agency responsible for collection, analysis and dissemination of national statistics. It can be accessed via www.statistics.gov.lk

footwear sector falls in (Department of Census and Statistics, 2014). Skills training for informal sector is found to be very minimal that create issues in improving efficiency of those employed in the informal industries (Dundar, Millot, Savchenko, Aturupane, & Piyasiri, 2014). Gunatilaka as cited in (Dundar et al., 2014) was of the view that most informal sector employees have fewer skills than formal sector workers. Howell et al., Kelley and Lee as cited in Sergeeva (2016) put forward the view that innovative persons has more of specific personality traits than that of skills that they learned in their working life. Owners or Chief Executives of firms are regarded as leaders who show the path for innovations, take risks and identify and promote ideas on innovations (Sergeeva, 2016). Research has found that the need of integration of human factors and technological factors in order to give birth to useful innovations (Smith et al., 2012). In recent decades, enterprise size is also considered a factor for innovations where small firms are more able and enthusiastic in doing things differently and in quality and thus found as a preferable organization form to be successful in business activities (Muthusamy & Dass, 2014). Wiggins and Ruefli as cited in Breznik & D. Hisrich (2014) put forward the view that enterprise life cycle has been shrinking where their period of being competitive is diminishing. Research has found that having collaborations with Tertiary and Technical and Vocational Education Institutions, innovative capacities can be translated to real innovations (Andrew Smith, Jerry Courvisanos, Jacqueline Tuck, 2011). In order to achieve higher productivity of human resource of an enterprise it is necessary to improve capacities of human resources which determine the competitiveness of enterprise (Huggins & Izushi, 2015). Porter as cited in Huggins & Izushi (2015) presented four factors for competitiveness of a nation where he stressed “factor conditions” meaning the availability and quality of human resources of an industry. Research has found that entrepreneurs’ cognitive style, innovative intentions, and subsequent behaviors can potentially be useful in guiding workforce staffing and training efforts for enhancing productive innovation in organizations (Ettlie, Groves, Vance, & Hess, 2014). Products like footwear is produced in volumes of thousands and usually use not-so-complex technology in enterprises mainly in low-labor-cost countries (Caskey, 2015). As labor cost is low, the entrepreneurs may invest money for training in innovations at training institutions. As cited in Breznik & D. Hisrich (2014) Prahalad’s and Hamel’s have emphasized enterprises must give attention to the knowledge, skills and technologies that include the set of resources of an enterprise. Their main premise was that when a firm creates new products, these should be oriented to the firm’s strategic resources, mainly capabilities (Breznik & D. Hisrich, 2014). Entrepreneurs acquire skills through on the job and apprenticeships in the industry (Dana, 2001). This mode of training lacks mostly the theoretical aspects which are an essential part of innovations. Informal methods of learning still in existence in developing countries (Dana, 2001). Designs play a key role in innovations which entrepreneurs decide in numerous ways. They use existing designs, designs by themselves, and buyers’ designs etc. The scholars discuss generation of designs by user communities which will eventually reach production and successful in the market (Caskey, 2015). When it comes to quality of skills training, scholars argue that quality of the education and training of the workforce is the single most important characteristic in determining economic competitiveness of a country (Ball, 2009). Learning has to take place throughout of life of people which includes education and training, the processes of both formal and informal learning: skills, knowledge, understanding, experience, attitude, values etc. (Ball, 2009). In Sri Lanka, competency based training (CBT) is in operation in training centres over the past decade based on competency standards and national curricula. Competencies are descriptions of essential skills, knowledge and attitudes required for effective performance in a work situation (Hackett, 2001). For the purpose of innovation, enterprises do not need higher level skills but a fair understanding of the entrepreneurship, industry trends and markets and customers remain the key (Stanwick, 2011). Scholars argue that lack of focus for innovation may lead to failure in business. Also, too many innovation ideas can cloud the thinking of entrepreneurs that end up in collapse of business (Vaduvescu, 2016). Literature shows that radical innovations though it is riskier is one of the key long term competitive advantages (Verganti, 2016). As people do not buy products but meanings, innovations driven by designs will be sustainable for many enterprises (Verganti, 2016). Given the level of globalization and other reasons, entrepreneurs having innovation skills is critical in 21st century (Asad, 2016).

Each person, regardless of ability, style or orientation can and should be more innovative all the time acquiring innovation skills continuously while making improvements in what they do in value chain of the business (Asad, 2016). Economically, innovation skills take a strong place and is a mainstay of industry and economic development and crucial for success of enterprises and most importantly enhance well being of mankind (Ali, 2014).

3.1 Limitations, reliability and validity

The scope of this research was leather products and footwear industry firms that employ 2 – 250 workers that usually regarded as SME firms by definition. The revenue criteria of the definition could not be met as respondents usually do not disclose facts that may lead to controversies. Therefore, the research considered only the number of employees of the firm in deciding whether it falls in SME definition. As per the definition of the World Bank (less than 99 employees as SMEs) a majority of respondents (92%) have employed less than 35 employees. Micro enterprises and large-scale enterprises were excluded from the survey.

When it comes to reliability and validity, the scholars have defined the terms reliability as the degree to which the measure of a construct is consistent or dependable whereas the validity refers to the extent to which a measure adequately represents the underlying construct that it is supposed to measure (Bhattacharjee, 2012). The questionnaire used to measure the dependent and independent variables was developed in consultation of industry experts and training experts in the industry. It was piloted among 10 entrepreneurs and was updated thereafter. The views of training experts of the Leather Products Development Centre¹ of the IDB, Sri Lanka, were sought and included in the questionnaire. Literature related to skills and innovations were also considered in developing the questionnaire.

3.2 Approach/Design/Methodology

The Leather Products and Footwear Industry is dispersed in all administrative Districts of Sri Lanka with a high concentration in the Western Province which is the main business hub of the country. The Industrial Development Board (IDB) of Sri Lanka² maintains a database of almost all SMEs in the country including all SMEs of the leather products and footwear industry. Therefore, the researcher sought assistance of the IDB in obtaining contact information of leather products and footwear firms in Sri Lanka. Accordingly, the IDB submitted a list of 290 SMEs in the industry with owners' names and postal addresses.

As the research explores the relationship between entrepreneurs' skills and firm innovations, the survey research method was used. The questionnaire with 18 relevant questions was administered during February and March of 2016 among the entrepreneurs in the industry. Depending on the availability of resources, 55 firms were personally interviewed by the researcher and then the questionnaire was sent to the remaining firms all over the country by post mail. Altogether, 185 questionnaires were gathered in both personal interviews and postal survey with a response rate of 63.8%. Personal face-to-face interviews were held to increase accuracy and quality of data being collected for reaching reliable conclusions. The data gathered accordingly have been fed to the SPSS database and analyzed for presentation. When it comes to literature, it has been found that very little amount of literature is available related to leather products and footwear industry of Sri Lanka and no research done in the industry related to the topic being investigated. However, available literature was reviewed in descriptive manner to understand the problem and unearthed available body of knowledge that leads to understand research gaps in relation to the topic being investigated.

4 Results

The research had surveyed entire population of 290 firms and 185 completed questionnaires were collected for analysis. When we look at the dispersion of firms we can observe that 35% of firms are located in Western Province which is the main trade and economic zone of Sri Lanka. Southern province records second largest concentration of 13% of firms. The two provinces together recorded 61% of responses of the survey. The size of the firm was queried and accordingly, the responses show 50% of firms employ 6-15 workers showing that majority of firms in the industry are small firms. 92% of them have less than 35 workers. When it comes to product category, the responses show that 61% of firms produce only slippers which is the dominant category followed by leather shoes category with 16% representation. 12% produce both slippers and shoes and 13% produce bags only and remaining 7% produce other leather goods. It was found that 63% of firms have been operating in the industry for 15 years which shows their long term experience in the industry. The survey showed that only 3% sell their products to overseas market and thus vast majority of 97% of firms sell the products in the local market. Out of this number, majority of firms sell to main distributors which hinder getting customer feedback on satisfaction of the product quality. Only 1% of firms sell products in their own shops. The question related to sources of capital received multiple responses where 89% of firms use own money and 37%

² The IDB is the statutory body established by an Act of Parliament to develop and assist SMEs in Sri Lanka.

have been able to obtain whatever the loans from banks. Only 10% opt for capital from local money lenders and relatives. A question was raised related to designs based on which firms produce their products. It was identified that 65% of firms rely on designs already available in the industry. The results show that 33% of firms produce products based on designs developed by their own firms. Only 3% of firms rely on designs from overseas as only 3% of firms sell their products to overseas market.

The research expected to identify current level of skills of entrepreneurs and the type of skills they look for in order to make innovations and thus the survey asked entrepreneurs about their general education achievements in order to gauge their basic education and literacy and numeracy skills. The Table 1 depicted below show that 64% of the respondents had education up to GCE (O/L) which is the basic competitive national level school education standard. 28% of them had GCE (A/L) which is the next higher national level standard. Only 6% of entrepreneurs had bachelor's level degree qualifications.

Table 1 General Education

Achievement	Frequency	Percent	Cumulative%
Up to O/L	119	64.3	65.0
Up to A/L	51	27.6	92.9
Degree	11	5.9	98.9
Post graduate	2	1.1	100.0
Total	183	98.9	
Missing	2	1.1	

Key: GCE – General Certificate of Education, O/L-Ordinary Level, A/L-Advanced Level

The entrepreneurs' way of acquiring skills was queried and, as specified in Table 2 below, 34% indicated that they have followed a formal training course at a training institute. The dominant way of acquiring skills was on-the-job-training which represented 57% of respondents. Only 6% have followed business/management course and 2.2% of entrepreneurs have received training in overseas. In this question, multiple responses have been received.

Table 2 Skills/Training Programs Completed

Program	No.	%
Followed a industry specific course at a training centre	63	34
Undergone apprenticeship training in industry organized by NAITA	18	9.7
On the job training	105	57
Followed business/ enterprise management course	11	5.9
Received foreign training	4	2.2

Source: Derived table from survey data

The entrepreneurs' skills requirements were queried and, not surprisingly, majority of 70% of respondents wanted design skills followed by entrepreneurship (62%) and production skills (61%) as shown in Table 3 below. ICT skills were also a requirement of 53% of respondents. This question received multiple responses.

Table 3 Perceived Skills needs to Improve Current Performance

Nature of skills	No.	%	Nature of skills	No.	%
Entrepreneurship skills	116	62	Communication skills	88	47
Design skills	131	70	ICT skills	98	53
Production skills	114	61	Any other skills (specify)	5	3

Source: Derived table from survey data

As discussed in the literature, use of technology is regarded as a key indicator of entrepreneurs' tendency for innovations. The survey expected to identify the current level of technology that the entrepreneurs use including the use of information and communication technology tools. The finding of the relevant question was that majority of entrepreneurs do not use or occasionally use internet, email, websites and social media in day-to-day business activities as shown in Table 4 below.

Table 4 Frequency of Use of ICT Facilities

ICT facility	Frequency of use									
	Not at all (1)	%	Occasional (2)	%	No idea (3)	%	Often (4)	%	Very often(5)	%
Internet	28	15	110	60	8	4	21	11	12	7
Email	30	16	97	52	14	8	26	14	13	7
Website	59	29	84	45	13	7	15	8	9	5
Social media (facebook, tweeter)	108	58	29	16	12	7	12	7	15	8

Source: Derived table from survey data

The question on ICT usage had a Likert scale where the respondents were asked to indicate how often they use them in a scale of “Not at all (1)”, “Occasional (2)”, “No idea (3)”, “Often (4)” and “Very often (5)”. The mean values in each of ICT facility in descriptive statistics as shown in Table 5 below are consistent with the result shown in Table 4 above thus showing entrepreneurs use them occasionally or do not use at all.

Table 5 Descriptive Statistics - Frequency of Use of ICT Facilities

As found in the survey, majority of firms use second hand (reconditioned) machines which indicates that the industry has been using old or outdated technology for production of footwear and leather products as shown in Table 6 below. The corresponding Table 7 below shows that 64% of entrepreneurs do not expect to buy new machines in near future. This shows their willingness to apply new technology in production process remains at low level.

Table 6 Nature of Machines Being Used

Condition	Age of machines	No.	%
Use second hand machines	Old less than 5 years	40	22
	Older than 5-10 years	64	35
	Older than 10 years	57	31
Use brand new machines	Old less than 1 year	12	6.5
	Older 1-5 years	16	9
	Older 5-10 years	7	4

Source: Survey data

As per the analysis, new product innovation remains dominant over process, raw material and new market innovations in this industry as shown in Table 8 below. When we compare general education levels with product innovation, it was found that 78 respondents out of 127 who involved in product innovations had GCE O/L and, interestingly, it was found that higher the general education lower the

involvement in product innovation. When it comes to training courses, 66 have received On-the-job-training, 46 have followed training courses and 17 have followed NAITA apprenticeship out of 127 who have involved in new product innovations. Those who have followed management courses and those who have gone abroad for training had very minimal involvement for product innovations. In relation to the industry experience by number of years in the industry with new product innovations, it was found that 100 of respondents with 6-20 years had involved in new product innovations. With regard to relationship between firm location and product innovation, it was found that firms in Colombo, Kalutara, Kandy and Kurunegala districts have involved in new product innovations. When it comes to financing, it was found that those entrepreneurs who use “own money” have higher involvement (116 respondents) in new product innovations.

A question was raised regarding the entrepreneurs’ involvement of product, process, raw material and market innovations over the past 2 years. Interestingly, the results show that 68% have involved in product innovations but very low percentage involved in process and raw material innovations. 18% of entrepreneurs have involved in new market innovations. More than 80% did not involve in process, raw material or new market innovations over the past 2 years. Table 8 brings the findings as shown below.

Table 8 Entrepreneurs’ Involvement of Innovations in Last 2 Years

Type of innovation	Yes	%	No	%
New product innovation	127	68	55	30
New process innovation	17	9	165	89
New raw material innovation	15	8	165	89
New market innovation	34	18	148	80

Source: Derived table from survey data

As the majority of entrepreneurs involved in product innovations, their target market was mainly ladies and gents followed by school children with percentages of 55%, 27% and 18% respectively. 6.5% of entrepreneurs target kids in new product innovations. Table 9 includes the findings.

Table 9 Target Market of the New Product Development

Target market	No.	%	Target market	No.	%
School Children	33	18	Gents	50	27
Ladies	101	55	Kids (less than 5 years old)	12	6.5

Source: Derived table from survey data

As indicated in Table 8, 68% of firms have involved in product innovations and in comparison of that result, the Table 10 shows that nearly 50% of entrepreneurs were of the opinion that their turnover of the new product developed has been increased and also nearly 50% of entrepreneurs indicated that their overall sales have been increased after the innovation of new product.

Table 10 Company Performance as a Result of Innovations

Variable	Strongly agree(1)	%	Agree(2)	%	No idea(3)	%	Disagree (4)	%	Strongly disagree (5)	%
Turnover of the new product increased	31	17	91	49	4	2	2	1	1	0.5
Overall sales of the company increased	29	16	91	49	3	1.6	6	3	1	0.5
Number of employees of the company increased	20	11	61	33	2	1.1	16	9	2	1.1

Source: Derived table from survey data

The question related to company performance had a Likert scale where the respondents were asked to indicate the impact for company performance as a result of any of the above innovations in a scale of “Strongly agree (1)”, “Agree (2)”, “No idea (3)”, “Disagree (4)”, and “Strongly disagree (5)”. The mean values in each of the variables in descriptive statistics as shown in Table 11 below are consistent with the result of Table 10 above thus showing an improvement of company performance as a result of new product innovation.

Table 11 Descriptive Statistics - Company Performance as a Result of Innovations

Variable	N	Mean	Std. Deviation
Increased sales in new product	129	1.8450	.61808
Increased total sales	130	2.0692	2.12839
Increased number of employees	101	2.1980	1.00020
Valid N (listwise)	99		

Source: Survey data

In relation to level of company innovativeness, a question was raised as to whether the firms have ability to do research on innovation, product/process innovation, innovations speedily, and whether the firms have increased their capability on innovations. Table 12 depicted below indicates the results and accordingly, entrepreneurs have reasonably good research capability, new product/process innovation capability despite they have problems in doing them speedily. However, they have improved themselves in foregoing areas over the years.

Table 12 Level of Company Innovativeness

Variable	Strongly agree (1)		Agree (2)		No idea (3)		Disagree (4)		Strongly disagree (5)		Responses	
		%		%		%		%		%		%
Our company has ability to do research on innovations	17	9	24	13	2	1.1	5	2.7	4	2.2	52	28
Our company has ability to develop new product /process	23	12	43	23	3	1.6	5	2.7	0	0	74	40
Our company can do new product development speedily	18	10	11	6	4	2.2	8	4.3	4	2.2	45	24
Our company has improved ourselves in new product development	25	13	77	42	1	0.5	7	4	2	1.1	112	60

Source: Derived table from survey data

The above question had a Likert scale where the respondents were asked to indicate their views on a scale of “Strongly agree (1)”, “Agree (2)”, “No idea (3)”, “Disagree (4)”, and “Strongly disagree (5)”. The mean values in each of the variables in descriptive statistics as shown in Table 13 below are consistent with the result of foregoing Table 10 thus showing reasonably good company innovativeness.

Table 13 Descriptive Statistics - Level of Company Innovativeness

Variable	N	Mean	Std. Deviation
Research capability	52	2.1346	1.20504
has ability to develop new product /process	74	1.8649	.78206
can do new product development speedily	45	2.3111	1.39516
has improved ourselves in new product development	112	1.9643	.80459
Valid N (listwise)	39		

In relation to entrepreneurs’ future plans on innovations, the respondents were given a Likert scale of “Strongly agree (1)”, “Agree (2)”, “No idea (3)”, “Disagree (4)”, and “Strongly disagree (5)” for 5 statements which illustrate their future plans. The mean values in each of the statement in descriptive statistics as given in Table 14 show that they are positive in increasing the production of new product, consolidation of sales in other parts of the country and, finding new buyers for the new product. Descriptive statistics show that the entrepreneurs are not that positive in entering to export market and setting up of a new plant for the new product.

Table 14 Descriptive Statistics – Future Plans on Innovations

Future plan	N	Mean	Std. Deviation
I will increase production of the new product by two fold	115	1.7304	.77597
I will go to other parts of the country to introduce new product	125	1.7520	.70317
I will find a new buyer for the new product	78	1.6795	.71157
I will export the new product	39	2.3333	1.26352
I will setup a new plant for the new product	40	2.3500	1.33109
Valid N (listwise)	36		

Source: Survey data

Entrepreneurs who did not do any innovations were asked to give the reasons and accordingly, the prominent reason they have cited as indicated in Table 15 below was their unwillingness to take risk by engaging innovations.

Table 15 Reasons for no Launch of Innovations

Reason	No.	%	Reason	No.	%
No idea	6	3.2	No sufficient finance	14	8
Not like to take risk	32	17	No facilities in the company	9	5
Fellow company failed in such a work	11	6	No necessary skills	6	3

Source: Derived table from survey data

It has been found that only 27% is willing to engage in innovations in next 6 months and majority of 69% are unwilling to engage in innovations in near future as shown in Table 16. This is consistent with finding of “not like to take risk” as shown in foregoing Table 15.

Table 16 Whether the Firms do New Product in Next 6 Months

5 Conclusions

5.1 Discussion with policy implications

This research explores for an answer to the research problem “Does entrepreneurs’ skills matter for enterprise innovations in leather products and footwear industry of Sri Lanka” as set out at the beginning of the paper. While searching for an answer to the research problem, it was expected to identify current level of skills and type of skills the entrepreneurs look for in order to make innovations. As vast majority of entrepreneurs had at least lowest standard of CGE O/L at school, they have literacy and numeracy skills in order to acquire job-specific or industry-specific skills in training institutions. The entrepreneurs involved in new product innovations but not significant involvement in process, raw material and new market innovations as per the findings. Highly educated entrepreneurs’ involvement in innovations is found to be minimal. Innovations related to process and raw material may need more of scientific knowledge which the current set of entrepreneurs may not have as their general education is at low level. Also, it was found that entrepreneurs’ main method of acquiring skills was on-the-job-training (OJT) mode. OJT usually allows people acquire job-specific and hands-on skills but not deep knowledge related to product development. Therefore, it is important to organize Continuous Professional Development (CPD) programs which bring new developments, research findings, new technology and customer trends into discussion. Competency standards and curricula have to be developed and implemented by the relevant government agencies related to these training areas. As the National Vocational Qualifications (NVQ) system is in place in Sri Lanka as the national skills certification system with 7 levels from certificate level up to degree level, courses on technology and innovations can be developed targeting the industry entrepreneurs. In the areas of skills needs as perceived by entrepreneurs, the responses match with current level of competencies and would help resolving current skills gaps of entrepreneurs. In the order of preference, they have mentioned, the need of design skills, entrepreneurship skills, production skills, ICT skills and communication skills will enable them doing what they have been doing much better. In relation to the current level of technology being applied in the industry including the ICT being used, it can be argued that as the level of education of entrepreneurs in the industry remains low, their ability to use ICT tools i.e internet, email, websites and social media may remain low. This situation adversely affects the new developments in the industry. In this context, following policy suggestions are proposed for consideration of relevant agencies;

Policy suggestion 1: Develop and implement CPD programs on regular basis for industry entrepreneurs that bring new developments, research findings, new technology including ICT tools and customer trends into discussion.

Policy suggestion 2: Develop competency standards and curricula for training programs in the

skills areas mentioned by the entrepreneurs and award National Vocational Qualifications (NVQ) enabling them doing higher level courses at diploma and degree levels while ensuring upward mobility in the NVQ framework.

In the area of current technology being applied in terms of machines, equipment and tools in the industry, it has been found that the entrepreneurs' willingness to apply new machines with new technology remains low. This may be because much of the entrepreneurs use own money as source of capital. Use of Banks as source of capital is not that popular among entrepreneurs which adversely affect the growth of this industry. As found in the survey, the industry is dispersed all over the country however; there is a higher presence in Colombo, Kalutara, Galle, Kandy and Kurunegala which are districts where much of commercial and industry activities are taking place. Financial services available in these areas are higher than that of other districts. Therefore, following policy suggestions are proposed in order to overcome the issues related to technology being used and to promote innovations in the industry.

Policy suggestion 3: Develop and implement industry specific funding scheme to help entrepreneurs to increase access for finance to buy new machines, equipment and tools which bring new technology in to the production process.

As majority of entrepreneurs have targeted ladies in new product innovations followed by gents and school children, design related courses can give much attention to designing of lady's footwear and leather products. Because the entrepreneurs have targeted ladies in new product innovations, the firms have been able to increase revenue and turn over. This makes sense as country's population is predominantly represented by females as per population statistics of the Government of Sri Lanka. As per the findings of the survey, the industry has a space for research and development in innovations. This is something the relevant government bodies have to take into consideration. If there is a promotion from the government front, only new things happen as entrepreneurs always focus on doing day-to-day businesses. On this backdrop, following policy suggestion can be proposed;

Policy suggestion 4: Establish and launch leather products research unit attached to Leather Products Development Centre of the IDB of Sri Lanka.

Few of researchers and data collecting staff with ICT facilities would be required for giving effect to the foregoing policy suggestion. This unit can be linked to new product, process and raw material related innovations that can be done in collaboration with the industry.

As revealed in the survey, the entrepreneurs are interested in increasing the production of new product, consolidation of sales in other parts of the country and, finding new buyers for the new product. This is an area to capitalize-on with some kind of promotion from the government and financing agencies like Banks etc. Since the entrepreneurs are positive in expansion of new products to other parts of the country, loans with low interest rates may be useful to support the expansion. A public-private-partnership between entrepreneurs, the IDB and the financial agencies like Banks can bring the results to improve the current status of the industry. Hence, following policy suggestion is proposed;

Policy suggestion 5: Establish public-private-partnership between interested entrepreneurs, the IDB and the Banking agencies in promotion of new innovations to other parts of the country.

Those who have not involved in innovations have cited "not like to take risk" as the reason for no engagement in innovations. This attitude can be corrected through CPD programs suggested in the beginning of the discussion.

The discussion was mainly built around enhancing the capacity of entrepreneurs by means of skilling them in entrepreneurship, designing technology, communications and awareness building focusing on the future prospects of the industry. The research problem raised at the beginning "Does entrepreneurs' skills matter for enterprise innovations in leather products and footwear industry of Sri Lanka" has sufficiently been investigated through the research. The research findings and subsequent discussion proved that entrepreneurs' skills matter in new product, process, raw material and new market innovations in the industry. Therefore, skilling them is vital to revitalize the industry through innovations. This vision can be reached by working in collaboration of government agencies and private sector according to a well set implementation plan.

5.2 Concluding remarks

Innovations improve competitiveness of firms irrespective of what they produce and what scale they produce. Leather products and footwear industry of Sri Lanka has fairly a long history however; their contribution to the national economy is relatively less despite the large number of people that this industry employs. This shows a productivity problem pull the industry back which needs urgent attention. This research has found out that there is a link between entrepreneurs' skills and their

innovativeness which finally lead to innovations in the industry. Sri Lanka economy is now in the efficiency-driven stage of development where productivity of factors of production including human capital matter in greater extent. New product, process, and raw material innovations are critical in improving productivity. In this regard, knowledge of entrepreneurs matters. If productivity improves only profitability improves. An industry cannot move forward or cannot be able to compete in the local or overseas market unless it does things differently as per the aspirations of its customer base. Research has a crucial role in this regard followed by innovations where the proactive leaders identify customer needs before competitors do. Visionary leaders do it even before the customers identify that they have a requirement which not yet fulfilled.

The leather products and footwear industry is in the SME sector which plays a key role in providing employment and income to local young people of the country. The industry has a country-wide presence in different representation which shows a huge potential for expansion if it given due attention by relevant agencies. There are responsible agencies who can make difference for betterment of the industry. As proposed in the foregoing section, work in collaboration between training providers, regulatory bodies and SME sector agencies is crucial in this regard. The Leather Products Development Centre of the IDB is an institute which can be developed as a flag-ship centre that do research and innovations and show path for entrepreneurs in addition to training of youngsters who join industry as a way of livelihood. Development of skills standards and curricula is a responsibility of Tertiary and Vocational Education Commission¹ with which the training agencies and industry have to work in collaboration in order to develop skills related documents. The SME sector of Sri Lanka, as they are fully focused on the day-today activities may find it difficult to attend whatever the capacity building initiatives organized by relevant agencies. The government agencies shall not be discouraged or demoralized at the beginning because of the aforesaid issue and shall move forward and show results and then many would rally around the initiatives.

The Government Treasury and the donors may focus on the policy implications proposed in this paper and consider allocating resources to improve an industry which has a huge potential for expansion. Local investments and foreign direct investments can do miracles as the market of the industry has been ever growing.

Strategic Evaluation of Key Factors Defining Tourism Destination Competitiveness: A Comparison Study Between Singapore and Sri Lanka

M. Prasad F. Jayasuriya, Cheng Guoping

School of Management, Wuhan University of Technology, Wuhan, P.R. China, 430070
(E-mail: mprasadj@yahoo.com, chenggp@whut.edu.cn - corresponding author)

Abstract: In world tourism there is a noticeable difference of destination competitiveness between developed and developing countries. The purpose of this study is to find the underlying reasons for such difference through a comparative study between Singapore and Sri Lanka. A survey instrument was used to examine 15 factors defining the tourism destination competitiveness and a total of 136 responses (70 from Singapore and 66 from Sri Lanka). The mean values were used in a model based on internal and relational capabilities to strategically evaluate the 15 factors to identify the strengths, weaknesses and competitive opportunities of the two countries. The results not only explained the competitive reality of the two destinations, but also provided strategic guidelines to both the countries to achieve greater destination competitiveness. Further, the model of strategic evaluation of tourism destination, originally tested in Spain was extended for applicability in different destinations and circumstances.

Key words: Developed and developing countries; Tourism destination competitiveness; Comparative study; Model of strategic evaluation of tourism destination

1 Introduction

While tourism generates a significant amount of foreign exchange earnings that also contribute to the economic growth of developed countries, such ingredient of growth has not been effectively harnessed by most of the developing nations. The world travel and tourism destination rankings of 2015 highlight this fact with developed countries occupying most of the top positions including the top 10 while developing nations are behind in the ranking list of 141 countries (TTCR, 2015).

This leads to the question ‘why many developing countries with bio diversity, strong culture, historical artifacts and abundance of natural resources are lagging behind in destination competitiveness?’, especially in comparison to developed nations which sometimes have limited natural or inherited resources. The answer to this question exposes the fact that unlike many commercial products, in tourism a destination delivers an “experience” to its visitors and the inherited resources only will no longer create that experience; instead, a destination’s competitiveness will be determined by how the inherited resources are effectively integrated through efficient management of the tourism supply chain (Fernando & Long, 2012).

Rodriguez-Diaz & Espino-Rodriguez (2008) successfully used a model of strategic evaluation based on internal and relational capabilities to study the factors defining the tourism competitiveness of Gran Canaria in Spain; The two scholars further said, ‘*Moreover, future research should validate the model in other destinations and circumstances*’ (p. 379).

The study tested this model of strategic evaluation of tourism destination in a developed and a developing country - Singapore and Sri Lanka respectively. In travel and tourism destination rankings, Singapore is 11th while Sri Lanka occupies the 63rd position; Regionally, Singapore is number one and Sri Lanka is number six out of a total of 15 south-east and southern Asian countries (TTCR, 2015). The objective of the study is to explain the different competitive positions of Singapore and Sri Lanka in tourism by identifying the country strengths and weaknesses in terms of factors defining tourism destination competitiveness.

By testing the validity of the model in two destinations with contrasting economies, the study contributes to expand the existing theoretical knowledge. On the other hand, the findings help the tourism authorities of the two countries to identify the factors that need special focus and attention to make their destinations more competitive, which can guide the shaping of their tourism strategies.

The introduction is followed by literature review in section 2 and research methodology in section 3. Data analysis, results and findings are presented in section 4, while section 5 is the conclusion. Section 6 discusses study limitations and directions for future research.

2 Literature Review

2.1 Tourism destination competitiveness

The competitiveness of a destination depends on its ability to offer goods and services to outperform other destinations (Dwyer & Kim, 2003). In tourism industry, according to Dupeyras & MacCallum (2013, p 14),

“Tourism competitiveness for a destination is about the ability of the place to optimize its attractiveness for residents and non-residents, to deliver quality, innovative, and attractive (e.g. providing good value for money) tourism services to consumers and to gain market shares on the domestic and global market places, while ensuring that the available resources supporting tourism are used efficiently and in a sustainable way”.

2.2 Tourism supply chain management

The importance of supply chain management in tourism destination competitiveness is evident from the above definition, as the objective of supply chain management is to maximize profits by increasing competitiveness through reduced costs and increased service levels (Crompton, 2009). In general, a supply chain includes all parties who will work together directly or indirectly to ensure customer demand level satisfaction (Chopra & Meindl, 2013) and supply chain management combines a number of business functions such as logistics, purchasing, operations and distribution (Johnsen, Howard & Miemczyk, 2014). In tourism, it involves combining and integrating different sectors, firms and stakeholders which includes tourism enterprises like hotels, restaurants, tour operators and transporters, supporting industries in entertainment, sports and shopping as well as both public and private sector destination management organizations (Fernando & Long, 2012). Therefore, the tourism supply chain management can be described as the ability to efficiently integrate all such sectors and functions to satisfy the tourist needs by meeting their service levels at reduced costs, leading to maximized profits through increased market share.

2.3 Destination competitiveness and tourism supply chain management

In tourism, the competition is not between companies but by supply chains (Christopher 2005) and if the tourism supply chain functions more efficiently and effectively with higher volume of business, the tourism destination will be more competitive (Rodriguez-Diaz & Espino-Rodriguez, 2008). So the tourism destination competitiveness can also be viewed as how a destination uses its available resources in an innovative way using tourism supply chain management.

2.4 Destination competitive models

Based on this understanding, over the last two decades, many scholars have worked on several destination competitive models on different settings (Khin, Daengbuppha & Nonsiri, 2014), with almost all the models centered around tourism supply chain with due consideration for other factors which include economic, social and political forces.

Hassan (2000) suggested a destination competitive model comprising of comparative advantage, demand condition, industry structure and environment commitment indicators, examining the relationships among stakeholders. Heath (2002) established a model emphasizing people as key success drivers and communication and information as vital linkages. Dwyer & Kim's (2003) integrated model consists of six key elements – inherited resources, created resources, supporting resources, situational conditions, destination management and demand conditions. Demand condition here means traveler motivation comprising tourists' perception, awareness and destination image, in contrast to Hassan (2000), where demand condition is the ability of destination to respond to changing nature of market demand. Fernando & Long (2012) further developed the Dwyer and Kim (2003) model and proposed a new conceptual model by including innovation perspective and focus.

The model developed by Ritchie & Crouch (2003), known as Calgary model is based on a destination's comparative advantage through inherited resources and its competitive advantage through created resources; this model links 36 attributes covering core resources and attractors, supporting resources and factors, qualifying and amplifying determinant, destination management, destination policy, planning and development as well as macro and micro environmental forces.

The Travel and Tourism Competitive Index (TTCI) developed and used by World Economic Forum since 2007 is the latest development in this endeavor; Today, the TTCI for global country ranking is based on four broad sub-indexes; enabling environment, policy and enabling conditions, infrastructure and natural and cultural resources; these sub-indexes consists of several pillars which are made up of different variables or attributes (TTCR, 2015).

Rodriguez-Diaz & Espino-Rodriguez(2008) successfully tested a model of strategic evaluation of tourism destination with factors defining the competitiveness of Spanish tourism destination Gran Canaria; this model in Table 1 is based on internal and relational capabilities and represents a double entry matrix

referring to internal and relational strategic value; the model evaluates key factors defining tourism destination competitiveness with tourism supply chain in the focal point combining other areas like geographical, social and socio-cultural conditions, public administration, policy and infrastructure, outsourcing operations, target market segment as well as other stakeholders of the marketing destination.

Table 1 Model of Strategic Evaluation of Tourism Destination adopted from Rodriguez-Diaz & Espino-Rodriguez (2008)

Relational		Internal strategic value		
/Internal		Low	Medium	High
Relational strategic value	Type I Low	C(Weaknesses) Factors not generating internal and relational capabilities	Potential factors to generate internal capabilities	High internal value factors that do not produce any synergies in the rest of destination
	Type II Medium	Potential relationships to generate relational capabilities	B (Competitive Opportunities) Potential factors of core competence	Factors with high internal value that produce a limited synergy effect
	Type III High	Relationships not exploited to develop core competence	High potential to develop core competence but factors are not considered important	A (Strengths) Factors generating internal and relational capabilities; core competence

3 Research Methodology

The study utilized quantitative methods, since it involves testing of an existing model for evaluating key factors defining tourism destination competitiveness.

3.1 Research context

The research survey was carried out in Singapore and Sri Lanka - two countries relying on tourism. In 2014, Singapore received approximately 13 million tourists, which accounted for 1.18% of the global market, while Sri Lanka - comparatively a much bigger country than Singapore had only 1.5 million tourist arrivals. In terms of average nights stayed by a tourist, the ratio of Singapore to Sri Lanka was 1 : 2.85 (Biyagama & Jayawardena, 2013), while the average per night expenditure of a tourist in Singapore was 2.35 times the average expenditure of a tourist in Sri Lanka¹.

3.2 Measures

To finalize the factors defining the tourism destination competitiveness of Singapore and Sri Lanka, in depth interviews were conducted with two experts having wider knowledge and experience of the Asian tourism industry. The experts were asked to review the factors used for the destination competitiveness of Gran Canaria (Rodriguez-Diaz & Espino-Rodriguez, 2008) and suggest any omissions and/or additions with reference to the context of Singapore and Sri Lanka. Based on experts' opinion, all 14 factors used in the original model were retained and one new factor - tourism supply chain innovations (TSC innovations) was added, making it a total of 15 factors.

3.3 Data collection tool and methods

The data collection tool was a structured questionnaire and the same questions used to determine the internal and relational value for tourism destination competitiveness of Gran Canaria (Rodriguez-Diaz & Espino-Rodriguez, 2008). were employed for this study. The 15 factors identified in section 3.2 were evaluated in each of the six close ended questions using a 7-point Likert-type scale, with 1 as the lowest score and 7 as the highest score. The first four questions examined the internal strategic value (ISV) based on importance, non-substitutability, benefits and contribution for improved competitiveness while the last two questions examined the relational strategic value (RSV) based on integration and sustainability.

The data collection was carried out in Singapore and Sri Lanka during the period January 2016 and May 2016 and purposive sampling method was used to select survey respondents based on their importance to and representation of the tourism industry of the two countries. Out of a total of 200 questionnaires distributed (100 in each country), only 136 were returned - 70 from Singapore and 66 from Sri Lanka and the sector representation of the survey respondents are given in Table 2.

¹ Data Atlas (2011-2015), Knoema[1]. Retrieved on 27th May 2016 from Knoema Website: <https://knoema.com>

Table 2 Sector Representation of the Questionnaire Respondents

Sector / Country	Hotels & Accommodation	Airlines	Travel Agents & Tour Operators	Tourism Ministry / Board	Complementary Offers
Singapore	27	7	17	8	11
Sri Lanka	24	8	16	6	12

3.4 Validity and reliability

Validity is the accuracy of measures or the extent which truthfully represents a concept (Zikmund, Babin, Carr, & Griffin, 2010) and by using literature review and expert opinion for identifying the 15 factors used in the study for defining the tourism destination competitiveness of Singapore and Sri Lanka, the authors have ensured the face validity of the data.

Reliability represents the internal consistency or the extent to which the sample patterns of responses to items are consistent or repeatable across items (Helms, 2006) and Cronbach's alpha reliability coefficient was used as the measure to test the reliability, with usual reliability range between 0 and 1 and higher values of Cronbach's alpha meaning good internal consistency of the items in the scale (Gliem & Gliem, 2003).

The Cronbach's alpha values of ISV and RSV for all 15 factors related to Singapore and Sri Lanka are higher than 0.70 as shown in Table 3, indicating reliability and internal consistency is within the acceptable range (Bryman & Bell, 2007).

Table 3 Cronbach's Alpha Values of ISV and RSV for the Destination Competitiveness Factors

	Factors Defining Destination Competitiveness	Singapore Cronbach's α of ISV	Singapore Cronbach's α of RSV	Sri Lanka Cronbach's α of ISV	Sri Lanka Cronbach's α of RSV
	Geographical	0.792	0.812	0.819	0.818
	Environmental	0.809	0.816	0.725	0.833

5	TSC innovations	0.810	0.816	0.821	0.819

4 Data Analysis, Results and Findings

To facilitate the use of the strategic evaluation model, the average values for the 15 factors were calculated under each of the 6 questions from the collected data. Then the internal strategic value (ISV) for each factor was determined by calculating the relevant mean value of question numbers 1 to 4, which addressed the factors in terms of importance(Q1), non-substitutability(Q2), benefits(Q3) and contribution for improved competitiveness(Q4). Similarly, relational strategic value (RSV) for each factor was determined by calculating the mean from question numbers 5 and 6, covering integration(Q5) and sustainability(Q6).

SPSS 22 was used for data analysis and Table 4 and Table 5 display the results of mean values and standard deviations (SD) related to each of the 15 factors with reference to Singapore and Sri Lanka respectively.

Table 4 Mean & SD values of ISV and RSV for the Destination Competitiveness Factors in Singapore

15	TSC innovations	2.53	2.36	2.49	2.29	2.24	2.54	2.41	0.19	2.39	0.21

With the objective of dividing the survey data into as many boxes as in the model of strategic evaluation of tourism destination, percentile calculations were used to identify the values 3 and 5 to

separate the data range of 1 to 7 into three groups. Then the calculated means of ISV and RSV for the 15 factors were used in the model to strategically evaluate their competitive positions in defining the tourism competitiveness of Singapore and Sri Lanka. (Refer Figure 1)

The strategic analysis of Figure 2 shows that Singapore is positioned on the main diagonal in strong equilibrium having seven factors in box A as strengths, six in box B as competitive opportunities and only two off the diagonal; In contrast, Sri Lanka is in imbalanced position on the diagonal with no strengths and having three factors as unexploited opportunities in box B, eight as weaknesses in box C while four are off the diagonal. Therefore, these results from the model of strategic evaluation of tourism destination provides sound explanation as to why Singapore is a top performing and high ranked tourism destination in comparison to Sri Lanka.

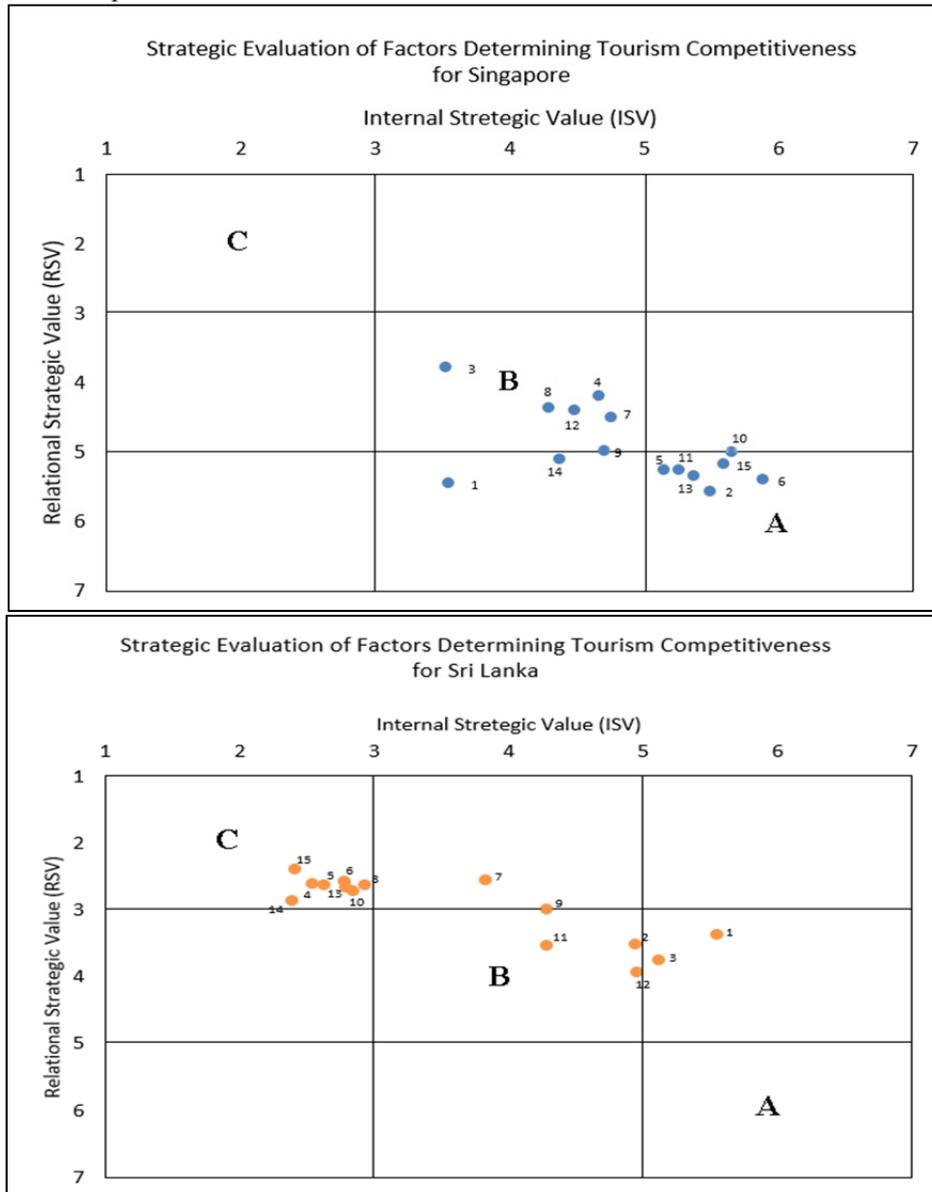

Figure 1 Strategic Evaluation of the 15 Factors Defining the Tourism Destination Competitiveness of Singapore and Sri Lanka

For further discussion and comparison, the strategic evaluation results of the 15 factors related to Singapore and Sri Lanka are summarized in Table 6.

In Table 6, the seven factors shown in box A are the core competence of destination for Singapore and the tourism authorities should continuously reinforce these strengths to ensure that they do not lose the internal and strategic value of these factors. The six factors in box B have medium strategic values

representing competitive opportunities and indicating unrealized potential. Strategically identifying the right factors in box B to pursue as strengths and developing actions to move them should be considered a priority. From the two factors outside the diagonal, direct sales could potentially be moved to a position of core competence with a focused strategy aimed at improving internal vision and generating synergies. Due to its limited natural resources, Singapore possibly may not be considering geographical factor as an internal strength, but has compensated for it with high relational value, which probably explains the off diagonal position of this factor.

Table 6 Summary of Destination Competitiveness Factor Comparison between Singapore and Sri Lanka

Description	Singapore	Sri Lanka
Factors in Box A Strengths leading to core competence	Environmental, Public administration, Public infrastructure, Airline companies, Travel agents and tour operators, Complementary offers, Tourism supply chain innovations (Total of 7 Factors)	
Factors in Box B Competitive Opportunities	Socio-cultural, Policy, Service companies (outsourcing), Customer segments, Customer performance, Hotels and non-hotel accommodation (Total of 6 Factors)	Environmental, Travel agents and tour operators, Hotels and non-hotel accommodation. (Total of 3 Factors)
Factors in Box C Weaknesses		Policy, Public administration, Public infrastructure, Customer segments, Airline companies, Complementary offers, Direct sales, Tourism supply chain innovations. (Total of 8 Factors)
Factors off and above the diagonal		Geographical, Socio-cultural, Service companies (outsourcing), Customer performance. (Total of 4 Factors)
Factors off and below the diagonal	Geographical, Direct sales (Total of 2 Factors)	

The lack of factors in box A indicates a relative weak position in destination competitiveness for Sri Lanka. The tourism authorities in the country should first concentrate on the three competitive opportunity factors in box B with stable plans to reposition them as core competence of the destination. Having as many as eight factors in box C as weaknesses and four others outside the diagonal suggest the need for a clear strategic direction for the tourism industry in Sri Lanka. Such direction should provide strategic actions and single out three to four factors to recalibrate as destination strengths while converting most of the remaining factors to a position of medium strategic value in box B. Identification of right factors should be done with the view that factors defining competitiveness in tourism may vary depending on the destination and targeted market segments (Enright & Newton, 2005). Further, the high IRV's of geographical and socio-cultural factors in comparison to RSV's explain the country dependency on natural and cultural resources for competitive advantage.

The comparison of RSV's show that Singapore has ten factors with high value and five with medium value while Sri Lanka has just the opposite, with five factors of medium value and ten factors of low value. This indicates a very strong comparative position of Singapore in terms of relational capabilities covering integration and sustainability of the tourism supply chain. This position of strength is evident through the competitiveness factor 'tourism supply chain innovations' - where Singapore has it as a strength in box A while for Sri Lanka it is in the weak zone of box C.

5 Conclusions

The empirical study of the factors defining the tourism destination competitiveness of Singapore and Sri Lanka shows that the model of strategic evaluation of tourism destination produces results which represent and explain the competitive reality of the two destinations. Hence the study contributes to the existing theory by extending the applicability of the model not only to a different region, but also to two different economies - one developed and the other developing.

The model also evaluated the factors based on internal and relational strategic values, which clearly identified the strengths, weaknesses and competitive opportunities for each destination which can guide the relevant tourism authorities of the two countries to take specific steps to improve their country competitive positions.

Finally, the successful application of the model for comparative analysis of two competitor destinations with different economic conditions helps to identify the fundamental lines of action to achieve greater competitiveness in tourism, which can be of more importance and value especially for countries with emerging economies.

The study was conducted with data collected from higher level respondents identified through purposive sampling, concentrating on strategic level factors defining the tourism destination competitiveness. This can be viewed as a limitation, since the findings may lack the operational level applicability to achieve tourism destination competitiveness.

The future researchers can conduct a detailed study using the same model to evaluate operational attributes relevant to each of the strategic factors and by involving wider cross section of respondents representing various operational levels of the tourism industry. Alternatively, this study can be extended to combine the operational attributes related to strategic factors which were identified as areas for more focus and special attention in Singapore and Sri Lanka. It will be also interesting to see how the model functions and performs in comparison studies between two developed nations as well as two developing nations, which can lead to some new insights.

Finally, tourism supply chain management and tourism supply chain innovations which showed a marked difference between Singapore and Sri Lanka opens up a completely new research area to explore in tourism and destination competitiveness studies.

Radiation Effect of Independent Innovation Demonstration Area: A Case Study of East Lake Demonstration Area

Zhang Shuai, Xie Kefan

School of Management, Wuhan University of Technology, Wuhan, P.R.China, 430070

(E-mail: 2292340715@qq.com, xkf@whut.edu.cn)

Abstract: With the rapid development of the new technology revolution and the increasing fierce competition in the globalization of science and technology, independent innovation demonstration area has been established and developed gradually. It plays an important role in promoting the transformation of regional economic development, especially the traditional industries. Firstly, this paper explains the relevant concept of demonstration area radiation effect. Then, this paper takes the East Lake demonstration area as an example for the empirical analysis, and provides some suggestions for further improving the radiation effect.

Key words: Innovation demonstration area; Radiation effect; East Lake demonstration area

1 Introduction

In the background of economic globalization, social technicalization and knowledge capitalization, the independent innovation demonstration area (hereinafter referred to as the "demonstration area") came into being. The establishment of demonstration areas for improving the system of scientific and technological innovation, speeding up the development of strategic emerging industries, promoting innovation driven development has the important radiation and leading role. After years of development, demonstration area from the "policy traction, elements of agglomeration" towards the stage of "industrial-led, innovation breakthrough", which means that it has entered the new process of second pioneering (Zhou Yuan, Wang Weicai, 2003). In this process, the demonstration area continues to play a radiation role in promoting Chinese traditional industry restructuring.

There is little research on the radiation effect of foreign scholars, and the related researches mainly focus on the aspects of spillover and diffusion. Montoro (Montoro, 2011) analysis knowledge spillover effect, found that the enterprises which located in the demonstration area have higher spillover effect. Tann (Tann, 2006) first proposed the concept of cluster of hi-tech zone in the field of geography. He believes that thigh-tech zone plays an important role in the transformation of technological achievements and high-tech enterprises agglomeration. Domestic research on the radiation effect of the demonstration area is not deep enough. Wu Wei and Cao Hezhu (Wu Wei, Cao Hezhu, 2011) analyze the adiation effect of Zhongguancun from the aspects of technology and products. They think that the radiation has the characteristics of multi-level and comprehensive abroad. Li Guoping (Li Guoping, 2014) has research on the development of science and technology innovation policy. He emphasizes that the demonstration area should optimize the allocation of resources of science and technology, strengthen the demonstration leading role. So as to promote the development of the integration of science and technology innovation. Zhang Tuoyu (Zhang Tuoyu, 2015) learns the Zhongguancun's construction experience, and puts forward the suggestion of "21 park" space layout. Thus can promote the overall planning and construction of Tianjin demonstration area. Demonstration area effectively enhance the core area of radiation driven function through the way such as brand output, technology transfer, corporate diffusion and mechanism innovation.

In general, scholars have few study on demonstration radiation effect, while the domestic is in the initial exploration stage, the qualitative analytic induction needs to be improved. Therefore, this paper firstly defines the related concepts of the radiation effect of the demonstration area, and then takes the East Lake demonstration area as an example to analyze the radiation effect, and finally puts forward some suggestions for the further improvement of the radiation effect.

2 Definition and Theoretical Analysis

2.1 Concept of radiation effect

In Physics, the radiation means that when the temperature above absolute zero, all the objects in the natural world are transmitted by the electromagnetic waves and particles. Radiation effect refers to the interaction of ray with matter. Definition of economic radiation effect is taking the city as the basis of the economic development. It can drive the development of economy, culture, education, science and

technology in the surrounding area through the advantage of its strong resources. On this basis, the radiation effect of the demonstration area is defined as follows: Demonstration area can promote the development of surrounding areas through its strong policy, science and technology, human resources, industrial and other resources. Demonstration area can gather different industries which have the same functions of the enterprise value chain (such as R & D, business, etc.), and attract all kinds of service institution. At the same time, the mature service environment will attract the enterprise which have the same function to gather in this area. This is the process of demonstration area to play the radiation effect.

2.2 Reasons of the radiation effect appearing

The reasons why the demonstration area produces the radiation effect are as follows: Firstly, it has the important function of the demonstration leading. Demonstration area can promote independent innovation and high-tech industry development, and explore the high-tech industry development policy and system. These models, systems, policies can be used by other companies for reference, and have a good role model. Secondly, the market capacity is limited. The demonstration area has developed and expanded, the market capacity has reached saturation. So they need to expand to meet the needs of the development. Thirdly, cost choice. Some demonstration areas affected by the geographical location, the costs of production and operating are higher. Therefore, in order to adapt the new competitive environment, they need to transfer the lower profits links (such as production and manufacturing links) to other places.

2.3 Radiation carriers and methods

Radiation carriers mainly include science and technology business incubators, industry technology innovation alliance, the engineering technology center, public technology service platform, etc. Through these carriers, demonstration area can play the role of radiation, gather innovation resources, cluster innovation capital, attract innovative talents and improve the environment of innovation. Radiation methods include policy radiation, technology radiation, talent radiation, industrial radiation. Demonstration area has a lot of pilot policies. These policies can be applied to other areas, driving the innovation and development. High-tech enterprises can be seen everywhere in the demonstration area. They have advanced products and technologies, formed an excellent industry-university-research system. These technologies and talents can communicate and share with other areas. In addition, the transfer and extension of advantageous industries in the demonstration area can promote the adjustment of industrial structure in other regions.

2.4 Radiation patterns

The radiation patterns of the demonstration zone are mainly point radiation and line radiation. Point radiation takes the demonstration area as the center and then spread to the surrounding areas. Such as the radiation of East Lake demonstration area to Wuhan. Line radiation generally takes the railway, highways, rivers, lakes and so on as the strip source of radiation, and then pushes to the sides or upstream and downstream areas. Such as the radiation of Sunan national independent innovation demonstration area to the Yangtze River Delta city group.

Demonstration area takes the incubator, public technical service platform as the carriers, uses the advantage of policy, technology, human resources, industry resources, and drives the development of other regions through the point radiation and line radiation, but also attracts more enterprises gathered in the region. The concept model of demonstration area radiation effect is shown in figure 1.

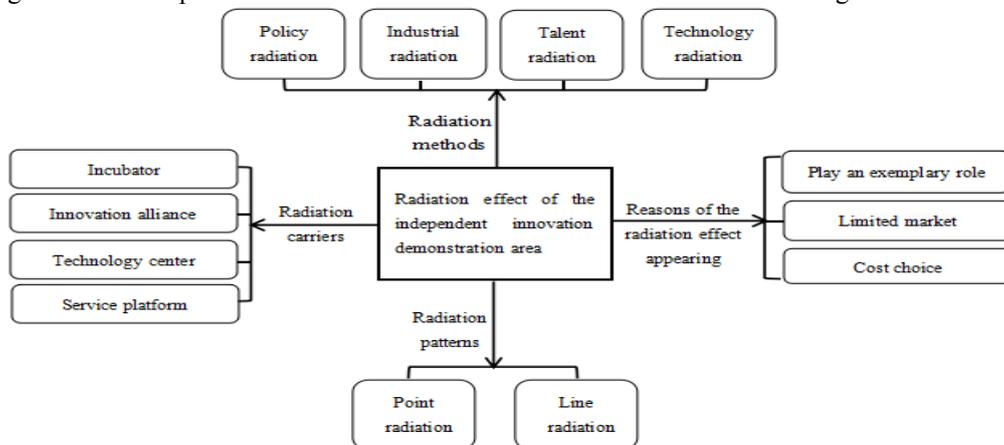

Figure 1 Concept Model of Radiation Effect in Demonstration Area

3 Radiation Effect of East Lake Demonstration Area

East Lake national independent innovation demonstration area (hereinafter referred to as the East Lake demonstration area) is approved by the State Council in December 2009. It's the second national independent innovation demonstration area after Zhongguancun. In China, it's the second largest resources concentration areas of science and technology in the high-tech zone. Photoelectric information industry is the characteristic industry of the East Lake demonstration area.

3.1 Status of radiation effect in the East Lake demonstration area

The construction of East Lake demonstration area is the reflection of building an innovative country strategy. Its purpose is to play an exemplary role to lead the transformation of economic development mode, increase our scientific and technological innovation capacity and economic efficiency. After years of development, East Lake demonstration area already has a certain radiation capacity. The radiation effect is shown in figure 2.

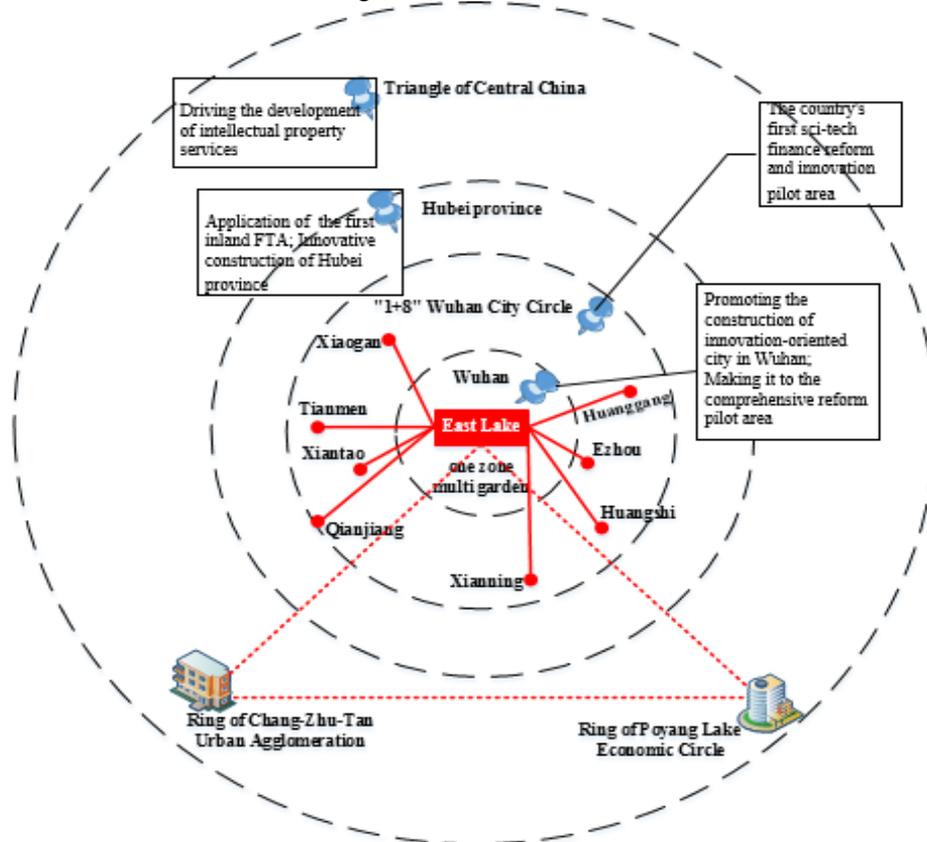

Figure 2 The Radiation Effect of East Lake Demonstration Zone

East Lake demonstration area has basically built a long-term mechanism to promote more mature and comprehensive innovation reform. It has made a number of major breakthroughs in science and technology management system, personnel training and motivation, scientific and technological achievements, intellectual property protection, financial innovation, open innovation and market fair competition. It has successfully formed a regional innovation platform with the demonstration and leading role.

1) Radiation of Wuhan. Relying on East Lake demonstration area, Wuhan carry out the pilot work of "one zone with multiple parks". It makes the various regions of Wuhan have their own "East Lake high-tech development zone". East Lake demonstration area has important demonstration, radiation and promoting effects on the establishment of the innovative city and the construction of the innovation in Wuhan.

2) Radiation of the "1+8" City Circle. Wuhan and the eight surrounding cities composed the "1 + 8" Wuhan City Circle. Among them, the "1" represents Wuhan, while the "8" represents the eight surrounding cities, such as Xianning, Huangshi, Xiantao, Tianmen, etc. The circle forms the core of economic development of hubei province, becoming the country's first experimental zone of financial

reform and science and technology innovation.

3) Radiation of Hubei province. Radiation of East Lake demonstration area to Hubei Province mainly reflected in the declaration of the free trade zone and the construction of innovative Hubei. On the one hand, Hubei Province takes the East Lake high-tech development area as the main body to apply for the first inland free trade zone. It makes the construction of high-tech area combine with the construction of free trade zone, so as to better realize the development of innovation driven. On the other hand, Hubei Province use the innovative advantages of the East Lake high-tech zone to emancipate the mind, deepen reform, promote open, strengthen the support, stand at the forefront, promote the construction of innovation.

4) Radiation of the Triangle of Central China. The Triangle of Central China is a large urban agglomeration, which takes Wuhan, Changsha, Nanchang as the center. It includes Wuhan City Circle, Ring of Chang-Zhu-Tan Urban Agglomeration and Poyang Urban Agglomeration. East Lake demonstration area has become the first national intellectual property service industry cluster development pilot area in the Triangle of Central China. And it will make a contribution to the industrial transformation and upgrading of the Triangle of Central China.

3.2 Suggestions to further improve the radiation effect of East Lake demonstration area

1) Expanding the scope of policy radiation, promoting pilot policy. East Lake demonstration area should further improve the policies of laws and regulations and the mechanisms of management. And these policies and mechanisms should be extended to more areas, thus can provide more convenient conditions and support for technological innovation.

2) Improving the ability of technical radiation, fostering more high-tech enterprises. Demonstration area should further promote the transformation of scientific and technological achievements and the construction of industry-university-research cooperation system, to achieve cross-regional sharing of intellectual property transaction and achievements, nurturing innovative technology enterprises.

3) Increasing the intensity of the personnel radiation, outputting talent intelligence. We should make full use of the East Lake demonstration area science, education, talent, innovation platform and other advantages, strengthen talent exchange, build up talent communication mechanism and realize the talent intelligence resource sharing.

4) Deepening industrial radiation level, optimizing the industrial structure. The area should be extended characteristic industry chain, strengthen industry support, optimize the industrial structure of radiation, play the role of industry radiation.

4 Conclusions

This paper defines the concept of radiation effect in demonstration area, analyzes the cause of radiation, and points out the way, carriers and patterns of radiation. Then, it takes the East Lake demonstration area as the research object, and analyzes the actual situation of the radiation effect. In the future development, the demonstration area should further expand the scope of policy radiation, improve technical radiation ability, strengthen personnel exchanges, and extend the characteristics of the industrial chain, so as to better play the role of radiation.

Through the research of this paper, we can understand the concept and mechanism of the radiation effect more clearly. It has important reference significance to improve the radiation effect of the demonstration area. The radiation effect of demonstration area is worth discussing deeply, but the study in this paper is still in the stage of qualitative research. In the following research, we will pay more attention to the study of indicator system and model framework.

Research on the Evolution Path of Innovation and Development in East Lake Demonstration Zone

Wang Wei, Xie Kefan, Peng Huatao

School of Management, Wuhan University of Technology, Wuhan, P.R. China, 430070

(E-mail: 894164524@qq.com, xkf@whut.edu.cn, penghuatao@whut.edu.cn)

Abstract: In recent years, as a national independent innovation demonstration zone, the East Lake Demonstration Zone's (ELDZ) economy maintains rapid growth. In the paper, the development of demonstration zone is divided into four stages incubation period, primary period, high speed development period, mature period and decline period by using Life cycle model. Then a case of ELDZ is studied, and indications from four dimensions of events, system innovation, technological innovation and integrated performance effect are compared. Finally the paper puts forward some relevant suggestions to improve the performance and capacity of innovation system. Under the construction of an innovative country and the "13th Five-Year Plan" strategy background, research on the path of innovation system development in ELDZ is of great significance.

Key words: East Lake Demonstration Zone; Life cycle model; Innovation system; 13th Five-Year Plan

1 Introduction

After 20 years of development, ELDZ with rapid growth of emerging enterprises, high-quality talent agglomeration has become rich in science and education resources, it's innovation atmosphere is strong, and mechanism of the system is relatively perfect. The construction of East Lake National Independent Innovation Demonstration Zone will become an important fulcrum of the rising strategy of central China. To improve the capability of independent innovation of the ELDZ has great potential, and it is the inevitable trend of national development. The development of ELDZ innovation system research has been the focus of research scholars, and the use of Life cycle theory in the development of the demonstration zone has never stopped.

The product Life cycle is first proposed by Professor Vernon Raymond (1966) in Harvard University, it refers to the market marketing products like a man's life, will experience formation, growth, maturity, decline of the cycle, and the cycle in different countries is not the same. The professor LE Greiner (1998) who first proposed the concept of enterprise Life cycle in 1972 in Harvard University, believed that each phase begins with a period of evolution, steady growth, and stability, and ends with a revolutionary period of organizational turmoil and change. G.Tichy (1998) put forward the four stage theory of cluster evolution which is based on the time referring to Vernon's theory of product life cycle. Maggioni (2004) used Life cycle model to show how different clusters' evolution are part of a wider picture in which technological and spatial interactions between emerging and declining clusters play a decisive role.

At present, there are few articles on the development of demonstration zones in China using the life cycle theory. Jia Xiaohui (2012) through the division of the life cycle of the industry cluster, studied the influence of the different life cycle stages on the regional innovation ability and put forward suggestions for promoting regional innovation in the Yangtze River Delta. Zhang Yi (2013), based on the life cycle theory, analyzed the characteristics of regional innovation in different stages of development, and tried to find out the roles and functions of local government in the corresponding period.

In summary, the development of the demonstration zone is a historical phenomenon in the process of regional economic development, and it's subject to the law of Life cycle.

2 Theoretical Analysis

The most important performance of the innovation system is the innovation ability, the periodicity of the demonstration zone innovation system is shown to a great extent by the periodicity of the innovation ability. Therefore, this paper makes the innovation ability as the main criteria for the demonstration zone innovation system development using life cycle model, divides the development of innovation system into five stages incubation period, primary period, high speed development period, mature period and decline period. The life cycle model of demonstration zone innovation system is proposed as shown in Figure 1.

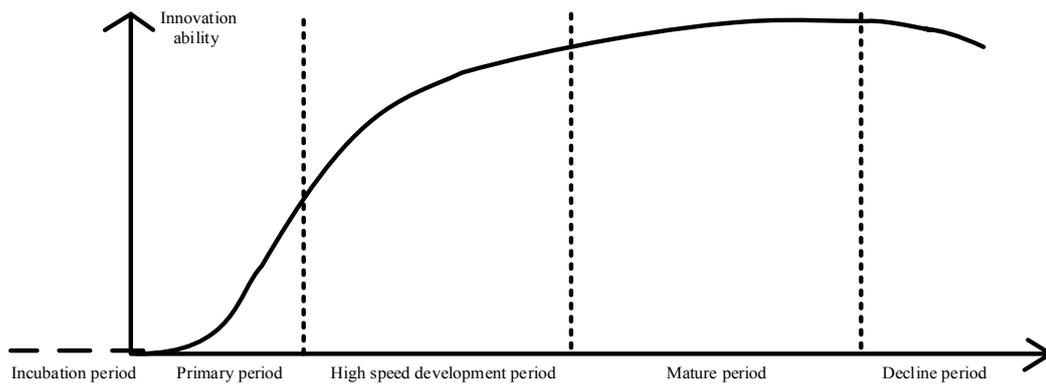

Figure 1 The Life Cycle Model of Demonstration Zone Innovation System

Incubation period is the first stage of the life cycle of the innovation system in the demonstration zone is mainly the preparation stage of the innovation system. The biggest sign of this stage is the initial formation of the industrial cluster. In Primary period, due to the initial formation of the industrial cluster, the demonstration area innovation system has been initially established, but it is just an embryonic form, in the stage of exploration and development. High speed development period is the third stages of the life cycle of the innovation system, with the development of industrial clusters and the gradual improvement of the software and hardware conditions of the demonstration zone, the innovation system in the demonstration zone has achieved rapid development, and the innovation ability has been improved by leaps and bounds. After the development of the high speed development period, the innovation system of the demonstration zone is gradually mature, and the innovation ability continues to develop. The innovation system has formed its own characteristics, and is rooted in the demonstration area. Decline period. At decline period stage, the innovation system has experienced a long period of development, began to go downhill, and innovation ability declines, the recession is a slow and long process of development.

3 Research on Innovative Development Path -- A Case of ELDZ

At present, the development of ELDZ on the axis of time can be divided into the following stages as Incubation period: the stage of creation; Primary period: formation stage of National Development Zone; High speed development period: subdivision for Optics Valley of China construction stage, independent innovation demonstration zone stage, and "13th Five-Year Plan": To establish an international comprehensive innovation and reform core area.

3.1 Origination period

ELDZ is the predecessor of East Lake technology intensive district in Wuhan of China. Between 1984 and March 1991 is the Origination period of the ELDZ. In 1984, in order to meet the challenges of global technological revolution, decision makers of Hubei Province and Wuhan city of China use the intellectual resources of East Lake technology intensive district to promote the transformation of scientific and technological achievements into productive forces, and carry out the "torch plan" to cultivate the high technology industry. In June 1987, East Lake New Technology Venture Center was established as China's first technology business incubator, created at the stage of this period, the ELDZ implemented the mode of "project started, and rolling development", followed the road of self development, self accumulation and self-improvement to develop high-tech enterprises.

3.2 Formation period of the national development zone

Nearly seven years of development, ELDZ has made some progress. In March 1991, ELDZ was approved by the State Council as a national high-tech industrial development zone. From April 1991 to 1999, East Lake high tech Zone has experienced the stage of scale development. ELDZ transformed to construct science and Technology Park and promote high-tech enterprise agglomeration. It successively built South Science Park, East Lake Science Park, Hubei software industry base, Wuhan of China International Business Park.etc. At the same time, radiation to the towns of Wuhan of China to form a district Park. At this stage, ELDZ formed a strong cultural atmosphere of innovation and entrepreneurship, created a number of entrepreneurs and nurtured a number of well-known enterprises.

3.3 Construction period of optics valley of china

From 2000 to 2009, ELDZ experienced construction period of Optics Valley of China. During this

period, ELDZ gathered key laboratories and engineering technology research centers including 33 national level's and 37 provincial level's, and 8 national enterprise technology centers, more than 500 R & D institutions. ELDZ has gradually developed into a high-tech park with distinctive features, strong strength, first-class domestic and internationally renowned. At this stage, ELDZ adhered to independent innovation, and constantly improved the ability to innovate, which walked out its own way to rely on independent innovation and development of the characteristics of high-tech industry.

3.4 Period of independent innovation demonstration zone

By the end of 2009, ELDZ is approved by the State Council as a national independent innovation demonstration zone. Since 2010, ELDZ actively carried out equity incentive and scientific and technological achievements into the reward, innovation of science and technology finance, government procurement, financial& tax policies, and supported new industry organizations to participate in the national major science and technology projects. With gathering and cultivating high level talents and promoting the construction of "two oriented society", ELDZ has made remarkable achievements. At this stage, the construction of Optics Valley innovation and entrepreneurship culture was constantly promoted, the cultural atmosphere of innovation was created, the spirit of entrepreneurship was shaped, and the connotation of Optics Valley brand deepened, that made the influence of Optics Valley brand expand.

3.5 "13th Five-Year Plan": establish an international comprehensive innovation and reform core zone

From 2016 to 2020, China has entered the "13th Five-Year Plan" stage. At this stage, ELDZ should seize the opportunity to actively participate in the international science plans and major scientific projects, and implement big data strategy. First of all, it should develop big data industry development "in 13th Five-Year Plan", make big data industry included in major scientific and technological projects, and build a common technical platform for big data and Collaborative Innovation Center.

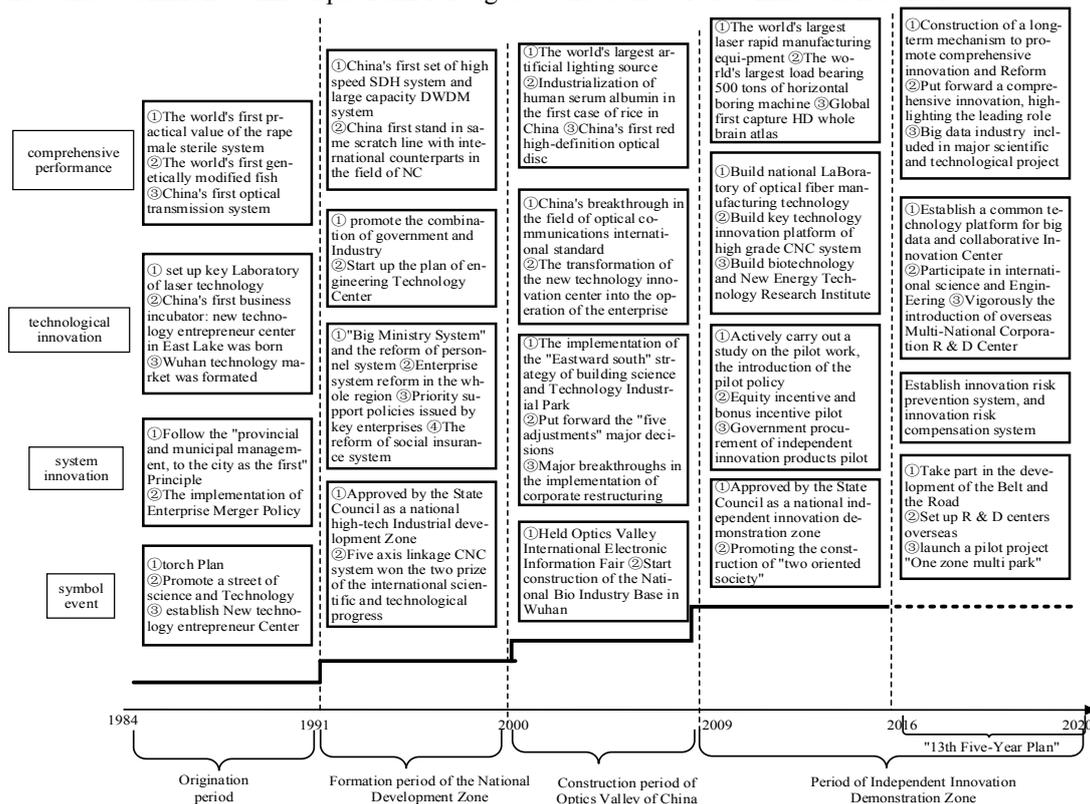

Figure 2 The Path of Innovation System Development of ELDZ

Wuhan of China is the city that won the first round of innovation and reform, in the "13th Five-Year Plan" stage, ELDZ should build an international comprehensive innovation and reform core zone. Its goal is to become the core of the comprehensive innovation and reform demonstration zone of Wuhan City and an international innovation center.

In order to make an objective, dynamic and comprehensive evaluation of the development of innovation ability of ELDZ, this paper mainly from four points: the symbol event, system innovation, technological innovation and comprehensive performance to show each period, as shown in Figure2.

4 Conclusions and Suggestions

This paper from the theory of life cycle, symbol events, system innovation, technological innovation and comprehensive performance for each stage of ELDZ were analyzed. The construction of ELDZ's innovation system is an asymptotic process, although the establishment of innovation system has already begun, but still needs to be strengthened. The promotion of innovation ability in ELDZ must give full play to the active role of government, enterprises, industry research cooperation mechanism, science and technology parks, universities and R & D institutions. According to the analysis above, this paper put forward relevant countermeasures and suggestions to upgrade the path of ELDZ's innovation system performance and innovation ability, it is necessary to strengthen the dominant position of enterprise innovation, constantly improve the innovation support system of ELDZ, and increase the support of local government. Only through breaking the constraints of reality, the life cycle of ELDZ can be extended. The suggestions are as follows:

1) Adhere to government guidance. If government can make effective and positive management of science and technology of international communication, make full use of international cooperation to obtain advanced science and technology, improve ELDZ's innovation system by allocation of resources, promote the accumulation of factors and reduce the cost, the scientific and technological innovation ability of ELDZ will be significantly improved.

2) Open up the channel between scientific and technological innovation and economic development. ELDZ should accelerate capitalization and industrialization of scientific and technological achievements, enhance the support of science and technology for economic and social development, promote enterprises as the main body to construct, establish a technical innovation system with the combination of policy and research, strengthen the use and service of intellectual property rights, and fully stimulate endogenous driving force of enterprise innovation.

3) Deepen the effective model of open innovation. ELDZ should make full use of scientific and technological achievements and high-end talents from all over the world, carry out more international cooperation and innovation with higher level; explore more open innovation policy, more flexible mode of cooperation, encourage foreign enterprises to realize industrialization in our country by introducing more innovation achievements, promote domestic technology and brand to go out. If ELDZ can make full use of global innovation resources, the innovation ability can be improved substantially.

Abstract: Based on the analysis of technology resources, including the R&D status, R&D funding, new products, patents, technological innovation and access of industrial enterprises of different regions on Yangtze River Economic Belt in 2013, this paper finished the empirical research on the S&T resources allocation efficiency of various areas in Yangtze River Economic Belt with data envelopment analysis on the evaluation index system of input of human and investment, output of new product and S&T achievements, then the advices to optimize resources allocation efficiency were also given.

Key words: Yangtze River Economic Belt; S&T resource allocation; Data envelopment analysis

1 Introduction

S&T has become the important determinant of national competitive advantage and social development and progress in knowledge society with the increasingly fierce global competition, and the S&T resources is the material basis for S&T creation, as well the element of "First Productive Force", known as "First Resource (Zhou Jizhong, 1999). There is a comparatively large regional difference in the distribution of the S&T resource, then the gap of economic in regions will be widened. "Relying on Golden Waterway, constructing Yangtze River Economic Belt." was stated in "Government Work Report" of Premier Li Keqiang in March 2014, to stress the new plan of regional development. There are 9 provinces and 2 cities in Yangtze River Economic Belt in economically geographical sense, namely Shanghai, Jiangsu, Zhejiang, Anhui, Jiangxi, Hubei, Hunan, Chongqing, Sichuan, Yunnan and Guizhou, total area of these regions is about 2.05 million km² and accounts for 21.35% of national acreage, the population of these regions was 580 million (2013 data) and accounted for 42.74% of national population, the GDP created by these regions was 28,468.9 billion (2014) and accounted for 44.90% of national GDP, which showed the increasing prominent in economic status and role of country.

2 Comparative Studies of S&T Resources of Industrial Enterprises in Yangtze River Economic Belt

2.1 R&D personnel

In 2013, the number of R&D personnel in Jiangsu Province and Zhejiang Province were 510,930 and 337,115 respectively, while the counterparts in Hubei Province, Anhui Province and Shanghai were more than 100,000. Comparing with the 2012, the highest growth rate of the number of R&D staff was 27.11% in Jiangxi Province, and the growth rate were more than 10% in other regions except for the Hunan Province, Yunnan Province and Shanghai (as shown in Figure1).

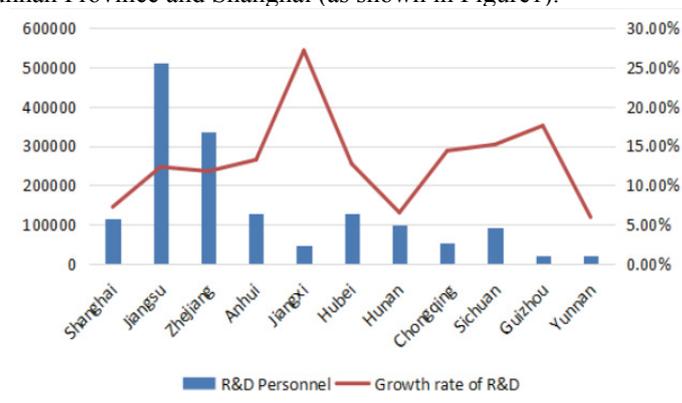

Figure 1 2013 R&D Personnel and Growth Rate of Industrial Enterprises in Yangtze River Economic Belt
Source: Statistical Yearbook 2014, China Science and Technology

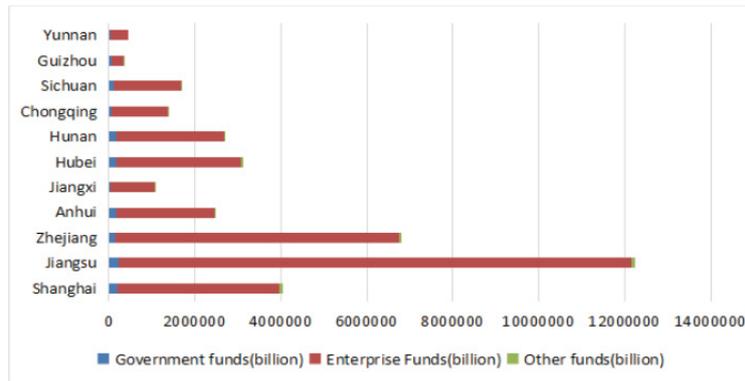

Figure 2 2013 R&D Intramural Expenditure and Growth Rate of Industrial Enterprises in Yangtze River Economic Belt

Source: Statistical Yearbook 2014, China Science and Technology

2.2 R&D intramural expenditure

In 2013, there were 123.96 billion RMB in R&D internal expenditure in Jiangsu, ranked the first of 11 regions of Yangtze River Economic Belt, which was the twice of the amount of Zhejiang, ranked second with 68.44 billion RMB. The fourth was Hubei, spent 31.18 billion RMB. There were large gaps among Guizhou and Yunnan and other areas. Besides, the main source of R&D Intramural Expenditure was the enterprise funds as shown in figure 2.

2.3 R&D projects and expenditure

In 2013, there were more than 40,000 R&D Projects in Jiangsu and Zhejiang, and more than 10,000 R&D Projects in Anhui, Shanghai and Sichuan, while the amounts for in Guizhou and Yunnan were less than 2,000 . There were 110 billion RMB R&D expenditures in Jiangsu, more than 20 billion in Shanghai, Hubei, Hunan and Anhui, and 3.18 and 3.65 billion in Guizhou and Yunnan, which were relatively backward (as shown in figure 3).

2.4 New product development projects and its sales

In 2013, there were 58,353 new product development projects in Jiangsu, ranked the first of 11 regions; followed by Zhejiang with 47,778 projects, and more than 10,000 projects in Shanghai, Anhui, Sichuan and Hubei, lack of 2000 in Guizhou and Yunnan. The sales of new product were similar with the new product development projects, the sales had broken 1 trillion RMB in Jiangsu and Zhejiang, it has to be mentioned that the sales of Jiangsu were close to 2 trillion (as shown in figure 4).

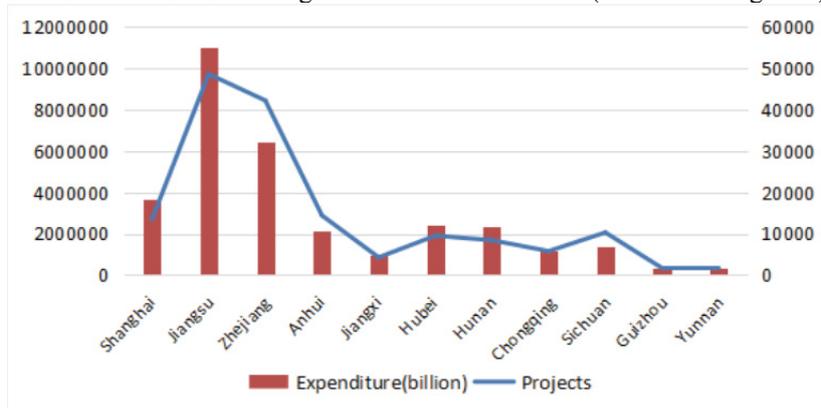

Figure 3 2013 R&D Projects and Expenditure of Industrial Enterprises in Yangtze River Economic Belt

Source: Statistical Yearbook 2014, China Science and Technology

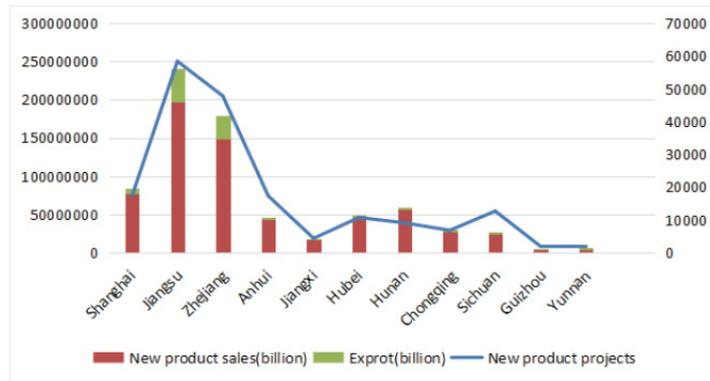

Figure 4 2013 New Product Development Projects and Its Sales of Industrial Enterprises in Yangtze River Economic Belt

Source: Statistical Yearbook 2014, China Science and Technology

2.5 Patent applications

In 2013, there were 93,518 patent applications in Jiangsu, which is the largest amount in Yangtze River Economic Belt, which and Zhejiang were ahead of others, and there were less than 5,000 patent applications in Jiangxi, Guizhou and Yunnan (as shown in figure 5).

2.6 Technology acquisition and renovation funds

In 2013, there were 7.15 billion RMB in technology acquisition funds in Shanghai, 5.25 billion in Jiangsu, more than 1 billion in Chongqing, Hubei and Zhejiang, and 18.57 million in Guizhou, which was significantly behind other regions. As to the technology renovation funds, there were 64.21 billion RMB in Jiangsu, ranked first, followed by 39.56 billion in Hunan, and excess of 10 billion in Zhejiang, Sichuan, Anhui, Shanghai and Chongqing (as shown in figure 6).

3 Empirical Analysis of S&T Resource Efficiency of Industrial Enterprise in Yangtze River Economic Belt

3.1 Evaluation methods

The evaluation of S&T resource efficiency of industrial enterprise in Yangtze River Economic Belt is essentially an input-output efficiency evaluation, so a number of indicators about input and output were needed to be considered, most of whose production function indicators and weights are difficult to pre-set. There are several benefits in DEA model. Firstly, it is more applicable in DEA model for the comparative analysis with similar reference system and for the analysis of multi-input, multi-output technology innovation. Secondly, the objectivity is another advantage of DEA model, which is superior to other methods without pre-setting function and weight. Finally, the simplicity in DEA model with statistical data regardless of the dimension of indicators no pre-correlation analysis of indicators. For these reasons, DEA can be regarded as the best method to evaluate the S&T resource efficiency of industrial enterprise in Yangtze River Economic Belt.

3.2 Index system of evaluation

According to scientific, consistency and comparability principles, according to the development of industrials in Yangtze River Economic Belt areas, the index system of evaluation for S&T resource efficiency of industrial enterprise was built from both inputs and outputs. The inputs in selects 3 indexes from human resources and financial resources, while the outputs selects 3 indexes from new product and S&T achievements (as shown in table 1).

Table 1 Index System of Evaluation for S&T Resource Efficiency of Industrial Enterprise in Yangtze River Economic Belt

	Category	Indexes
Inputs of S&T Resources	Human Resources	R&D Personnel
	Financial Resources	Intramural Expenditure for R&D
		Expenditure Projects Funds
Outputs of S&T Resources	New Product	Sales of New Products
	S&T Achievements	Number of S&T Projects
		Patent Applications

3.3 Evaluation

The 6 indexes of S&T resource of industrial enterprise (as shown in Tab.1) in 2009~2013 of 11 regions in Yangtze River Economic Belt Region were calculated and analyzed with Win4DEAP, the data for 5 years avoids the contingency and improves the exactness with the selected years' data. The input-oriented, variable returns to scale of DEA (1-stage) model had been selected to calculate (as shown in Tab.2), and the technical efficiency industries was also drawn in Radar Figure7.

Table 2 Win4 DEAP Software Testing Results -1

Areas (DMU)	crste	vrste	scale	
Shanghai	1.000	1.000	1.000	-
Jiangsu	0.799	1.000	0.799	drs
Zhejiang	1.000	1.000	1.000	-
Anhui	1.000	1.000	1.000	-
Jiangxi	0.752	0.856	0.879	irs
Hubei	0.818	0.823	0.993	irs
Hunan	1.000	1.000	1.000	-
Chongqing	1.000	1.000	1.000	-
Sichuan	1.000	1.000	1.000	-
Guizhou	0.833	1.000	0.833	irs
Yunnan	0.700	1.000	0.700	irs
mean	0.900	0.971	0.928	

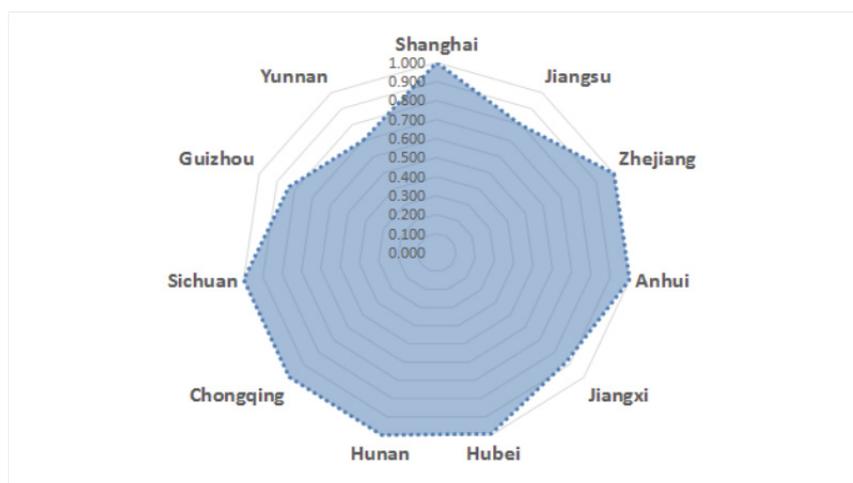

Figure 7 Radar Figure of Technical Efficiency of Industrial Enterprises in Yangtze River Economic Belt

There were following questions in the Efficiency of Industrial Enterprises in Yangtze River Economic Belt:

3.3.1 Entire developments were good, some areas needing to adjust S&T resources allocation

Technical efficiency (overall efficiency value) reflects the ability of DMU to obtain output in the case of the given investment, or to reduce inputs in the case of the given output, thereby to reflect the overall effectiveness of evaluated object. The mean of indexes of Technical Efficiency was 0.9 in 11 regions of the Yangtze River Economic Belt analysis (as shown in Tab.2), wherein, the indexes of Technical Efficiency were 1.000 with active technical efficiency and best scale in Shanghai, Zhejiang, Anhui, Hunan, Chongqing, Sichuan 6 regional; and there were 5 regional allocation efficiency were non-active but the data for those areas were above 0.7, which needed adjustment in the input and output. Overall, the allocation efficiencies of industrial enterprises in 11 regional of Yangtze River Economic Belt were good.

3.3.2 Higher level of management and more developed on S&T resources

The efficiency of DUM was decided by technical efficiency, but cannot explain the invalid reason of DMU, the further analysis on pure technical efficiency and scale efficiency of DMU were required to find out the cause of inefficient of DMU and then upgrade it. Pure technical efficiency is used to judge whether the output has reached the maximum in the given inputs, whether production could increase through optimizing the structure of investment or improving management. From Tab. 3-2, the average of index of pure technical efficiency of 11 regions of the Yangtze River Economic Belt was 0.971, which is close to 1, 9 regional's indexes were 1 and in pure technical efficiency active, except the amounts for Hubei and Jiangxi were 0.856 and 0.823 respectively.

3.3.3 Inadequate investment in S&T resources resulting in inefficiency in resource allocation in some areas

Table 3 Investment Target of DEA Operation Results

Areas	R&D Personnel (People)	Intramural Expenditure for R&D	Expenditure Projects Funds
Shanghai	116806	4047800	3672035
Jiangsu	510930	12395745	11009479
Zhejiang	337155	6843562	6421123
Anhui	127627	2477246	2161182
Jiangxi	46599	1091773	986917
Hubei	110541	2693118	2388780
Hunan	99002	2703987	2352569
Chongqing	53781	1388199	1176841
Sichuan	92424	1688902	1373596
Guizhou	20026	342541	318579
Yunnan	20323	454278	364648

Scale efficiency is the ratio of technical efficiency and pure technical efficiency, which reflects the relationship between the changes of output caused by the change of investment; the closer to 1 of scale efficiency, the more suitable of the presents scale of production, and the greater of productivity. The returns to scale of the S&T resources of input-output industrial enterprises were constant in Shanghai, Zhejiang, Anhui, Hunan, Chongqing and Sichuan; was decreasing Jiangsu, whose scale of investment was too large; were increasing in Jiangxi, Hubei, Guizhou and Yunnan, whose scale of investment were not enough. The efficiency of S&T resources could be adjusted (as shown in Tab.3).

4 Countermeasures to Improve S&T Resource Efficiency of Industrial Enterprise in Yangtze River Economic Belt

4.1 Increase investment of S&T resources, security diversification

S&T resources should be increased referring to the investment target of DEA operation results (as shown in Tab.4-1) to enhance the allocation efficiency of industrial enterprises in the Yangtze River Economic Belt because of the inadequate investment in the previous section More than 90% or even 95% regional R&D funding came from business investment, so the industrial enterprises of Yangtze River Economic Belt should increase S&T investment sources: on the one hand, industrial enterprises themselves should increase S&T investment to strengthen the core competitiveness of enterprises force of product and innovation to gain greater development potential and boost the development of Yangtze River Economic Belt; on the other hand, industrial enterprises should increase the introduction of social capital and foreign capital, and establish the multi-channel S&T funding system of government, enterprises and supplemented by social and foreign.

4.2 Optimize staffing of S&T, improve recruitment system

The talent incentive mechanism should be improved to strengthen the introduction of international talents in the economic globalization and the training of their own knowledge-based staff. Besides enterprises should increase S&T staff's funding level and improve the quality of life.

4.3 Adapt introduce technology to enterprise, promote industry

The development of S&T in Jiangsu Province was ahead of others in 11 regions of Yangtze River Economic Belt. Based on the foregoing analysis, the investment in introduction of technology expenditures were not much, but in technical reconstruction and funding were significantly higher than others. The enterprises should make the technology to combine and adapt to the characteristics and development of enterprises and regions after the introduction of technology. In order to accelerate S&T achievements in industry, companies should cooperate with universities and research institutions to strengthen the exchange of technology and personnel, to achieve mutual benefits.

4.4 Improve resources utilization, sharing among regions

The S&T resources should be shared among the various regions on Yangtze River Economic Belt to avoid wasting and internal friction, Jiangsu, Zhejiang, Shanghai and other developed areas should help Guizhou, Yunnan and other areas, to achieve the overall improvement and development. The regional governments could establish cooperation sharing platform to strengthen links among regions and implement the recombinant and cooperation among regions. In addition, the regions of Yangtze River Economic Belt should learn, exchange and cooperate with other regions of China and International in a wider range, and a higher level of cooperation can help them share S&T resources, then allocate resources more efficiently.

5 Conclusions

The countermeasures and suggestions to improve the efficiency are to increase investment of S&T resources, to security diversification, optimize staffing of S&T, to improve recruitment system, adapt introduce technology to enterprise, to promote industry, improve resources utilization, sharing among regions, were put forward based on the comparative study within six indexes such as R&D Personnel, Patent Applications, and evaluation with DEA for S&T resource efficiency of industrial enterprise in Yangtze River Economic Belt.

Abstract: Despite the surprising and tremendous role of self-service technologies (SSTs) in services industries, some customers may actually feel reluctant to exploit SSTs due to their anxiety and lack of trust in technology. This research examines the influence of technology trust and technology anxiety on customer satisfaction with SSTs. Hierarchical regression analysis of 135 responses reveals that technology anxiety is one of the major factors thwart customer satisfaction with SSTs. The findings also report that technology trust has also a significant influence on customer satisfaction with SSTs. Important implications for services industries, directions for future research and limitations of the study are also presented.

Key words: Technology trust; Technology anxiety; Customer satisfaction; Self-service technologies

1 Introduction

Dynamic and competitive service industries are increasingly offering their services through technology-assisted channel. The industry is surprisingly going to be revolutionized by adapting low-touch high-tech technology enabled services or self-service technologies (SSTs). Substantial benefits are influencing them to deploy technology-assisted services. Some crucial benefits are- cost savings or reduces cost (Dabholkar, 1996, Bitner et al., 2002), increase productivity (Dabholkar, 1994, 1996, Kelly 1994, Alpar, 1992), accelerate speed of delivery, precision and customization (Berry, 1999), differentiate through technological reputation (Meuter & Bitner, 1998), increase customer satisfaction and customer loyalty (Alcock & Millard, 2006; Bitner et al. 2002), to reach new customer segments (Bitner et al. 2002).

Growing tendency of customer to interact with technology is another reason for which the firms are receiving advantages. The tendency of customer is growing since they are also enjoying plenty of benefits. For instance, cost and time savings, better control over the service consumption (Meuter & Bitner, 1998), increased perceived level of customization (Meuter & Bitner, 1998), even enjoyment in some circumstances even enjoyment (Dabholkar, 1996), efficiency, flexibility & surprise (Bitner et al. 2000) and convenience of location (Kauffman & Lally, 1994).

In spite of numerous benefits are embraced by both the service industry and customer, still customers feel uncomfortable of using SSTs (Meuter et al., 2003). Evidence also shows that customer frustration is increasing in interacting with SSTs (Parasuraman, 2000). Therefore, it is becoming increasingly difficult for services industries to ignore the understanding the degree of impact of technology anxiety and technology trust as factors of feeling discomfort or comfort with SSTs. They both should be taken into consideration in order to perfectly predict and realize the sensitivity and response of customers toward SSTs. A considerable amount of literature has been published on SSTs. But there has been a few research studies investigating consumers' feeling due to technology anxiety and technology trust.

A conceptual framework is developed for examining and understanding the influence of technology anxiety and technology trust on customer satisfaction with SSTs along with developing hypotheses and extensively amalgamating related literature on SSTs, technology anxiety, technology trust and customer satisfaction.

2 Conceptual Background and Hypothesis Development

2.1 Self-service technologies (SSTs)

Self-service technologies (SSTs) are technological interfaces that allow customer to embrace the opportunity of producing a service without depending on direct service-employee involvement (Meuter

* Corresponding author: reachable at zapan@cu.ac.bd

et al., 2000). Examples of SSTs include automated teller machines (ATMs), telephone banking, e-commerce, e-stock trading, etc.

2.2 Trust in technology and technology anxiety

Trust is intricate judgment that implies risk and uncertainty (Kenworthy and Jones, 2011). Trust, according to Fukuyama (1995) & Luhmann (1979), is also crucial for almost each and every kind of situation in which either uncertainty exists or unexpected result may arise. Trust in technology is a belief that the specific technology possesses the capability, functionality, or features to do what a person wants to do (Mayer, et al., 1995). Anxiety is feeling of discomfort due to uncertainty. Technology anxiety is the panic, apprehension and expectation customers realize when thinking to use or actually using any sort of technology (Cambre and Cook, 1985; Kay 1993). In a research of Yao & Liao (2001), they suggested that perceived risk is significantly affected by anxiety, which is strongly related to trust (Mayer et al., 1995). Therefore, technology anxiety is a considerable factor in technology trust. Strong empirical background helps us to propose the hypothesis given below:

Hypothesis 1: Customers with higher technology anxiety will have lower technology trust with SSTs

2.3 Technology trust and customer satisfaction with SSTs

Customer satisfaction with SSTs is the result of many antecedents, including trust. Generally and inherently lack of trusting belief leads to dissatisfaction in any kind of deal or transaction including the use of self-service technology. According to Balasubramanian, Konana, & Menon (2003), low satisfaction arises from the absence of trusting belief. Shunzhong (2012) suggested that customer satisfaction with SSTs is significantly and positively influenced by technology trust. Recent studies in relationship marketing, consumer behavior, information system and self-service technology indicate that higher trust is a strong predictor of higher satisfaction with technology. Therefore, the hypothesis would be:

Hypothesis 2: Customers with a higher technology trust will have higher satisfaction with SSTs

2.4 Technology anxiety and customer satisfaction with SSTs

Although it is extensively recognized that the way of doing business in the past decade has been revolutionized due to the use of SSTs (Bitner et al. 2010), in some interesting circumstances customer may be reluctant to use certain SSTs, even the benefits are noticeable and evident (Meuter et al., 2003; Parasuraman, 2000). Customer usually exhibits anxiety related to operation of SSTs although it brings suppleness (Lin & Hsieh, 2006; Meuter et al., 2003, Yen, 2005; Zeithaml et al., 2002). Therefore, researchers tried to find the relationship between anxiety and satisfaction with technology. Butcher et al. (2001) suggest that anxiety negatively influence the customer satisfaction. Therefore, we hypothesized:

Hypothesis 3: Customers with higher technology anxiety will have lower satisfaction with SSTs

2.5 Technology anxiety, technology trust and customer satisfaction

Shunzhong (2012) found that increased technology anxiety leads to minor technology trust. Meuter et al. (2003) found that customers with high technology anxiety were less satisfied with the use of SSTs. Overall satisfaction with SSTs is significantly influenced by trust (Johnson et al.; 2008). From the mentioned relationships we could assume that:

Hypothesis 4: Technology anxiety, technology trust and customer satisfaction are correlated

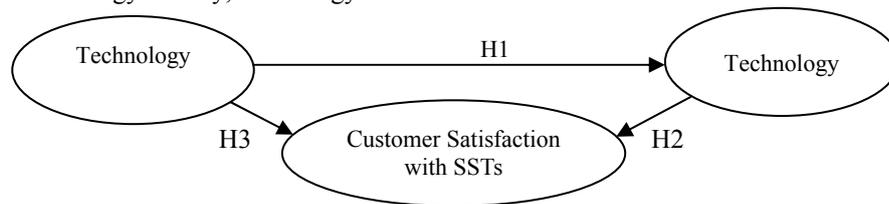

Figure 1 Conceptual Model

3 Methodology of the Study

In order to attain the objective, the study followed a thorough review in the literature on technology anxiety, technology trust and satisfaction with SSTs to identify the key issues. Survey instrument was constructed incorporating 3 constructs. The study picked up three item scale from Johnson (2007) for technology trust and three items scale for customer satisfaction from Fornell et al. (1996). To measure the technology anxiety, we adapted 3 items scale refined by Shunzhong (2012) of the original nine items scale of Meuter et al. (2003). Each indicator of the dimensions was measured using 5-point Likert scale. Using convenience sampling method, questionnaires were sent to 200 respondents in Chittagong city, Bangladesh, and 160 responses were received. After thorough checking, 135 questionnaires were found usable.

4 Findings and Result Analysis

4.1 Reliability of data

The reliability of the data was tested using most widely used and acceptable method Cronbach’s alpha. The values of Cronbach alpha for technology anxiety construct is 0.864, for technology trust construct is 0.893, and for customer satisfaction is 0.863, which are above the cutoff value 0.7 recommended by the most of the researches (Hair et al., 1998). These values of Cronbach indicate that the data collected from the respondents are reliable for the study.

4.2 Respondents’ demographic characteristics

Out of 135 respondents 71.1% were male and the balance 28.9% were female. 57.8 % respondents were graduated where 42.2% were undergraduate level. 65.2% respondents fell between 25 to 34 years, 27.4% respondents were between 18 to 24 years and 7.4% were 35 and above. Majority of the respondents (66.7%) were found to be employed in service where 28.9% were students and the rest 4.4% were involved in businesses.

4.3 Findings

The results of mean and standard deviation of technology anxiety, technology trust, and customer satisfaction, and correlation among the three constructs are summarized in table 1. The mean and standard deviation were found consistent with the previous study (Shunzhong, 2012). Significant correlations were found among all the three constructs. It is also apparent from the following table that technology anxiety is negatively correlated with technology trust and customer satisfaction ($r = -0.607, p < 0.01$ and $r = -0.613, p < 0.01$) respectively. On the other side, positive relationship ($r = 0.555, p < 0.01$) was identified between technology trust and customer satisfaction.

Table 1 Mean, Standard Deviations and Correlations Matrix

	Mean	STD	1	2	3
1 Technology anxiety	2.3778	1.03968	1		
2 Technology trust	3.3654	1.19206	-.607**	1	
3 Customer satisfaction	3.2988	1.22797	-.613**	.555**	1

** . Correlation is significant at the 0.01 level (2-tailed). $N = 135$,

Table 2 postulates that the most significant variance in customer satisfaction was explained by the technology anxiety. It explained 35.2 per cent (R^2) of customer satisfaction with SSTs. Another important construct is technology trust. It also explained 6.0 per cent (R^2) of customer satisfaction with SSTs. Only 2.3% (R^2) variance in customer satisfaction was explained by the demographic characteristics (Age, Education, Occupation, and Gender). This shows that demographic characteristics are not significant at all. Furthermore, simple regression analysis to predict the impact of technology anxiety on technology trust has an effect of 36.8% (R^2) which is found significant at $p < 0.00$. Finally, it is suggested that technology anxiety and technology trust would have been used for predicting customer satisfaction with SSTs.

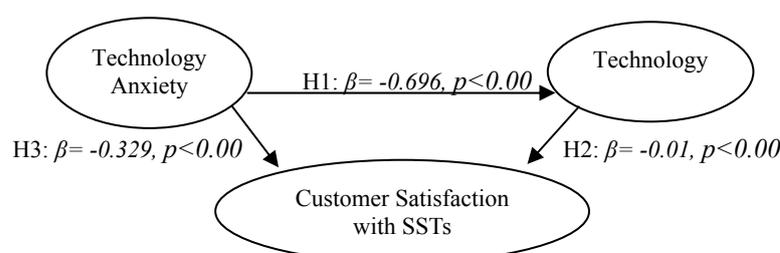

Figure 2 Estimated Model

5 Discussions and Implications

In this study we aimed at exploring the influence of technology anxiety and technology trust on customer satisfaction with SSTs. Simple linear regression analysis of the study supported the contention of the hypothesis 1 which affirmed customers with high level of technology anxiety will experience low level of technology trust with SSTs. Not capable of being bent and lack of ease to use of SSTs lead customers feel anxiety. This negative relation is also consistent with the findings of the previous research studies (Shunzhong, 2012; Hwang & Kim, 2007). The second hypothesis of the study was found to be significantly perceived by the respondents. That is Customers' trust increases when the associate factors with SSTs such as flexibility, smooth operation etc. are at desired level and hence they feel satisfied with SSTs. This relationship is consistent with earlier studies (Meuter et al., 2003; Butcher et al. 2001). The findings for hypothesis 3 is in agreement with Shunzhong's (2012) findings which showed customers with high level of technology anxiety will experience low level of satisfaction with SSTs i.e. they are negatively correlated. The results of the current study also present a support for the supposition that the three constructs are significantly correlated.

In the era of competitive world, services industries have to adopt SSTs to provide services promptly and to capture new customer in order to sustain. In doing so, the management of service industries should focus on the psychology of the customer and quality of SSTs to improve the perception of the customer about SSTs. To reduce the technology anxiety, the industries should introduce flexible and ease to use SSTs including educating the customer with SSTs. Essentially, higher technology trust with SSTs ultimately leads to better customer satisfaction. Therefore, managers should be attentive to improve the technology trust to enhance the customer satisfaction.

6 Conclusions

First limitation of the study is use of convenience sample with a small number of respondents. All respondents were from the same city is another limitation for generalizing the findings. Future study would be benefited from geographical dispersion and a large number of respondents. Despite the limitations, the paper will help the service industries' managers to strategically rethink the adoption and deployment of SSTs. Services industries should tactically introduce the SSTs so as SSTs can reduce the anxiety and increase the trust besides offering others competitive advantage in order to long run business development in the sophisticated up-to-the-minute competitive business arena.

Abstract: A method combining economic evaluation and social impact assessment creates information that can be applied when making decisions about a new tenement building or renovation of existing buildings. The aim of the economic evaluation is to ensure that economic aspects are adequately considered and investment is realisable from a monetary point of view. Social impact assessment reveals intangible pros and cons related to an investment or investments to be considered. This paper presents a framework that combines economic and social aspects and supports decision making related to affordable housing.

Key words: Decision-making; Investment; Affordable housing; Impact assessment; Economic; Social

1 Introduction

The aim of social or affordable housing is to ensure ‘a decent home for every household at a price they [can] afford’ (Scanlon, , Whitehead, Fernandez, 2014). Access to decent and affordable housing is a critical condition for economic growth and a stable society (King,2006). Thus governments and communal municipalities in different countries allocate tax revenues to support the housing of people with low income. Mechanisms to offer affordable housing vary in different countries as well as the proportion of social housing of the overall housing stock (Scanlon, Whitehead, Fernandez, 2014). In Finland the Housing Finance and Development Centre of Finland(2015) implements housing policy by providing subsidies for new construction, renovation and purchase of housing. These subsidies can be applied for by individual citizens as well as local authorities or public and other corporations that fulfil certain preconditions.

Investment decisions on affordable housing can be considered through three levels that are presented in Figure 1; macroeconomic, company management and operation processes (Forss,2013). On the top is the macroeconomic level where housing policies and allocation of tax revenues for different affordable and social housing interventions are defined. A company’s strategic decisions, which follow national housing policy, are done on the company management level. Operational level decisions are for practical implementation of national policy and a company’s strategy. In this paper the focus is on practical tools to support decisions on new investments, i.e., operational-level decisions.

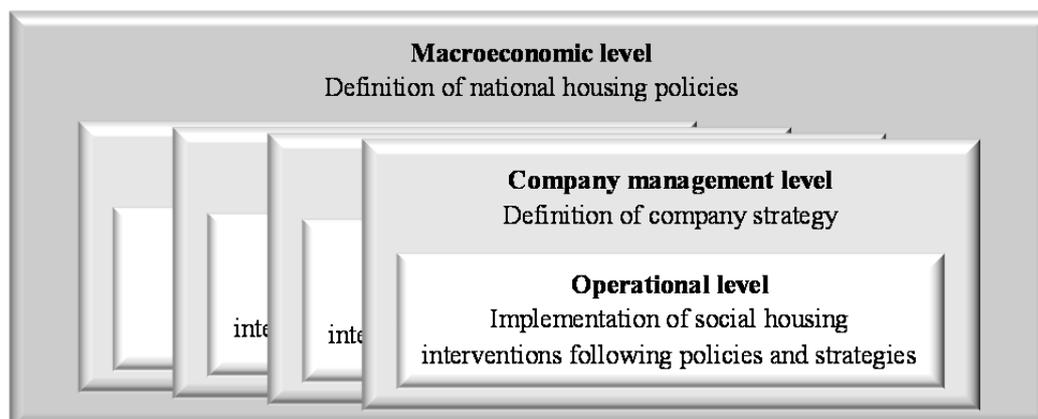

Figure 1 Decision-making Levels

When making investment decisions on new construction or renovations of affordable housing estates, economic values and affordability are typical criteria while the importance of other issues like

housing location and quality is sometimes underestimated (Mulliner, et al, 2013). Economic issues create boundaries to practical-level social housing interventions, which is a clear reason for its important role in decision-making. For example, a non-profit but self-financing company that builds, owns and rents out houses, must balance costs and income to be able to continue in market. Benefits achieved by investing in affordable housing cannot only be measured by economic values. It is important to include an assessment of intangible values in investment evaluation as well. Thus, a method combining evaluation of economic and intangible values is needed.

In recent years, there has been rising interest and activity in impact investment, which are “investments made into companies, organizations and funds with the intention to generate social and environmental impact alongside a financial return” (CA, 2015). The ability to measure and demonstrate the impact of these investments has become increasingly important. In a recent review of state-of-the-art of impact assessment, the following types of impact assessment are covered (W.K, 2014; Clark, et al, 2004; Hehenberger, et al, 2013; Wilson, 2014; Bond and Pope, 2012): Environmental Impact Assessment (EIA); Strategic Environmental Assessment (SEA); Policy Assessment; Social Impact Assessment (SIA); Health Impact Assessment (HIA); and Sustainability Assessment. EIA emerged from the National Environmental Policy Act 1970 (NEPA) in the USA. It can be considered the origin of impact assessment. EIA can be seen as a term that captures the idea of assessing proposed actions for their likely implications for all aspects of the environment, from social to biophysical, before decisions are made to commit to those actions, and the development of appropriate responses to the issues identified in that assessment (Morgan, 2012). However, these methods are not directly focused on affordable housing, but rather on assessing impacts of investments towards sustaining development processes and generating a positive impact on society as a whole and especially in a less developed countries. Therefore, there is a clear need for a method focusing only on affordable housing and taking into account the specific needs of social housing financing system and housing policy in Finland.

This paper presents a conceptual model to support investment decision-making, taking into account economic and intangible aspects. The model is developed as an ongoing project and thus the results from method implementation are not yet available.

2 Research Objective and Methods

The aim of this paper is to contribute to the understanding of social and economic aspects of investment decision-making, addressing how to ensure that the most suitable investments get appropriate focus. Consequently, the paper contributes to the practical assessment on the new construction and renovation investments in affordable housing in a way that the goals of the decisions can be reached. The underlying research question of this paper is: how can the economic and social impact of affordable housing be assessed in a practical manner?

The paper is based on research carried out in the research project ‘Towards risk-conscious investment decision making and value creation’ partly funded by Tekes (the Finnish Funding Agency for Innovation) by the fund “New value creation”. The project responds to the growing need to enhance the sustainable competitiveness of value networks. It aims to advance companies’ ability to create value and to provide decision models and tools to evaluate investments and to assess uncertainty and risk.

The main research methodology is constructive research. The actual framework development is based on problem solving and solution building.

3 Case Description

The case company TVT Asunnot is a real estate company owned by city of Turku, i.e., it is a public non-profit corporation that offers affordable rental housing aiming to maintain and promote the wellbeing of individual citizens and society. TVT owns almost 11,000 homes providing a wide variety of residential options in blocks of flats, terraced houses and small private homes throughout Turku. The value of real property is over 1 billion €. In 2015 the company has yearly turnover of 75 M €; administration, maintenance and repairs add up to 48 M € and finance costs are 23 M €.

The aim of the case is to develop the company’s own investment decision-making and to provide more information about investment alternatives to city authorities and other stakeholders. The developed method is aimed at supporting a selection of the suitable investment to be realised out of the 2 to 10 alternatives. To promote method utilisation in practice, a calculation tool that supports the decision-making will be created. It includes all required equations and templates and thus the user only needs to input case-specific parameter values.

4 Method for Economic and Social Impact Assessment

The method that yields information about the economic values and social impact of different investment options can be presented as a process with five main phases. In the first phase, all the investment alternatives to be compared are defined. In the second phase, monetary values for all alternatives are given and the options that are acceptable from an economic point of view are selected. In the third phase, intangible social impact generated by investment alternatives is assessed. Both economic and social impact assessments are presented in more detail in the following sections of this paper. Results of the assessments are presented by figures and tables that combine economic and social viewpoints in a way that supports the selection of the investment to be proceeded with. Case-specific values used in such an assessment are inherently uncertain since they will be realised only after the investment has been implemented. Sensitivity analysis will reveal how the ranking of alternatives will change if the results are recalculated by values deviating from original estimates.

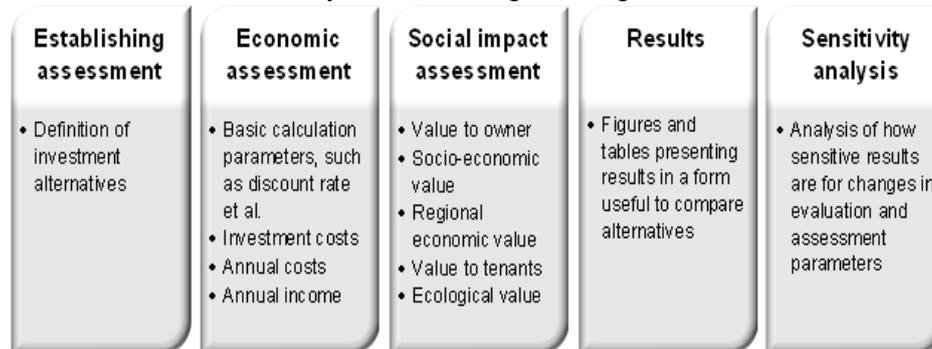

Figure 2 Phases of Economic and Social Impact Assessment Method

4.1 Economic assessment

The aim of the economic assessment is to support investment decision making by providing information on economic profitability of different investment options. The case company has two main economic restrictions related to renovations and new buildings. Although the case company is a non-profit corporation, it needs to cover expenses. Public funding is used in investment financing, when terms of loans are more favourable than terms in an open financial market, but housing expenses are not directly compensated by tax money. The other restriction limits rents to a level that is about 10% lower than in the same kind of tenements in free markets. Via economic evaluation, a real estate company can assess whether the intended rent level can be achieved by the planned investment and which of the planned investments leads to the most cost-effective outcome.

The economic evaluation method applied in this case consists of five phases described below.

1) Basics of evaluation

The first phase is to define investment options to be compared and basic information related to investments. The intended area of buildings and type of the investment that can be either renovation or a new construction are examples of the basic information on buildings. Basic economic parameters used in calculations are discount rate, inflation of expenses, inflation of rent and the expected lifetime of the investment.

2) Investment cost

The second phase includes the definition of investment cost structure, the valuation of cost elements and the calculation of the total investment cost for each of the investment options. Investment costs consist of various cost elements and thus a structured approach is needed to incorporate all relevant cost items in the calculation. The numerical values for all costs items related to investment cost can typically be obtained from offers and other documents. The total investment cost is typically calculated simply by summing up different cost values.

3) Annual costs and income

To balance investment and lifetime cost with expected incomes, the next phase of the process focuses on the definition of the structure for annual costs and income related to each investment alternative. Compared to investments costs, lifetime costs and income are more challenging to value because the values will be realised only in future and are inherently more uncertain than investment cost. Expected annual costs in the real estate business can be estimated rather accurately utilizing data and experiences from other kinds of tenement buildings. Incomes of a tenement building consist of rent

payments, water costs and other living costs, e.g., parking, use of laundry, etc., paid by tenants. In this kind of situation when income needs to cover expenses, required income and rent per square meter can be calculated based on investment and annual costs.

4) Results

Results of economic evaluation provide information on which investment options are acceptable according to required rent per square meter. In addition, investment options can be compared by rent payments and payback times. By combining economic evaluation and intangible impact, it can be considered whether desirable intangible forms of impact are achieved by reduced rent.

5) Sensitivity analysis

Uncertainty is inherently related to basically all decision-making situations. However, this case features fewer uncertain elements than many other cases. The simplest form of the sensitivity analysis is the what-if analysis that provides new results after the calculation values are changed. The main source of uncertainty is the utilisation rate of houses. Low utilisation rate decreases income while costs remain fixed, which causes a pressure to raise rental rates. The sensitivity analysis creates information about the lowest utilisation rate that still provides an acceptable rent level and covers costs.

4.2 Social impact assessment

The social impact assessment in this case study is made by applying multi-criteria decision-making techniques. The method used to assess the non-monetary impacts of affordable housing is derived from the work of Keeney & Raiffa (Götze, et al, 2008; Keeney and Raiffa, 1993) who presented the multi-attribute utility theory (MAUT). The multi-attribute utility theory provides a tool to aggregate different aspects, which can be tangible and/or intangible, into one index that enhances the comparison of investments from a social standpoint. Weights needed in calculations are defined by an analytical hierarchy process (AHP) (Saaty, 1980). The underlying objective is to establish relative weights for the main criteria and factors by means of pairwise comparison. Generally, the more critical a factor is, the more weight it should be given. These methods were chosen since they provide a flexible and easily understood method of analysing complicated problems, while also allowing consideration of subjective and objective factors in decision-making processes and being able to handle conflicting factors.

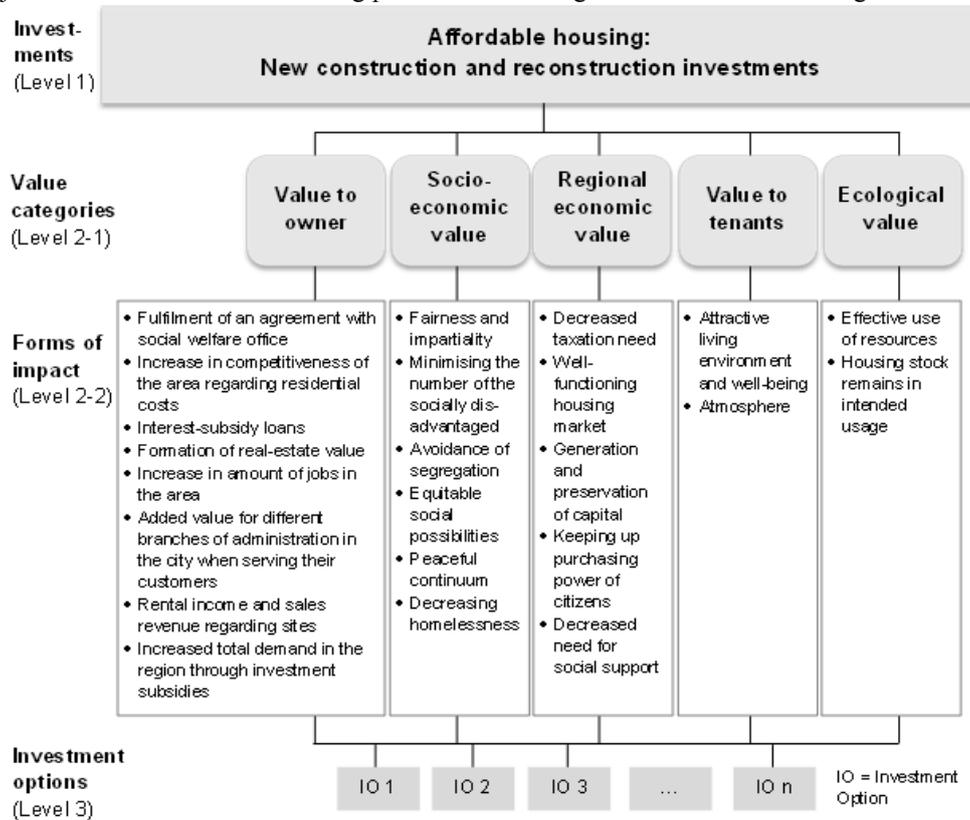

Figure 1 The Proposed Impact Structure for New Construction and Renovation Investments in Affordable Housing

In the case study, the hierarchy for categorizing the social impact of new construction and reconstruction investments was developed (Figure 3). It was created by analysing and combining the knowledge and opinions of TVT Asunnot Ltd. and the results of literature review conducted by the researchers. In addition to the top level, “new construction and reconstruction investments in affordable housing”, the structure includes levels of value categories (value to owner, socio-economic value, regional economic value, value to tenants and ecological value), impacts and alternative investment options.

In the next phase of the research project, the structure described in Figure 3 will be further tested and applied by assessing the company’s current investments and investment proposals.

The weighting of value categories and evaluation of various impacts is done by using expert judgment. Each value category is compared in relation to the others and the results are presented in a matrix form. After the weighting is completed, the impacts are ranked and evaluated. In order to increase the objectivity of the evaluation, the impact scoring is determined based on a fixed scoring system. The scales, i.e., the scores for various impacts are mainly modelled on a “very high (5)”, “high (4)”, “medium (3)”, “low (2)” and “very low (1)” scale. By multiplying the weights and the impact scores, the profile for different investment options can be illustrated. The weighted score for individual investment can be calculated, and thus the order of superiority of alternative investments can be determined.

5 Conclusions

This paper presents a framework with the aim of creating information that supports affordable housing investment decisions. The framework integrates economic and social impact assessment in a way that supports multi-criteria decision-making and thus enhances the selection of the most attractive investment alternative from the tenement owner as well as from a tenant point of view. This makes the proposed method unique as often the assessment of investments focuses almost exclusively on the direct economic impacts, rather than indirect or intangible impacts. During the development, the structures for investment and annual costs and income as well as for intangible impacts of affordable housing were determined. Moreover, result indicators for both economic (required rent per square meter, payback time) and social impact assessment (weighted score) were developed. By combining economic and social impact and viewpoints of different stakeholders, the framework supports holistic assessment and increases the capability to handle multifaceted situations. It also assists in making decisions on whether desirable intangible impacts of investments can be achieved by reduced rent. Moreover, the structured assessment process will enhance the transparency of decision-making.

In the next phase of the research project, the proposed framework will be further tested with TVT Asunnot Ltd.’s current and planned investments in new tenement buildings and renovation of existing buildings. It is expected that in most cases the method can be used as such as it is developed in close co-operation between researchers who were responsible for the theoretical background and scientific knowledge on investment appraisal and impact assessment methods and experts in affordable housing who brought their domain competence on social housing and related investments to the development work. This contributes also to the adaptability and scientificity of the method. On the other hand, these future tests can reveal challenges in data collection that are crucial for the reliability of the eventual results. Economic evaluation and especially social impact assessment rely on expert judgements, i.e., on the knowledge and experiences of decision-makers and other possible stakeholders. This is because there is typically no collected data available for this kind of analysis. However, as both scientific and practical viewpoints are taken into account in the development, it can be concluded that limitations related to, e.g., data collection and the ability to ensure the fulfilment of practical requirements are considered, even while the results of empirical tests are as yet not fully available.

Bottom up Direction on Kaizen: Production Innovation Activity for Shop Floor Engagement and Development

Kamal S. K, Hiroshi Nakanishi
Malaysia Japan International Institute of Technology
Universiti Teknologi Malaysia, Kuala Lumpur Malaysia
(E-mail: kamalsk76@gmail.com, h.nakanishi@utm.my)

Abstract: It is very important to analyze Lean production direction of Kaizen activity named Junshi. Presently, there are many variations in understanding how Toyota develops its' shop floor staff to support daily Kaizen, especially when Toyota staffs have different layers of understanding of Toyota Production System (TPS) and skills essential in applying TPS. This paper aims to clarify the Toyota's Junshi process in the context of strengthening Just In Time (JIT) and analyze both the technique and management aspects of lean small group activity by adopting the eight step of Toyota Business Practices (TBP) problem solving. Through this research, it was made clear that most attempts to imitate Toyota fail because techniques are adopted in pieces with little understanding of why they exist or what kind of organizational culture is needed to keep them alive. Junshi serves as an example of a technique which is successful only when embedded within the right organizational culture.

Key words Shop floor development; Continuous improvement; Just In Time; Toyota business practice

1 Introduction

Toyota's business success is largely and directly attributed to their unique approach to manufacturing. The Toyota production system (TPS) or more generically, "lean manufacturing" has been widely studied in the early of 1970s with quite a numbers of successful imitators. Thus, operational management researchers continue attempting to understand how TPS works. What makes Toyota's approach to manufacturing difficult to grasp is often the implicit or perspective of the analyst, not necessarily TPS itself. That is, TPS is too often examined analytically and as if it were static – despite notable examples of a contrary view (Bhasin & Burcher, 2006). For one main reason, at any given point what is called TPS is actually the state of a dynamic system that has evolved to a point and will continue to evolve. Commentators have described Toyota's approach as a set of contradictions (Osono, Shimizu, & Takeuchi, 2008). As Fujimoto sees it, the mystery is that Toyota's production system has evolved emergent qualities that cannot all be known in advance. He sees TPS problem solving as an "evolving learning capability" that is both "intentional" and "opportunistic" in that the company uses established routines to generate possible new production improvements and at the same time is able to seize emergent "unintended" or surprise improvements and then skillfully institutionalize them as well (Fujimoto, 1999) and that is Toyota Business Practice (TBP).

The scope of this work is to analyze how Toyota applies Junshi to develop shop floor worker ability to solve problems in daily activities and to support problem solving skills by management team. Correspondently, Toyota must establish an organizational culture where workers feel comfortable asking for help and learning TPS. This paper will evaluate what makes Junshi successful. One case study that illustrate some prominent characteristics of Junshi inside Toyota are included. Lastly, Junshi are discussed as they might exist "outside" Toyota. The goal of this paper, however, is not to enable copycat imitation of Quality Circle, but to offer a point of view that may be helpful for those interested in understanding TPS as a system.

2 Literature Review

2.1 Quality control circles

Shortly after World War II, the Japanese government encouraged the formation of several industry organizations to help Japan recover from the war. The most noteworthy of these governing bodies has been the Union of Japanese Scientists and Engineers (JUSE). The union brought together leaders and experts from all of Japan's major industries so that they could share best practices. This was exercised in the hope of revitalizing Japan's economy. Its main directive was to revitalize Japan's economy and eliminating waste by improving quality. It wasn't until 1949 that JUSE began to host statistical quality control seminars. In 1950 JUSE invited Dr. W. Edwards Deming (Deming, 2009), a U.S. government statistical advisor to lecture to them on use of statistical quality control.

Although JUSE offered Dr. Deming the royalties for his lectures, he refused. JUSE, inspired by

Dr. Deming's kindness, began the Deming Prize in 1951 from those same royalties. The prize, which is a bronze medal bearing a likeness of Dr. Deming is awarded to those who have contributed to field of quality control. The Deming Prize was originally awarded in two categories. It is awarded to *individuals* who make a significant contribution to the theory and application of quality control and also to *firms* that obtain outstanding results in the application of quality control.

Another quality guru that also contributed to the culture and credence of JUSE was Joseph Juran (Juran, 1988). He like, W. Edwards Deming, was also invited to give lectures to the still burgeoning JUSE and did so in 1954 and 1960. His lectures focused more on a managing quality and how to make quality a business strategy. His ideas greatly supported JUSE's tenet beliefs in continuous improvement and quality circles. The most influential figures in the history of JUSE have been its founder Ichiro Ishikawa and his son Kaoru Ishikawa. In 1946 Ichiro Ishikawa (Hung, Lien, Yang, Wu, & Kuo, 2011) organized JUSE and helped many of the top Japanese executives to meet and pay attention to W. Edwards Deming. However, it was his son Kaoru that headed JUSE during its flourishing and led the Japanese to internalize the teachings of Deming and Juran. As a professor of engineering at Tokyo University, he developed the concept of quality circles. A Quality circle is an approach to Total Quality Management that encourages workers to form teams to present process changes to management for implementation. This reinforces Deming's 14th point for management, "*Quality is everybody's responsibility*" Kaoru Ishikawa spearheaded the Japanese Quality Revolution that has given JUSE the prestige it enjoys today. Ishikawa left behind him a focus in JUSE of training others how to use Total Quality Management tools especially quality circles.

The quality circle concept has become so popular that there are now over 426,000 registered quality control circles in Japan. These groups, some small while others quite large, permeate all of Japan's industries and play a major role in Japan's culture. These quality control circles have helped Japan's industries thrive and often define the work and social context of many Japanese.

2.2 Toyota business practice (TBP)

The eight-step process aims to break down large problems into small problems and test various countermeasures for each small problem. The eight-step method is an agreed to use procedure for developing countermeasures that keep problems from returning. The eight-step is effective because, it links methods to results by running trials to determine countermeasures. Examples of its use and detailed descriptions of its steps can be found elsewhere (Ohno, 1988) (Liker & Hoseus, 2010).

- 1) *Clarify the problem*
 - Identify problems at worksite.
 - Search for problems that are related to work processes, wastage, productivity, quality, cost etc.
 - Brainstorm, Genchi Genbutsu, past records.
- 2) *Breakdown the problem*
 - Refer to problem statement on what data to collect (Object).
 - Check past data(if any) / Collect fresh data.
 - Analyse flowcharts(if any)/ Create flowcharts on current process (if unavailable).
 - Examine the situation over a period of time.
- 3) *Set the target to be achieved*
 - State where the improvement is to take place and visualize in chart or graph.
 - Make it clear what is to be done and what the objective is.
 - Express topic in terms of attacking something bad rather than improving something good.
 - Use SMART technique (Specific, Measureable, Achievable, Realistic and Time bound).
- 4) *Think through to the true cause*
 - Indicate your problem statement.
 - Use Fishbone/Ishikawa/Cause & Effect Diagram.
 - Brainstorm of possible causes.
 - Do the '5 Whys'.
 - Identifying the causes of the problem.
 - Narrow the long lists of causes down to the most important ones.
 - Use facts, data, past history and personal opinions to focus on the most important cause.
 - Verify the cause whether it is true or false. Evaluate the degree of influence of each causes identified.
- Collect data on the most important cause and present it on graph.
- 5) *Develop countermeasures*
 - Suggest the countermeasures / corrective action based on the cause analysis,

- Think of creative solutions.
- Use 5W 2H to describe countermeasure.
 - o come-out with several alternatives solution, consider the advantages and disadvantages of each countermeasures in term of its effect, cost and practicality.
- 6) *Follow through on the countermeasures*
 - o To execute countermeasures and monitor the implementation
 - o Confirm the tangible and intangible results.
 - o Analyze result based on quality, cost, time and other benefits.
- 7) *Evaluate the result and the process*
 - o To confirm and monitor the results of countermeasures against the target.
 - o Compare result with target set, evaluate and study why target did not achieve.
 - o Confirm your achievement by checking your data.
 - o Evaluate success and failure.
- 8) *Make sure the results take hold*
 - o Monitor the trends of result obtained to confirm the effectiveness of countermeasure for long term.
 - o Where results are successful, standardize the countermeasures and establish as SOP (Standard Operating Procedure).
 - o Create a system in which can confirm that SOPs are followed and continue to have the desired effect (Training, Audit, Result Monitoring and etc).
 - o To standardize the countermeasures that are effective in eliminating root causes of problem for permanent and long term effect.
 - o Review the project.
 - what went well.
 - what did not go well.
 - o Record the remaining problems that were not solved and select new theme for next project.
 - o Review the benefits that the team has received in being part of the project.

2.3 Junshi

If lean is a discipline that develops over time, then it requires commitment and consistent leadership engagement and participation. One element in the current TPS approach that is of interest as a focus and can also make this picture of lean clear is Junshi. There have been various attempts to explain small group activities such as Jishuken (Marksberry, 2011); however, these attempts have described only Quality Circles as a rapid shop floor activity similar to the kaizen blitz model (Rodriguez & Lopez, 2012; Suárez-Barraza, 2013) with connections to supplier quality development for those situations needing urgent solutions. What is more misleading is that none of the current work discusses how lean problem solving is applied or how this activity can actually weaken shop floor worker involvement if applied incorrectly. There is also little understanding of how managers can initiate, support or lead problem-solving activities when they themselves need help in developing their understanding of TPS problem solving.

These descriptions of Junshi mislead by creating the impression of a static impression, that shop floor within Toyota have a complete understanding of TPS, one which they somehow attained instantly without needing to develop it over time (B.-H. Lee & Jo, 2007). Seen more clearly, Junshi's, like many other TPS activities, have both a learning development goal and a productivity goal: as they harness shop floor teams for problem solving needed by the production process, Junshi help managers continue to improve their ability to coach and teach TPS problem-solving to others, specifically production staffs.

What is important about this procedure is that the Junshi team will pass much time studying and examining the current scheme to discover the smallest possible root causes for each countermeasure. This procedure can consume time and cannot be rushed, which is why Junshi can take weeks or months to complete, when performed right. Although Junshi may vary in time depending on the nature of the problem, the Junshi team may meet as needed to complete the problem-solving process. Junshi could meet continuously over a short period or spend a few hours a week over the span of several months. The form of time spent depends on the nature of the problem and what is involved in completing the problem-figuring out countermeasures. The only reliable way to know if a countermeasure was successful is by monitoring and monitoring through the current arrangement. This process can sometimes take weeks or months to complete and depending on the nature of the problem can be difficult to track. The research methodology used are based on PDCA cycle introduced by Dr. Deming which later it was developed further by Taichi Ohno. It is known as Toyota Business Practice (TBP) until today as the eight steps problem solving process.

3 Research Result

3.1 Research method

Mixed methods studies the relationships of management understanding, support and execution towards Junshi implementation.

3.1.1 Qualitative method

A qualitative research Case study/Phenomenology design was carried out on one purposively-selected Malaysian manufacturing company that has implemented lean manufacturing system deploying the Kaizen practices. Exploratory longitudinal fieldwork of research diary and field notes with key informants over a period of time using descriptive, analysis and interpretation through unstructured interviews, meetings, document and observation to develop’s an insiders point of view. Using the practical approach consists of the empirical study of small group activity of hands on approach. It involves first hand research through observations, data collection and discussion groups.

1)Data collection was conducted internally within the company through observation and interview techniques with these respondents.

2)Interview was conducted with the managers in the manufacturing company so as to understand the manufacturing operations and to gather accurate information on their current kaizen system used in the facility.

3)This was followed by on-site visit to the premise. Two managers were purposively selected as respondents for the study and interviews were conducted at the respective offices. Interviews were conducted (lasting between 1.5 and 2.5 hours) using unstructured question based upon the four research propositions. In total, 2 different managers and team leader were interviewed. The four exploratory propositions;

- a. Junshi as an outcome will improve business performance.
- b. Junshi implementation for production's development trajectory is unique.
- c. Junshi activity is dependent upon the context of the firm.
- d. Junshi maximises general innovative activity.

The interviews were 5 hours of interview, notes into a series of observations and quotes.

3.1.2 Quantitative method

This type of research methods requires quantifiable data involving numerical and statistical explanations. Quantitative Research is used to quantify the problem by way of generating numerical data or data that can be transformed into usable statistics. It is used to quantify attitudes, opinions, behaviors, and other defined variables and generalize results from a larger sample population. Quantitative Research uses measurable data to formulate facts and uncover patterns in research.

3.1.3 Case Study: Junshi Project for the Inventory Reduction

The implementation of the small group activity activity namely Junshi has been executed upon several breakthrough cases in the automotive industry. Previously, there was a workers small group activity on complexity planning for automotive components using this approach. In this study, a project that explores new approach from small group activity known as ‘Inventory Reduction’ is presented. In the automotive industry, inventory plays a critical role in controlling and keeping optimum stock that bring high impact to manufacturing competitiveness in terms of cost effectiveness.

It aims to create an opportunity to develop own style, alongside cost reduction on the benchmarked systems. The case project in adopting using Junshi activity was conducted in an automotive OEM. The focus area was selected because of their incapability in controlling a full cycle production process. The cost improvement results were recorded after the case implementation was completed.

Process flow for performing Junshi

The general process flow for performing Junshi is explain in the follows the eight-step problem-solving process are as follows:

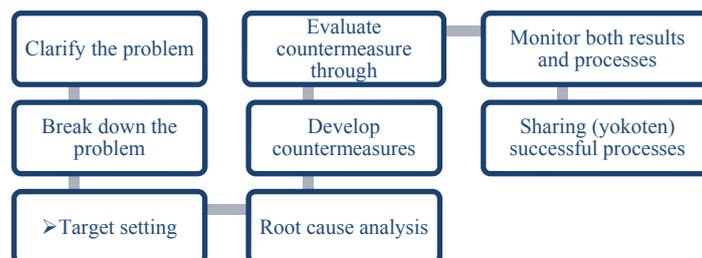

Figure 1 Process Flow of Junshi Activities

The clarification and target of stock reduction activity

Inventory plays a significant role in a manufacturing environment, one most widely use term is Just In Time (JIT) concept, as it derive as a pillar by Taichi Ohno, creator of Toyota’s production system. The Just-in-Time approach attempts to reduce costs and improve workflow by carefully scheduling material to arrive where needed at the right amount and at the right time. Consequently, costs of inventories can be substantially reduced and the use of space can be maximized. In this case, this approach is targeted to lower the cost of the product. Due to space limitations, inventory is high thus the problem is surfaced.

Break down the problem example using 5W2H

What; To optimize stock reduction activities.

Where; To which focuses on Finish Good (FG), Local parts and Completely Knock Down (CKD) parts inventories.

Who; A team that specialized in the automotive material management and inventory was established and explored the stock reduction on manufacturing system.

Why; The research target of this study is to reduce the holding cost and towards having the right parts at the right quantity at a right time.

When; The duration of the case study was around 3 months to be completed at the conceptual level, and further 6 to 12 months to actually implement the concept into the production systems.

How; Junshi approach was used to explore this situation and to demonstrate how results can be achieved.

How much; The cost improvement results were recorded after the case implementation was completed.

Root cause analysis and development of countermeasure

<u>Root cause</u>	<u>Action taken</u>
1 Customer order not stable	Bi-monthly SAP safety stock level adjustment based on requirements and daily production control To revise Monthly Kanban formula (eg. Safety stock level , lot size change) to reflect customer order
2 Transport not optimise	Revise production lot size for low volume model, especially models to match lorry loading
3 Line process not match to daily requirement	Monthly manpower meeting to determine manpower distribution at Production to suit the production order
4 No proper Handover from Vendor Dev. to Purchasing	Proper handover process from Vendor Development to Purchasing for new & carry-over parts
5 Delayed firm info from customer	To update Kanban using forecast figures for n+1 mth (complete on weekk 3 of n mth) for early kanban adjustment
6 Improper arrangement during phase in/out	Include standard packaging revision and order quantity for local vendors
7 Delivery frequency and quantity not revised/updated	Delivery frequency revision and safety stock to match production daily reqmt (inclusive of Milk Run, DTS-related parts, Stamping material/ coil)
8 Part pakaging size > Production Lot	Standard packaging review for CKD parts (concentrate on high volume model)
9 CKD Delivery frequency not revised to match production	Customer production plan improvement to match with CKD incoming plan Revise delivery frequency/timing for incoming CKD parts

Figure 2 Summary of Identified Root Causes and Countermeasures Taken

Root cause analysis looks at all three types of causes below. It involves investigating the causes of negative effects, finding hidden flaws in the system, and discovering specific actions that contributed to the problem. This often means that root cause analysis reveals more than one root cause. ou'll usually find three basic types of causes:

- 1) Physical – Tangible, material items failed in some way.
- 2) People – workers did something wrong, or did not do something that was needed. people causes typically lead to physical causes.
- 3) Organization – A system, process, or policy that people use to make decisions or do their work is faulty.

3.2 Result

Intangible and tangible results;

- a) Increased safety for workers working at robot station.
- b) Eliminate near miss accident during robot operation.
- c) Safe working environment.
- d) Prevent loss time (ie; worker injuries manpower planning)
- e) Improved shop floor worker engagement.
- f) Inventory cost reduction activity achieved.
- g) Increase worker morale and support.
- h) Improve material management and workflow.

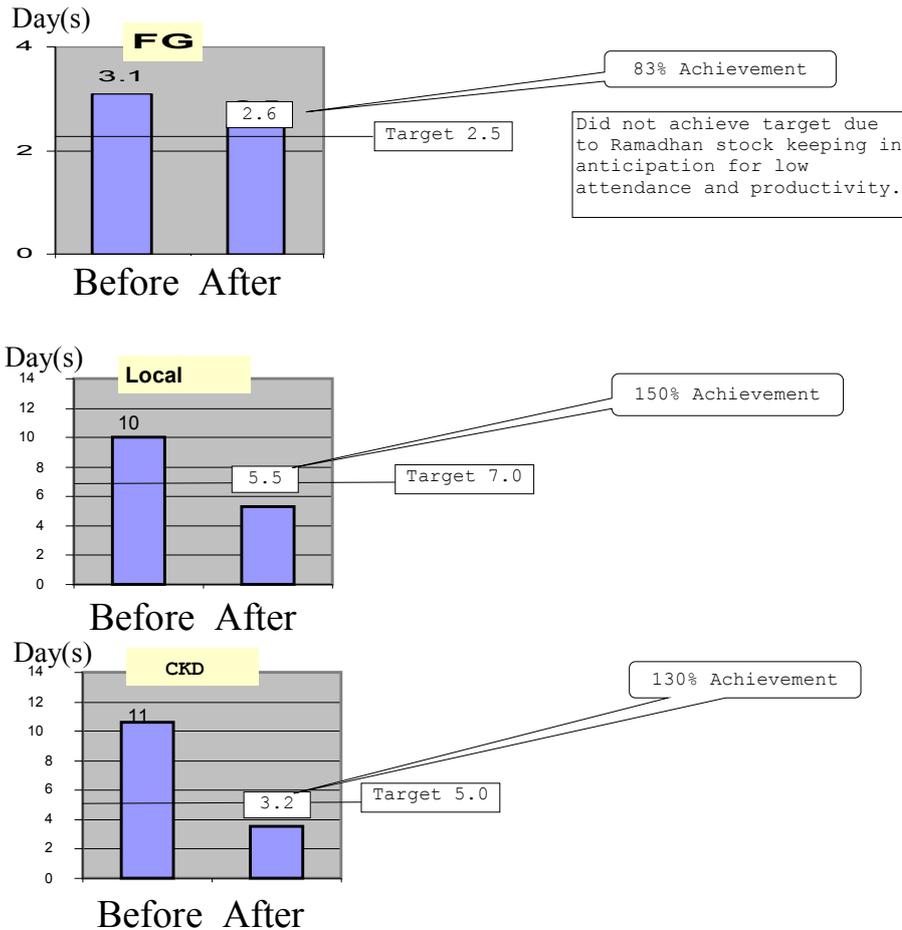

Figure 3 Summary of Tangible Results before and after at Focus Area

Observation

- 1) Using a longitudinal exploratory approach better help in identifying a relationship between shopfloor engagement or contribution and problem solving skills development towards Junshi activity.
- 2) Observation that was carried out at a just one point in time, known as cross-sectional that provide a snapshot of what is happening in that particular process kaizen group at that particular time. Qualitative analysis brings problems out into the open;
 - a) By definition of propositions, directions and perceptions vary across individuals.
 - b) Configurations of propositions, directions, and perceptions are not static and stable but potentially subject to reflective transformation.
 - c) Individual proposition may be modified to better fit lived experience and/or cope with a given situation.
- 3) The pre-eminence of the lean production paradigm reflects the academic and practitioner effort that has been directed towards establishing and transferring ``best practice" in operations.

4) This study has offered a theoretical critique of this generic approach and the empirical evidence presented adds further support, suggesting that contingency and complexity are the dominant characteristics of any successful implementation process.

5) In all circumstances, the unstructured interview took place as an informal conversation, with the researcher asking follow-up questions in response to statements made by the interviewees. This type of interview resulted in some irrelevant information, but also allowed evidence related to the variables of interest to emerge naturally.

6) Sometimes structured interviews may be biased by the emotional involvement of the interviewee with the topic. Observations, however, can also be biased. Data collected during observations may be limited by the researcher’s judgment of what is important enough to record.

However, the direct and indirect relationships between these factors describe the situation far more accurately than the individual factor taken into isolation

An important difference between Quality Circle and Junshi activity.

A significant difference between Quality circle and Junshi activity is the team members are coming from bottom up with support and commitment from management. Therefore, the engagement of shop floor workers in problem solving activity is being recognized and highlighted by the management. Junshi can be misunderstood as “single purpose”: as only a plant improvement activity^{10,13-15}. In fact, Junshi has two main purposes: to solve problems in the workplace that need management attention and to correct, enrich and deepen understanding of TPS by management through first-hand on the job application of the problem-solving principles using hands-on activity and coaching. It differs from problem-solving activity conducted by management (“Quality Circle” in Toyota’s language) because Junshi involves only shop floor workers to identify the problems and implement the countermeasures.

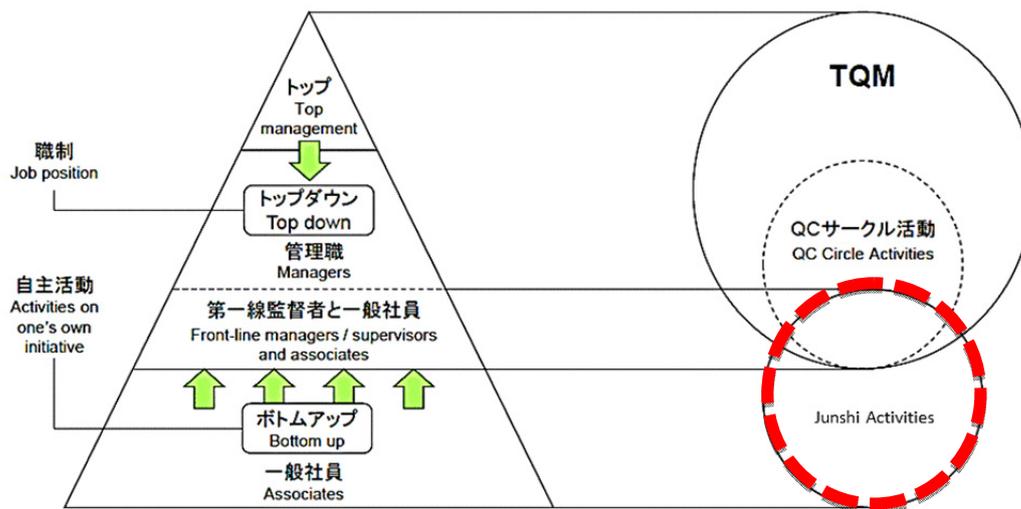

Figure 4 Scope, Structure and Direction of Junshi Activities

Significant roles and support function of management

Since in addition to their other roles, managers perform an important function in TPS as coaches and teachers for team members doing problem solving, Junshi is both a technical problem-solving activity and a management development process that helps managers learn how to be better teachers^{16,17}. Junshi continually develop management’s interpersonal skills so that they understand the right way to coach and support kaizen¹⁸. A third organizational culture function of Junshi is to communicate, maintain and reinforce the company’s values, beliefs and behaviors (known as the Toyota Way) (The Toyota Business Practice (Toyota Motor Corporation, 2005)). Participation in Junshi gives management a common language and a common approach to problem solving standard across the company.

4 Conclusions

In conclusion, establishing a culture among front line managers that values identifying and solving problems among themselves and in the production workers they teach and guide is an essential step toward establishing that culture on the shop floor. Establishing this kaizen culture means shop floor

workers demonstrates their abilities in identifying and solving problems are valued by making those abilities part of their work, rather than a potentially causing of troublemaking that needs to be hidden (Fujio, 2006).

1) This paper expands the theoretical foundation of kaizen activity principles by studying and analysing a practical application of the concept.

2) As a result, the case study is opportune for presenting a relevant overview of the relevance and applicability of the research methodology. This single case study is particularly appropriate for completely new and explorative investigations.

3) However, the study has some weaknesses. The main one is the fact that the methodology is based on experts' judgments. To overcome this weakness, it will be necessary to widen the panel of experts and diversify them as much as possible.

4) Moreover, the research can be based on a wider database, including other courses of the same model factory or to test it into other companies.

In the larger sense, Junshi can also be usefully seen as demonstrating that Toyota Production System or Lean Manufacturing, though it can be seen as a collection of tools and activities, is better approached as a dynamic evolving system within which those "tools" have multiple mutually reinforcing purposes in developing workers creativity whilst, eliminating the number eight muda. It could be generalize as a tool to engage and develop workers and also as a management recognition of such improvement activity done by shop floor as the process owner. Since this initiatives starts from workers being proactive in solving the problem at workplace, is the key to sustainable lean practices success. Celebrating the success and standardize the activity plus recognition from the management has brought Junshi to a significant level in Lean innovation and sustainability.

Abstract: Tourist visits create tourism demand. This demand in national parks is particularly important as it generates revenues for the parks operation especially nature conservation and offers economic benefits to the local community. Satisfied tourists increase chances of repeat visits, loyalty and positive word of mouth communication with others and hence tourists may contribute to higher tourism revenues. Therefore, it is important to maintain tourist satisfaction that serves as an important indicator in sustaining tourism demand at a destination. This study has two key objectives. Firstly, it aims to measure the overall tourist satisfaction based on eight dimensions namely the quality of park, service and hospitality, natural attractions, accommodation, food, transportation and recreational activities and lastly the perceived cost. Secondly, it intends to determine the level of tourist satisfaction by nationality. This study has selected 40 tourists through convenience sampling technique for its pilot survey. The collected data were then analysed with Kruskal-Wallis Test. The results show that the tourists were generally satisfied with their overall travel experience and there is no significant difference among different nationalities on tourist satisfaction. It is concluded that the tourists may not expect high on a natural-based tourist destination, such as a national park that only allows limited development for better nature conservation. Basic services and facilities which were offered in the park are deemed sufficient and have met their expectations.

Key words: Tourist satisfaction; National park; Nationality; Kruskal-Wallis

1 Introduction

A national park is one of the most important natural-based tourist attractions that focuses on protecting natural ecosystem and biodiversity while offering educational experiences and recreational activities (Department of Wildlife and National Parks, 1987; International Union for Conservation of Nature, 2015). According to Choi, Huang & Shen (2015), Kamri & Radam (2013) and Prebensen (2002), tourists visit to national parks for relaxing, social trip, learning, nature tour and fitness purposes. Their visit creates tourism demand which then generates revenues to be used for the parks general operation and to support park conservation activities. At the same time, it also offers economic benefits to the local community. Akama & Kieti (2003), Jarvis, Stoeckl & Liu (2016) and Mohamad & Ghani (2014) revealed that satisfied tourists increase chances of repeat visits, loyalty and positive word of mouth communication with others, hence tourism revenues are likely to be higher. Therefore, a well-maintained tourist destination is important to increase tourist satisfaction that would generate continuous demand thereby supporting the local livelihoods while enhancing the park revenues. Other words, tourist satisfaction serves an important indicator in determining the sustainability of a tourist destination (Candrea & Ispas, 2009; Goh, 2008).

Numerous studies on tourist satisfaction had been carried out either in Taman Negara National Park (TNNP) or Taman Negara Pahang (TNP) (Nor' Ain, Nor Asmalina & Lim, 2010; Tan, Aziz, Khairil &

* Corresponding author: Ph.D Candidate, Center for Sustainable Urban Planning and Real Estate, Faculty of Built Environment, University of Malaya, Kuala Lumpur, Malaysia 50603

Zaiton, 2015; Teo, Chui, Rahim, Hassan, Musa & Yusof, 2010). However, the dimensions being studied are rather limited to a few specifically on the quality of services or activities provided. In general, tourist satisfaction in the national parks can be measured based on the quality of tourist facilities and services, experience of the activities tourists participated, the perceived costs and most importantly their overall experience when they come into contact with the natural settings - the resource that is fundamental to the tourism development. Therefore, this study examines the overall tourist satisfaction with their travel experience and the tourist satisfaction level among different nationalities, adapting all dimensions of tourist satisfaction derived by Pizam, Neumann & Reichel (1978).

2 Tourist Satisfaction

Satisfaction is a concept derived from social psychology and consumer behavior theory (Oliver, 1980). According to Klaus (1985 as cited in Kozak, 2001a), satisfaction refers to a post-consumption evaluation determined by the relationship between one's perceptions and product attributes. Swan & Combs (1976) found that satisfaction is measured according to the expressive (psychological) and instrumental (physical) dimensions of a product while Engledow (1977) refers satisfaction as the result of an interaction between an individual's expectation level and the actual experience of outcome. An individual is satisfied if the experience exceeds expectation or vice versa. While the studies in examining the antecedents of satisfaction had been extensively conducted since 1970s, the focus later evolved to focus on determining the gaps between expectations and perceptions (Kozak, 2001a).

Pizam et al. (1978, p. 315) defined satisfaction in the context of tourism as "the result of interaction between tourist's experience at the destination area and the expectations he had about the destination". Based on their study conducted at Cape Cod, Massachusetts, eight factors of tourist satisfaction were identified namely beach opportunities, hospitality, eating and drinking facilities, accommodation facilities, campground facilities, environment and the extent of commercialization. These factors covered both expressive and instrumental dimensions as revealed by Swan & Combs (1976). This is consistent with the study findings revealed by Akama & Kieti (2003), who reported that overall tourist satisfaction was mainly affected by tourism products and services quality in tourist destinations. Moreover, the experience encountered when tourists participated in activities and the perceived price also affect their satisfaction level (Arabatzis & Grigoroudis, 2010).

Pizam et al. (1978) reported that ease of access, traffic conditions, directional signs and information are not important once tourists are at the destination area. However, it was later shown by Akama & Kieti (2003) that bad quality of accessibility has resulted in low satisfaction level in Tsavo West National Park. Similarly, Akama & Kieti (2003), Arabatzis & Grigoroudis (2010) and Hamilton, Crompton & More (1991) also argued that signs and information are equally significant in such matter. In addition, Jarvis et al. (2016) reviewed and summarized the significance of several economic, social and environmental factors of trip satisfaction, including demographic profile (e.g. age, gender, education level, country of origin, income), trip cost, tourist facilities, climate, economic development, quality of personal safety and natural environment quality.

3 Research Methodology

Malaysia is well-known with its natural scenic beauty and wildlife diversity (Mohamad & Ghani, 2014; Mahadzirah, Abdullah & Mokhlis, 2012). TNP is chosen as case study for its nature conservation, its reputation as the largest and oldest protected area in Malaysia, and as one of the most popular eco-tourism destinations in the country. Tourists are offered with a wide range of activities including the visit to the settlement Orang Asli, wildlife and bird watching, jungle and mountain trekking, cave exploration and other outdoor activities.

It was school holiday from 12 – 20 March 2016 and the data collection was conducted from 14 – 17 March 2016 at TNP and Kuala Tahan, the entrance point. The date was chosen to ensure the equal opportunities in receiving feedback from both local and foreign tourists throughout the survey. The respondents were selected through convenience sampling technique where the researcher waited at the park main entrance and at the floating restaurants across the river which marks the park boundary from the local villages, targeting tourist who were having their meals and those waiting for transport ready to depart. According to Hertzog (2008), there is no specific sample size recommended to assess the feasibility of instrument, but depending on different aims. However, he suggested that 25 samples are the minimum number for the instrument development purpose. Johanson & Brooks (2010) stated that 30 samples are reasonable to consider enrolling in a pilot study. For this pilot study, a total of 40 responses

were collected from both local and foreign tourists who had participated in the activities and experienced the services in and around TNP.

Quantitative research method was applied in this study as suggested by Pizam, Neumann, & Reichel (1979) and Likert scale was used to measure tourist satisfaction. The questionnaire was made up of three parts: demographic profile, travel profile and tourist satisfaction. The first part of the questionnaire contained the socio-economic factors that affect trip satisfaction adopted from Jarvis et al. (2016). Second part of the questionnaire covered tourists trip profile and the participated activities (Jarvis et al., 2016; Neal, 2003) while most of the dimensions to measure tourist satisfaction in the last part were adapted mainly from by Pizam, Neumann & Reichel (1978) besides Arabatzis & Grigoroudis (2010) and Yu & Goulden (2006). In addition, relevant attributes were also added from the findings by Akama & Kieti (2003), Kozak (2001b) and Sukiman, Omar, Muhibudin, Yussof & Mohamed (2013).

Table 1 Dimensions of Tourist Satisfaction

Dependent Variable	Dimensions
Tourist satisfaction	Park
	Service & hospitality
	Natural attractions
	Accommodation
	Food
	Transportation
	Recreational activities
	Perceived cost
	Overall satisfaction

Source: Adapted from Pizam, Neumann & Reichel (1978)

The respondents were asked to rate their satisfaction based on the dimensions using the 7-point Likert scale ranging from 1 (strong disagree) to 7 (strongly agree) with a neutral position in the middle and 0 for not applicable. According to Krosnick & Presser (2010), 7-point scale is reliable and sufficient enough in most cases. All attributes were validated using internal consistency reliability measure. Subsequently, descriptive analyses including the frequency and cross tabulation analyses were performed on tourist demographic and trip profile as well as their overall satisfaction. Lastly, Kruskal-Wallis test was employed to determine whether there is any significant difference by nationality on satisfaction level.

4 Findings and Discussions

4.1 Tourist demographics and trip profile

Selective demographic details of the respondents and trip profile are summarized in Table 2. The survey shows that more than half of the tourists came from Europe. In general, the Europeans see Malaysia as a desired tourism destination because of the low foreign exchange rate and reasonable living expenses. Specifically, they visited TNP for its unspoilt natural scenery and landscape. Relatively the main motivation among the Asian tourists to TNP was to spend time with family or friends. Majority of the respondents were adults aged from 22-50. This could be due to the fact that TNP offers a wide range of active recreational activities such as night walk, mountain climbing and jungle trekking, which are more suitable for teenagers and adults although more passive activities as fishing, bird watching and wildlife observation are available for all age groups. A trip to TNP is deemed affordable because it receives tourists from all income groups.

The findings indicate that 97.5% of the tourists visited TNP for the first time. The interviews conducted with this group of tourists found that, while they were satisfied with their visit, most probably they would not be visiting TNP again because they wished to explore other places. The only tourist who came to TNP for the third time indicated that it was interesting to do bird watching in the park and this was the key motivation for the repeated visits. Relatively, Asian tourists to TNP preferred packaged tour arrangement compared to European tourists, with the independent travelers as majority. This finding is in line with the studies by LaMondia, Snell & Bhat (2010) and Pizam et al. (2004), who revealed that there is a different between nationality and choice of travel arrangement due to their different behavior and cultural background. In addition, the average length of stay in TNP was three to four days which

was considered as adequate for tourists to explore the park and participate in their desired recreational activities.

Table 2 Demographic Details and Trip Profiles

Characteristics	Samples (n=40) 100%	Asia (n=11) 27.5%	America (n=3) 7.5%	Oceania (n=3) 7.5%	Europe (n=23) 57.5%
Age					
Under 20	(4) 10	7.5	0	0	2.5
20 – 55	(31) 77.5	20	5	7.5	45
Above 55	(5) 12.5	0	2.5	0	10
Income (RM)					
Not applicable	(11) 27.5	10	0	0	17.5
10,001 – 30,000	(6) 15	2.5	0	0	12.5
30,001 – 60,000	(5) 12.5	10	0	0	2.5
60,000 – 100,000	(3) 7.5	2.5	2.5	0	2.5
More than 100,000	(15) 37.5	2.5	5	7.5	22.5
Travel purpose					
Spend time with friends/family	(12) 30	12.5	2.5	0	15
Education/Research	(4) 10	7.5	0	0	2.5
Teambuilding/ camping	(1) 2.5	2.5	0	0	0
Scenery/landscape	(11) 27.5	0	5	2.5	20
Flora/fauna	(5) 12.5	2.5	0	0	5
Culture of indigenous people	(3) 7.5	0	0	5	2.5
Bird watching	(3) 7.5	0	0	0	7.5
Honeymoon	(1) 2.5	2.5	0	0	0
Travel frequency					
First time	(39) 97.5	27.5	7.5	7.5	55
Third time	(1) 2.5	0	0	0	2.5
Travel arrangement					
Package tour	(16) 40	22.5	2.5	2.5	12.5
FIT	(24) 60	5	5	5	45
Length of stay					
Day trip	(2) 5	2.5	2.5	0	0
2 days	(6) 15	0	0	2.5	12.5
3 days	(17) 42.5	20	0	2.5	20
4 days	(11) 27.5	5	5	0	17.5
More than 4 days	(4) 10	0	0	2.5	7.5

4.2 Overall tourist satisfaction

Table 3 The Overall Tourist Satisfaction (n=40)

Dimensions	Number of items	Cronbach Alpha	Mean	SD
Park	5	0.733	5.19	1.04
Service & hospitality	19	0.848	3.52	1.41
Natural attractions	3	0.839	5.64	1.12
Accommodation	4	0.857	4.79	1.77
Food	3	0.902	4.99	2.01
Transportation	9	0.875	3.30	1.66
Recreational activities	3	0.905	4.50	2.01
Perceived cost	9	0.841	3.08	1.54
Overall satisfaction	3	0.776	6.20	0.81

The Cronbach's alpha scores for each dimension are shown in Table 3. Tourists showed the highest satisfaction on the natural attractions followed by park, food, accommodation and recreational activities. They were slightly dissatisfied with the service and hospitality, transportation and perceived cost. However, the overall satisfaction on travel experience was relatively high. This variance is observed because there were tourists indicated "not applicable" in the questionnaire represented by "0" when they were not in contact with any park rangers or nature guides, did not use public transportation or accommodation service or they were not aware of the perceived cost for those who came by packaged tour.

Table 4 Kruskal-Wallis Test on Tourist Satisfaction among Different Nationalities

	Overall Satisfaction Level (n=40, 100%)				χ^2	df	Sig
	Asia	America	Oceania	Europe			
					2.259	3	0.520
N	27.5	7.5	7.5	57.5			
Mean Rank	16.45	25.67	20.33	21.78			

The tourists generally indicated high overall satisfaction. The result is consistent with findings of the past studies by Nor' Ain et al. (2010), Tan et al. (2015) and Teo et al. (2010). Despite prior evidences (Kozak, 2001b; Shahrivar, 2012; Yu & Goulden, 2006) showed that nationality affects tourist satisfaction, this study reveals that there was no significant difference by nationality on the level of tourist satisfaction in TNP ($\chi^2 = 2.259$; $df = 3$; $p > 0.05$) as shown in Table 4. This may be due the fact that all the tourists did not have high expectation on a natural-based tourist destination such as national parks that only allow for limited development in order to conserve the natural landscape as compared to a tourist destination in built environment setting. The mean rank values show that among the nationalities, American tourists showed the highest satisfaction level followed by the European tourists and Oceania tourists while Asian indicated the lowest satisfaction level of all nationalities.

5 Conclusion and Implications

This pilot study was conducted in preparation for the study in researcher's PhD. It intended to ensure correct interpretation of the questionnaire contents, reliability of the research instrument after all to access the feasibility of the full-scale survey. This study examines the overall tourist satisfaction and the tourist satisfaction level by nationality at TNP. The result reveals that the tourists were generally satisfied with the perceived costs and all the facilities and services offered in the park. There is no significant difference shown for by nationality on satisfaction level. The survey provides valuable findings to the park authority and local tourism operators to evaluate the quality of their current operations and for future planning. With continuous efforts to improve tourist facilities and service quality, and to conserve the existing natural resources and environment, TNP will attract more tourists which would enhance the revenue generation from tourism activities to ease the park operation burden and to support park nature conservation. At the same time, it also helps to secure earning and diversify the job opportunities available to the local folks directly contributing to improve their quality life.

The Impact of Contemporary Innovation Management Trends Towards the Organization of IT Projects

Tasha Ibrahim, Chandana Gamage

Department of Computer Science & Engineering, University of Moratuwa, Sri Lanka
(E-mail: tasha.ibrahim@gmail.com, chandag@cse.mrt.ac.lk)

Abstract: Innovation failures when properly understood will support to improve the understanding of innovation success, which will help management improve their strategies. The objective of the research presented in this paper is to explore the efficiency in the organizing of innovative IT projects in the Sri Lankan context. Grounded Theory was used as the central methodology for this qualitative research study, where data was collected through open-ended questions based interviewing of corporate informants. An analytical tool, MAXQDA, which is a software that supports the analysis of qualitative data was used to electronically store, document and structure all interview transcripts. This research has found that the ordering of aspects of innovation management that influence the organisation of IT projects to be Reward Structure, Recruitment, Training and Development, Gamification, and Employee Empowerment; where Reward Structure had the highest code frequency per document and number of documents per code. For different innovation management methods, the ordering of the factors which influence the organisation of IT projects was further elaborated upon in this research. In the observation of 11 target organisations, it was found that there were no two identical innovation management implementations and each organisation provided a different experience. Data sources for the interviews were limited because the preliminary review of opportunities to study innovation management in the Sri Lankan context revealed that only a selected set of organisations would be relevant to the research. This research has important uses as only a small fraction of the existing literature attempted to establish any relationships between the variables Trend and Project Organisation. In order to introduce or improve innovation management in an organisation, the budget, needs of the organisation, how to introduce the implementation and investment evaluations need to be considered.

Key words: Innovation management; IT project organisation; Grounded theory

1 Introduction

Organisations should continuously strive to innovate in order to develop new products or processes. This is considered an important factor in order to survive in the IT industry and at the same time it is considered a challenging endeavour in the practical world. From the historical overview of innovation management after World War II, innovation was considered as crucial for the economic and technological survival of nations leading to a scientific research in innovation management (Ortt & Duin, 2008).

Innovation failures when properly understood will support to improve the understanding of innovation success. When the root causes for the failures are analysed, managers can intervene to reduce the future occurrences of such failures. Some of the reasons for innovation efforts to fail have been identified as inadequate customer focus or even innovations rejected by customers, employees not engaged in strategy, a disempowering culture of blame, with ineffectual communication prevalent and tolerated, ineffective teamwork, communication and collaboration, and suppliers not engaged or fail to deliver on requirements (Balmaekers, 2014).

This paper is organized in the following way. First, it provides a critique of the existing literature and shows how it contributes to this research study. Second, it describes the research methodology used for this research and thirdly, it presents the findings of this study. Finally, it offers conclusions and possible avenues for future research.

2 Literature Review

In past research work, innovation management and its impact in several areas were studied. However, such research was lacking in how it impacts to organise IT projects. Researchers have examined innovation management from various perspectives.

2.1 Cultural

Several studies have focused on organisation's innovation culture and climate (Ahmed, 1998;

Sharifirad & Ataei, 2012). Drews et al. (2013) found out from the 14 semi-structured expert interviews carried out that IT innovation should not be limited to the management level but by establishing a culture of innovation would lead to a successful IT innovation management. Similar work in their view is presented in several studies (Ahmed, 1998; Martins & Terblanche, 2003; Schneider, Brief, & Guzzo, 1996; Steiber & Alänge, 2013). Whereas Drews et al. (2013) state that the innovation process should be formalized partially, the study by Steiber and Alänge (2013) reveal that it is not possible to have a manager in charge for innovation or formalize the innovation process as anyone could give ideas at Google.

2.2 Leadership

Numerous studies highlight the importance of support for innovation and have found that there is a positive relationship between an organization's culture on its innovation when the support for innovation is high (Ahmed, 1998; Choi et al., 2013; Sharifirad & Ataei, 2012; Stamm, 2009; Tushman et al., 2010).

Leadership is the process of influencing others towards achieving a desired outcome (Jong & Hartog, 2007). In the qualitative study carried out by Jong and Hartog (2007), they interviewed 12 managers and identified 13 leadership behaviours that included innovative role modelling, intellectual stimulation, stimulating knowledge diffusion and support for innovation.

Previous research has focused on the importance of leadership for sustaining innovation in organisations (Jong & Hartog, 2007; Stamm, 2009). Whereas Steiber and Alänge (2013) have discussed the importance of selecting and developing leaders so that they could support innovative employees.

2.3 Organisational structure

An organisational structure is defined as the arrangement of responsibilities, authorities and relationships between people (Manning et al., 2006). A considerable amount of literature has been published on how an organisational structure influences innovation (Ahmed, 1998; Daugherty et al., 2011; Steiber & Alänge, 2013).

Organic structures promote innovation and mechanical structures hinder it (Ahmed, 1998; Arad et al., 1997; Martins & Terblanche, 2003). In the study on Google by Steiber and Alänge (2013), it was found that employee's innovative ideas were welcome through a bottom up process and clear goals and priorities were set from the top. In the study by Martins and Terblanche (2003), found that organisational culture has an impact on organisational structure. The values inculcated by the structure can encourage or limit novelty in organisations. Arad et al. (1997) also found that when employees are empowered to involve in decision making in problem solving, it is positively related to innovation.

2.4 Reward system

Lim and Ling (2012) defined a reward system as the package/system that contains rewards and benefits, e.g. holiday leaves, medical benefits, transport allowance and performance bonus. Several studies have revealed that organizations highlight individual based rewards in order to encourage innovation as variations in rewards can be justified based on performance and is a method to stimulate performance (Carneiro, 2008; Lawson & Samson, 2001). Amabile (1988) argues that money should not be used to bribe employees to generate novel thoughts. Ahmed (1998) discusses rewards under cultural norms that promote innovation. He also states that if rewards are not based on innovation but on task performances, employees will be cautious and hesitant.

Lawson and Samson (2001) stated that successful innovative organisations had reward systems that consisted of dual ladder systems, suggestion schemes, public recognition, and financial rewards. Whereas in the study by Steiber and Alänge (2013), it was found that the performance and incentive system was not a major factor behind Google's innovativeness. However, it served to recognize innovative employees. It was also found in the study of Google that the intrinsic motivation was identified as more vital for innovation.

2.5 Organisational learning

Whereas Steiber and Alänge's (2013) study on Google revealed that learning was vital for current products and process improvements than new innovations, Sicotte et al. (2014) found that innovation portfolio management need to build skills where learning would help them to be ahead of the competitors.

In the qualitative study by Duygulu et al. (2015), they interviewed 38 R&D official representatives consisting of R&D directors, managers and coordinators and found that learning and development is one of the major attributes of an innovative culture.

3 Research Methodology

3.1 Theoretical framework

The theoretical framework summarised in Table 1 was developed from the literature review and it lists the factors used for the study. However, from the full list of factors identified from the literature survey, some were not included in the theoretical framework. The reasons for those factors to be omitted are as follows:

The factor, employment growth is linked to innovation. Acs and Armington (2004) identified that employee growth has other factors affecting it. Therefore, measuring the contribution of innovation is difficult. The factor, growth in output is also linked to innovation. However, Fountas et al. (2002) found that it is influenced by other factors such as inflation and inflation uncertainty. Therefore, it is not suitable to be used in this study. The factor productivity will not be used as Feldstein (2008) states that it is influenced by rise in wages. Share of sales of new products was also not used because Cao and Li (2015) found that this factor is controlled by many variables such as advertising, working capital and competition. The factor firms' R&D investments was not used as Lai et al. (2015) found that it is influenced by financial autonomy, profitability degree, company size, capital structure, goodwill and patents, human resources and business resources. The factor firm size is not used because Kumar et al. (1999) found that it is influenced by other factors such as institutional factors consisting of the effectiveness of the legal system and financial market developments and also the amount of capital and the market size of the firm. Project size was also not used as Park and Papadopoulou (2012) found that it is influenced by cost and duration.

3.2 Participant recruitment

As the research design was intended to develop a theory as it emerges, theoretical sampling was used to recruit participants for the research on the basis of relevancy to the emerging theory. In this study a total of 14 participants who were relevant to the research area took part in the study. The individuals were a cross section of people directly involved in innovation - Heads of Research, Product Managers, Project Managers and Software Architects. The criteria for selecting the participants were based on their experience and knowledge in the research area.

3.3 Data Collection technique

For this qualitative research study, data was collected through open-ended questions to interview corporate informants to gather data to analyse perceptions of the participants with regard to innovation management in IT projects. The theoretical framework was used to develop the interview questions. Interviews were used to collect data as the participants' experiences can be thoroughly explored by conducting interviews. By using this approach, each organisation was assessed to see whether innovation is fostered using semi-structured expert interviews. The study included face-to-face interviews collected over a two-month period.

After a selected expert interview with a key person from one of the largest e-Health providers to see the validity of the questions, a series of semi-structured interviews was conducted. Each interview lasted approximately 45 to 60 minutes and was handwritten and later transcribed for analysis purpose. MAXQDA, a software that supports the analysis of qualitative data was used to electronically store, document and structure all interview transcripts.

Table 1 Summary of the Factors Used in the Theoretical Framework

Variables	Type	Dimensions	Measurement
Trend	IV	Cultural	Employee empowerment Gamification
		Leadership	Talent development
		Rewards	Reward structures
		Resources	Recruitment process
Project organisation	DV	Resources	Team distribution
		Leadership	Support for innovation
		Organisational structure	Type of organisational structure
		Rewards	Incentives for innovation

4 Analysis

The data gathered from the open ended interview transcripts were analysed in a qualitative manner. Qualitative content analysis and Grounded Theory approaches (Glaser & Strauss, 2009; Miles &

Huberman, 1994) were used in this research because the phenomena studied is specified in the interview questions and forms the basis for understanding why different innovation management trends and organisation of IT projects are used.

4.1 Analytical strategy for interview transcripts

The analytical strategy consisted of Grounded Theory (Glaser & Strauss, 2009; Miles & Huberman, 1994). For answering the questions: 1) what aspects of innovation management influences the organisation of IT projects and 2) for different innovation management methods what is the ordering of the factors which influence the organisation of IT projects, the following three steps were followed during the analysis (Miles & Huberman, 1994).

- 1) Data Reduction
- 2) Data Display
- 3) Drawing conclusions

4.1.1 Data reduction

In order to carry out the exploratory and inductive analysis of this study the 14 interviews resulting in 29 pages of interview transcripts and notes have been stored and analysed with the help of MAXQDA. In order to reduce the data, open coding (Glaser & Strauss, 2009) was followed and 59 codes that were grounded in 126 quotations were identified. In this step of the analysis a total of 291 code assignments were found and the reason for this was the multiple coding for a single quotation.

Thereafter, axial coding was used to link the codes to categories and sub categories that facilitated to reassemble the data and to form the theory. The coding scheme was refined by introducing several categories and sub categories. Next, selective coding was used to selectively add new codes and properties where required and further refine the categories and sub categories. The facility in the MAXQDA tool to add memos to the identified codes supported to structure the codes during data analysis. The creative coding feature, where a plain map is used to visually arrange the codes in MAXQDA was used to build categories from open coding.

Code Theory Model

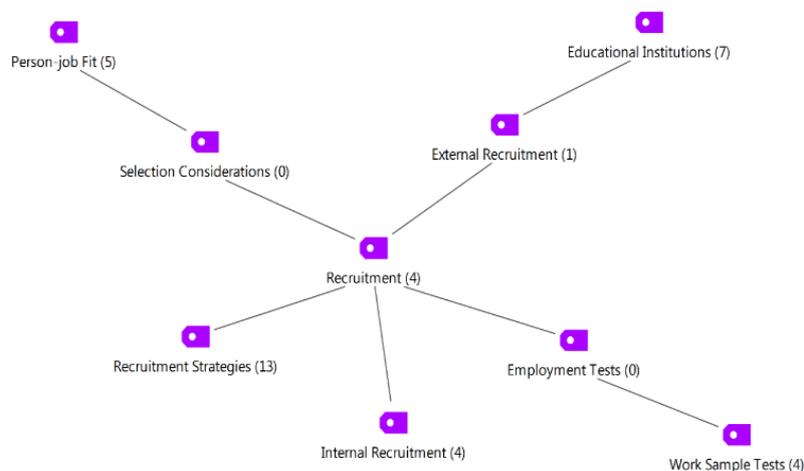

Figure 1 Code Theory Model – Recruitment

At the axial coding stage, the main categories identified initially for Recruitment were External Recruitment, Internal Recruitment and Recruitment Strategies. At the selective coding stage, the codes were then grouped and refined into 5 higher order categories and 3 subcategories as shown in Figure 1.

4.1.2 Data display and drawing conclusions

A variety of options to visualize data is presented using MAXQDA. In this stage of analysis, the responses for the research questions were reviewed. The questions were focused on the aspects of innovation management that influence the organisation of IT projects and for different innovation management methods what is the ordering of the factors which influence the organisation of IT projects. In order to protect the participants' anonymity, they were categorized according to their primary work responsibility into 3 areas and assigned with a code to represent them as shown in Table 2. The 3 main areas were Research, Engineering and Management.

Table 2 Study Participants

Codes	Description
E1	An Associate Software Architect at a prominent innovative financial technology business.
R1	Vice President - Research at a lean enterprise middleware company.
R2	Head of Research at a leading international travel solutions company.
M1	Director Advanced Services and TQM at a global technology innovation services provider.
M2	Director at a global technology innovation services provider.

4.2 The aspects of innovation management that influence the organisation of IT projects

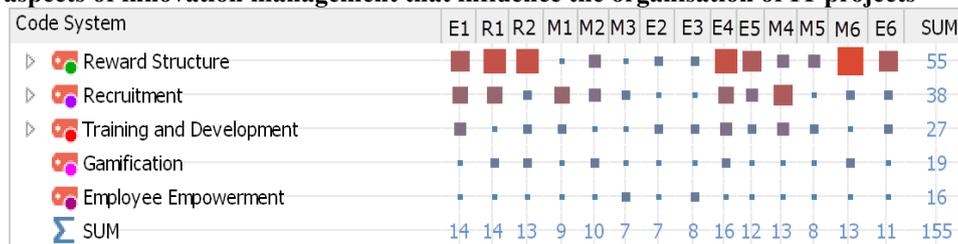

Figure 2 Code Frequency per Document – Overall

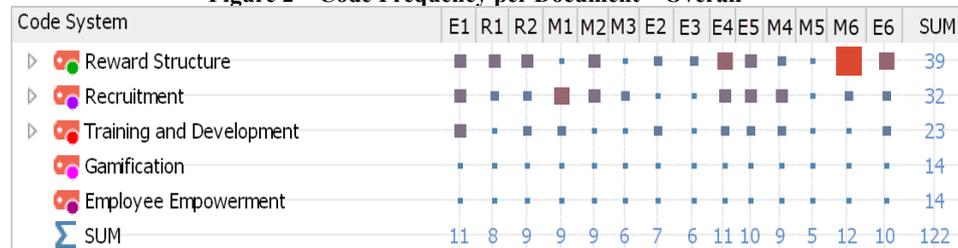

Figure 3 Number of Documents per Code – Overall

As shown in Figure 2 and Figure 3, all codes have been related to the five trends of innovation management, with the highest density resulting for Reward Structure with 55 empirical groundings derived from 12 different codes. The second highest code was for Recruitment, with 38 groundings derived from 9 different codes. Training and Development received 27 groundings. Finally, Gamification and Employee Empowerment had only 19 and 16 empirical groundings respectively.

The overall ordering of the innovation management trends based on the code frequency per document and number of documents per code were as follows:

- 1) Reward Structure
- 2) Recruitment
- 3) Training and Development
- 4) Gamification
- 5) Employee Empowerment

4.3 For different innovation management methods, the ordering of the factors which influence the organisation of IT projects

4.3.1 Reward structure

Incentives for innovation

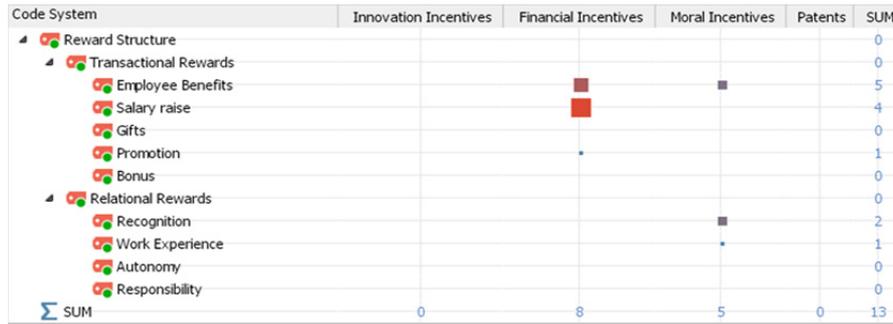

Figure 4 Total Code Relations of Co-occurrence of Codes Between Reward Structure and Innovation Incentives

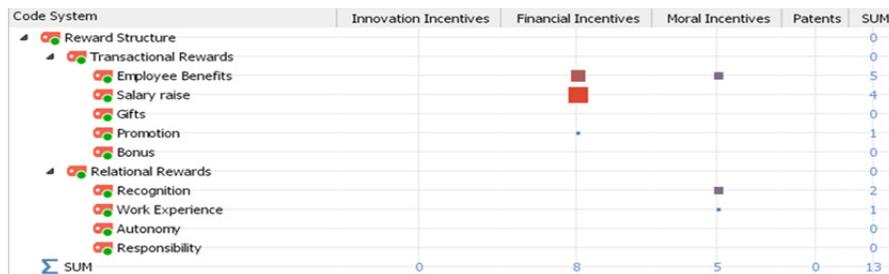

Figure 5 Number of Documents per Code Relations of Co-occurrence of Codes Between Reward Structure and Innovation Incentives

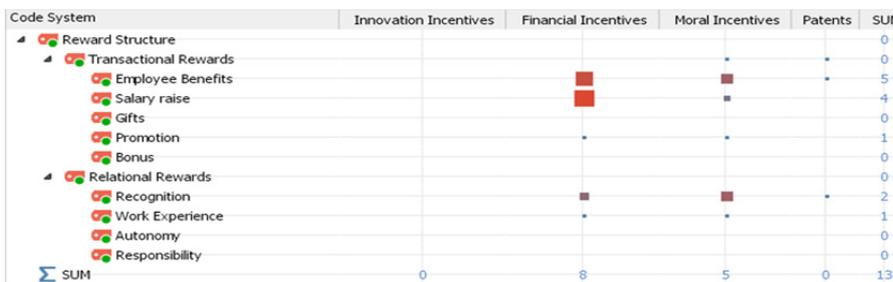

Figure 6 Total Code Relations of Near Codes Between Reward Structure and Innovation Incentives

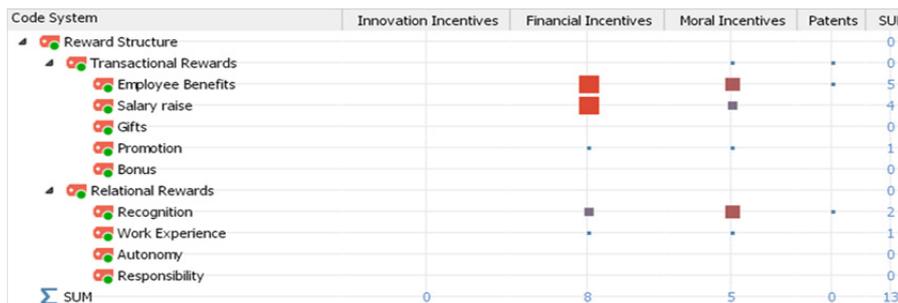

Figure 7 Number of Documents per Code Relations of Near Codes between Reward Structure and Innovation Incentives

The visualisations of the intersections of activated codes in Reward Structure and Innovation Incentives in a group of activated documents by using the MAXQDA Visual Tool - Code Relations Browser are shown in Figures 4, 5, 6 and 7. The Complex Coding Query feature with the following functions were used to retrieve code relations between Reward Structure and Innovation Incentives.

- If inside - Search for segments assigned to any one of the codes in Reward Structure that are also completely surrounded by a segment assigned to the code Innovation Incentives: 18 segments
- Followed by - Search for segments assigned to any one of the codes in Reward Structure that is followed by a segment assigned to the code Innovation Incentives within no more than 1 paragraph: 26 segments

• Near - Search for segments assigned to any one of the codes in Reward Structure that is preceded or followed by a segment assigned to the code Innovation Incentives within no more than 1 paragraph: 26 segments

The above results generated indicated that there were code relations between Reward Structure and Innovation Incentives.

Similarly, the factors Team Distribution, Management Support and Organisation Structure were compared with each innovation management method.

The overall ordering of factors which influence the organisation of IT projects for the innovation management method Reward Structures were as follows:

- 1) Organisation Structure
- 2) Innovation Incentives
- 3) Management Support

4.3.2 Recruitment

The overall ordering of factors which influence the organisation of IT projects for the innovation management method Recruitment were as follows:

- 1) Organisation Structure
- 2) Innovation Incentives

4.3.3 Training and development

The overall ordering of factors which influence the organisation of IT projects for the innovation management method Training and Development are as follows:

Team Distribution, Management Support and Organisation Structure were at the same level.

4.3.4 Gamification

Only Organisation Structure influenced the organisation of IT projects for the innovation management method Gamification.

4.3.5 Employee empowerment

Only Organisation Structure influenced the organisation of IT projects for the innovation management method Employee Empowerment.

Table 3 presents a comparative analysis of innovation management trends in the literature and the findings from this research on how organisations succeed by overcoming the challenges and failures in innovation.

5 Conclusions

5.1 Recommendations

From the observation done on the 11 organisations, it was found that there were no two identical innovation management implementations and each organisation provided a different experience. Designing an innovation management implementation for your organisation will require the careful assessing of the following:

- It is important to do a situation analysis on innovation management in the target organization so that the strengths, weaknesses, opportunities and threats of the organization are identified.
- Also, it is important to assess the benefits the organisation would most value in receiving from the implementation.

Successful innovation management for a particular organisation will not be identical to other organisations. In order to introduce or improve innovation management the following is recommended:

- The findings suggest that it is useful to determine where to invest the budget for innovation management.
- It is important to build an innovation management implementation that meets the organisation's needs.
- The implementation needs to be introduced in a way that the organisation accepts it.
- Identify ways to evaluate the outcome of the investment.

This study revealed different innovation management trends and the results of such management approaches. In order for the innovation management model to successfully fit the organisation and to reap the benefits from the implementation to the organisation, managers should come up with different strategies.

5.2 Research limitations

The study encountered the following limitations with regard to building up the theory and to the empirical study.

5.2.1 Methodological and empirical limitations

Data sources for the interviews were limited because the preliminary review of opportunities to study innovation management in the Sri Lankan context revealed that only a selected set of organisations would be relevant to the research and a deeper study of management trends at each of these organisations to be necessary.

5.2.2 Theoretical limitations

The researcher identified significant gaps in the available literature. The variables Trend and Project Organisation had a lot of research relevant to it and independent of each other. Only a small fraction of the existing literature attempted to establish any relationships between these variables.

5.3 Future research

This study highlighted the impact of innovation management trends towards the organisation of IT projects. Several important findings were revealed. Suggestions for areas of interest for future research and development are as follows:

- Further study how giving more responsibility can contribute to innovation.
- Comparing innovation management in IT projects from a classless management perspective.
- Study how innovation management in IT projects could lead to organisational learning.

- Study the effect that motivation has on innovative IT projects.
- Researching how job performance can be evaluated in a way that contributes to innovation.
- Study how outdoor training can influence innovation management.
- Study how designations can contribute to innovation.
- The difficulties and challenges that have to be overcome to achieve innovation management success.

Manufacturing Industrial Agglomeration, Technological Innovation and Regional Differences

Yuan Hua, Li Ruoxi, Zhao Hongzhong

School of Economics, Wuhan University of Technology, Wuhan, P.R.China, 430070

(E-mail: kimiyuan@163.com, lrxsgly@foxmail.com, zhaohz22@163.com)

Abstract: The paper carries out empirical analysis of correlations between agglomerating degree of manufacturing industry and technical innovation by utilizing data of industrial enterprises above designated size from 2013 to 2014, and employing generalized least squares method(GLS). It carries out analysis by using innovation ability and innovation activity together as parameters for measuring innovation level, with research results showing, for nationwide manufacturing industry, the higher degree of agglomerating, the stronger the technical innovation ability, also the lower the innovation activity. Throughout various regions, the agglomerating degree of manufacturing industry would have differing effect on the innovation ability and innovation activity.

Key words: Manufacturing industry; Agglomeration; Technical innovation; Regional differences

1 Introduction

The manufacturing industry has always been an important pillar industry in China. In 2015, Made in China 2025 presents a development goal of converting China from a big manufacturing country into a powerful manufacturing country, wherein the innovation-driven implementation is exactly a basic way for such a goal. Thus, the research on relationship between agglomeration of manufacturing industry and technical innovation is of great practical significance.

As early as in the 19th century, Marshall started to pay attention to a phenomenon called industrial agglomeration, and presented the concepts of "internal economy" and "external economy". After Marshall, the theory of industrial agglomeration saw great development, with emerging schools like theory of location of industry by Weber, theory of new economic geography by Krugman, theory of competitive advantage by Port, etc.

Presently, there're three main conclusions of research on relationship between agglomeration and scientific and technical innovation by scholars at home and abroad: first, it's recognized that agglomeration and innovation are interactive (Philippe Martin, Gianmarco I. P. Ottaviano 2001), and agglomeration can reduce cost of innovation by external effect, thereby attracting enterprises into a certain region, and thus forming a new agglomeration; second, it's recognized that agglomeration can facilitate innovation, thereby facilitating growing of regional economy (Krugman 1991; Kelly and Hageman 1999; Paci and Usai 1999; Hanson 2001; Megha and Mukim 2012; Cao Yuping 2012); third, it's recognized that industrial agglomeration brings no positive influence on innovation by externality, but instead brings negative influence on innovation (Abdullah M. Khan, 2008). From point of view of research, some scholars studied locational change of manufacturing industry at provincial-level from meso-perspective of regional growth (Qiu et al., 2013); while some studied the relationship between development of manufacturing industry and agglomeration from micro perspective of enterprises (Lu and Chen, 2009; Rijkers et al., 2010; Yuan et al., 2012a). In recent years, scholars at home and abroad have also carried out empirical research on relationship between agglomeration of manufacturing industry and technical innovation. Wang Wenyi, An Tongliang (2014) studied a mechanism by which the knowledge spillover of micro subjects within a certain region affected the industrial agglomeration and innovation by using listed companies in Chinese manufacturing industry from 2003 to 2011 as subjects of the study. Han Qingxiao, ZhaHuachao, Yang Chen (2015) examined the influence on innovation efficiency by industrial agglomeration throughout both the population manufacturing industry and the manufacturing sectors as divided by differing factor intensities by using Malmquist index.

2 Model Assumption and Data Explanation

2.1 Model building

To analyze a quantitative relationship between agglomeration of manufacturing industry and technical innovation, we use existing research results and construct a measurement model. The model is set as follows:

$$\ln(\text{Innovation}) = \alpha + \beta_1 \ln(\text{Agg}) + \beta_2 \ln(\text{Staff}) + \beta_3 \ln(\text{EAR}) + \varepsilon \quad (1)$$

where Innovation is an explained variable-technical innovation level of manufacturing industry, Agg is

an explaining variable-agglomerating degree of manufacturing industry, Staff and EAR are control variables, Staff represents investment of R&D staff in manufacturing industry, EAR represents technology import and technical transformation expense in manufacturing industry.

2.2 Variable explanation and data source

The paper carries out empirical analysis by choosing data of manufacturing enterprises above designated size in 2013 and 2014. Due to incomplete data, the analysis is carried out by using data of 30 subsectors of manufacturing industry across 30 provinces in China.

As data is stemmed from manufacturing enterprises above designated size, which case is different from other researches measuring innovation level of manufacturing industry, the paper, based on status quo of manufacturing enterprises, chooses two dependent variables as parameters for measuring innovation level of manufacturing enterprises, first, as a parameter reflecting technical innovation ability, and second, the number of valid patents is used to measure technical innovation activity. See table 1 for detailed explanations:

Table 1 Variable Interpretations and Explanations

Variable type	Variable Name		Variable Code	Explanations
Dependent variable	Technical innovation level	Innovation	Y1	Innovation ability is calculated by utilizing sales revenue of new products
			Y2	Innovation activity is calculated by utilizing the number of valid patents
Independent variable	Agglomerating degree	Agg	X1	Measured by utilizing location quotient of each region
Control variable	Investment of R&D staff	Staff	C1	The number of R&D staff in manufacturing industry is calculated
	Technology import and technical transformation expense	EAR	C2	Calculation is performed by utilizing the combination of technology purchase, technology assimilation and technical transformation expense.

All data originates from China Statistical Yearbook (2013-2014), China Statistical Yearbook on Science and Technology (2013-2014), and China Statistical Yearbook on Industrial Economy (2013-2014).

3 Results Analysis

Considering short time span of data, we thus carry out analysis by using annual panel data. For data processing, processing on multicollinearity is firstly performed, with White's test showing presence of heteroscedasticity in the results. Thus, estimate is made by choosing generalized least squares method (GLS).

3.1 Nationwide population regression analysis

We estimate the coefficient of explaining variables by utilizing two cross-section data of nationwide manufacturing industry in 2013 and 2014, see Table 2 for results:

Table 2 Regression Results of Agglomeration of Nationwide Manufacturing Industry

Variables	2014		2013	
	lnY1	lnY2	lnY1	lnY2
lnX1	0.145** (2.309)	-0.681*** (-6.352)	0.453*** (15.054)	-0.387*** (-2.805)
lnC1	0.954*** (31.729)	1.332*** (36.191)	0.650*** (15.404)	1.126*** (12.889)
lnC2	0.301*** (6.521)	-0.126*** (-3.304)	0.549*** (11.663)	0.019 (0.317)
Constant term	0.924*** (5.667)	-1.910*** (-8.532)	0.906*** (7.573)	-1.869*** (-7.59)
Adj R-squared	0.997	0.992	0.997	0.988
F statistics	3245.441	1176.08	3485.553	794.338
Sample size	30	30	30	30

Note: ***, **, *respectively represents significance at levels of 1%, 5% and 10%, and between brackets are corresponding t statistics of variables.

The regression results demonstrate that:

1) The agglomerating degree of manufacturing industry has positive influence on sales revenue of new products, but negative influence on the number of valid patents. This indicates the scale effect resulting from agglomeration allows new products to embrace a broader market, which drives enterprises to continuously develop new products. But conversely, agglomeration of manufacturing industry would also result in decrease in the number of valid patents, it indicates knowledge spillover incurred by agglomeration is increasing, thereby making enterprises' innovation activity decrease.

2) As is seen from different time period, agglomerating degree has different influences on innovation level. In 2013, the influence on sales revenue of new products was greater than as in 2014, but with less negative influence as in 2014.

3) The investment of R&D staff has great impact on scientific and technical innovation, and the increase of R&D staff would facilitate the enhancement of scientific and technical innovation level regardless of specific years.

3.2 Regional regression analysis

To understand influences brought in by agglomeration of manufacturing industry in different regions, we again perform GLS regression analysis of original data in terms of regions, with regression results shown in Table 3:

Table 3 Regression Results of Agglomeration of Manufacturing Industry in Terms of Regions

Variables	Eastern Region		Central Region		Western Region	
	lnY1	lnY2	lnY1	lnY2	lnY1	lnY2
lnX1	-0.430*** (-4.147)	-1.080*** (-8.071)	0.647** (3.886)	-0.236** (-3.134)	0.774 (1.284)	-0.229 (-0.717)
lnC1	1.005*** (18.805)	1.337*** (9.611)	0.591** (4.171)	1.246*** (15.228)	0.718*** (4.163)	1.222*** (11.355)
lnC2	0.173** (3.469)	-0.174* (-2.242)	0.885*** (12.878)	0.431*** (6.421)	0.727*** (3.668)	-0.073 (-0.939)
Constant term	1.496*** (8.095)	-1.635*** (-4.582)	-0.844 (-1.207)	-4.922*** (-26.266)	-0.429 (-0.376)	-1.653*** (-5.760)
Adj R-squared	0.998	0.980	0.997	0.999	0.879	0.998
F statistics	2175.405	161.875	878.370	3300.149	25.144	1407.686
Sample size	11	11	8	8	11	11

Note: ***, **, *respectively represents significance at levels of 1%, 5% and 10%, and between brackets are corresponding t statistics of variables.

It can be seen from the regression results, the expression of the relationship between regional innovation level and agglomerating degree differs. As shown in regression results:

1) Both sales revenue of new products and number of valid patents had significant negative relationship with agglomerating degree in the eastern region in 2014, which indicated the agglomerating effect caused by manufacturing industry changed in the eastern region, and the market expanding effect caused by the agglomeration of manufacturing industry in the eastern region begun to turn from positive into negative, that is to say, the crowding effect of agglomeration of manufacturing industry in the eastern region begun to emerge.

2) In the central region, agglomerating degree had significant positive correlations with sales revenue of new products and significant negative correlations with the number of valid patents, but with different degree of impact. This indicated the market scale effect caused by agglomeration of manufacturing industry facilitated the improvement in enterprises' innovation ability, and meanwhile the deepening of agglomerating degree would also result in the decrease in technical innovation activity in the central region.

3) There was difference between the western region and the central region as well as the eastern region. The data in 2014 indicated the influence caused by agglomeration of manufacturing industry was not significant, and the agglomerating degree of manufacturing industry had no significant correlations with sales revenue of new products and the number of valid patents, which might be due to relatively weak foundation of manufacturing industry in the western region.

4 Conclusions

The paper first calculates the agglomerating coefficients of manufacturing industry by using regional and industrial data of manufacturing enterprises in 2013 and 2014, and then performs empirical analysis of relationship between agglomeration of manufacturing industry and scientific and technical innovation by utilizing generalized least squares method, with analysis results as follows:

First, the regional data shows agglomeration of manufacturing industry has influence on technical innovation, which effect is represented in increase in sales revenue of new products and decrease in the number of valid patents. The effect resulting from agglomeration of manufacturing industry is due to the fact that agglomeration would create a bigger market, and thereby exert market effect. Meanwhile, as agglomeration would result in knowledge spillover, enterprises can reduce cost of research and development by sharing knowledge with other enterprises, thereby reducing enterprises' technical innovation activity.

Second, innovation effect of agglomeration shows differently in various regions. The manufacturing industry in the eastern region has gained considerable development during last 40 years. Consequently, the market scale effect caused by agglomeration of manufacturing industry has been continuously weakened, and even the over agglomeration of manufacturing industry shows "crowding" effect, which effect would reduce regional technical innovation level. In contrast, the agglomeration of manufacturing industry in the central and western regions has no significant negative effect on regional technical innovation.

Third, the investment of R&D staff has significant positive effect on technical innovation. The increase in investment of R&D staff would significantly increase sales revenue of new products and the number of valid patents, and correspondingly, the technical innovation would rely more on investment of human capital.

Analysis of Stakeholders in the Emergency Industry Based on Game Theory

Fan Sha, Ma Ying, Wang Lijuan

School of Management, Wuhan University of Technology, Wuhan, P.R. China, 430070

(E-mail: 895956574@qq.com, mying331@163.com, 1964677873@qq.com)

Abstract: With the development of emergency industry, the problem about stakeholders which are in the conflict of interest issues in emergency industry are increasingly prominent. The paper uses game theory to analyze the relationship of involved stakeholders. Then based on the incomplete information game, the specific analysis is made on each pair of stakeholders. At last, according to the game analysis, the paper explores the causes and effects of the conflict of interests between stakeholders, and puts forward the corresponding countermeasures and suggestions. The analysis is helpful to guide the stakeholders to make the right decisions in the conflict environment, promote the healthy development of the emergency industry as well.

Key words: Emergency industry; Stakeholders; Game theory

1 Introduction

In recent years, the sudden disasters occurred frequently in the world, and even have caused serious casualties and property losses. The emergence of the emergency industry is an opportunity, to a certain extent, to enhance the public's ability to respond to emergencies. Emergency industry is an emerging industry which is derived from the occurrence of public emergencies, mainly relating to the production of emergency products in emergency management and the supply of emergency services. However, as an industry, the object groups involved will have the corresponding conflict of interest. According to the "economic man" hypothesis: People always pursue their own best interests. Therefore, in this large group of emergency industry, if each stakeholder pursues its own interests, the conflict of interest will inevitably lead to the public interest can not be maximized. The introduction of game theory can help us to analyze how to make the related stakeholders reach the maximum profit.

It is of great practical significance to study the game process of stakeholders in the emergency industry. Many scholars have already done many researched in the field of emergency up to now. Priscilla, Murphy (1997) used game theory to study the conflict between the organization and the public in the crisis situation, they considered that the game theory helps people to identify specific decision-making models according to certain strategies. Fragnelli, Vito (2008) discussed the problem of emergency unit location based on game theory. Yang Jing, Chen Jianming (2005) thought that the whole process of dealing with emergencies are dynamic game process between emergency management and emergency management decisions. Zhang Xuxia (2007) studied the trust relationship between the government and the public in the process of emergency management of public emergencies based on a simple analysis of the behavior of the government and the public. Pang Hai Yun, Liu Nan (2012) aimed to a situation where short period of time cannot satisfy all disaster emergency needs, put forward a strategy of not completely extinguished the disaster and constructed a complete information non cooperative game model. Zhao Shuhong, Zhang Li (2010) analyzed various game relationship appeared in the process of emergency management, including subject and object. Yaojie (2005) analysed the dynamic game process between emergency management "crises" and "crisis management" in the framework of the dynamic game model, and discussed how to use game model to make a plan. Yu Lei, Xue Huifeng (2008) introduced evolutionary game theory to study public health emergencies crisis management, and used Swarm to simulate the evolution of the game. Ma Xiangguo, Hui Liming (2013) used cost model to analysis the premise condition where government and enterprise cooperate and the game model of the cooperation of emergency material storage. Si Yaping (2008) accorded the government's attitude and measures in the process of public crisis management in view of the different interest groups of public crisis, to discuss strategies to crack the "prisoner's dilemma" game model using game theory. In general, game theory in the field of emergency is mainly concentrated in the field of emergency management, and for the emergency industry, the classification of stakeholders and the game analysis of the main stakeholders are lack of research. As a new industry, the game analysis of the stakeholders of the emergency industry will help the decision makers to make the right decisions in the conflict environment, and promote the healthy development of the emergency industry.

2 Stakeholders in the Emergency Industry

The emergency industry is a comprehensive industry which involves a lot of stakeholders, mainly including government, profit organizations (mainly refers to enterprises producing the emergency product or retailers), NGOs (charity or the masses, etc.), the media. The government plays an important role in the emergency industry as the main emergency supplies procurement, the storage as well as the supervisory, it has a direct interest relationship with profit organizations, non-profit organizations and the media.

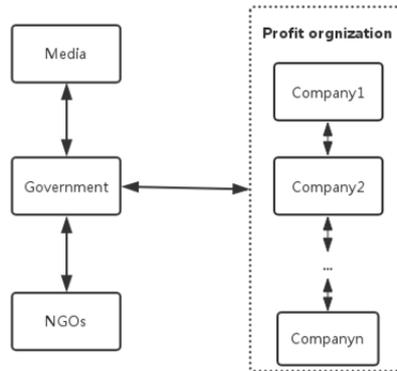

Figure 1 Game Relation Between stakeholders

Emergency industry operation depends not only a single subject but two or more interactions between the subject, and each subject have their own interests, the interests between different subjects may cause some conflict and collision, here comes to the analysis of the game between subjects. The following analysis are about the specific analysis of different subjects of the game analysis.

3 Game Analysis of Stakeholders

3.1 Game between government and profit organizations

In the whole operation of the emergency industry, the game between the government and the profit organization is mainly caused by the intention of cooperation between the two sides. In the event of an emergency, government and profit organizations can adopt a cooperative manner: the government can directly purchase from partners, on the contrary, nonprofit organizations can also derive income. But due to unexpected events, cooperation has a risk. Considering this risk, the paper analysis the game between government and profit organization.

3.1.1 Hypothesis

1) **Participant.** Participant include the government and the profit organizations. Assuming that both parties are fully rational, their decisions depend on the expected benefits that can be obtained. The decision of the government depends on the maximization of the overall interests of the society.

2) **Information.** For both government and profit organizations, information is not complete, whether the two sides are cooperative and non-cooperative are not sure, In this paper, it assumes that the probability of cooperation of the government is x , and the probability of the cooperation of profit organizations is y .

3) **Strategy.** it is assumed that there are two strategies for both the government and the profit organization, namely, cooperation(C) and non-cooperation (N).

4) **Payoff.** when the government does not cooperate, it need pay the betrayal cost $C1$, in the same situation, profit organizations need pay betrayal cost $C2$. The payment matrix is shown in table 1.

Table 1 Payment Matrix of Government and Profit Organization

		government	
		C (x)	N (1-x)
profit organization	C (y)	(A1, B1)	(-A2, B2-C1)
	N (1-y)	(A3-C2, -B3)	(A3, B2)

3.1.2 Game analysis

It can be seen from the payment matrix above, Whether government or profit organization, they don't select a particular action in each given information, but choose a course of action randomly with

some probability, that is, the game between government or profit organization is a mixed strategy Nash equilibrium.

For the government, the expected payoff on the choice of cooperation is $M1=y*B1-B3*(1-y)$; otherwise, the expected payoff is $M2=y*(B2-C1)+(1-y)*B2$. Setting $M1>M2$, that is $y*B1-B3*(1-y)>y*(B2-C1)+(1-y)*B2$, therefore, $y>\frac{B3+B2}{B1+B3+C1}$. we can come to conclusion, when $y>\frac{B3+B2}{B1+B3+C1}$, the government chose cooperation as the optimal strategy; when $y<\frac{B3+B2}{B1+B3+C1}$, the government chose not to cooperate as the optimal policy.

For the profit organizations, the expected return on the choice of cooperation is $N1=x*A1-(1-x)*A2$; otherwise, the expected payoff is $N2=x*(A3-C2)+(1-x)*A3$. Setting $N1>N2$, that is $x*A1-(1-x)*A2>x*(A3-C2)+(1-x)*A3$, therefore, $x>\frac{A3+A2}{A1+A2+C2}$. There is a conclusion, where $x>\frac{A3+A2}{A1+A2+C2}$, the profit organizations chose cooperation as the optimal strategy; where $x<\frac{A3+A2}{A1+A2+C2}$, the profit organizations chose not to cooperate as the optimal policy.

Under normal circumstances, the two sides choose to cooperate with the largest revenue, by the results show that when $x>\frac{A3+A2}{A1+A2+C2}$ and $y>\frac{A3+A2}{A1+A2+C2}$, the two sides of the optimal strategy is to cooperate, that is to say, the larger of both sides of the cooperation intentions, relatively speaking, the greater the payoff can get for both side. In other words, the game is fundamentally due to trust issues. On how to improve trust issues, it can be carried out with contract or the high cost of betrayal.

3.2 Game between the government and the media (and NGOs)

In the emergency industry, the media which can not be ignored have an important role in promoting the development of the emergency industry. However, ‘Water carry a boat, can capsize them’. Sometimes the government needs to carry out effective supervision of the media to guide the public to the right direction of the event, while for media, false information can enable it to obtain additional benefits, for government, effective supervision need relatively supervision cost. Just like media, NGOs is an organization which can be helpful in emergency industry or do harm to industry, it need government’s supervision. The game analysis is similar, so here, in this paper, we just analysis the game between the government and the media.

3.2.1 Hypothesis

- 1) Participant.** Participant include the government and the media. Assuming that both parties are fully rational, their decisions depend on the expected benefits that can be obtained.
- 2) Information.** For both government and media, information is not complete, in this paper, it assumes that the probability of government supervision is α , and the probability of false information of media is β .
- 3) Strategy.** The government's strategy is {S, N}, S means supervision, N means not supervision; the media’s strategy is {F, Y}, F means false, Y means right part.
- 4) Payoff.** The payment matrix is shown in table 2.

Table 2 Payment Matrix for Government and Media

		Media	
		F (β)	Y ($1-\beta$)
Government	S (α)	(A-C+ θ D, B- θ D)	(A-C, B)
	N ($1-\alpha$)	(A-D, B+D)	(A, B)

A represents the government's payoff; B represents the media's payoff. When the government conscientiously perform their duties of supervision, supervision cost is C, media’s additional income due to false information is D, but if the government find media publish false information, the media should accept θ ($\theta>1$) times fine.

3.2.2 Game analysis

It can be seen from table 2, For the government, the expected payoff on the choice of supervision(S): $E1=\beta*(A-C+\theta D)+(1-\beta)*(A-C)$; the expected payoff on the choice of indulgence(N): $E2=\beta*(A-D)+(1-\beta)*A$. Setting $E1>E2$, namely $\beta*(A-C+\theta D)+(1-\beta)*(A-C)>\beta*(A-D)+$

$(1-\beta) * A$, so $\beta > \frac{C}{(1+\theta)D}$. Therefore when $\beta > \frac{C}{(1+\theta)D}$, government choosing supervision(S) is the optimal strategy; when $\beta < \frac{C}{(1+\theta)D}$, government choosing N is the optimal strategy. For the media, the expected payoff on the choice of F: $F1 = \alpha * (B - \theta D) + (1 - \alpha) * (B + D)$; the expected payoff on the choice of Y: $F2 = \alpha * B + (1 - \alpha) * B = B$. Setting $F1 > F2$, namely $\alpha * (B - \theta D) + (1 - \alpha) * (B + D) > B$, so $\alpha < \frac{1}{1 + \theta}$. therefore, when $\alpha < \frac{1}{1 + \theta}$, the media choosing Y is the optimal strategy; when $\alpha > \frac{1}{1 + \theta}$, the media choosing N is the optimal strategy.

Seen from the game result between the government and the media, media are always rational and always pursue the maximization of their own interests without considering α and β . Once introducing α , media have to make a balance between payoff and risk, when government increase α , media will consider if it is worthy of risking for the additional income or taking strategy N for safe payoff. On the other hand, once β increase, the government will increase α for the maximum interest for society. The media are always rational and pursue, the government regulation of the media have obvious effect, government regulation will significantly curb the media of false information spread. Therefore, whether media choose the F strategy or N strategy, government should invest a certain fund to supervise. In order to effectively prevent and resolve such incidents, the cooperation of government and media is needed.

3.3 Game between profit organizations

With the development of the emergency industry, the profit organization is increasing rapidly, which makes the market saturated. The competition between the suppliers and the suppliers is more and more fierce. In the supply of emergency products, in order to maximize their own interests, profit organizations will choose a price reduction strategy in their own range. The game between profit organizations is similar to the prisoner's dilemma, if both sides trust each other, the overall income is the largest, but in reality, people are rational and always pursue to maximize their own interests, unfortunately it finally leads to the unwise results.

3.3.1 Hypothesis

1) **Participant.** Participant include organization1 and organization2. Assuming that both parties are fully rational, their decisions depend on the expected benefits that can be obtained.

2) **Information.** For both government and media, information is not complete.

3) **Strategy.** The strategy is both D (decrease price) or N (not decrease price)

4) **Payoff.** Assuming organization1 and organization2 both choose N, the obtained income is 800 yuan; One choose N and One choose D, the side who choose D obtain 1000, the other side obtain 350; both side choose D gains 600. The payment matrix is shown in Table 3.

Table 3 Payment Matrix Between Profit Organizations

		Orgnazition2	
		D	N
Orgnazition1	D	(600,600)	(350,1000)
	N	(1000,350)	(800,800)

3.3.2 Game analysis

Seen from the payment matrix between profits organizations, this game exists two Nash equilibrium strategy: {D, D} and {N, N}, it seems that {N, N} strategy is superior to {D, D} strategy, whether for profit organization1 or profit organization2. But in reality, the final equilibrium is often the same as the strategy {N, N}. Because people often have to consider each other's betrayal of the consequences in a real life.

In emergency industry, It seems that lower prices benefit for the purchaser, but in a long run, it is not conducive to industrial development, this kind of price competition will eventually lead to industry entry barriers for new businesses or retailers. So how to avoid the "prisoner's dilemma"?

1) 'Tit for tat' (Robert Axelrod, 1980). That is, the game party first to adopt a cooperative strategy {N,N}, then adopt strategy same with the other part's strategy. Because the profit organization is not a simple one-time game, but a repeated dynamic game. Therefore, the two sides may start from the long-term interests of the game, and then choose the strategy of cooperation;

2) Third party participation. when the game of the two sides strapped into the prisoner's dilemma,

the introduction of third party players can change the pattern of the game, Here the third party is mainly refers to the government or some regulatory authorities. The three party game together can break the structure of the original game, so as to avoid the occurrence of vicious price war.

4 Conclusions

In this paper, through the game analysis of stakeholders in the emergency industry, the game relationship between stakeholders of emergency industry is systematic discussed. Meanwhile, the game model between different stakeholders and stakeholders is established based on game theory. This paper study is helpful for stakeholders to make a right decision in an conflict situation, and promote the healthy development of the emergency industry as well. However, in this paper, game theory is just applied under many assumptions and limitations, in practical situation, the situation as well as the game mode is often more complex, which is the shortage of this research and it need to be further studied.

The Determinants of Technological Innovation Adoption in SMEs Manufacturing in Malaysia

Noni Ngisau, Nurhani Aba Ibrahim

School of Business Management, Campus Kota Samarahan, 94300 Kota Samarahan, Sarawak, Malaysia
(E-mail: noni.ngisau@gmail.com, nurhani.ai@gmail.com)

Abstract: technological innovation (TI) progress and growth has long been considered as the heart of development. For many years technological innovation adoption was significant with the growth of productivity in SMEs manufacturing sector. Diffusion of Innovation (DOI) and Technology-organization-environment (TOE) framework provides insight into the determinations influencing of TI adoption process. Several gaps have prompted this research including the lack of non-western (particularly Malaysian country) perspectives in the TI adoption literature. Apart from that there are lack of empirical research on the relationship between the adoption of TI and firm performance; and most empirical studies are derived from the DOI theory and the TOE framework as complete model to be considered. Data collected from National Survey of Innovation (NSI) 2012 with 445 firms in Malaysia are used to test the related hypotheses. Structural equation modelling (SEM) was used to empirically assess the research model. Smart-PLS software was used to assess the reliability and validity of the measurement models and structural models. Among the innovation characteristics, we find that compatibility is the strongest driver in determinants of TI adoption. Among the TOE variables, technology contexts are the greater effect on the TI adoption.

Key words: Technological innovation; Diffusion innovation; Technology-organization-environment

1 Introduction

Technological innovation (TI) adoptions has been one of the extensively researches areas. Studies on technological innovation adoption have aimed to understand, predict and explain variables influencing adoption behaviour at individual as well as organizational levels to accept and use the TI. These studies have developed a conceptual models and frameworks to understand the relationship of these variables with the adoption determinants. Therefore, this study makes an attempt to investigate, and acknowledges greater significance of Diffusion of Innovation (DOI) and technology-organization-environment (TOE) framework to explained the determinant of TI adoption. Furthermore, it supports the integration using the set of variables explaining the adoption TI on how the two models can be integrated for better explanation the determinant of TI adoption.

2 Literature Review

Two theories are commonly used in TI and adoption studies in organizations namely DOI theory and TOE Frameworks. Others theories such as technology acceptance model (TAM), theory of planned behaviour (TPB), unified theory of acceptance and use of technology (UTAUT) and etc. are commonly used to determinants the TI adoption in individual level.

DOI theory (Roger, 2003) is a prominent adoption model used in technological innovation research such as in information system research. The theory proposes five attributes that explain the adoption of innovation in an organization. 1) Relative advantage: define as the extent to which an innovation is better than the previous generation; 2) Compatibility: the degree to which an innovation can be assimilated into the existing processes, practices, and value systems; 3) Complexity: the level of difficulty to use the innovation; 4) Observability: extend to which the innovation is visible to others; and 5) Trialability: the ease of experimenting with the innovation.

TOE framework (Tornatzky and Fleischer, 1990) is developed to explain the process of innovation in the context of an enterprise. It considers three features of an enterprise that influence the adoption of technological innovation namely technology, organization and environment. 1) Technology context: refers to the internal and external technology relevant to the organization, and the technologies that are available for possible adoption. 2) Organization context: refers to the characteristics of the organization such as scope, size, and managerial structure, degree of centralization, resources and communication among employees. Finally, 3) Environment context: refers to the area in which a firm conducts its business, referring to its industry, competitors, and dealings with the government.

3 Research Model and Hypotheses

The integrative model is shown in Figure 1. The model is combining the innovation characteristics of cloud computing with the technology, organization and environment context of the TOE framework.

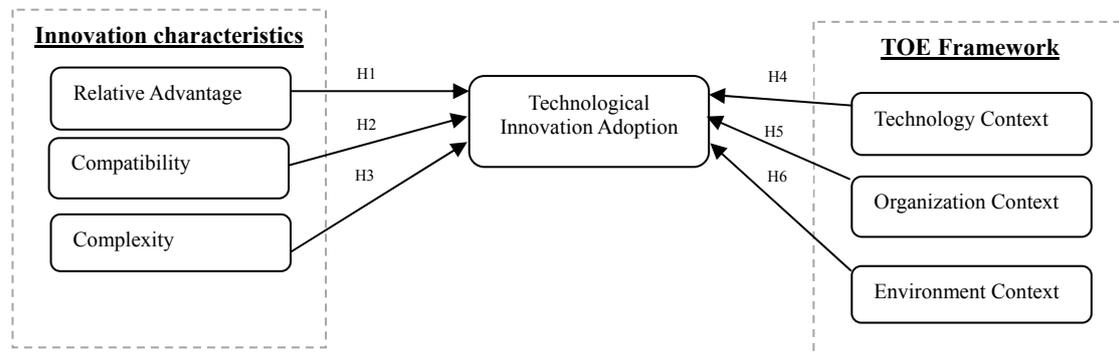

Figure 1 Research Model

Relative advantage is defined as the degree to which an innovation is perceived as being better than the idea it supersedes (Roger, 1995) and perceived as providing better organizational advantages than either the status quo or its precursor (Wu & Chuang, 2010). Most of innovation adoption studies have particularly emphasized that the impact of relative advantage attribute enhance the likelihood of innovation adoption (see Oliveira et al. 2014, Wu & Chen, Lin 2013, Wu and Chuang 2010, Kuan & Chau 2001 and etc.). Since the adoption of technological innovation will benefit and advantage in creating effectiveness in both producing and processing product hence to increase the firm productivity, therefore the merits will positively influence its adoption. Accordingly, the following hypothesis is proposed:

H1. Relative advantage will have a positive effect on technological innovation adoption.

Second DOI attributes that consider in the framework is complexity. Complexity is defined as the degree to which an innovation is perceived to be relatively difficult to understand and use. The attribute has been indicated as negatively associated with adoption of innovation and it is an inhibitor for successful implementation (Wang et al. 2010). Lack of qualified personnel in conducting new technology may lead to reluctant to adopt the new technology. Therefore, the following hypothesis is proposed:

H2. Complexity will have negative effect on technological innovation adoption.

Finally, the third DOI attribute in the framework is compatibility. As relative advantage attribute, compatibility is positively associated with innovation adoption. Rogers defines compatibility as the degree to which the innovation fits with potential adopter's existing value, previous practices, and current needs. Even though compatibility to be relative less important in determinant the innovation adoption (Rogers, 1983) however in this context of study technological compatibility is important in order to be consistent with the business operation and needs. Therefore, compatibility may be an important determinant of technological innovation adoption. Thus,

H3. Compatibility will have positive effect on technological innovation adoption.

The technology context refers to both the internal and external technological characteristics relevant in the organization (Zhu et al. 2002; Oliveira et al. 2014). As for this study, technology context will represent by technology competence as adoption driver. This will consist two predictors to determinant of adoption namely technology infrastructure and training (Zhu et al. 2002). Technology competence are found to be significant adoption facilitator whereby technology infrastructure and training are believed to produce new or significantly improved goods, services, production processes, or delivery method and gaining knowledge know-how through internal and external training. These perspective lead to the following hypothesis:

H4. Technology context will have significant effect on technological innovation adoption.

Organization context is referring to descriptive measures about organization such as scope, size and managerial structure (Oliveira & Martin, 2011). Firm characteristic which includes year of establishment (firm maturity) and firm size has been consistently recognized as an adoption facilitator (see Zhu et al. 2002; Zhu, Xu, & Dedrick, 2003; Zhu & Kraemer, 2005; Lin, 2014; Awa et al. 2012). Literature search for technology adoption and user acceptance models and frameworks used in the past

research by Hameed et al. (2012) found that organization size (firm size) is the most significant factors in the technological innovation adoption. With regard to technological innovation adoption, larger firms have several advantages over small firms in term of financial and the firm capacity. Beside that larger firms are more likely to achieved economies of scale, bearing the high risk of adoption and possess more power to urge trading partners (Zhu et al. 2002).

Top management support have been found to be positively related to technology adoption (Wang et al. 2010; Cao, Jones, & Sheng, 2014). In this study, management support is one of the reason for the adoption of technological innovation. Hameed et al. (2012) literature analysis also found that top management support is among the most considered factors and found significant in the innovation adoption studies.

One of the inhibitors for technological innovation an adoption in the organization is cost (Coa et al. 2014; Kuan & Chau, 2001). Cost too high, lack of funding internal and external are the reasons for reluctant to adoption. It is important to the business industry to getting the funding for innovation activities to overcome the adoption cost. The funding can be internally and externally. Therefore, perceived financial funding is identifying as important factors for technological innovation adoption.

New variable that should be consider in this study that is management awareness of National Innovation Model (NIM). In NIS 2012 objectives, one of its objective have emphasize on the important of NIM in order to transform the country from a resource based economy to innovation based economy; to adopt a balanced approach to market-driven and technology-driven innovation and to raise the country's capacity for knowledge, creativity and innovation and nurture "first classmentality" among organization. Therefore it is important to consider the management awareness of NIM in organization context.

H5. Organization context will have significant effect on technological innovation adoption.

Research has shown that external environment plays an important role in the adoption of technology through a numbers of environmental attributes such as competitive pressure (see Zhu & Kraemer, 2005; Oliveira et al. 2014), external pressure (Coa et al. 2014; Kuan & Chau, 2001), government support (Kuan & Chau, 2001) and regulatory support (Zhu & Kreamer, 2005). Those attributes have been examined and found to be significant (see Hamed et al. 2012). In the context of this study external pressure, partnership quality and regulatory pressure will be examined to the technological adoption.

External pressure or so called referred to the influences from the external business environment (Kuan & Chau, 2001). Competitive pressure can be referred to the market dominated by establishment enterprise. Reluctant to adopt technological innovation in order to create new product good or new processes given more advantages to others establishment to dominate the industries. Other than that, innovation is easy to imitate, this may be a challenges to the business industries. As market competition increases, firms may feel the need to seek competitive advantage through innovations (Wang et al. 2010). Thus, external pressure plays a significant role in pushing firms toward to adopt technological innovation.

Partnership quality may also influence the adoption through it collaboration in creating innovation activities in the industries. This is due to fits the business partners (supplier and main customers) that adopted innovation (Wang et al. 2010).

Regulatory support is another critical environmental factor that influence to effect innovation adoption. Regulatory support is refers to government policies to support or encourage the adaptation of innovation activities in the firm (Zhu, Kraemer, & Xu, 2006). Government regulatory might have either beneficial or a detrimental effect on innovation (Baker, 2012). However, difficulty in fulfil regulation and standard by government can extent the adoption. Other than that insufficiently flexibilities or regulation or standard and limitation of science and technology public policy may also hamper the adoption. Accordingly, the following hypothesis is proposed:

H6. Environment context will have significant effect on technological innovation adoption.

4 Methodology

This study is using a cross-sectional secondary data. Data collected from National Survey of Innovation (NSI) 2012 with 445 firms in Malaysia are used to test the related hypotheses. Structural equation modelling (SEM) was used to empirically assess the research model. Smart-PLS software was used to assess the reliability and validity of the measurement models and structural models. This study is using secondary data; therefore the used of the measurement items for constructs is based on

comprehensive review of literature and empirical studies; and the items is relying on relevance and availability of the data.

a) Measurement Design

There are four influential factors were identified in this study as antecedent variables technological innovation adoption: innovation characteristic from DOI theory with the three main items namely relative advantage, complexity and compatibility; whereas the TOE framework with its three main variables namely technology context, organizational context and environment context. Whereby, firm performance variables will be as dependents variable.

Innovation characteristic was measured by relative advantage which explained by perceived benefits and perceived cost saving; knowledge factors will lead to complexity measurement and rate of innovation activities influences will be used to measure compatibility. For TOE constructs, technology context will be measured by 2 main items that is technology infrastructure and innovation training; Firm size, perceived financial funding and management support will be use to measures organization context; and environment contexts will be measured by three main items such as external pressure, partnership quality and regulatory pressure.

5 Results

a) Measurement models

There are two evaluations of the measurement models, reflective and formative models must be distinguished. The two approaches are based on different concepts and required different evaluation measure (Hair et al., 2014). For this study, only reflective measurement models evaluation are used to assess on their internal consistency reliability and validity. Three specific measures include composite reliability (to evaluate internal consistency), convergent validity (evaluate by individual indicator reliability and average variance extracted (AVE)) and discriminant validity (using Fornell-Larcker criterion and cross loading).

This section discusses the latent variables of the scales used in the study based on: the internal consistency reliability, indicator reliability, and convergent validity (Hair et al., 2014). Basically, there are eight latent variables with reflective measurement models are used in this study namely, relative advantage (RA), compatibility (COM), complexity (CMPLX), technology context (TC), organization context (OC), environment context (EC), and technological innovation adoption (TIA). For reflective measurement models, one need the estimates for the relationships between the reflective latent variable and their indicators.

After performing the assessments, one of the major construct that is relative advantage was deleted from the model and all the indicators below than 0.58 were dropped from further analysis. RA is dropped from the measurement model due to low indicator outer loading (below 0.5) and the value of CRs and AVEs does not exceed the threshold value 0.06 to 0.70 and 0.50 respectively. Therefore, only seven out of eight latent variables are considered for further analysis.

Table 1 Fornell-Lackers Criterion

Construct	1	2	3	4	6	7	8	9
1. CPX	0.842*							
2. CPB	-0.214	0.727*						
3. EC	0.073	0.027	0.749*					
4. FS ^a	0.127	0.010	-0.083	single-item construct				
5. MS ^a	0.123	0.091	0.287	0.164	0.863*			
6. NIM ^a	0.039	-0.031	0.063	0.051	0.201	0.87*		
7. TIA	-0.158	0.106	-0.339	0.009	-0.025	-0.025	0.799*	
8. TC	-0.113	-0.017	-0.302	-0.264	-0.254	-0.142	0.357	0.763*

*Square root of the AVE on the diagonal (in bold).

^a first order construct of the higher-order construct organization context

Fornell-Larcker criterion and cross loadings allow checking for discriminant validity. As shown in Table 5.1, the square root of the AVE is greater than the recommended 0.50 values. The square root of AVE each construct each construct is higher than the construct's highest correlation with any other construct in the model. The square root of the reflection constructs' AVE on the diagonal and the

correlation between the construct in the lower left triangle (i.e. construct CPX has value of AVE2 = 0.842, is higher than all correlation value in column 1). Overall, the square roots of the AVEs for the reflective constructs CPX (0.842), CPB (0.727), EC (0.749), MS (0.863), NIM (0.87), TIA (0.799) and TC (0.763) are all higher than the correlations of these constructs with other latent variables in the path model.

Alternatively, one can check the cross loading to check the discriminant validity when an indicator's loading on a construct is higher than all of its cross loading with other constructs, i.e. indicator CPX1 has value of 0.71, which highest value for loading with its corresponding construct CPX, while all loadings with other constructs are considerably lower (e.g. CPX1 on CPB: -0.149). The same finding holds for the other indicators of CPX as well as the indicator measuring CPB, EC, MS, NIM, TIA and TC (see Table 2).

Table 2 Cross Loading

	CPX	CPB	EC	FS	NIM	MS	TIA	TC

c) Assessment of structural model

The assessment of the structural model will be addressed once the measurement models have confirmed that the construct measures are reliable and valid. The assessment involves examining the model's predictive capabilities and the relationships between the constructs. The central criterion for evaluation the structural measurement model are the significant of the path coefficients, the rate of reliability R^2 of the latent endogenous, the f^2 effect size, the predictive relevance Q^2 , and the q^2 effect size (Chin, 1998; Stone, 1974; Henseler et al., 2009; Hair et al., 2012; Hair et al., 2014).

Before doing the assessment of structural model, collinearity of the structural model is examined. To assess collinearity, statistic software package, IBM SPSS Statistic 22 is used to run the multiple regressions between independent and dependent variable in structural model. With the exception of the collinearity analysis, the results of the regression analysis do not matter and are not further analyzed. The only result that is important for assessing collinearity issues is the VIF (or tolerance). Each predictors construct's tolerance (VIF) value should be higher than 0.20 (lower than 5). Otherwise, consider eliminating construct, merging predictors into single construct or creating higher-order constructs to treat collinearity problems (Hair et al., 2014). As show in Table 4, all VIF values are the threshold value of 5. Therefore, collinearity among the predictor constructs is not the issue in the structural model.

Table 4 Collinearity Assessment

Construct	Collinearity statistics	
	Tolerance	VIF
Complexity	0.936	1.069
Compatibility	0.951	1.052
Technology context	0.868	1.152
Organization context	0.927	1.079
Environment context	0.894	1.119

d) Path coefficient estimates for the main effects model

The results showed that complexity is not significant to technological innovation adoption while the others four main construct namely compatibility ($\beta=0.07$, $p<0.05$), technological context ($\beta=0.26$, $p<0.01$), organization context ($\beta=0.14$, $p<0.01$) and environment context ($\beta=-0.20$, $p<0.01$)

are significant to the technological innovation adoption. Environment context have negative effect on technological innovation adoption whereas compatibility, technology context and organization context have positive effect on technological innovation adoption. This supported the hypothesis H3, H4, H5 and H6. Among the four construct technology context have the greater effect on determinant of technological innovation adoption. Table 5 below displays the path coefficients, t values and their significance levels, and the 95% confidence intervals for the main effects model, it shows the results of the main effect of the structural model.

Table 5 Significant Testing Results Of The Structural Model Path Coefficients

Path	Coefficient	t-value	95% CI
Complexity → Technological Innovation Adoption	-0.09	0.71	NS
Compatibility → Technological Innovation Adoption	0.07*	1.66	(0.08, 0.10)
Technology Context → Technological Innovation Adoption	0.26**	4.69	(0.22, 0.24)
Organization Context → Technological Innovation Adoption	0.14**	2.41	(0.09, 0.10)
Environment Context → Technological Innovation Adoption	-0.20**	4.45	(-0.21, -0.19)

t-values > 1.645* (p< 0.05); t-values > 2.33** (p< 0.01)

e) Test of hypotheses on direct effect between exogenous latent variables and endogenous variable

Hypotheses H1, H2 and H3 are derived from DOI attribute theory. Hypothesis H1 suggests that relative advantage will have a positive influence on technological innovation adoption however the variable has been remove from the model due to its weaknesses to fulfil the criteria of the measurement model assessment. Therefore relative advantage in this study is not examined for hypothesis test. Hypotheses H2 suggest that complexity will have negative effect on technological innovation adoption. The results do not support this hypothesis at the $p < 0.05$ level ($t = 0.705$, $p = 0.240$). The results show significant supports for hypothesis H3 that suggest compatibility will have positive effect on technological innovation adoption at significant level $p < 0.05$ ($t = 1.655$, $p = 0.049$). Therefore, only compatibility attribute of DOI theory have significant influence on technological innovation adoption in this study.

Hypotheses H4, H5 and H6 derived from TOE framework developed by Tornatzky and Fleischer (1990). Hypotheses H4, H5 and H6 suggest that technology context, organization context and environment context will have significant effect on technological innovation adoption. The results show strongly significant supports for these three hypotheses. Moreover, hypotheses H4, H5 and H6 are all significantly supported at the higher significance level of $p < 0.01$ with ($t = 4.819$, $p = 0.00$), ($t = 2.414$, $p = 0.00$), and ($t = 4.451$, $p = 0.00$), respectively. Hypothesis H4 and H5 have positive significant influence to technological innovation adoption while H6 have negative significant influence to technological innovation adoption.

Table 6 Summary Of Result Of Hypotheses Testing

Theory	Hypothesis	Relationship	t-value	p-value	Decision
DOI	H1.	Relative advantage will have a positive effect on technological innovation adoption.	N/A	N/A	N/A
	H2.	Complexity will have negative effect on technological innovation adoption.	0.705	0.240	Not supported
	H3.	Compatibility will have positive effect on technological innovation adoption.	1.655*	0.049	Supported
TOE	H4.	Technology context will have significant effect on technological innovation adoption.	4.819*	0.00	Supported
	H5.	Organization context will have significant effect on technological innovation adoption.	2.414*	0.00	Supported
	H6.	Environment context will have significant effect on technological innovation adoption.	4.451*	0.00	Supported

t-values > 1.645* (p< 0.05); t-values > 2.33** (p< 0.01)

6 Discussion

This study demonstrated the value of using DOI theory and TOE framework to understand technological innovation adoption. The empirical results indicated that there were significant determinants in each context of the DOI and TOE framework. Thus, determinants affecting the

adoption of technological innovation in the SMEs manufacturing industry should include not only the innovation characteristics of the technology itself, but also factors related to the internal organization and the external environment. Thus, the discussions about each determinants affecting technological innovation adoption were obtained as follows:

DOI theory

In general, the three DOI attributes (i.e. relative advantage, complexity and compatibility) were important antecedent on technological innovation adoption. In many literatures, among the three attributes, relative advantage (H1) is more important than others in determinant of the adoption (Wu and Chuang, 2010). In this study relative advantage is not relevance to the adoption. Complexity (H2) was found insignificant to the adoption. This may due, the firm can hired outsourcing to overcome the obstacle to the nature of complexity that relatively associated with difficult to understand and use. However, in the earlier study by Wu and Chuang (2010) found that complexity has significant influence on technological adoption. In contrast, compatibility (H3) has positive significant relationship with technological innovation adoption with significant level $p < 0.05$ and $\beta = 0.073$ which explain 7.3% of variance in the technological innovation adoption. This may due to firm consistent with the business operation and needs. However the study by Oliveira et al. (2014) found that compatibility was significant in service sector and insignificant in manufacturing sector. Thus, compared to the earlier study, the results for DOI attributes are mixed and more investigation is needed to reach a definitive conclusion.

TOE framework

Many studies found that TOE has significantly relationship with technology adoption (see Cao et al., 2014; Oliveira and Martins, 2008; Liu, 2008; Zhu and Kraemer, 2005; Zhu et al., 2003; Kuan and Chau, 2001 and etc.). Consistent with the previous study, TOE was found to have significant relationship with technological innovation adoption in this study. Technology context (H4) and organizational context (H5) was found to have a significantly positive effect on firm decisions to adopt technological innovation. Meanwhile environment context (H6) was found to have a significantly negative effect on the adoption. Among the three aspects, technology context has a greater effect on the adoption. Thus the finding is consistent with that Wu and Chuang (2010), Kuan and Chau (2001), Zhu and Kraemer (2005). A reasonable explanation could be that the firm believed that technological innovation adoption by purchase advanced technology and proper innovation training will benefits the firm to improved goods, production, processes and delivery methods.

As posited, organization context is found to have significant effect on technological innovation adoption. The technological innovation adoption is influenced by the management awareness of National Innovation Model 2007 and management support. The SMEs believed that the national vision of National Innovation Model is to transform the country from resource based economy to innovation based economy and capable to adopt a balanced approach to market-driven and technology-driven innovation in Malaysia context. Management with more positive attitude towards change and have ability to devote staffs to innovation activities could lead to technological innovation adoption. This empirical result corroborates with the findings from others scholars who validated the significant role of management support and IT attitude on technological innovation adoption (T. Ramayah et al., 2016; Al-Qirim, 2005; Lin, 2006).

7 Conclusions

This study sought to explore the patterns of technological innovation adoption by SMEs manufacturing sector in Malaysia. The factors influencing the adoption are explored base on the DOI theory and TOE framework. The research model is constructed comprehensively with factors related with innovation characteristics (relative advantage, complexity and compatibility), technology context, organization context, and environment context. The data is analysed with structural equation modelling using SmartPLS 2.0 to examine the model.

The determinant of technological innovation adoption is influence by several factors within innovation characteristics and technology-organization-environment contexts. Among the three DOI attributes, compatibility found to be significant effect on the technological adoption, meanwhile, relative advantage are not recognized in this study and complexity are found to be not significant. This study empirically verifies and supports the applicability of TOE framework in the understanding technological innovation adoption. The TOE framework provides a good starting point for analyzing and considering suitable factors that can influence business innovation adoption decisions. This study

found that, all the TOE factors are found to be significant in this study. This study found the management awareness of National Innovation Model 2007 significant determinant the technological adoption, which were seldom explored in the prior innovation adoption research. This study empirically uses a large and representative sample which consists of several technological innovation adoption decision makers in the Malaysian manufacturing industry. Thus, the findings of this study are valuable and provide several implications for technological innovation adoption research and practice. This study has following implications for researchers and practitioners initiating on considering technological innovation adoption:-

i. For researchers: this study proposes comprehensive model that features DOI and TOE framework as determinants regard to technological innovation adoption. Apart from that, these model can be used to study other types of technological innovations.

ii. For practitioners: Top management and IS executives need to assess their technological innovation investment that will implies with the firm's compatibility in both physical infrastructure and intangible knowledge including acquisition other external knowledge.

iii. This study emphasizes that it is imperative for firms to pay as much attention to the internal technological innovation activities with their integration trading partners and government regulations.

However, this study has several limitations that also represent opportunities for future research. Since the sample is based on only one country, it may not be sufficient to generalize to the entire population of the manufacturing industry in the world. Furthermore, because the sampling frame of this study was the SMEs list manufacturing firms in Malaysia, these firms might have less resources and capabilities to be able to afford technological innovation adoption investments and risk. For this reason, the adoption rate may be lower than the technological innovation adoption rate in Malaysia or others countries. Thus, caution needs to be exercised in generalizing our findings to the entire industry population in Malaysia or others countries.

Finally, although this study focused on general technological innovation, its fail to differentiate between factors that influence each of the technological. This study is using secondary data, the variables is restricted to availability of the data. Therefore, further research can be performed on non-adopters to determine the differences in the DOI and TOE factors between adopters and non-adopters.

Study on the Applied and Innovative Personnel Training System of Universities in the New Industrial Revolution Background: A Case Study of the Automobile Engineering Specialty

Dong Nengdan, Yan Shu

School of Automotive Engineering, Wuhan University of Technology, Wuhan, P.R.China, 430070
(E-mail: kongdnd@163.com, 254157723@qq.com)

Abstract: Training applied innovative talents become an important measure of Chinese industrial revolution to seize the new opportunity. Based on the comparative analysis of the similarities and differences between academic, applied, skilled personnel training methods, combined with "old third theory(stomatology, information theory, cybernetics(SCI))" and "new third theory(theory of the dissipative structure, synergetic and catastrophe theory (DSC))", this paper explores the applied innovative talents in university and how to build systems, and make an example of automotive specialty aim at putting forward hierarchical structure and composition of elements of the applied and innovative personnel training system Then the essay discussed the mechanism design and application mechanism of the applied and innovative personnel training system under the Perspective of "flow" and "potential" visual threshold.

Key words: The New Industrial Revolution; "third theory"; Applied innovative talents; Automotive undergraduate

1 Introduction

For seizing the opportunity of the new round of industrial revolution, all countries in the world have launched to seize the world manufacturing industry at the forefront of the national strategy, for example, Germany have launched "industrial 4.0" plan, the United States have launched the "American Innovation Strategy", the Japanese have launched "Our Growth Plan: Science and Innovation in 2015", the China have launched "2025 strategy to conform to the needs of the times, therefore, a new round of technological revolution and industrial revolution and to accelerate transformation of the mode of economic development to form the historic intersection in China, Chinese Minister of industry and information Miao Wei pointed out that the biggest advantage in China is that there were a number of strong talent resources, and it's an urgent problem to solve that how to transforming talent resources into talent capital. National Conference on science and technology in 2006 pointed out that applied innovative talent training is an important strategic choice for China to build innovation oriented country, in 2007 the Ministry of education issued the documents "under the concept of popular education, the training of undergraduate level applied innovation talents should be different from the academic and research talents, and should be different from the training of skilled personnel". In 2010, "focusing on expanding the application type, compound type, skill type talent cultivation scale" is enshrined in the <National long-term reform and development plan (2010-2020)>. By 2015, the State Council approved the <Overall plan to promote the development of world - class universities and first - class disciplines>, also put forward "to strive to cultivate a sense of historical mission and social responsibility and full of innovative spirit and practical ability of all kinds of innovative type, application type, compound type talents".

At present, there is no unified concept of "Applied Creative Talents", scholars expanded research from different perspectives, Fan Hua (2006) believes that "Applied Creative Talents" is a relative research (theoretical) talent, they believed that the carrier was the application of innovative talents to make science and technology into real productivity. Zhang Xuehong (2012) believed that innovative talents were mainly based on the needs of the market, the discovery, invention, creativity could become a practice or close to practice, mainly responsible for the transformation of the application and the actual production tasks. Che Rushan (2015) thought diversity cross knowledge structure, profound professional technical ability, a strong sense of social responsibility sense, full of critical spirit and innovation consciousness research should be basic quality characterization in applied innovative talents. In this paper the author takes the automotive industry as an example, combined with the background of the new industrial revolution, to try to build a vehicle type application innovation personnel training system.

As table 1 shows, compared with the academic and technical talents, the core of automotive specialty application type talent is "used", in essence of applying what they have learned, with the

foundation which is to acquire knowledge and ability, with the object which is the social practice, with the purpose which is to meet the needs of the society, and to promote the social progress.

Table 1 Academic, Applied, Skilled Personnel Difference

Personnel types	Academic Talents	Applied Talents	Skilled personnel
Training objectives	The discipline of solid basic theory and system of professional knowledge, dispelling any of the discipline of higher level of teaching, scientific research, engineering and technology management work.	In a new generation of vehicle engineering field, especially in the field of a new generation of automotive design, manufacturing, marketing and service in scientific research, technology and product development, production engineering design, quality control and production management of senior specialized talents.	In the first line or work site for the community to seek direct interests of the work
knowledge structure	Discipline system as the standard, focusing on the systematic and theoretical knowledge of the subject.	Based on industry background, the basic theory, basic experimental skills and scientific innovative research methods of the new generation of automotive technology and engineering focus on the current, complex and interdisciplinary research methods.	Based on the professional post standard, the basic theory is built with the principle of "necessary and sufficient".
Ability Structure	Research, innovation	The comprehensive ability of using scientific theories and solving problem in practice, with stronger social skills, such as language expression ability, self-expression, team spirit, coordination, communication ability etc.	Skills of practical ability.

2 Automotive Specialty Applied Innovative Talents Training System

The third industrial revolution is wider range and greater depth of force in the world than ever, and new energy, new network, new materials is subversive to promote modern car industry to higher industry fusion, technical innovation and product replacement. The cultivation of applied innovative talents of automobile specialty cannot exist as a closed system, but it should be adapted to the social environment. The education system is a branch of the whole social system which takes teachers, students and administrative support staff as the core, and the external environment of material, energy and information exchange, dynamic and open system. Education system consists of three aspects, including the level structure, the elements and the internal operation mechanism, respectively, corresponding to the structure, elements and flow.

2.1 Hierarchy

System theory is that the system is hierarchical, and each system can be considered as a component of a larger system. The education system constitutes the three level of information associated with each other(Figure1).

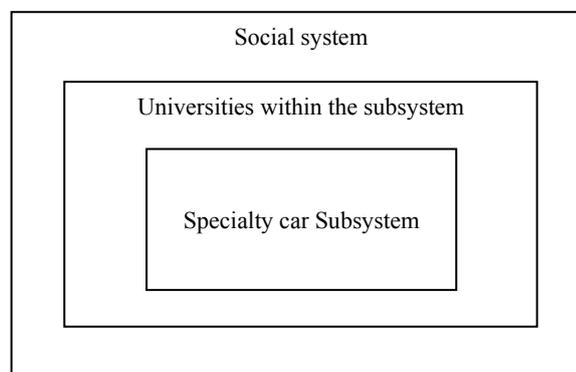

Figure 1 System Structure Of Automobile Talents Training In Universities

2.2 Constituent elements

Automotive specialty subsystem is a component of the subsystem in university. So in the composition, the object of study should be the parallel with the professional automobile components. Similarly, in the study of social systems, the object of study is the composition with the compound to the community with the university. This paper divided the composition of the system into two categories, one is the person or the composition of people, and the other is the composition besides people, but it is created and controlled by people. It is known as the resources and environment, such as equipment resources, cultural resources etc. The specific composition is shown in Figure 2.

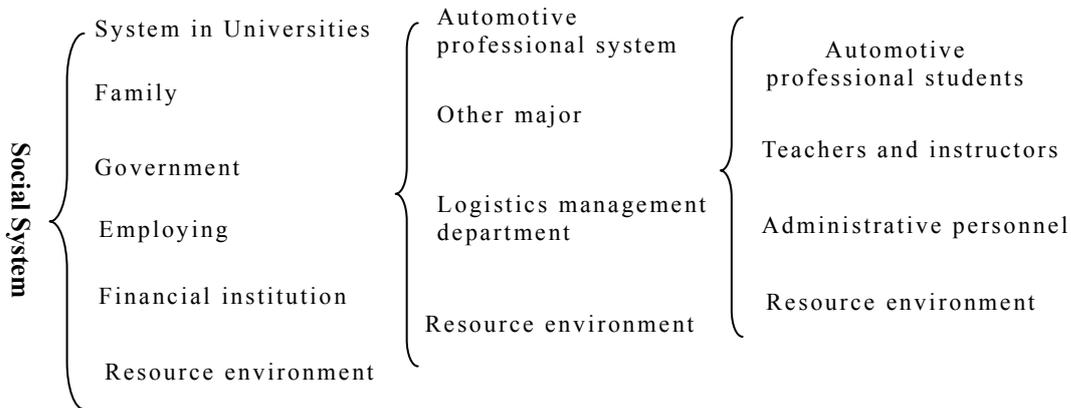

Figure 2 The Automobile Professional Talents Training System

3 “flow” Perspective Applied Innovative Talents Training System Mechanism Design

The components of the system are connected with each other through the flow, and the components of the system are influenced by the input form of the direct or indirect flow to the students of the automobile profession. Significant factors affecting personnel training is the material flow and information flow, and the material flow includes the property rights which are for the role of the physical substance of personnel training such as teaching resources, living resources, and the information flow. And information flow is divided into two categories for conducting research, one is knowledge flow which is information transmission to professional automobile individual students who will continue to maintain the original form or converted into other forms of knowledge; another is the effect of flow which is information transmission that is to affect or change the automobiles majors intrinsic behavior.

3.1 Material flow in the cultivation system of applied creative talents

1) To establish an open laboratory. The cultivation of innovative abilities of students majoring in vehicle needs through a combination of theory and practice, especially some operational skills, completed in the specific vehicle, and only the school or professional laboratory has the equipment. Therefore, schools and colleges should open the laboratory as far as possible without affecting the normal teaching and research, for the students operating the equipment in the laboratory.

2) The construction of practice base. Practice base has two forms, one is school and enterprise cooperation, another is built on campus. In specific practice, practice base can enhance students' application ability and stimulate innovation potential.

3) The establishment of innovation fund. The establishments of innovative funds support students for innovative research work in order to enhance the ability to apply knowledge and innovation in research.

3.2 Knowledge flow of application oriented innovation talents training system

The traditional way of focusing on the students' training of is a solid theoretical foundation, cultivate the way of lecturing, but in such a way, it can't adapt to the cultivation of innovative talents. This paper argues that transmission of knowledge can be carried out in the following three aspects to improve.

1) The improvement of the training system. Automotive specialty is an application of the disciplines, innovation and application of the ability should be obtained in practice, so in the training system, you can take the following methods to increase the proportion of practice:

To encourage and assist students to participate more internship related to vehicle;

In the process of engaging in the application of scientific research projects teachers can arrange for students to participate in;

Schools sets up special application research projects, tendering to students, encouraging the formation of a team of students to complete;

For graduation design, greater emphasis on practicality rather than the usual review of the current theoretical.

2) The improvement of curriculum. For automotive professional students, the curriculum teaching is still the key link of personnel training. Curriculum settings can be set as shown in Figure 3(CheRushan,2015). In addition, due to external other institutions of education, such as training courses, to offer more courses. Therefore, the school can be external courses to be incorporated into its curriculum system that allowing students to participate in external courses, after the audit, it can replace internal course or offset.

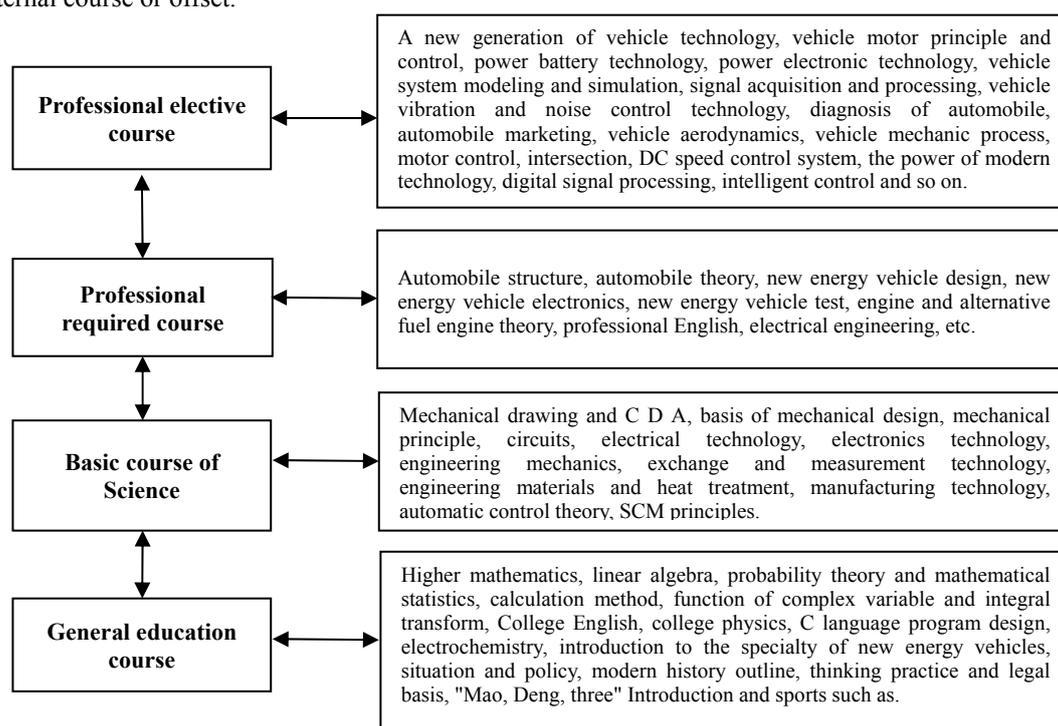

Figure 3 Curriculum Model

3) Changes of the content of the class. In the classroom, especially professional course of study, the teacher teaches how to apply professional knowledge in practice, so this not only requires teachers to pay attention to the secondary practical information, but also to practice.

3.3 The impact of application oriented innovation personnel training system

For the influence of flow, in addition to the traditional control of student daily behavior, and through the influence of the related subject in the system, students improve the consciousness and ability to innovate, which mainly includes the following four aspects:

1) The improvement of classroom teaching methods. In order to improve the students' ability to solve practical problems, the teacher takes interactive teaching, discussion teaching and heuristic teaching instead of the former teaching based on Teachers' teaching.

2) The improvement of students' assessment methods. The assessment methods includes two aspects, one is examination of the adjustment, taking the actual problem solving ability assessment instead of the traditional examination oriented to the book knowledge, including conventional problems and innovation problem; the second is evaluation system of adjustment, from the learning achievement to the comprehensive evaluation.

3) The improvement of the incentive mechanism for students. It will be the material of the incentives to the opportunity to drive, such as the better internship opportunities for the best students, etc.

4) The impact of the composition of the system on the behavior of students. This is not only the school of the composition, such as teachers, the school's cultural environment, etc., other components that affect the students, such as the family and the public, it should also be influenced by the behavior of students, so that students should establish the consciousness of innovation and application, and correct their behavior.

4 Operation Mechanism of Application Oriented Innovation Talents Training System in the Perspective of "potential"

From the dynamic perspective of theories, the synergy is close and organic coordination. The synergy principle shows that, in order to optimize a process, or to obtain some maximum benefit, the relationship between the various factors must be established. Material flow of the flow potential (referred to as logistics potential) is a demand on the material, and material flow resistance (referred to as logistics resistance) exist in the series of activities in the logistics potential (i.e. demand) which in certain conditions should be to minimize logistics resistance, namely the logistics activities were planning, organization, command, coordination, control and supervision , and make the logistics activities to achieve the best coordination and cooperation, reduce ineffective loss in the system, with the flow of material producing the corresponding energy flow and information flow. Macroscopically speaking, due to the material flow is formed by demand, so energy flow potential (potential) and information flow potential (potential) are derived from demand as the same. As shown in Figure 4, applied innovative talents system's internal driving force is "innovation type, application type, compound type talent", which is the important task of colleges and universities "two class" construction, and external driving force is the new industrial revolution which brings the upgrading of talent demand, in order to maintain the competitiveness of colleges and universities graduates, forcing changes in college personnel training mode.

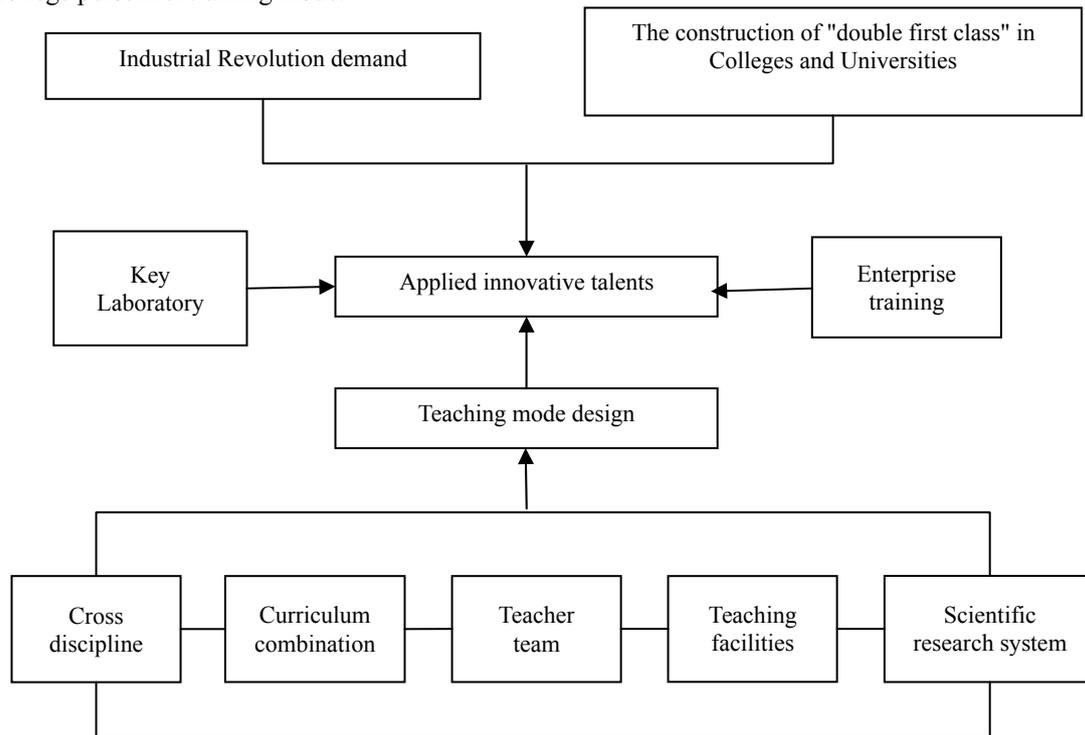

Figure 4 The Internal Operation Mechanism of the Application Type Innovation Talents Training System

Each subsystem consists of a static component with different levels and a corresponding flow to form a dynamic system, which is a MIMO multivariable system. Through the synergistic effect of 3 subsystems, the entropy (thermodynamics Entropy) is achieved for the smallest ordered structure, which makes the system achieve the global optimal result. The three subsystems of the applied innovative talents system include "Key Laboratory, corporate training, teaching mode design" three subsystems, and their objectives and tasks are "frontier research, actual technical requirements of enterprises,

interdisciplinary composite type teaching". The key laboratory is engaged in scientific research, encouraging college students to go to the laboratory to study, which not only can develop their basic scientific research ability, but also increase their knowledge of the leading edge theory. Enterprise training is a necessary part of the combination of theory and practice in university academic, through entering the university cooperation enterprise training center to practice, increasing the student's cognition to the practice, and knowing the society's demand for technology. Interdisciplinary teaching is the key link to cultivate innovative talents, belong to students, teachers and counselors, administrative personnel, logistics support and other diverse subjects, schools, colleges, departments and other multi-level structural elements of cooperation, through the combination of professional, curriculum, teaching staff, teaching facilities, scientific research system and other ways to complete the teaching mode design, to training applied innovative talents. Coordination, coordination, restriction and promotion of the three subsystems achieves the general goal of the large system based on achieving the goals and tasks of the subsystem, to achieve the optimal structure of the application of innovative talents training system.

5 Conclusions

To boost the country's industrial transformation and upgrading to achieve national economy to innovation driven transformation, applied innovative talents cultivation and transportation become an industry vitality for enterprise clusters and cluster development of a supporting element (Chang lv,2008), edition of 2009, 2011 and 2015 version of < National innovation strategy of the United States > will take innovative talent training as an important strategic initiative. It is a complicated system engineering to explore a new generation of vehicle personnel training mode, which is a complicated system engineering, and is also the practical need of the national higher education reform. Ecological system of the automobile specialty talents training is constitute of the social system, sub system in the colleges and universities and automobile professional subsystem in a hierarchical structure, the components of the system are connected with each other with material flow, knowledge flow and influence flow, By coordinating operation with three subsystems of "Key Laboratory, enterprise training and teaching mode design", taking the "double first class" construction and the industrial revolution demand as the driving force and driving force, establishing the training system of applied creative talents of automobile specialty in universities , can the university ultimately realizing the goal of the training of automotive professional application oriented innovative talents in colleges and universities.

Research of the International Market Power of China Textile and Apparel in USA Market

Zhou Hao, He Boyuan

School of Economics, Wuhan Textile University, Wuhan, P.R. China, 430073

(E-mail: zhouhaoli@163.com, hbywksrgfq@163.com)

Abstract: Textile and apparel is an important export product of China. The product with higher international market power means more profit in return. This paper selects the H61 and H62 two types of products which are the most representative in textile and apparel trade. Using the data of these two categories from 1995 to 2014, the international market power of China textile and apparel in the United States are estimated based on residual demand elasticity model, and the affecting factors were screened, then the weight ratio of various affecting factors are identified through entropy analysis method. Finally, the conclusions and corresponding suggestions are put forward.

Key words: Textile and apparel; International market power; Affecting factors; Residual demand elasticity model; Entropy analysis

1 Introduction

Annual data released by China Customs show that since 2010 the growth of China's textile and apparel exports has gradually slowed down, and decreased greatly. In the meantime, China's textile and apparel exports accounted for the proportion of the country's total exports in slow decline overall, indicating that textile and apparel trade in China's trade position has not been strengthened and its role in promoting the domestic economy has gradually weakened. According to the theory of market power, which is based on the ability of the seller monopoly price addition. Namely, higher market power will bring us more profits in return. Therefore, we need to study the international market power of China's textile and apparel to analyze the main factors and countermeasures in order to get more revenue.

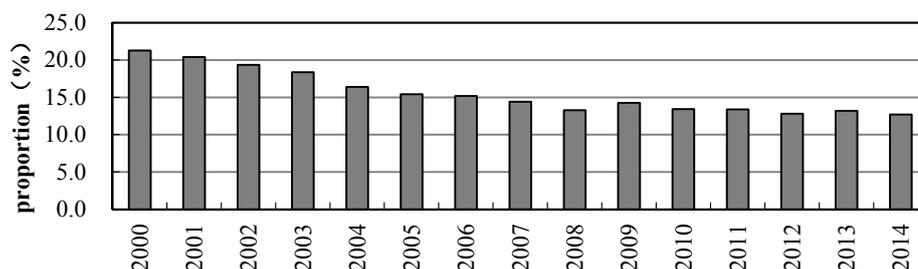

Figure 1 The Proportion of China's Textile and Apparel Exports Accounted for the Country's Total Export (2000- 2014)

Source: Data obtained from the process of the annual data released by General Administration of Customs

Sutton (1995) suggests that the market power is the capability that an enterprise or group of enterprises will continue to maintain prices above marginal cost, even if prices rise, would not lead to a big drop in sales. That is, a price bonus capability. International market power is the price bonus capability of a country in specific industries, which can affect the level of international market position and the amount of benefit of division of a country's specific industries.

In the study of market power, foreign started relatively earlier. According to the traditional theory, market concentration is one of the most important observations of market power, especially in the study from Bain (1951). Bain used CR8 model and found that the enterprise whose degree of concentration is higher will have greater profitability. Hall (1986) collected data on a large number of export products, and used the price - marginal cost model to measure market power of these products, which had attracted wide attention. Soon after Baker & Bresnahan (1988) proposed that the theory that market forces measured by the residual demand elasticity also entered the people's attention. Goldberg & Knetter (1999) refined and improved the model, and the main change is the exchange rate factor joined them. British economist Beccarello (1996) used improved Hall (1986) model to study the market power of Group of Seven manufacturing on the basis of Cost-plus ability.

There are also a number of related research in China, the studies of Wen Hu, Zeng Gang (2004) and Zhang Ye (2006) and others have pointed out the source of market power and found the multinational

corporations' control to market power. Besides, the results have a positive reference to our large-scale garment enterprises. Zhang Xiaodi, Zhu Qin (2007) considered that innovation and interaction have a prominent role in the market power oriented global value chain. Huang Xianhai, Chen Xiaohua (2007) estimated the international market power of Zhejiang Province textile and apparel, so that our theoretical studies of market power are more enriched.

2 The Setting and Measurement of International Market Power Model

2.1 The setting of international market power model

This paper selected the residual demand elasticity model of Goldberg & Knetter (1999) as the model to measure international market power, in order to analyze the international market power of China's textile and apparel.

$$P=D(Q, J, M, \varepsilon) \tag{1}$$

we take treating method of double logarithmic to Goldberg & Knetter (1999) residual demand elasticity regression model, the specific form:

$$LnP=CONST+a_1LnQ+a_2LnD+a_3LnC+a_4LnE+a_5LnW+\varepsilon \tag{2}$$

Where LnP represents natural logarithm of China's textile and apparel export price (USD/ piece); $CONST$ represents a constant term; LnQ represents natural logarithm of China's textile and apparel export quantity (pieces); Target market demand factors include the United States national income (GDP, USD amount) and the consumer price index (CPI), LnD , LnC are their natural logarithms; Cost factors of competitors use exchange rate (EX) and the inputs price index (WPI), LnE , LnW are their natural logarithms; ε is a random disturbance term.

Our goal is LnQ 's coefficient- α_1 (namely, residual demand elasticity), whose absolute value measures the relative size of the international market power of our textile and apparel industry, the greater the absolute value of α_1 , the stronger the international market power will be.

2.2 International market power model data selection and description

In this paper, the model selects the United States for target market, through the residual demand elasticity regression model estimates the size of the international market power of China's textile and apparel in the US market. The United States is a major importer of textiles and apparel, while China's textiles and apparel account for about 2/5 in its market share in recent years. Therefore, the model set the US as target market. In this paper, the model selects India as competitor for the reason that in addition to China, India is one of the most major importing countries in the US textile and apparel market. The trade data mainly comes from the United Nations UNComtrade database, specifically use statistical data of two broad categories: H61 (knit or crochet apparel and clothing accessories) and H62 (not knit or crochet apparel and clothing accessories). These two categories occupy a large proportion in our country's textile and apparel export trade over the years, approximately maintained at around 60%. As a rival, India's exchange data (Rupees per dollar equivalent form) and producer price index are derived from the IMF's IFS database and the United Nations Statistics Division; US GDP and CPI data come from the US National Bureau of Statistics and the ILO database.

2.3 International market power estimates

This article uses Eviews statistical software through the ordinary least squares (OLS) estimates the international market power of China's textile and apparel industry in the US market from 1995 to 2014

Table 1 1995-2014 the International Market Forces of China's Textile and Apparel in the US Market

years	International market power	years	International market power
1995	0.34	2005	0.37
1996	0.40	2006	0.49
1997	0.55	2007	0.51
1998	0.31	2008	0.76
1999	0.28	2009	0.92
2000	0.55	2010	0.93
2001	0.56	2011	0.92
2002	0.68	2012	0.92
2003	0.56	2013	0.91
2004	0.55	2014	0.91

By examining the regression equation on the whole showed that the US textile and apparel market is not fully competitive, indicating that China's textile and apparel export prices may partly be explained by changes in their own exports, which is meant the existence of market power. China has long occupied a market share of about 1/3 to 2/5 of the US market, high market share gives us a favorable market power in return. Compared with Italian market power in foreign countries is more than 0.8 in long-term, Prior to 2008 the international market power of China's textile and apparel industry is still a bit too small. However, the data in Table 3 show that nearly 20 years, despite the international market power of China's textile and apparel industry in the US market had the ups and downs, but on the whole continued to rise, basically in a rising trend. During 2009 to 2014, China's market forces have reached more than 0.9. It shows that in recent years, the price addition ability of China's textile and apparel export has significantly enhanced and returns has improved obviously.

3 International Market Power Influencing Factors Analysis

3.1 The sources of international market power

According to the research of the predecessors, there are several important sources of international market power.

1) Economies of scale. Economies of scale generally means an economic model, which is due to the expansion of production scale to bring the improvement of professional level and other factors, which led to reduce unit production costs as well as long-run average cost of enterprises will decline as production increases. Generally it believed that there is positive correlation between the economies of scale and market power.

2) Barriers to entry. Bain (1951) argued that the entry barriers (Barriers to entry) enables enterprises to get access to far more than normal profits without threat by other companies. Which means that when potential competitors enter into unfamiliar market will bear some extra costs and be at a disadvantage in market competition. Generally it believed that there is positive correlation between entry barriers differentiation and market power.

3) Product differentiation. Product differentiation is the company in some way to change those basically same products to convince consumers that these products are different and then have different preferences. Generally it believed that there is positive correlation between the product differentiation and market power.

3.2 An empirical analysis of influential factors

3.2.1 Model setting and influencing factors screening

Based on the consideration of the above three levels of influencing origin, this paper selected 7 variables to validate the role of these factors in China's textile and apparel international market power, respectively represented by X_1 to X_7 . Which the total textile and apparel exports to the United States, namely X_1 , is selected based on scale effect; Textile raw material purchase price index X_2 , other staff salaries X_3 , and exchange rate of RMB against USD (unit RMB equivalent in US dollars) X_4 are related to the cost element and selected based on the entry barriers, experiment and development expenditure funds X_5 , fixed assets investment X_6 , and patent filings X_7 are related to innovation and selected based on product differentiation.

The international market power in the US market S as the dependent variable to build the regression equation:

$$S = CONST + \alpha_1 L_n X_1 + \alpha_2 L_n X_2 + \alpha_3 L_n X_3 + \alpha_4 L_n X_4 + \alpha_5 L X_5 + \alpha_6 L_n X_6 + \alpha_7 L_n X_7 + \varepsilon \quad (3)$$

By using Eviews stepwise regression to take regression analysis on equation, the regression results show that the regression coefficient of some variables is not significant. Based on consideration of the degree of freedom, we remove the variable X_1 , X_2 , X_3 , X_7 , the final regression results show that significant level of variable X_4 , X_5 , X_6 is very high, all in under 1% significance level.

The regression results show that preserved three variables except X_5 is positively correlated with market power, two other variables X_4 , X_6 are negatively correlated with the market power. The fixed asset investment on the one hand will bring technological innovation- this favorable factor, on the other hand, the increase of investment will lead to the rise of production costs, particularly in the low-end, disordered, repeated investment will more easily lead to rising production costs, and this kinds of investments bring in a small number of technological advances, which has not obvious advantage in international market, therefore the regression results of variable show that the fixed asset investment does more harm than good and is negatively correlated with the international market power of textile and apparel.

Table 2 Regression Results

Variable	Coefficient	StdError	t-Statistic	Prob*
X_4 (exchange rate of RMB against USD)	-2.897193	0.654223	-4.428450	0.0004
X_5 (experiment and development expenditure funds)	0.713684	0.206287	3.459672	0.0032
X_6 (fixed assets investment)	-0.887852	0.273363	-3.247893	0.0050

F-statistic	37.56578	Durbin-Watsonstat	1.871883	
Prob(F-statistic)	0.000000			

3.2.2 Calculation of influence weight

To further understand the contribution of influence factors for the international market power, the paper continues to perform entropy analysis on X_4, X_5, X_6 to determine the specific weight. If the smaller the entropy of index is, the greater the amount of information will be provided by this index, the bigger the role ought to have in the comprehensive evaluation, the higher the weight should be.

First of all, calculate the proportion of factor “ i ” in indicator “ j ”:

$$P_{ij} = \frac{x'_{ij}}{(\sum_{i=1}^m x_{ij})(i=1,2,\dots,m; j=1,2,\dots,n)} \tag{4}$$

Entropy of indicator “ j ” calculated by the following formula:

$$e_j = -k \sum_{i=1}^m p_{ij} \ln(p_{ij}) \tag{5}$$

In equation (5), k is the proportion of factor “ i ” in indicator “ j ”; m is the number of influence factors in indicator “ j ”. $\ln(m)=2.99, k=0.33$.

Table 3 Entropy

Variable	X_4	X_5	X_6
Entropy	0.906774	0.910998	0.877767

Finally, calculate the indicators’ weight, calculating equation as follows:

$$g_j = \frac{1-e_j}{n-E_e} \tag{6}$$

Wherein, n is the number of indicators (herein relates to three variables, then $n=3$), $E_e = \sum_{j=1}^n e_j, 0 \leq g_j \leq 1, \sum_{j=1}^n g_j = 1$.

Table 4 Weight

Variable	X_4	X_5	X_6
Weight	0.3062	0.292326	0.401473

The results of entropy weight analysis show that X_4 and X_6 which are negatively correlated with the market power occupy a larger weight and add up to about 70%; X_5 which is positively correlated with market power occupy a smaller weight, accounting for about 30% of the weight. In order to further improve China’s textile and apparel market power, we should avoid weaknesses, reduce or inhibit the reverse effect of “exchange rate of RMB against USD” and “fixed asset investment” exert on the international market power and give full play to the positive impact that “experiment and development expenditure of funds” exerts on the international market power.

4 Conclusions

We conclude the following conclusions:

First of all, while China’s textile and apparel exports is still in the stage of big in amount and low in price, but there is still international power of China’s textile and apparel market in the US market.

Secondly, the international market power of China's textile and apparel in the US market has been rising and at an upward trend in past 20 years. Meanwhile, 2009-2014 the return of Chinese textile and apparel exports improved significantly.

Thirdly, there are three factors significantly impact on the international market power of China's textile and apparel in the US market, respectively are the RMB against the US dollar, experiment and development funds and fixed asset investment.

Last of all, "exchange rate of RMB against USD" and "fixed asset investment" are reverse impact on the international market power, the total influence weight is big and about 70%; "experiment and development funds" is the positive impact on the international market power and its influence weight is about 30%.

In order to maintain the sustainable development of China's textile and apparel trade and obtain the normal trade interests, we should continue to improve the international market power of China's textile and apparel. In this regard, we propose the following measures and suggestions: Firstly, control the production scale of textile and apparel, reduce the disordered and repeated investment of low-end industries and eliminate backward production capacity. Secondly, broaden the value-added channels of value chain. Thirdly, focus on technological innovation, through the combination of schools and enterprises to improve the technical conversion efficiency.

Dynamic Mechanism of Independent Innovation of Biological Industrial Cluster and Its Empirical Study

Wu Na

School of Business, Wuhan Huaxia University of Technology, Wuhan, P.R. China, 430223
(E-mail: haha0629@126.com)

Abstract: Independent innovation is the main source of cluster economic growth, and it is also the driving force of cluster development. Through the relevant literature, this paper analyzes connotation and motivation of the independent innovation biological industry cluster, and constructs the dynamic mechanism model on this basis. A case study of biolake in Wuhan, this paper analyzes its status quo independent innovation, and puts forward the corresponding countermeasures in view of the obstacle factors restricting the power of independent innovation, and the aim is to provide theoretical and practical guidance value for the sustainable development of the biological industry cluster.

Key words: Biological industry cluster; Independent innovation; Dynamic mechanism; Wuhan biolake

1 Introduction

The development of biological industry has been unprecedented attention all over the world, many countries in the area of technology, talent, capital intensive, has formed a relatively complete biomedical industry cluster, China will vigorously develop modern biotechnology as an important national strategy. According to incomplete statistics, China's bio-industrial park above the provincial level to reach more than 400 at present, the bio-industry will become a pillar industry of the national economy by 2020.

Some scholars have carried out a wealth of research on the dynamic of cluster innovation, representative views are shown as follow: Thomas Brenner (2001) used to set up a mathematical model to explore the dynamic factors for the evolution of the cluster, He believed that the memory of the cluster in seven power of innovation: cooperation between enterprises, enterprises rely on each other, the local capital market, human capital accumulation, informal communication, public opinion and local policy. Swann et al. (2002) through the example analysis method, the dynamic mechanism of cluster innovation depicted as including the interaction of dominant enterprises, new enterprises to enter, enterprise incubation increase and climate, infrastructure, and cultural capital of positive feedback system. Liu Hengjiang and Chen Jixiang (2005) described the dynamic mechanism of cluster innovation from two aspects: the excitation power and endogenous power. Motivation mechanism mainly referred to the clusters where the external environment on the cluster control and planning role, such as related policy and regulations, regional brand awareness, competitive environment; in addition to these external factors, there were some influencing factors from inside the cluster, such as complementary to the innovation of the network, the division of labor, for knowledge contribution degree, which was the impact of the fundamental factors of cluster innovation. Gao Daocai et al. (2007) argued that the independent innovation dynamic system was composed of external power, peripheral motion and driving force of three subsystems, which outer driving force was the foundation, around power was the guarantee, inner driving force was the soul of innovation activities, at the same time, they restrict and promote each other, jointly promote individuals actively engaged in innovative activities.

Previous studies showed that the independent innovation activities may not be determined by the chance of a single factor, it is determined by the interaction of various factors, such as society, economy, science and technology, culture and policy. This paper argues that the independent innovation activity of the biological industry cluster is affected by the external factors and internal factors, its independent innovation dynamic factors are composed of source dynamic factors and environmental dynamic factors.

2 Analyses on Dynamic Mechanism of Independent Innovation of Biological Industry Cluster

2.1 Source dynamic factors

Source dynamic factors, mainly refers to the existence of the biological industry cluster, which produce core power to biological industry cluster independent innovation, including the independent innovation ability of the enterprise in the biological industry cluster, the benefit pursuit of enterprise or innovation organization in the biological industry cluster, the incentive of innovation agents to generate

innovative behavior, and the power of cluster subject collaborative innovation. It directly influences formation and quality of the independent innovation of biological industrial cluster.

2.2 Environmental dynamic factors

Environmental dynamic factors, refers to the biological industry cluster as a result of external factors on its own initiative to promote the role of innovation, including the pulling power of market demand, the driving force of technology, the pressure of market competition, the government's support, the influence of other environment, For example, the macroeconomic environment, cluster regional innovation resources, social and cultural environment, talent market conditions, financial market conditions, property rights, legal system environment and market economic system, etc.. Through the interaction between the biological industry clusters, they have some influence on the formation, operation and duration of the biological industry clusters.

2.3 Dynamic mechanism of independent innovation of biological industry cluster

The dynamic factors and the environmental dynamic factors interact and influence each other; they have a huge driving force for the formation of the independent innovation of biological industry cluster, as shown in figure 1.

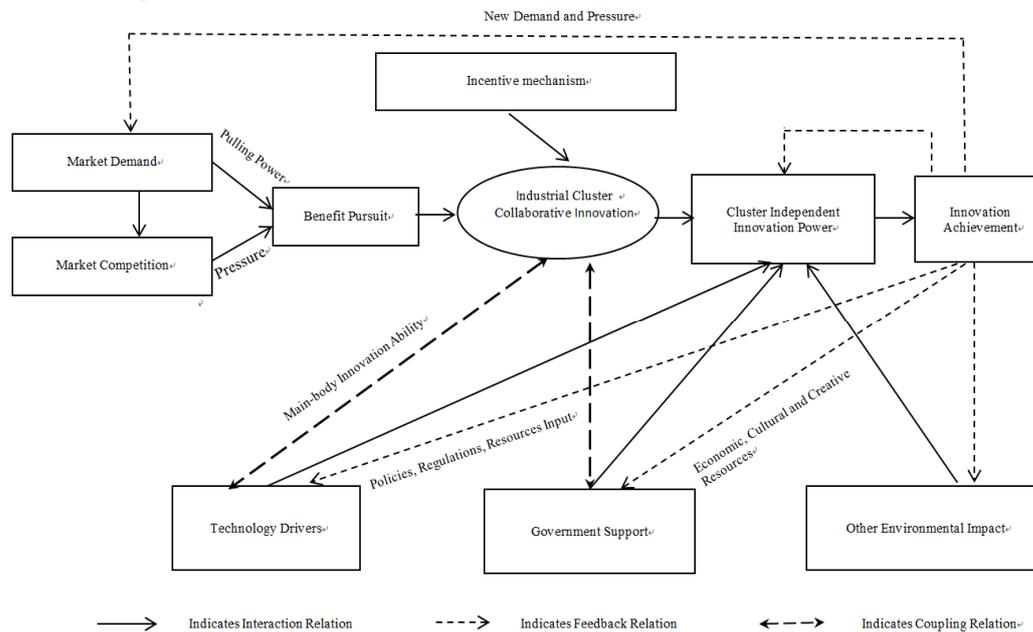

Figure 1 Biological Industry Cluster Independent Innovation Dynamic Mechanism

The pulling power of market demand and market competition pressure force the biological industry cluster to maximize the pursuit of benefit, the benefit pursuit of enterprise or innovation organization in the biological industry cluster directly or indirectly drives enterprise and innovation institution to engage in independent innovation activities. The enterprise innovation ability in the biological industry cluster is the material basis to ensure the realization of the innovation activity, scientific and technological progress is conducive to improving the ability of independent innovation of the cluster, forcing the main body of the cluster to increase R&D investment, develop new technologies and new products to meet market demand, so as to enhance the market competitiveness. However, the improvement of independent innovation ability of biological industrial cluster can promote the progress of the whole society and science and technology. The government's policies and regulations can effectively protect the biological industry cluster to complete the independent innovation activities, and the independent innovation of the biological industry cluster has promoted the improvement of the government's policies and regulations and the increase of tax revenue. Incentive mechanism can stimulate the innovation main body consciousness engaged in independent innovation, collaborative innovation of the main body of in the biological industry cluster enables the innovation resources and elements in the cluster to converge effectively, and promote the flow of talents, technology, information, capital and other factors of innovation in the main body, so that the process of independent innovation is more successful. The success of the independent innovation activities of the biological industry cluster has the promotion effect on the market, technology, government and environment, which in turn stimulates new innovation

motivation, thus forming a continuous cycle, makes independent innovation activities continued to proceed.

3 Status Quoined Pendent Innovation in Wuhan Biolake

Approved by the National Development and Reform Committee (NDRC), Wuhan Biolake is a national industrial base combining biological products research, production and logistics. Having been established for over 8 years, Biolake has gathered 6 companies from world top 500 such as Pfizer, 11 listed companies such as National Medicine Group and other over 900 biological companies. The number of scientific and technological activities has broken through 40000; the scale of industrial production grows by an average of 40% per year and industry revenue has exceeded 80 billion RMB at the end of 2015. At present, compared with the other 107 domestic biological parks, Biolake ranks second relying on its comprehensive strength.

Having introduced 168 international high-end talent teams and 10 academician projects, Biolake has gained financial support up to 180 million RMB with 16 people selected to "National 1000 Talents Program" and 11 people selected to "Hubei Provincial 100 Talents Program". The number of enterprises' patent application reaches 428, among which 186 are approved and 60 are converted into achievements. Wuhan Heathen Biotechnology Company and Hamilton Biological Company have successfully landed at "new three boards"; a number of independent development products such as recombinant human serum albumin, nano-drugs, diagnostic reagents, EPA and DHA with high purity, cell disruption system, pesticides, food testing box have successfully come into the market.

4 Obstacles of the Independent Innovation of Biolake

Although Biolake has achieved a lot during over eight-year development, some problems still exist in the motive aspect of the independent innovation, which is likely to cause a lack of stamina if not paid much attention to.

4.1 Insufficient collaborative innovation capability

The establishment of the Wuhan Institute of Biotechnology provides a platform for the cooperation of enterprises in Biolake and other innovative ones. Yet the industry-university-research collaborative innovative network in the biological industrial cluster has not formed completely, and the jointed innovative atmosphere is not active. There are 85 ordinary universities in Wuhan, among which are 7 "211 Project" universities, ranking the forefront of the country. Although the universities and enterprises have established an industry-university-research cooperation mode to build innovation laboratory, jointly develop technology innovation and develop new projects, the ability of market docking of the scientific research achievements is still not strong.

4.2 Lack of attractiveness to talents

Gathering a large number of colleges and universities, Hubei does not lack talents. According to statistics, there are over 300 thousand graduates, but among which only 1% Ph.D students, 4% master students and 11% undergraduates stay in Hubei every year. Meanwhile, universities disjoint market and industry development on cultivating. There are few new-rising subjects, few high-level research and development talents who can master the key technology and have the ability of independent innovation, and even fewer compound leaders with research and development background and operation capability, which cause an insufficient development of Biolake.

4.3 Lack of cooperation and coalition of leading enterprises

The leading enterprises have a great impact and appeal, a certain demonstration effect and guiding function on other peer enterprises in the same industry. Taking a comprehensive view of the successful development experiences of the industrial cluster in the USA, there is at least one leading enterprise that enjoys a high reputation. Such as Genentech and Chiron in Silicon Valley, Biogen in Boston, and Affymetrix in Biotechnology Bay, San Francisco.

Currently, Biolake has gathered the world's biggest pharmaceutical enterprise---Pfizer; Asia's greatest and world's third greatest genome research organization---Shenzhen BGI; the best subcontractor in Asia preclinical new drug's research and development and the world's best small molecule compound new drug's research and development enterprise---Wuxi AppTec; the best enterprise in Chinese pharmaceutical logistics industry---Sinopharm Group Company Limited; the biggest Chinese private vaccine enterprise---Changsheng Biotechnology; the leading enterprises of pharmaceutical industry in China---China National Seed Group, Grand Pharmaceutical(China), Longping High-Tech Agriculture and Wuhan Human Well Hi-tech Industry Company Limited etc. But those famous transnational

enterprises contact more with their parent company instead of making technical exchanges with local enterprises in the industrial cluster. Therefore, the participation of transnational bio-enterprises doesn't bring the diffusion of the core technology.

5 Strategies to Promote Independent Innovation in Biolake

5.1 Establishing the innovation union and creating a collaborative innovation network with enterprises dominating and industry-university-research combining

By making the most of technology and talent in universities and scientific research institutes in Hubei Province, the collaborative innovation strategic alliance in Biolake is built, through which the multiform cooperative innovation between independent innovations is achieved. The intellectual property alliance, organization and technology alliance, industrial cooperation are established on major technology projects. Grasping the trend of industrial forefront in time and developing communication and industry-university-research cooperation in international dimensions promote the cooperation between enterprises or scientific institutions in the cluster and enterprises with strong research strength in the world. By following, studying, re-innovating and other ways to improve the independent innovation capability, the international competitiveness of Biolake industrial cluster will be enhanced.

5.2 Perfecting regulation system to create favorable policy environment

As a supporter of independent innovation activities, Wuhan municipal government should do a good job of service and create favorable policy environment. Firstly, the government should reach the grass-roots level, do well in the research work, investigate and analyze the developing situation of enterprises, the status quo of independent innovation and the existing problem in the industrial cluster in Biolake. On the basis of this, effective and pointed policies can be put forward pertinently, which includes financial budget, tax policy, special fund, application of major projects, public service platform and so on. Secondly, the government should adjust and reform the policies and measures in new drugs' approval, in market management, in financial credit, in tax deduction and exemption, in facilities, in talent introduction, etc., and further optimize the independent innovation environment in Biolake. Thirdly, the government should intensify the protection of intellectual property in the biology industrial cluster. Besides, to build a good independent innovation atmosphere in Biolake, the government should formulate and perfect the laws for the intellectual property, and increase the intensity to punish whoever violates the intellectual property of others.

5.3 Promote talent gathering to form the talent pool

To become a "magnetic field" where domestic and foreign excellent talents yearn and gather, Biolake should not only attract talents but also to retain them. In order to achieve this, Biolake should continue regarding "3551" Talent Project and Yellow Crane Talent Program as carriers to intensify high-level talents introduction and bring in the leading talent teams with projects and achievements. A number of outstanding scientists and research teams, as well as technology and products with international influence in biological industry will come into being by assembling high-level talents and supporting specifically. Besides, Hubei Provincial Government should intensify the construction of biological classes in universities and strengthen the cultivation of the professional technical talents and compound talents. According to the market demand, colleges need to adjust professional structures and talent training program, and set new-rising majors concerning biotechnology, so that universities can cooperate with enterprises to establish employment practice bases.

5.4 Cultivating leading enterprises and promoting their cooperation

For the development of the whole industrial cluster's independent innovation, Biolake should focus on supporting Wuhan Human well Hi-tech Industry Company Limited, Sinopharm Group Company Limited and other pharmaceutical enterprises to cultivate the leading enterprises with independent innovation superiority by making good use of management, market, brand, talent, capital, etc., playing the leading role of independent innovation technology demonstration, product radiation, sales network and information diffusion and pulling other enterprises' promotion of innovation ability in the cluster. Besides, Biolake should also take a variety of channels, forms, levels to integrate the research strength and facilitate leading enterprises at home and abroad on projects or technology integrating or high grafting to achieve the promotion of independent innovation and the upgrading and industry expanding.

6 Conclusions

Although Wuhan Biolake has made remarkable achievements, there are still some obstacles to the driving force of independent innovation. The collaborative innovation capability of independent

innovation subject, the government support, talent depressions formed, the collaboration between the leading enterprise aspects has carried on the detailed analysis, and on this basis, this paper puts forward some effective countermeasures.

Country Characteristics and Csr Disclosure in Islamic Banks

Rochania Ayu Yunanda, Mohammed Ali Tareq, Akbariah Binti Mahdzir
Management of Technology, MJIT – UTM
(E-mail: ray@gmail.com)

Abstract: Corporate disclosure has been one of major areas discussed in accounting research. It is a tool to discharge a company's accountability and transparency. Basically, corporate information and disclosure is used to diminish the conflict of interests among stakeholders. The most accessible source providing corporate information and disclosure is published annual report. Having particular nature and objective, Islamic banking is one sector that has been growing fast in the global financial industry. Islamic bank is a making profit institution which must be in line with Shariah compliance (Islamic requirements) and has social orientation as the prime consideration. Examining 18 Islamic banks in 10 countries, this paper attempts to explore the social disclosure extent provided by Islamic banks. The data is analysed using content analysis and correlation. This study supported the previous theory that Disclosure correlates with country values regarding transparency. Unexpectedly, Disclosure has a negative correlation with Human Development Index. Although the correlation value is relatively low, it can be concluded that Disclosure has a positive correlation with the percentage of the moslem in the country. This study has provided some interesting insights into cultural influences on accounting practices. Last but not least, this study found the themes disclosed comprehensively in the annual reports. Those themes are zakah, employee right, and other community involvement.

Key words: stakeholder theory; stakeholders; shareholders; disclosure; extent

1 Islamic Banking Disclosure: A Background

Corporate Social Responsibility (CSR) disclosure refers to the degree of the information communicated by the companies. CSR is largely accepted as a good instrument which shares the information among the stakeholders. CSR disclosure provides social and environmental information (J. Gunawan,2015; S. Farook,et al ,2011). The discussion on CSR continues in almost all sectors including banking industry as it has got a particular attention after mortgage crisis in 2008(V. Hugo,et al,2015). The industry has been required to be more responsible for the society(M. I. Jizi,et al,2014). Disclosing CSR information shows that the industry complies with the regulation and (B. FASTERLING,2012) and provides a moral responsibility of the company (M. Carina,et al,2014)and compliance with legal requirements(A. Hassan,et al,2010).

Islamic banking part of banking industry has been growing fast in the global financial industry (S. Farook,et al ,2011; R. Ghayad,2008; M. Asutayet al,2015). According to the World Bank Report 2015, the growth of Islamic banking assets is higher than conventional counterpart and it plays the role in enhancing society welfare. The development of Islamic banking industry initiates a few researchers to address the matter of CSR disclosure in Islamic banks. They found that many studies explored corporate reporting of Islamic banks in normative and analytical ways (S. Farook,et al ,2011) and empirical analysis is quite rare in the area of Islamic banking industry (R. Haniffa,et al,2007). Some past studies proposed different disclosure patterns for Islamic banks (S. H. Ibrahim,et al,2008; R. Haniffa,et al,2007; M. Rashid,et al,2013). Haniffa and Hudaib (2007) developed ethical identity benchmark for Islamic banks. The banks should provide ideally ethical and social communicative information to all stakeholders.

It is found that CSR disclosure vary among countries (V. Hugo,et al,2015; S. Chanchani,et al,2004; T. Khanna,et al,2004). It proves that culture and country affect the disclosure practice. especially when the countries have weak investment regulations and board governance (H. Jo,et al,2016). These studies are in line with the idea of Gray's cultural accounting framework stating that accountants' decision on reporting is influenced by their cultural values(S. J. Gray,1983). Accounting has been growing in different cultural context; particular values must have been embedded in accounting itself. Hofstede (2001) suggests that the more judgment an activity requires, the more it is ruled by values and thus influenced by cultural differences. He suggests that accounting decision and its implementation must vary along cultural differences(G. T. Tsakumis,2007).

Different countries have different human development which is measured by Human Development Index. Human Development Index (HDI) is a compound indicator comprising educational factors, life expectancy and GNI (Gross National Income). The higher index shows the better human development in a country (V. Hugo,et al,2015; P. J. Reed,et al,2016). Besides that, the number of particular people influence

the level of CSR activity (T. H. Abbasi, et al, 2012). The higher the ratio of moslem population in a country inclines to demand for more detailed information provided by Islamic banks (S. Farook, et al ,2011) Islamic banks in moslem majority countries are estimated to disclose more information (Wan, et al, 2013).

This study attempts to explore the disclosure extent provided by Islamic banks. More specifically, the focus of this study is more on social disclosure because the Islamic banks claim to have more social responsibilities as compared to the counterpart conventional banks. This study is expected to contribute towards the existing literature Islamic banking disclosure in different countries. Furthermore, this paper highlights the influence of country values on the disclosure level. The rest of the paper is organised as follows. The next section provides the literature review discussing on the disclosure practices in Islamic banks and country characteristics. The next section focuses on data collection and analysis followed by the result analysis and discussion. The last session concludes this study.

2 Literature Review

2.1 Disclosure practice in Islamic bank

Discussion on disclosure has been still going on since some researchers divided it into mandatory and voluntary disclosure (M. J. Fishman, et al, 2003; G. S. Miller, 2002). Mandatory disclosure refers to the extent of information obligatory and regulatory required. Voluntary disclosure denotes the information voluntarily published by the companies. Many empirical studies concluded that voluntary disclosure has a positive impact and financial effect on the companies (S. J. Gray, 1983; Z. Embong, 2014; H. Nobanee, et al, 2015). Companies with broader disclosures will generate more financial benefits (Y. Qiu, et al, 2016).

Previous studies examined the extent voluntary disclosure in different sides. Hugo & Simão (2015) conducts a study on corporate social disclosure themes in banking sector. One recent work in banking industry studies 24 corporate disclosure themes in environmental and energy (H. Nobanee, et al, 2015). Another study focuses on measuring the disclosure based on each stakeholder's social benefits (A. Khan, et al, 2013; Z. Ali, et al, 2010). The other study scrutinizes the disclosure on other aspects including environmental, social, health and safety (J. D. Mahadeo, et al, 2011). Corporate disclosure may also emphasis on compliance disclosure (B. FASTERLING, 2012).

The growing Islamic banking industry has raised academic interests in exploring disclosure practice in the industry. Maali et al. (2006) could be the pioneer in proposing the disclosure benchmark for Islamic banks. They proposed the expected disclosure in the industry which has been developed and modified by other researchers. The disclosure has also been extended to other aspects of disclosure (S. H. Ibrahim, et al, 2008; S. Farook, et al , 2011; A. Hassan, et al, 2010; R. Haniffa, et al, 2007; M. Rashid, et al, 2013). In general, the disclosure should cover the following items:

- a. Shariah statement – Shariah compliance
- b. Islamically unlawful transaction (haram) – Shariah compliance
- c. Zakah - Social
- d. Qard Hassan (benevolent charity) - Social
- e. Charity - Social
- f. Social activities and expenditures
- g. Employees' rights and welfare
- h. Treatment for bankrupt clients
- i. Environmental activities and expenditures
- j. Other aspects of community development and involvement

Haniffa & Hudaib (2007) proposed "ethical identities". Subsequently, this ethical identity concept was modified by the other researchers (M. Rashid, et al, 2013; P. Mia, et al, 2009). Basically, Haniffa & Hudaib categorize the disclosure into eight dimension namely visionary objectives and missions, BOD structure and top management formation, products and services, zakah and charitable funds, commitment towards employees, commitment towards debtors, commitment towards customers, and Shariah Supervisory Board structure and competence. Another study proposed "Islamicity disclosure" consisting of Shariah compliance assessment, corporate governance evaluation and social/environment performance (S. H. Ibrahim, et al, 2008).

2.2 Country characteristics

Gray's work in 1983 was a pioneering paper contributing the idea that culture might affect accounting practice (Chanchani, Willett, 2004). He proposed some hypotheses derived from Hofstede's work in 1980. Hofstede categorized and grouped the countries based on cultural characteristics. Gray

attempts to see the possibility of cultural values influences accounting practices (S. J. Gray, 1983). Gray came up with four hypotheses regarding the issues on measurement and disclosure practices in diverse nations.

Firstly, a country with high level of individualism, weak uncertainty avoidance and low power distance tends to have high level of professionalism. Secondly, a country with strong uncertainty avoidance and large power distance but low level of individualism is more likely to have high uniformity. Thirdly, the higher a country ranks in term of uncertainty avoidance and the lower it ranks in terms of individualism and masculinity, the more likely it is to be more conservative. Lastly, a country with higher uncertainty avoidance and power distance and lower level of individualism and masculinity tends to have higher level of secrecy. High level of secrecy indicates the tendency to disclose less information (R. Orij, 2010).

Some studies also found that Human Development Index in different geographical areas affect the distribution of information (V. Hugo, et al, 2015; P. J. Reed, et al, 2016; S. S. Ali, et al, 2014). Human Development Index (HDI) was created to show that the development of a country is also determined by the people and their capabilities. The HDI can also refer to the national policy and government priorities, because two countries with similar Gross National Income can end up with different human development results. The Human Development Index (HDI) is published yearly by the United Nations. It is a summary measure of some human development measurements comprising a long and healthy life, educational level of the people, a standard of living.

A number of countries in one region have differences with regards to disclosure, it is proven by a study in Arabian countries (S. Askary, et al, 2008). Social and political condition may affect the need of particular society interest and distribution of information. The percentage of the moslem population can be considered as a proxy for the Islamic society which could affect the extent of disclosures (S. Farook, et al, 2011). According to Farook et al. (2011) the extent of Islamic bank's CSR disclosures depends on the power of the proportion of particular population who affect the activities of Islamic banks.

3 Research Methodology

This is a descriptive study. By using content analysis approach, this study examines the annual reports of 18 Islamic banks year of 2014 in 8 countries. This study scrutinizes the depth of social disclosure based on the comprehensiveness. Several past studies gave score 1 if the information related to a particular social disclosure was provided, and 0 if there was no information (S. Farook, et al, 2011; B. Maali, et al, 2006). However, this study adopts the disclosure score ranging from 1 to 5 (V. Hugo, et al, 2015). The disclosure level is evaluated with 1, "None"; 2, "Minimum"; 3, "General"; 4, "Detailed"; 5, "Very detailed", respectively, for each one of the disclosure themes. The operationalization of the variables is tabulated as follows:

Table 1 Operationalization of Variables

MAIN VARIABLES	VARIABLES	PROXY	MEASUREMENT
DISCLOSURE	Disclosure	Social disclosure level: a. Zakah b. Qard Hassan (benevolent charity) c. Charity d. Social activities and expenditures e. Employees' rights and welfare f. Treatment for bankrupt clients g. Environmental activities and expenditures h. Other aspects of community development and involvement	1 = None 2 = Minimum 3 = General 4 = Detailed 5 = Very detailed"
COUNTRY CHARACTERISTICS	Moslem population	The percentage of moslem population in the country	Percentage

	Country Value	Country ranks (Hofstede, 1983; Gray, 1988) Uncertainty avoidance and power distance (Hofstede, 1983) relates to transparency	Country Rank
	Human Development	Human Development Index issued by United Nations.	Index

4 Analysis and Discussion

The descriptive of the data is shown in the following table.

Table 2 Descriptive Statistics

Disclosure		Uncertainty Avoidance		Power Distance		Human Development Index		Moslem Population	
Mean	21	Mean	62.00	Mean	77.67	Mean	0.74	Mean	85.27
Minimum	11	Minimum	36	Minimum	55	Minimum	0.538	Minimum	61.4
Maximum	35	Maximum	85	Maximum	104	Maximum	0.85	Maximum	99.7
Count	18	Count	18	Count	18	Count	18	Count	18

This study examines 18 Islamic banks in 10 countries. It classifies the social disclosure into eight themes. The higher disclosure score is 35 and the lowest is 11. According to the above table, it can be concluded that the data range of each variable is relatively wide. It can be seen from the minimum and maximum value of the data. Uncertainty avoidance and power distance indices shows the tendency of each country to provide the information transparently. The higher the index shows the higher secrecy or the less transparency. In contrary, the higher the Human Development Index should trigger the country to provide more transparent information. The more moslem population in a country is expected to demand for more detailed information provided by Islamic banks.

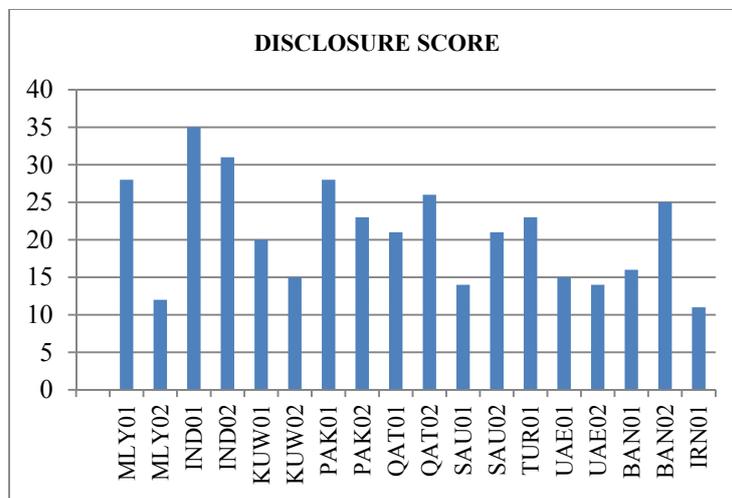

Figure 1 Disclosure Score

The above histogram depicts the disclosure score of the sample banks. For more detail, the score is described in the following figure:

Mostly, all banks disclose zakah information, employee right, and other community involvement clearly and broadly in the annual reports. However, there is no detail information on how the banks deal with non-performance loan (financing) due to insolvent customers. Besides that, a number of banks do not disclose qard fund comprehensively.

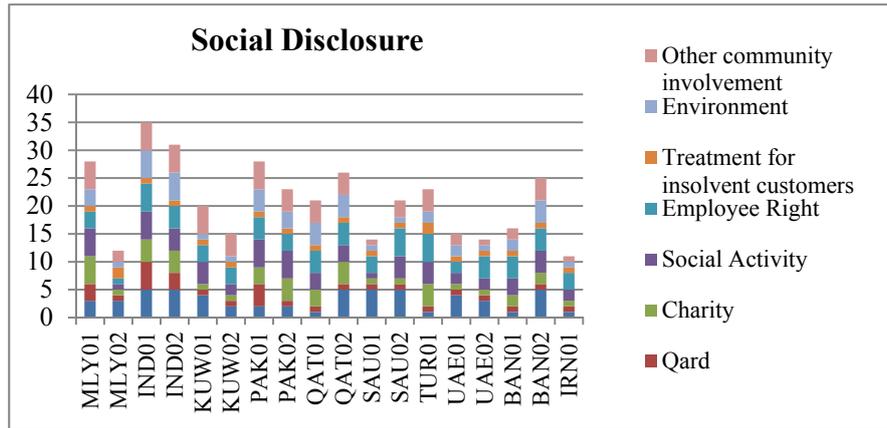

Figure 2 Social Disclosure

Table 3 Correlation

	Disclosure	Uncertainty Avoidance	Power Distance	HDI	Moslem Population
Disclosure	1				
Uncertainty Avoidance	-0.1786	1			
Power Distance	-0.0824	-0.6495	1		
HDI	-0.3839	0.0786	0.4415	1	
Moslem Population	0.0478	0.6237	-0.8335	-0.3176	1

A country with higher uncertainty avoidance and power distance and lower level of individualism and masculinity tends to have lower level of transparency. In the case of Islamic banks, it is proven that Disclosure has negative relationships with both Uncertainty Avoidance and Power Distance. Surprisingly, Disclosure has a negative relationship with Human Development Index. Lastly, although the correlation value is relatively low, it can be seen that Disclosure has a positive correlation with the number of the moslem in the country.

5 Conclusions

Culture and country characteristics have a powerful influence underlying human behavior and social values, and its impact on accounting practices cannot be underestimated. Different characteristics within national boundaries have the potential to endorse and sustain significant differences in accounting practices. Gray (1983) introduced four hypothesis linking relationships between Hofstede’s cultural dimensions and accounting value dimensions. However, Gray did not conduct empirical tests to support his framework; rather this has been left to other accounting researches to prove its validity. Reexamining Gray’s hypotheses can be very valuable to further prove the impact of culture on accounting.

This study has provided some interesting insights into cultural influences on accounting practices. The differences among countries and nations have contributed towards different disclosure practices. The study found that majority of the banks provide comprehensive information on zakah, employee right, and other community involvement. However, there is no detail information regarding qard fund and non-performance loan (financing) due to insolvent customers.

Critical Success Factors of Food and Beverages Manufacturing Small and Medium-Sized Enterprises: A Case Study Approach

Lee Chun Hui, Yee Choy Leong

Department of Management and Marketing, Faculty of Economics and Management,
University Putra Malaysia, 43400 Serdang, Selangor, Malaysia
(E-mail: chchunhui@gmail.com, yee@upm.edu.my)

Abstract: This research aims to explore and understand critical success factors (CSF) of small and medium-sized enterprises (SMEs) in food and beverage (F&B) manufacturing industry. This research focuses on food and beverage industry (F&B) because F&B manufacturing SMEs play a significant role in a country's economies. However, these SMEs face multiple challenges to gain competitiveness in the marketplace. This research employed multiple case study method and has conducted in-depth interviews with 8 SMEs owners and top management. It has identified 16 CSFs that influence the success of the F&B manufacturing SMEs. Among all, are business strategy, networking, foreign worker management, attractive product packaging, innovation, family capital, business experience, online visibility, access to finance, entrepreneurial orientation, professional management team, effective food safety system, effective quality management system, halal certification, entrepreneurial competencies and supply chain management. The study provides useful guidelines for business owners of SMEs and lays foundation for future research work.

Key words: Critical success factors; Food and beverages manufacturing; SME; Strategic management

1 Introduction

Strategic management is one of the areas of business economics that focus on helping firms to operate successfully and sustain competitive advantage (Breznik & Hisrich, 2014). The market-based views focus on industry effects in explaining variances in firm performance (McGahan & Porter, 1997) while on the other hand the resource-based views focus on individual firm effects on the performance (Barney, 1986, 1991). Nevertheless, the quest for best strategic practices remained as globalization has tremendously reduced the average period which business firms are able to sustain their competitiveness (Wiggins & Ruefli, 2005).

This research focuses on the strategic management of small and medium-sized enterprises (SMEs) in food and beverage (F&B) manufacturing industry. First of all, F&B industry is transformed by globalization into a borderless and complex interconnected system in which firm source materials and distributing products around the globe (Trienekens & Zuurbier, 2008). The F&B manufacturers especially SMEs hence face threefold of challenges. With availability of choices and alternatives, consumers are now become increasingly demanding and concerned about the quality and safety of food (Bigliardi & Galati, 2013). Both national and international governments also imposing stricter legislation and regulations to ensure safe production, restricted pollution and prevent excessive wastes. For instance, all F&B manufacturers in Malaysia are governed by Food Act 1983, Food Regulations 1985, and Trade Descriptions Act 2011, additionally Malaysia Protocol for Halal Meat and Poultry Productions 2011 and Malaysian Standard MS 1500:2009 Halal Food – Production, Preparation, Handling and Storage – General Guidelines (Second Revision) for those manufacturers with Halal certifications. For food exporters, they are further required to follow on the foreign countries' rules and regulations. The survivability of F&B manufacturers hence heavily depends on their quality and safety control (Trienekens & Zuurbier, 2008). Furthermore, the phenomenon of globe as a marketplace is especially evident in the F&B sector (Bigliardi & Galati, 2013; Trienekens & Zuurbier, 2008), manufacturers regardless of domestic or foreign owned and sizes compete with one and another. All in all, SMEs are required to meet not only the same set of food safety and quality standards, but also the constantly switching consumer demands and preferences only with lesser resources as compared to the large corporations. Provided the aforementioned stringent conditions to survive in the market, yet limited research explore on the strategic management of F&B manufacturers particularly on SME, as certain F&B manufacturing SMEs still manage to achieve high growth rate consistently over the years and become successful. In addition, SMEs especially in manufacturing industry are important contributors to the world economic and social development (Ayyagari et al. 2011).

Therefore, the research aim is to continue the discussions on manufacturing SME strategic

management and develop the understanding on SME business success (Ayyagari et al. 2011) through the theoretical lens of critical success factors (CSF). So, the critical questions of this paper are: what are the critical success factors of food and beverages manufacturing SMEs? What and how do SMEs do in these factors? How these factors lead the SMEs to success?

The paper's novelty relies on some crucial elements. First, the strategic management has generally study manufacturing industry as a whole and only limited studies has focus on food and beverage manufacturing industry and none to our knowledge has focus on the Malaysia food and beverages manufacturing SMEs. This would result relevant and important insights for entrepreneurs and managers, as it may clearly point out if and how specific factors are able to lead the F&B SMEs gaining advantages over competition. Second, study on critical success factors from a holistic perspective is rare. This would represent, in turn, a solid basis for the development of most effective strategies and policies on the ground. Thirdly, by using the critical success factors theoretical lens to understand the F&B industry in which may offers a unique opportunity to provide empirical evidences of the importance of certain policy measures or systems thus for the promotion of future food policies for manufacturing SMEs. Even though we acknowledge that the results of this study cannot be generalized for all countries and industrial contexts, the findings represent a good basis for further investigation and research in industry.

The remaining of the paper has been structured as follows: in Section 2, a literature review on the main theory supporting present research which is critical success factors theory and explain on how the present research aims to identify CSFs and seeking to extend the theory of critical success factors to strategic management of SMEs in general and more specifically in food and beverage manufacturing industry. Section 3 is devoted to describe the research methods and the sample involved in the investigation. Section 4 will present the findings and analysis of the study. Next, the discussions are presented. Finally, insights are extrapolated from the findings providing the basis for conclusions and implications for managers and recommendations for further research.

2 Literature Review

2.1 Critical success factors theory

The theory of critical success factors (CSF) has its foundation within management information planning (Daniel, 1961; Rockart, 1979). CSF referred as “three to six factors that determine success... must be done exceedingly well for a company to be successful...” (Daniel, 1961, p.111) or more commonly cited as “the limited number of areas in which results, if they are satisfactory, will ensure successful competitive performance for the organization” (Rockart, 1979, p.85). Strategic scholars then adapted the concept in strategy research (De Vasconcellos et al. 1989; Jenster, 1987; Leidecker & Bruno, 1984). CSF approach in strategic research allows the identification of CSF to achieve organizational target (Leidecker & Bruno, 1984) as well as enable a clear causal relationship between factors and target outcomes to be deducted (Kaplan & Norton, 1996). The measure of success is crucial in identifying the critical success factors of an SME (Watson, 2003). As our research focus on highly competitive F&B manufacturers, success is perceived achieved when SME able to experience positive business growth consistently within a period of 3 years. Business growth is an important business success dimension among Malaysian SME owner-managers (Ahmad et al., 2011). Thus we would explore on F&B manufacturing SMEs which achieve positive business growth for consecutive three years and identify critical factors that contribute to their success.

The next subsection presents literature review on the potential success factors of F&B manufacturing SMEs. With relatively less researchers has focus on the F&B manufacturing SMEs, first we present the common CSF we drew from entrepreneurship, small business and strategic management literature, then from the F&B literature, we identify specific elements of the industry such as food safety, quality management systems and supply chain management that may affect firm success.

2.2 Critical success factors of food and beverages manufacturing SMEs

2.2.1 Common critical success factors among SMEs

1) Entrepreneurial competencies

Entrepreneurs establish their own SME and spearheaded major decision makings. Thus, their characteristics substantially affect their ventures (Van Praag, 1999). In entrepreneurship literature, specific group of competencies related to successful entrepreneurship are identified and referred as entrepreneurial competencies (Mitchelmore & Rowley, 2010). In entrepreneurship and SME research, the personal competencies are often cited as most influential factors to firm performance which include

demographic characteristics (Cowling et al. 2015), personal background and experience (Murray, 1996), education background (Basu & Goswami, 1999), personalities (Martin & Staines, 1994), skills and abilities (Gasse & d' Amboise, 1997).

2) Business experience

Another common investigated variable in entrepreneurship literature is the entrepreneur business experience (Brüderl et al. 1992; Shane & Stuart, 2002; Unger et al., 2011). The business experience can be differentiate into managerial and industry experience (Dencker & Gruber, 2015). Entrepreneurs gain managerial experience or in-general know-how of business operation through involving and understanding the business routines and consistently observing, studying, and making business decisions (Cooper et al., 1994). On the other hand, entrepreneur prior experience in the industry of his venture is known as industry experience (Gimeno et al., 1997). Both managerial and industry experience have been demonstrated positive effects on firm performance (Brüderl et al. 1992; Cooper et al., 1994), however other researchers have failed to identify a significant causal links between business experience and performance (Chandler, 1996 ; Kalleberg & Leicht, 1991; Stuart & Abetti, 1990).

3) Family capital

Entrepreneurship and small business literature particularly the family business literature has placed significant emphasis on the family capital (Dyer et al., 2014). Family capital here covers three distinctive forms of resources namely human, social and financial capital that entrepreneurs acquired from the family affiliations (Danes et al., 2009; Dyer et al., 2014). Furthermore, the family capital served as important resources to SME with four distinct advantages inclusive of difficulty to be imitate, high mobilization, low transaction costs and transferrable across generations (Hoffman et al., 2006).

Families may generate human capital from two ways. Firstly, families who own businesses may pass their knowledge of operating and managing business to the family members particularly next generations (Dyer et al., 2014). In fact, research has supported that entrepreneurs worked with family business performed better compare to those who do not (Fairlie & Robb, 2008) Alternatively, research indicate family members can also become employees of the business in which they generally perform better than employees with no family connections due to the social and emotional attachment (Herrero, 2011).

In term of social capital, the family members may have some unique advantages in developing long term relationship with their family's stakeholders (e.g., friends, clients, business associates, community leaders, etc.) that provide the members of that family access to important resources in starting a business because such relationships are difficult for potential competitors to replicate (Dyer & Singh, 1998). Furthermore, these family social capitals are generally stronger and have greater power influence due to the commitments made by families across generations (Danes et al., 2009; Ermisch et al., 2012; Zellweger et al., 2012).

Lastly, as access to financial capital is generally an important limiting factor for business start-ups (Fairlie & Robb, 2008), family may serve as an important source of finance. For instance, (Sirmon & Hitt, 2003) pointed out several important roles of the pooled financial capital of the family in providing the firm a competitive advantage compared with those firms without access to such capital. Firstly, it helps sustain the business during poor economic times. Secondly, they can also assist family members in finding capital to launch new ventures.

4) Access to finance

Finance has been important elements for business firms seeking growth and investment opportunities (Beck et al., 2005), active involving in innovations (Beck & Demircuc-Kunt, 2006; Mazzucato, 2013) and creation of a new venture (Evans & Jovanovic, 1989). When SME has limited access to finance, for instance inability to borrow from banks, it face credit constraints (Blanchflower & Oswald, 1998) which may further lead to capital constraints, the situations in which a firm was prevented from funding the desired investments to and even forced to forgo investments that they made (Lamont et al., 2001). Capital constraints can hinder SME growth (Evans & Jovanovic, 1989; Mazzucato, 2013) and entrepreneurs with lower capital constraints were found more likely to survive (Cheng et al., 2014). The literature has found important of finance-seeking and management skills (Holtz-Eakin et al., 1994) and ways to lower capital constraints (Lamont et al., 2011) important to support SME business development.

5) Entrepreneurial orientation

Entrepreneurial orientation (EO), or commonly regarded as firm-level entrepreneurship (Petersen & Rajan, 2002) is refer as "processes, practices, and decision-making activities that lead to new entry"

(Covin & Wales, 2012) or in general the specific manner in which firms act upon opportunities (Lumpkin & Dess, 1996). The common dimensions associated with EO including proactiveness, innovativeness, and risk-taking (Lumpkin & Dess, 1996; Miller, 1983).

Proactiveness reflects the process of “seeking new opportunities which may or may not be related to the present line of operations, introduction of new products and brands ahead of competition, and strategically eliminating operations which are in the declining stages of life cycle” (Lumpkin & Dess, 1996) which allow firms to identify and seize opportunities and gain high profit (Miller, 1983).

Innovativeness refers to the tendency to “engage in and support new ideas, novelty, experimentation, and creative processes that may result in new products, services, or technological processes” (Covin & Wales, 2012). It facilitates the use of new approaches to seize opportunities brought about by changes in external environment (Miller, 1983).

Risk-taking implies a willingness to commit resources to projects with high failure rates and unknown outcomes (Miller, 1983). It enables new ventures to conduct risk-taking behaviors in the interest of obtaining high returns (Lumpkin & Dess, 1996) and it contributes to embarking on proactive and innovative initiatives to alter the competitive landscape of the market (Miller, 1983).

As EO has been extensively studied in the entrepreneurship literature, its impacts on firm performance however are not unequivocally strong. Firstly, EO was found insufficient for wealth creation for ventures (Wiklund & Shepherd, 2005). Furthermore, the positive correlation between EO and firm performance were reported most in studies on developed countries in which the same were not found in emerging economies (Rauch et al. 2009). This lead to the argument in which the impacts of EO on firm performance is subject to constraints faced by firms operating in different contexts (Rauch et al. 2009; Wang, 2008).

6) Network

Entrepreneur and businesses are social enactments and hence fundamentally associated with networking (Hill et al., 1999; Lumpkin & Dess, 2001). Furthermore, SMEs are more prone to resource constraints as compared to large firm, network become important as a mean for SMEs to access resources (Hill et al., 1999). The empirical evidences have shown that networks are important mean to extend the potential resource base of the entrepreneur (Jack et al., 2010), improve the possibilities of success (Brüderl & Preisendörfer, 1998; Shaw, 2006) and indeed, increase venture survival (Jack & Anderson, 2002).

7) Competitive strategy

A competitive strategy explores how a firm operates (Huggins, 2000) and competes within its industry (Schendel & Hofer, 1979). Porter’s competitive strategies framework (Parnell, 2008) is most widely accepted in strategic management literature (Porter, 1980). According to Porter’s (Parnell, 2008) framework, a business can pursue superior performance by either cost leadership or differentiation strategy. Cost leadership generally based on process innovation, learning curve benefits, economies of scale and efficient manufacturing design (Allen et al., 2006; Chaganti et al., 2002; Porter, 1980) in which proven to be successful strategy especially among firms who enter the industry late and able to sustain low-cost designs (Grant, 1998). On the other hand, differentiation aims to create superior and unique value either through product design, quality, range and type of features or after-sales support (Allen et al. 2006; Chaganti et al., 2002; Porter, 1980) as a mean for SME to compete with larger firms (Grant, 1998).

Although some scholars argued that businesses successfully combining the two may create synergies that overcome any tradeoffs that may be associated with the combination (Lechner & Gudmundsson, 2014; Parnell, 1997), it has shown inferior results (Chan & Wong, 1999). Nevertheless, it is anticipated that development of one effective strategy, either cost leadership, product differentiation or combination of both strategy is essential for the performance of small firms (Thornhill & Amit, 2003; Thornhill & White, 2007).

8) Professional management team

As SME develops, it transitions from individual entrepreneurs to the formation of professional management team for further development and expansion (Parnell, 2011). Previous research also highlighted the roles of managers in mediating the relationship between resources and firm performances (Casson & Della Giusta, 2007). Additionally, Sirmon, Hitt, Arregle, and Campbell (2010) show that managers’ actions must simultaneously address capability strengths and weaknesses in order to realize a competitive advantage.

2.2.2 Critical success factors in F&B context

1) Effective food safety systems (FSS)

As the consumers have increasingly concerned with food safety issues, alongside with legislative enforcements, food companies would need to ensure food safety and avoid product failures, safety and health problems, customer complaints and failure costs (Van der Spiegel, 2005). Food safety systems (FSS) have hence frequently implemented by food and beverages company (Kafetzopoulos & Gotzamani, 2014) for instance the Hazard Analysis of Critical Control Points (HACCP). Nevertheless, researchers have found that all FSS does not guarantee food safe, rather it is the effective implementation of the food safety systems that prevent food borne diseases and reducing food safety risks to an acceptable level (Kafetzopoulos et al., 2013; K ok, 2009) and thus contribute to the business performance (Kafetzopoulos & Gotzamani, 2014).

2) Quality management systems

As food quality food products were found to be highly inconsistent due to process variability and the nature of their perishability (Gauri, 2003; Pable et al., 2010) and depends heavily on the factors in production processes (Orr, 1999), quality control (QC) and hence Quality Management Systems (QMS) are crucial elements in food manufacturing industries (Oliver, 2009; Paiva, 2013). Quality control is carried out by inspecting quality of final products which is commonly incorporated under QMS and focus on monitoring and controlling of quality of day-to-day operations (Paiva, 2013).

In spite of the limitations, the food manufacturing industry generally impose statistical process control (SPC) as a required effective control techniques for reducing non-conforming products by the quality management systems and food safety systems (Hubbard, 1999) which were found useful in defective products' reduction, food safety management improvement, and cost savings improvement (Abdul Halim Lim et al., 2015).

The previous research also highlight that the quality management system are able to enhance competitiveness of a company in the long run (Anderson et al., 1994). In fact, most food and beverage companies would combine both QMS and FSS to assure the quality of the products (Kafetzopoulos & Gotzamani, 2014).

3) Supply chain management

Supply chain (SC) refers to the chain of organizations composed by those involved in fulfilling a customer's order that may be covering from suppliers' supplier to customer's customer and beyond (Chopra & Meindl, 2007). Supply chain management (SCM) enables organizations to manage the whole SC as single process with a common goal (Rashid & Haris Aslam, 2012). Previous research has found that the SCM is an effective strategic tool to increase firm competitiveness, business stability, and revenue growth (Gunasekaran et al., 2008; Ou et al., 2010) and reduce operation cost (Simchi-Levi et al., 1999). In spite of the benefits of SCM, there are very few researches explore SCM from the standpoint of SMEs food and beverages manufacturers (Ruteri & Xu, 2011).

Moreover, there is an emerging trend in the study of quality management (QM) from SC perspective termed as "supply chain quality management." in the recent years (Kuei, et al., 2011; Rashid & Haris Aslam, 2012; Zhang, et al., 2011) in which the literature suggested that SCM and QM efforts improve each other's performance and integration between the two functions can be beneficial for an organization in many ways (Foster Jr, & Ogden, 2008).

4) Innovation

Food manufacturing industry is often classified as mature and traditional industry characterized by little investment in R&D and low-tech intensive (Triguero et al., 2013). However, previous research have found that the firm's return and growth depend on the innovation capability (Rama et al., 2003) as it allows firms to maintain better process controls, exploit economies of scale, and guarantee food safety, variety, and quality (Traill & Meulenberg, 2002). In addition, changing in consumer demands and requirements have lead innovation be important instruments for food companies to overcome competition and satisfy consumer expectations (Menrad, 2004).

The literature review has highlighted potential CSFs of F&B manufacturing SMEs. Subsequently, the next section present the research methodology used to identify the CSFs for successful SMEs.

3 Research Methodology

3.1 Multiple case-study approach

Given the aim of the investigation and our conceptual starting points, this research employed an "iterative-grounded" research process (Orton, 1997) in which we first reviewed the literature and then used empirical data to fill in the gaps by discover emerging patterns and practices (Meredith, 1998). We adopted qualitative and exploratory approach in our empirical analysis. More specifically, we employed

multiple case study methodology (Yin, 2014). Multiple case study approach is most appropriate method in conducting exploratory research on previously under-investigated areas (Eisenhardt, 1989) and allows us to study the problem and the context to deduce both cause and effect (Leonard-Barton, 1990). The case studies also provide a stronger base for theory building: 'the theory is better grounded, more accurate and more generalisable (all else equal) when it is based on multiple cases' (Eisenhardt & Graebner, 2007).

3.2 Sample

In this study, we adopted purposive case selection based on two selection criteria which are relevance and access to data. Firstly, success in our research context referred to the positive business growth for three consecutive years. We chose relative sales growth as the business growth indicator as it is applicable to all firms, insensitive to capital intensity and as the indicator preferred by managers and practitioners (Delmar et al., 2003). We also ensure our cases fit common business success criteria of Malaysia SME owners managers (Ahmad et al., 2011) in which the owners are also satisfied with their financial and non-financial performance and perceived the firm as market leaders or top-performers. Referring to access, we selected companies for which we could interview their owners and top management (e.g. managing directors, chief executive officers, chief financing officers, general managers). All companies agreed to be the subject of this case study with the understanding that their identity and information would be treated with confidentiality. In selecting the number of cases, several studies recommend that four as the minimum number to achieve theoretical generalizability (Eisenhardt, 1989; Yin, 2014) however case sampling is considered adequate when patterns have emerged in which consecutively two cases do not contribute to additional information (in our case, new CSF) and the study is then deemed to have reached "theoretical saturation" (Eisenhardt, 1989) which in our case occurred during the 7th and 8th cases (Case G and H).

3.3 Data collection

To ensure consistency of data collection across cases and researchers, a case study protocol was established to guide data collection (Yin, 2014). The information gathered regarding the companies was primarily based on on-site interviews with owners or top management of each field study firm. The interview generally last from 2 to 5 hours and it is guided by semi-structured interview guide with open-ended questions. The interview is also supported and supplemented by direct observations from tours around the premises of the company, unstructured conversations with employees, and secondary sources of archival data, such as databases of published financial information, websites, newsletters and news articles about the companies. All of this documentation provided further evidence to corroborate and augment the interview data, thus establishing triangulation for the case studies for construct validity and data verification (Yin, 2014).

3.4 Data analysis

Given the extensive amount of data (both primary and secondary) gathered for each company, it was necessary to codify these into succinct categories that could be used to classify and profile the companies in the sample. This could further facilitate the comparison of the findings from each case study. Thus, a three-step approach was employed. First, following (Graebner & Eisenhardt, 2004) suggestions on the need for data triangulation, individual case studies were built, employing data from the following sources of data: semi-structured interviews, public documentation, archival records and the researcher's participant observation diary to classify the examined companies according to their common characteristics. The analysis was conducted through a within and cross-case approach which was proposed as the most appropriate technique for exploring relationships among different cases (Graebner & Eisenhardt, 2004). The within-case analysis incorporates the study of each case separately, allowing for better familiarization, recognition of patterns to emerge and comparison among cases. In all cases, we were examining the presence or absence of a particular CSF, while at the same time ascertaining whether it had been fulfilled in a meaningful way. To assure the significance and completeness of identified CSFs, feedback cycles among the field study companies were initiated. The field study companies provided feedback on the presented CSFs. Then cross-case analysis was conducted whereby a list of common themes was identified and cross case comparisons were made by using a pattern-matching technique (Yin, 2014).

The following section first presents on the summary of within case analysis before presenting the summary of cross-case analysis and discuss on each CSF identified based on the reconciliation between participant input and literature.

4 Findings

4.1 Within-case analysis

Table 1 Summary of Within-Case Analysis

Case ID	Products	Year Founded	Annual Sales	Critical Success Factors Identified
A	Processed and Ready-To-Eat Poultry and Seafood Products	1997	RM 20 million	Business Strategy Networking Foreign Worker Management Attractive Product Packaging
B	Packaged Coffee Powder and Products	1964	RM 1.5 million	Innovation Family Capital Business Experience Online Visibility
C	Functional Food and Health Supplements	2006	RM 3.5 million	Innovation Access to Finance Entrepreneurial Orientation
D	Functional Food and Health Supplements	2008	RM 3 million	Business Strategy Family Capital Business Experience
E	Frozen and Ready-To-Eat Bakery, Pastry and Sauces	1994	RM 10 million	Access to Finance Professional Management Team Effective Food Safety System Effective Quality Management System Halal Certification
F	Food Pastes and Sauces	1998	RM 6 million	Online Visibility Entrepreneurial Orientation Entrepreneurial Competencies Supply Chain Management
G	Food Pastes	2010	RM 4 million	Networking Foreign Worker Management Entrepreneurial Competencies
H	Coffee Products, Tea and Chocolate Beverages	1998	RM 8 million	Networking Professional Management Team Effective Food Safety System Effective Quality Management System Halal Certification

4.2 Cross-case analysis

Table 2 Summary of Cross-Case Analysis

Identified Critical Success Factors		Case Codes							
		A	B	C	D	E	F	G	H
CSF 1	Business Strategy	✓			✓

CSF 16	Supply Chain Management						✓		

4.3 Identification of critical success factors

4.3.1 Business strategy (CSF1)

Company A although sell products made from poultry and seafood but has always employed a differentiation strategy. The managing director of the company highlighted “We always try to create value differences and never depend on price competition. We allow our customer to customize the products as they wish and we give them the best quality. Even though our price is higher than other market players, we succeed with our strategy and have achieved consistent high growth rate of over 20% in last 5 years, even when economic downturn in (year) 2015.” Company D on the other hand, sell functional food in which this type of products has to depend on unique product value offerings to capture consumers. Companies D generally win customers by consistently offer additional nutritional values and benefits when launching new products to keep themselves on a higher market position as compared with competitors. “Our company trusted you (Company D) and your products. As business partners, we can easily market every single products (of company D) successfully within a short time.” (Company D’s business partner testimonial). Align with the strategic management literature, SMEs can create value by differentiation strategy through product quality or unique features of products (Allen et al. 2006; Porter, 1980).

4.3.2 Networking (CSF2)

In case A, the entrepreneur is socially active in business associations and served as community leader. These social networks increase his exposure and have facilitated many business opportunities especially new distribution channels in which the firm captured and grew. On the other hand, Company G has actively joining government efforts and collaboration in growing the business. For instance, Company G will join exhibitions and trade fairs organized by Malaysia External Trade Development Corporation (MATRADE) in which had helped the company attract foreign sourcing agents to distribute the product oversea. Company H, initially as a start-up at home has grew along with many of its customers. Strong rapports were built and when the clients become domestic market leaders in restaurants and hotels industry, company H has benefited from sharing the growth along their business expansion. Compared to large firms, SME often lack the relevant resources to achieve growth (Storey, 1994). However, as case A, G and H demonstrated, networking helps SMEs to market their products and services (O'Donnell, 2014).

4.3.3 Foreign worker management (CSF3)

In order to ensure the operation and product quality, foreign worker management is essential for Company A to achieve success as the proportion of foreign worker is high. The initiatives include reporting yield of each of each production line daily, assigned an internal audit role to all production teams in which they will cross-check the other production team’s area and minimizing hygiene issues and defect problems from arising. In regard of Case G, as more than 3 quarters of the workforce comprised of foreign workers, by giving the equal benefits and promotion opportunities to the foreign workers, the company able to engage the employees and achieve high efficient operation. Although workplace diversity is an emerging theme in management, it remains under-study and tends to accumulate on the multinational enterprises practices (Lauring, 2013). Case A and Case G have shown the significant of foreign worker management toward their success and remain good starting point for further research on the diversity management involving foreign workers with different culture.

4.3.4 Attractive product packaging (CSF4)

Company A has packaged products into different size ranges in which the products are within specific size dimensions. This type of packaging has allowed housewives and restaurants to prepare the food easily. Furthermore, besides nutritional labelling, the packaging also attached with recommended recipe, spices and cooking method for various flavours. This has increased customers attention on the unique product features of Company A and further increase the sales volume. This aligned with empirical evidences which shown packaging can influence consumers’ purchase intentions (Löfgren & Witell, 2005).

4.3.5 Innovation (CSF5)

Although a half-decade old firm, Company B is dedicated in R&D and employed various process innovations. For instance, the owner has innovated and created a mobile roof shelter that allow the coffee beans to be completely sheltered from rain with just little efforts. The innovation has replaced the traditional style of moving all coffee beans in- and out-door. Being a functional and health food manufacturer, Company C has relied on research and development in giving the products competitive advantage such as additional nutritional values, new flavors and enhanced formula. Both case B and C have supported the notion that innovation is strategic tool for food firms to capture consumers (Menrad,

2004).

4.3.6 Family capital (CSF6)

Family capital is evident as critical success factors in Case B and D, however in diverse ways. Company B is a wholly-owned family business and current managing director is the 2nd generation of the company founder. He has accumulated years of experiences and knowledge in processing coffee as he has helped his father in business since childhood. These experiences have been fundamental for him to inherit the business from his father and continue to expand the business. While in the case of Company D, the entrepreneur has his start-up capital pooled from the family. Moreover, he set up his first production facility on the piece of land owned by his parents at zero cost. Thus Company D has relatively less financial burden during the start-up stage. Quote the owner-manager of Company D “I was able to kick-in full gear when the opportunities come without worrying about the capital. It is (capital) most important factor for every business.” Both case B and D demonstrate how entrepreneur may gain human and financial capital respectively from family which in turn generates competitive advantage for them. Hence, family capital may be CSF for SME by providing entrepreneurs resources (Danes, et al., 2009; Nahapiet & Ghoshal, 1998).

4.3.7 Business experience (CSF7)

Company B produce coffee products in which the processes of drying and roasting severely affect the taste and quality of the products and hence it's required in-depth experience and expertise of the coffee manufacturer in producing consistent high quality coffee. On the other hand, Company D has been able to help clients to launch a new product within 3 months and capable of shortening the period into a month if the product is within Company D specialty after accumulating years of industry experience. The business experiences of any entrepreneur can generally be separated into managerial and industry experience (Delmar & Shane, 2006) in which both types of experience have associated with firm performance (Stuart & Abetti, 1990).

4.3.8 Online visibility (CSF8)

Company B has good online visibility following their strong search engine optimization. Search words such as Malaysia coffee factory, how to make coffee in Malaysia would lead to blogs and medias published about Company B in which lead to even higher traffic into the Company B for coffee visits and purchase. One of the success factors of Company D is their high online visibility. Since 6 years ago, Company D has been working on search engine optimization (SEO). The early initiatives include posting and advertising on online portals, forums and e-commerce websites include Alibaba. The high online visibility allows clients to easily locate them especially when they perform online keyword search regard of contract manufacturer for health food. This in turn generated a competitive advantage where clients will automatically send in inquiries when they locate the contacts online. This has help Company D restrain themselves from doing aggressive persuasive selling, rather they become a focused solution provider for the inquiries. This has guaranteed the automatic generation at least 6 new clients every month. Limited literature has explored on online visibility as source of competitive advantages among SMEs besides tourism (Smithson et al., 2011). The case B and D suggested SMEs from other industry may benefited from high online visibility.

4.3.9 Access to finance (CSF9)

In order to expand the production facilities which were fully utilized, Company C has needed to secure financing facilities from banks. Within the short period of time, the loan is approved and Company C is able to acquire and develop their new factory without disruptions on their production. On the other hand, Company E does not able to borrow from financial institutions; instead it is the government grant which provided them financial aid to market their products oversea. Regardless the finance source, access to finance is important for business development (Evans & Jovanovic, 1989).

4.3.10 Entrepreneurial Orientation (CSF10)

During the initial startup phase, Company C manufactured instant coffee powder and Ji Kut Teh soup packet but low reception from the market. The owner decided to change its strategic direction and venture into become contract manufacturer and producing for business that can do well in marketing. Company F however experience great success during early stages when the firm proactively looking for opportunities and succeed to distribute their products overseas. Both risk-taking and proactive are important dimensions of entrepreneurial orientation (Covin & Wales, 2012) and each single dimension of EO can contribute to firm performance (Wales et al. 2013).

4.3.11 Professional management team (CSF11)

The founder of Company E transformed the company into market leader by establishing the top management by recruiting professional talents. The managers in general are trained to be all-rounder by

performing job rotations and cross-function portfolios. As direct consequences, the company efficiency increases as operations never disrupted under circumstances like employee leaves or turnover. In case H, the entrepreneur appreciates the professional values that a great management brings to the firm. With a complete succession plan and performance appraisal system, the entrepreneur is able to engage young talents into the company and expand the business. Professional management team is thus important contributors to competitive advantage of firm (Parnell, 2011).

4.3.12 Effective food safety system (CSF12)

Company E is able to distribute their products to the oversea when it attracted the oversea distributor by having the accreditation for ISO Food Safety Management System (ISO 22000:2005) and Hazard Analysis and Critical Control Point (HACCP). As another HACCP and ISO22000 accredited firm, Company H is reaping the benefits of having standardized procedures and key performance indicators for key operational and managerial activities. This directly improved the efficiency of the company from top management to the lower subordinates through transparency and clear guides. Thus these cases supported the notion that effective implementation of FSS contribute to the SME performance (Kafetzopoulos & Gotzamani, 2014).

4.3.13 Effective quality management system (CSF13)

In Company E, the GMP and ISO 9001 allows the management and executives to be genuine paying attention on what may goes wrong in the production and operation thus increasing the whole company efficiency and effectiveness in preventing problems and waste. On the other hand, the owner in Company H is benefiting from the QMS as the key activities and performance indicators allow all employees to comprehend the company operations within a short period of time. Both company E and H have benefited from effective QMS in which they gained competitiveness in the long-run for being efficient and effective (Anderson et al., 1994).

4.3.14 Halal Certifications (CSF14)

Company E has able to distribute to the foreign markets within the first year of their establishments mainly due to the Halal certifications which allowed their products to be immediately accepted in Saudi Arabia and started their internationalization. Company H is able to sell to almost all large HORECA (hotels, restaurants and cafes) chain in Malaysia as the products and producing premises are Halal certified. Halal certification in fact has been a new strategic tool for businesses to differentiate their products (Rajagopal et al., 2012).

4.3.15 Entrepreneurial competencies (CSF15)

Following the remark of chief financial officer in Company F, "Our boss (the owner) is a natural leader, he always lead us, both physically and psychologically. He is able to engage everyone and made us want to contribute more to the company. This is key reason why with the workforce of a small company, we have accomplished achievements like a large company and for so many years. He is the key factor." On the other hand, the observations and archival records in Company G shown that the entrepreneur has been frequently awarded as the best trainer in the sector of ICT training and development and had certifications as regional leader in some of the South East Asia projects before she venture into the food business industry. In line with existing entrepreneurship literature, the personal qualities and abilities of the entrepreneur is influential to the firm performance (Martin & Staines, 1994; Gasse & d'Amboise, 1997) and the entrepreneurial competencies of owners are critical factors to successful venture (Mitchelmore & Rowley, 2010).

4.3.16 Supply chain management (CSF16)

Company F main raw materials are spices and seasonings in which Company F has currently producing on their own to ensure the quality and taste. The spices and seasonings are forecasted to be new addition into the standalone product lines after moving into new manufacturing facility in coming 2017. By managing the supply chain, Company F is able to minimize and eliminate production input disruptions and focus solely on improving the operation and production. This supported previous research which reported SCM as an effective strategic tool to increase firm competitiveness, business stability, and revenue growth (Rashid & Haris Aslam, 2012; Gunasekaran et al., 2008).

4.4 Discussions on Findings

16 CSFs were determined from the case study investigation. The overall results mapped well to identified factors from the literature. Some of the CSFs which were not identified in the initial literature review for instance foreign worker management, attractive product packaging, online visibility and Halal certifications. Among these CSFs, foreign worker management and Halal certifications are not common research themes especially in the western countries. On the other hand, online visibility and attractive product packaging are emerging themes in marketing literature (Löfgren & Witell, 2005;

Smithson et al. 2011) which is not extended to the study of F&B manufacturers yet.

5 Conclusions

This paper identified critical success factors (CSF) of the small and medium sized enterprises in food and beverage manufacturing industry. Based on extensive literature review and exploratory research study, this paper identified 16 CSFs that impact the success of the SMEs food and beverage manufacturers, namely business strategy, networking, foreign worker management, attractive product packaging, innovation, family capital, business experience, online visibility, access to finance, entrepreneurial orientation, professional management team, effective food safety system, effective quality management system, halal certification, entrepreneurial competencies and supply chain management.

The theory of critical success factors provided an effective theoretical lens as foundation of this study and served as applicable theory in strategic management. Thus, the research provided a potential area for studies on other industry and sectors. Practically, this study contributes to the understanding of Malaysian SMEs in food and beverage manufacturing industry. Potential entrepreneurs and investors may consider on these CSFs before starting up company in the F&B industry. In addition, current managers and entrepreneurs may improve their operations based on the CSFs identified.

The current study explored only 8 companies in the F&B industry. Therefore the sampling logic for findings generalization may not be applicable. In addition, there may be more potential CSFs available. Therefore, the future research should involve more companies and further validate on the CSFs identified.

Research on the Development Status of Emergency Industry in China

Wang Lijuan, Gao Weiyi, Fan Sha

School of Management, Wuhan University of Technology, Wuhan, P.R.China, 430070

(E-mail: 1964677873@qq.com, gweiyi@whut.edu.cn, 895956574@qq.com)

Abstract: At present, China, as a big country in the rapid development, has entered a period of frequent public emergencies and emergency management capabilities need to be improved. The demand of emergency management has led to the formation and development of the emergency industry. The production characteristic of the emergency product and the supply characteristic of the emergency service make it become a comprehensive industry. This study that base on relevant theoretical research analysis clear the connotation and characteristics of emergency industry in order to objective and systematic analysis present situation of the development of emergency industry in China and proposed future work about developing emergency industry in our country, in order to provide the corresponding reference to our country emergency management work.

Key words: Emergency industry; Emergency services; Emergency

1 Introduction

China is a country with many disasters. With the development of society, all kinds of unexpected events are more complex, which seriously affect the people's lives and property safety.^[1] According to the National Bureau of statistics data ,we can know that in 2014 all kinds of natural disasters caused a serious damage .A total of 2 billion 435 million 370 thousand people were affected in our country, 1583 people were killed and direct economic losses reached 33738 billion yuan, the situation is very grim.^[2] Such serious impact would serve as a wake-up call to the China, who's ability to respond to emergencies need to be improved and will be more concerned about the development of China's emergency industry. Emergency industry is a new industry in China, and it is an important material and technical guarantee for emergency management. On 24 December 2014, the State Council formally announced the "guidance of speeding up the emergency industrial development" (Kai Yang,2015), which shows that our country has been highly concerned about the development of emergency industry. Related data show that in 2015 the number of people affected by disaster declined in China, this year was the least affected by disaster since 2000. It can be seen, Chinese emergency response capacity is gradually increased (Ma YuLing ,2016). But the development of China's emergency industry is not mature, the future's road is still hard. The purpose of this paper is to summarize and review the relevant literature, so that put forward the future work of China's emergency industry, and provide some reference for the follow-up development of emergency industry.

2 Development Process of China's Emergency Industry

In this study, the development of China's emergency industry is divided into three periods: establishing, developing and accelerating. As shown in Figure 1.

Establishing: November13, 2007, the State Council convened conference to implement "Emergency Response Law" (Ji Hong Mo, 2009), indicates that the development of emergency industry was been paid more and more attention in China.

Developing: September27, 2009, "guidance on strengthening emergency management in industrial " (Ji Hai Zhang, 2013) issued by the Ministry of industry and information technology, which pointed out the importance of accelerating emergency industry development. In 2011, formulated by the national development and Reform Commission, the industry structure adjustment Guidance Catalogue (2011 Edition) adjust the industrial structure to make further development for emergency industry(Lian She; Xu Jing, 2011).

Accelerating: September22 ~ 25, 2012, China's first emergency Industry Exhibition was held in Guangzhou, which theme is "Enlarge emergency industry and accelerate its transformation and upgrading". This made the emergency industry more and more popular with the public. On 24 December 2014, the State Council formally announced the "Guidance of speeding up the emergency industrial development" (Kai Yang,2015). It is the first time to make comprehensive arrangements for emergency industrial development in China.

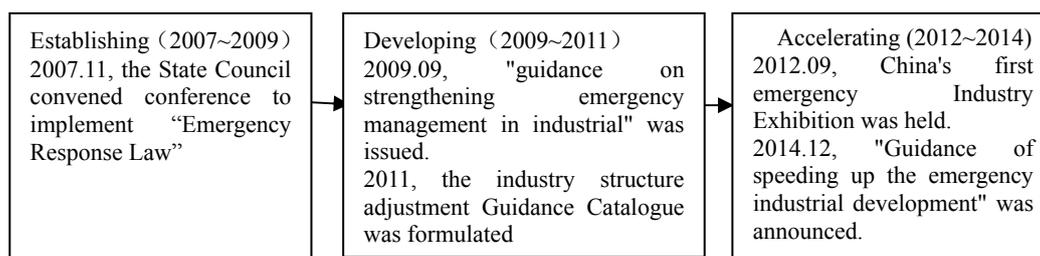

Figure 1 Development Process of China's Emergency Industry

3 Connotation and Characteristics of Emergency Industry

3.1 Connotation of emergency industry

Emergency industry is a kind of economic activity. It includes enterprises and organizations of the economic activities and products and services that with emergency function can meet public growing demand for security. Emergency industry is the creation of human being at a proper social stage and final result of specified social division of labour, which is derived from traditional industry and different from it, they are mutual integration, overlapping and interwoven presenting. Therefore, the emergency industry is a comprehensive emerging industry which is closely linked with other economic sectors. The definition of emergency industry subject to the approval of the State Council. Emergency industry is an industry which provides special products and services for emergency preparedness, monitoring and early warning, disposal and rescue (Jian Guang wang, 2015).

3.2 Characteristics of emergency industry

Beside these features summarized by former research, such as, the universality of demand, rigid demand, diversity of supply, timeliness and use of the convertible. (Ji Hai Zhang, 2013) There are many other characteristics:

Public goods and market failure. A part of emergency products are public goods, which is provided by the government free of charge, so the enterprise doesn't want to provide products or services without corresponding revenue, and lead to market failure.

Industry technology lack of commonality. Initial development of industry is restricted by key technology, but emergency industry involves lots of industries, so that it lacks a universal technology.

Industrial stage property is not uniform. Different products or services is in different stages of technological development, which should be given different levels of attention, such as personal protective equipment at a mature stage, but is not so for emergency decision support system.

Dual attributes of product. Some emergency products and services with public goods properties, but in the daily context show a properties of private goods.

4 Promising Development Trend and Existing Problems of Emergency Industry in China

4.1 Promising development trend

Overall, China's emergency industry is developing at a promising trend.

4.1.1 The emergency industry are developing rapidly.

Coverage of Chinese emergency product is expanding widely. We have made remarkable achievements in those region, such as coal mine risk, high-rise fire rescue, food safety inspection, geological disaster monitoring, emergency communication and emergency command. A number of innovation results were obtained when emergency high technology is applied in emergency management, such as space technology, information technology, networking technology, etc. Emergency service industry is developing rapidly, mainly related to road rescue, air rescue. In 2013, related person in charge of the Ministry of industry and information technology made a estimation about output value of national security emergency, emergency equipment in areas such as special products and services, the number reached nearly one trillion yuan. The number greatly stimulated the enthusiasm of all types of market players and all levels of government to develop emergency industry. (Fang Xiao, 2015)

4.1.2 Force of emergency industry development continues to grow.

In the recent years, force of emergency industry development in China has been growing, and advantages of industrial cluster are more obvious. Emergency industrial base are established in Beijing, Guangdong, Hebei, Chongqing, Anhui. That make emergency industry resources get reasonable configuration,

so that we can timely take measures to mobilize emergency supplies when the emergency will happen. For example, Anhui province constructed public emergency industrial base in Hefei national high tech park, and strive to make public security industry as dominant industry with independent intellectual property rights and international competitiveness. (Li Zheng, 2015) Emergency technology innovation and emergency industry alliance accelerate emergency industry development. Xinxing Cathay International Group Co., Ltd has founded industry alliance combined a number of enterprises and scientific research institutions in August 2011, which became only national league in this field. Such as China Aerospace Science & Industry Corp, those large enterprises are paying more attention on emergency industry development. Development of the emergency services bring out a number of small and medium-sized enterprises that expand scale and strength of emergency industry development. (ShengLi Zheng, 2010)

4.1.3 Support capacity of emergency industry enhance further.

With the development of emergency industry, all kinds of emergency products and services have been widely used to deal with emergencies, and have achieved social effects and economic returns. For example, after Wenchuan's earthquake, support capacity of Sichuan Province has been greatly improved. In the matter of earthquake early warning technique, Sichuan Province has formed innovation chain structure of that from scientific research to commercial production, sales, service, which find a new growth point for the Sichuan province to accelerate emergency industry development. In 2013, earthquake early warning products sales revenue is 600 million yuan and contribute 150 million yuan. With society's deepening understanding of earthquake early warning, the product' annual output value is expected to over 100 million yuan.

4.2 Existing problems

Overall trend of emergency industry is better in China, but there are existing notable problems that delay and hinder its developing speed.

4.2.1 Equipment lack of scientific and technological innovation

In recent years, more attention is paid to enhancing level of emergency equipment. In China, foundation of industry is weak and emergency industry starts late. China's emergency equipment and products cannot meet emergency needs. Most emergency products lack of core technology and independent innovation, so key emergency equipment depend on imports that led to the emergency disposal effect is very poor. For example, the main developed countries and some developing countries have formed their own comprehensive aviation emergency rescue industry that have a strong emergency rescue capability and is suitable for national conditions. By 2015, Australia possess 10455 navigable aircraft, Canada keep 28737, Brazil has 9908, but China just have 1000 and many of them are unable to fly. There is a relatively large gap between China and foreign countries (Pengyu Ding, Jiangtao Li, 2015).

4.2.2 Talent shortage

At present, there is a serious lack of professional talents of emergency industry in China. According to the Emergency Management Office of Guangdong province, the demand for emergency professionals in Guangdong Province is about 30 thousand people, the personnel lack degree of emergency industry in whole of China can be imagined. Emergency personnel supply cannot meet the demand in our country at present stage. Parts of training emergency personnel is research talents but technology R & D skilled practical talents is particularly deficient. Present main emergency personnel training institutions are not numerous, which concentrated in a handful of universities and cadre education institutions. It is difficulty to cultivate all-around emergency personnel without a specific plan for training emergency personnel.

4.2.3 Policy of emergency industry development is imperfect

There are many policy flaws to promote development of emergency industry in China. Without a sound system of integrating policy of emergency industry development. Current emergency industrial policy scatter various departments and even in various laws and regulations. Relevant policy is short of guidance that encourage society to participate. Now emergency industry mainly relies on government to participate and lack of policy measures to incentives enterprise to take apart in, social organizations don't have confidence and unwilling to take risks to be involved. Policy that only have a general guiding framework without specific details and supporting measures is not conducive to implement. In China, emergency industry management mode is single, independent and decentralized, due to lack of emergency management organization, which cause difficult to integrate and coordinate rescue resources to make systematically and efficiently rescue, once sudden public events outbreak.

5 Conclusions and Future Work of Developing China's Emergency Industry

Although the development trend of China's emergency industry is promising, there is a great gap

with the developed countries' mature emergency industry. Future work of developing China's emergency industry is arduous and heavy. Recent years, scholar no longer analysis characteristics and existing problems of emergency industry, they focus on a certain industry. So future research should promote development of emergency industry according to present opportunities and challenges. Based on the analysis and conclusion of the above research, this paper consider that future works could be carried out from following aspects.

Pay attention to the role of the market in the emergency industry. Previous studies have emphasized the government's leading role not market. The leading role of the market in the emergency industry remained at the level of concept that lack of practical operational measures, and at present related research is less. Actually, the degree of marketization will determine speed of future emergency industry development. If we want to develop emergency industry, we must determine the main tone of market, adhere market-oriented and government guidance, give full play to the decisive role of market allocation of resources. China will continue to build an innovation-demand-driven. Only by doing so, more social capital inflows will be created in emergency industry, and form a virtuous circle

Widen the scope of purchase. Research more on how to enhance the public's emergency awareness, promote demand, stimulate vitality of market. Purchase behavior lead to competition that is a strong way to promote innovation. But the consumer should not be confined to the relevant enterprises and government, it should be expanded to the general public.

Pay more attention on core contradiction. It is about stochastic and fragmented nature of emergency industry demand and the continuity of emergency industry development. The contradiction restricts the development of emergency industry in China.

In the era of big data, Data is becoming more and more important. Due to lacking of normative data system of emergency industry and incomplete data. Exchanging and updating information for all trades become more difficult.

Abstract: With the rapid development of the Internet and mobile Internet era of marketing campaigns, experiential marketing theory increasingly influences the corporate marketing activities, because of its own characteristics, marketing of agricultural products changes slowly. With the Internet era of consumer experience marketing has gradually become the new norm, this paper explores the agricultural products experience marketing model based on the theory, proposes a subscription mode of land and urban farm representative mode, analyzes its characteristics and advantages, and provides a new perspective for production and marketing enterprises to refer to.

Key words: Experience marketing; Land subscription mode; Urban farm mode

1 Introduction

1.1 The concept of experience marketing

Experiential marketing refers to marketing to consumers through the creation of sharp eyes, ears, try and use, and other related environmental participation, to mobilize and stimulate customer senses, association, behavior, feelings, thinking, action, contact and other emotional factors and rational factors, subversion in the past to design and create a new type of marketing tool (Wang yonggui, et al, 2011).

1.2 The type of experience marketing

"Experience marketing" Robert • H • Smith for changes in the way of performance experience, invisible, diversity, experience marketing model will be divided into five types, namely sensory experience, thinking experience, behavioral experience, emotional experience, associated with experience. Sensory experience as the name suggests, the integrated use of consumers in the marketing process to see, hear, touch, taste, smell and other senses to experiential marketing.

That perceptual experience sensory experience, the sense of smell, touch, taste, sight, hearing and other organs of perception used in the marketing process(Zhen rui, Yang lei ,2012); experience of thinking through creative to attract customers think and arouse the attention of customers; behavioral experience for consumers first by perception and experience to perception marketing merchandise to bring them to change their lifestyle, and then replace the existing way of life and form; that is the emotional experience of consumers in the consumption process through the emotional perception and experience to choose to buy products; related experience is a high form experience marketing model, that is through practice so self-continuous improvement, so that consumers feel good for marketers, and encourage customers to establish a system of consumer goods and consumer awareness and even social systems and establish some kind of proprietary brand preference.

2 Agricultural Products Experience Marketing Mode

In the traditional perception, the stage consumer participation in marketing of agricultural products can only be reflected in the scene later stage, while the new consumer marketing experience to participate in agricultural innovation model, consumers can pre-sale, sale and through different forms of participation stage based on consumers differ in different stages of the focus of attention (Li guangming ,et al,2010), therefore, the corresponding experience and there are also differences.

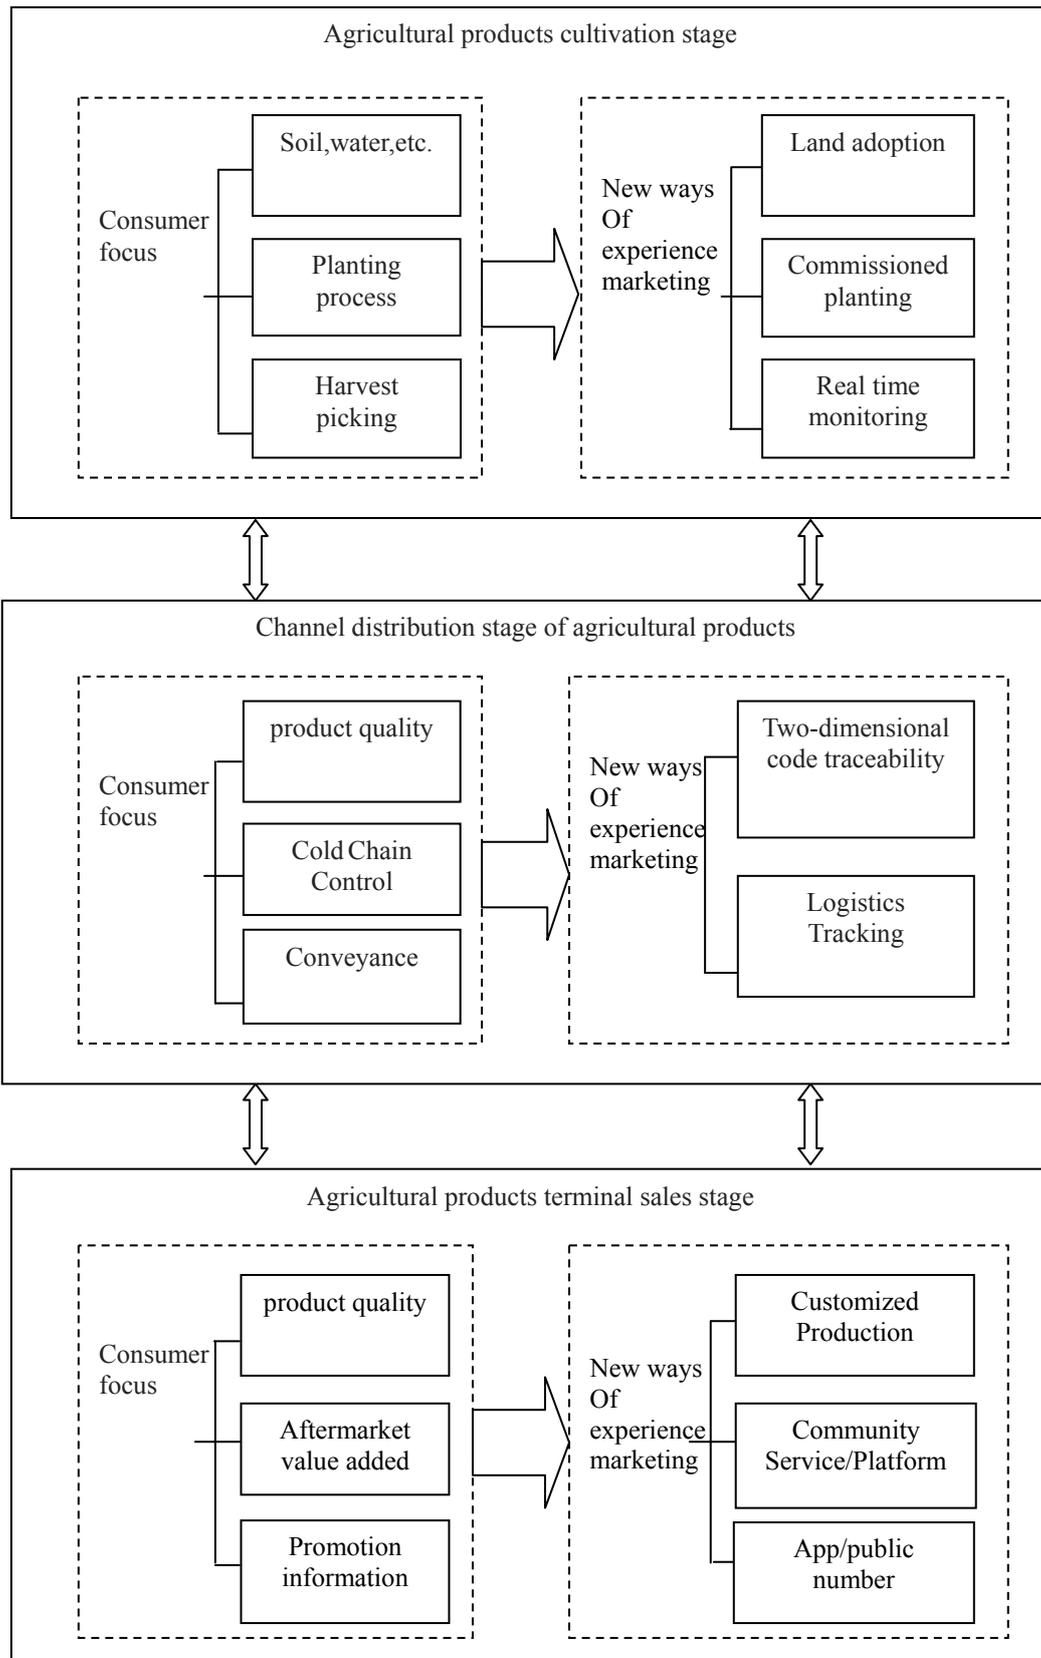

Figure 1 Agricultural Products Experience Marketing Mode of Consumer Participation

3 Agricultural Products Experience Marketing Representation Mode

3.1 "Land subscription" mode

3.1.1 Subscription land pattern concept

Land subscription model is the rapid development of agricultural products marketing mode in recent years (Chen Junjin ,2015). Consumers through online subscription customized private farm land, by hiring local farmers harvest their crop, while land planted during the entire all-weather monitoring, and networking with the owner of a computer, consumers can view the computer at any time by planting their own land situation, and be able to receive a monthly output of its own land of fruits and vegetables, and to enjoy free local participation rights planting both travel accommodations.

The participants of land subscription model were land operators, as farmers sell land use rights of the parties, as the end consumer of land use rights of the Subscriber, as sales of land use rights transfer intermediary platform, as agricultural cultivation entrust the management of the local Party cooperative. The main responsibilities of the participants are shown in Table 1.

Table 1 Land Subscription Mode Participant Responsibilities

Objects	Core responsibilities
Land carriers	Collection of land use rights and payment of land rent; Commissioned cultivation, packaging, and farmers pay the wages of labor; Land charge subscription money while completing the agreement of distribution of agricultural products
Farmer	Sale of land use rights, access to appropriate rent; Through labor in exchange for wages
End consumer	Subscription and payment of land through an intermediary platform; Full participation in monitoring the cultivation of agricultural products; Ready to experience the process of agricultural cultivation, and ultimately enjoy physical products
Mediation platform	Responsible for the promotion of land Subscription projects; Acts as contracting platform and network payment platform
Local cooperatives	After the operator entrusted the management of land resources, cultivation, farming, logistics and distribution

3.1.2 Land subscription mode marketing processes

Consumers can subscribe for free land according to the location and size of household demand, full participation, after the subscription, per month what to grow, by the local rural cooperatives responsible for hiring local farmers by the consumer need for professional planting and care, post-mature crops and other local farmers will cycle courier to the user every two weeks. Currently, the "Land adoption + sales" model in the country has the lead in the operation of enterprises, such as the next gather cost-effective platform, "Ali poly land" project, but not universal.

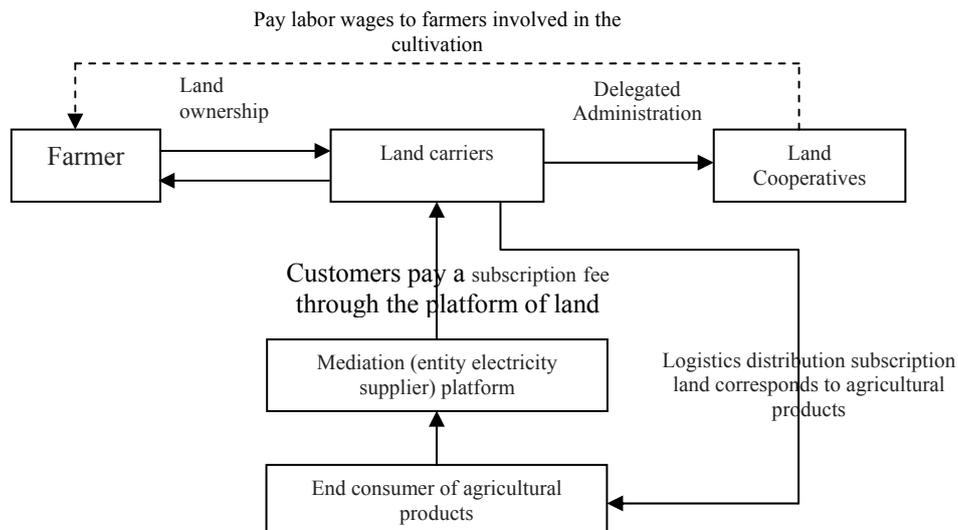

Figure 2 Land Subscription Mode Marketing Processes

3.1.3 Advantages of land subscription mode

1) To achieve win-win situation. Consumers through realization of land subscribe, can give full play to their initiative, full participation in the selection of varieties of agricultural products, to monitor the breeding process of planting, planting and breeding outcome of the whole process has kind; at the same time, by sight, touch, experience and other ways to experience the behavior consumer perception of the realization process, in order to buy more is the price of agricultural products with a more assured quality. For farmers and farmer cooperatives where this pattern can be achieved to provide job opportunities, increase income effect. For countries, revitalize the stock of land resources, creating a new model of land transfer.

2) Social economic benefits of both. On the one hand, for the end consumer, the pattern and the full realization of the leading consumer participation in providing healthy, fresh, safe, and green customized products, but also to meet the consumer a "private agro-master" mentality demand, while also boosting the tourism development of the land where the village subscription; on the other hand, land subscribe to test the water of the government does not intervene directly in the market circulation under the platform through the promotion of mediation, the right to use the subscription price of agricultural land is formed by the market; at the same time since no changes in agricultural land use purposes, the relative does not involve government approval procedures.

3) To the middle part of Mediation platform by the "final consumer of agricultural products" and "farmland management rights owner" directly integrated transaction; not only revitalize the agricultural land, but also to solve the production and sale of agricultural land matching problem (Tan Shenhua ,2014). Crowdfunding sales for ordinary consumers such participation would be difficult to split the "ownership of agricultural land use certificates" to achieve a greater degree of segmentation of "agricultural property the ownership of agricultural land for the production of varieties of farm products discretion "sales.

3.2 Urban farm mode

3.2.1 The concept of urban farm mode

Urban farm model, first proposed by the American urban agriculture advocates Farmery company whose main idea is to let more farms move into the city, in order to try to solve the problems in the current system of agricultural consumption of consumer participation and experience is not enough.

Urban Farm is a holistic system of growing and selling model, the core is the high cost of land in the city (such as a city high-rise buildings or building container roof or shed) where direct selling vegetables grow vegetables, achieve cultivation, harvesting, selling fully integration, able to participate through a unique and complete consumer and customer experience, reduce transportation costs and other storage methods, the value of such products have relatively large increase. Like urban farm can cover a variety of food cultivation and breeding - mushrooms, vegetables, herbs, fish, and the price of organic products is quite common, even cheaper than ordinary organic products.

3.2.2 Characteristics of urban farm marketing mode

1) Low cost replication and expansion. Urban existing farm land may have been the city's most select residential or office / residential high-rise, its low construction cost, easy expansion and rapid reproduction. In the open-air roof can be discarded or recycled containers converted into mini urban farm, the outer wall of the container is a vertical garden, the interior is used to cultivate mushrooms, green construction and organic food sales outlets combined, will be a brand new innovations.

2) Homegrown modes. Yield stability, small-scale cultivation, more diverse species, consumers have the opportunity to plant some unusual varieties, and even participate in determining plant varieties of agricultural products, therefore, do not worry too much about sales.

3) Product quality full traceability. Fresh is an important criterion for good ingredients. Long-term storage and transportation of food will inevitably lead to reduced quality. For example, within 24 hours after picking lettuce, nutrients will be reduced by half. In urban farm, the product collected and sold by now, the full realization of the full product quality traceability.

4) Unique urban farm picking experience. Consumers can pick directly from the farm in the city, such an experience in the city is hard to come by. In enhancing the value of products, but also let the "distance" between the city and the food is greatly shortened; for kids, it was a rare agricultural education places.

3.2.3 Advantages of urban farm mode

1) Because the basic products are homegrown, greatly reducing storage and transport costs, but also reduces the ordinary supermarkets in storage and transport will inevitably lead to food waste.

2) Because reduce intermediate links, urban farm model can make a consumer demand for faster,

more agile response.

3) For the production, packaging is not required, thus saving a lot of natural resources.

4) Consumers personally picking, full participation store experience reduced labor costs and picking originally needed.

4 Conclusions

Experience marketing mode of agricultural products in China is still in the trial stage, it has a huge space for development, but also objective constraints. The problems and difficulties they face including logistics and land distribution. In the absence achieve scale, the layout of the premise, the more obvious its regional restrictions, for a second-tier city consumer, the high cost of land resources are particularly scarce. Therefore, the establishment and consolidation of the distribution network system of land resources is the biggest shortcomings of the current mode of agricultural products experience marketing.

Abstract: The paper analyses the reasons of the popularity of Geely Automobile in overseas markets from the perspective of quality innovation. It holds that, when faced with overseas customers, Geely Automobile has been constantly working on product innovation, service quality innovation and management quality innovation, so as to gain a large share of the overseas market. Through the analysis on Geely Automobile's popularity on overseas market, this essay suggests that the inspiration it has brought to Chinese manufacturing enterprises is: (1) innovate on independent research and development, to improve the core competitiveness of the enterprise; (2) optimize quality management system, and establish quality innovation consciousness; (3) perfect quality of after-sales services, and improve consumer satisfaction.

Key words: Quality; Quality innovation; Geely Automobile; Inspiration

1 Introduction

Though the total trade volume of our country is large, problems still exist, such as extensive mode of trade, weak core competitiveness, low level of export products, and lack of enterprises that are capable of participating in in-depth international competition and cooperation etc. Most foreign trade protection measures use product quality standard to inhibit import of our products, and quality has become one of the main means for many countries setting up trade barriers. Promoting product quality development and improving product competitiveness with quality as the core element will be an inevitable choice for our export enterprises to adapt to the complicated trade environment in the international market and realize sustainable development of foreign trade. China has been adhering to the economic policy of trading market for technology, taking technology as rigid index for production of products. However, not every enterprise holds high and new technology; many medium and small-sized enterprises mainly survive as OEM (original equipment manufacturer). With continuous development of science and technology, nowadays consumers focus on quality more and more, and they pay more attention to quality of products. On the relationship between product quality and enterprise, Cheng Hong (2009) pointed out that enterprises need to improve the quality of products to win consumers. Niu Bianxiu (2003) pointed out that the core competitiveness of enterprises is the quality of innovation. Dili Naer Yasheng (2011) emphasized the importance of the quality of the products innovation on the survival and development of enterprises. Melitz (2002) proposed and use quality heterogeneous enterprise model (QHFT), from the theoretical and empirical evidence on the relationship between product quality and enterprise export behavior. Tang Haiyan (2009) pointed out that The main difficulty for Chinese enterprises to "Going abroad" is their lack of technological innovation. Qin Hong (2011) pointed out that improving the competitiveness of "made in China" is to improve the competitiveness of its quality. Li (2015) obtained the conclusion that the product quality promotion significantly improves our country's export competitiveness through empirical study. This paper through analysis on the phenomenon of Geely Automobile's popularity on overseas market, this essay analyses the reasons why Geely Automobile can gain large shares on the overseas market and win high yield and reputation from the perspective of quality innovation. Based on the analysis, the essay also sums up the inspiration it brings to Chinese manufacturing enterprises.

2 Quality Innovation and the Reasons for Geely Automobile's Popularity on the Overseas Market

2.1 Quality and quality innovation

Quality is a concept that varies with time, at first it was used to describe whether the product is good or bad, then with continuous development and evolution, its use has been expanded to all fields

such as services, engineering, and environment etc. Presently the most widely used definition of quality is the one in ISO9000-2000 “the degree of a set of inherent characteristics can satisfy the demand”.

Quality innovation means a process in which an enterprise makes constant innovation in manufacturing to ensure quality, performance and services of products satisfy consumer needs. Based on previous researches, Haner (2002) has introduced the concept of innovating quality as a breakthrough. Combining innovation with quality, he holds that quality innovation is the final result of all innovations, including quality of products and services and enterprise management. Swann (1986) brings up that quality innovation is one part of product innovation, the products are ones that already exist, and quality innovation is the way to improve quality and performance of existing products, in other words, quality innovation means innovation to make obvious improvement in quality aspect.

For enterprises, significance of quality innovation shows in three aspects: (1) quality innovation improves core competitiveness of enterprises. The purpose of quality innovation is to improve products quality and competitiveness of the enterprise, and to improve the competitive edge of the enterprise on the market. (2) Quality innovation is fundamental to survival of enterprises. The society pursuing for high quality products is the momentum for enterprises to make constant quality innovation. Only by following development rules and characteristics of social economy and constantly conducting product innovation, can enterprises survive on the market. (3) Quality innovation expands scale economy effect in enterprises. By establishing an efficient production and management system, quality innovation expands operation and reduces costs, and achieves the goal of optimizing profit of the enterprise.

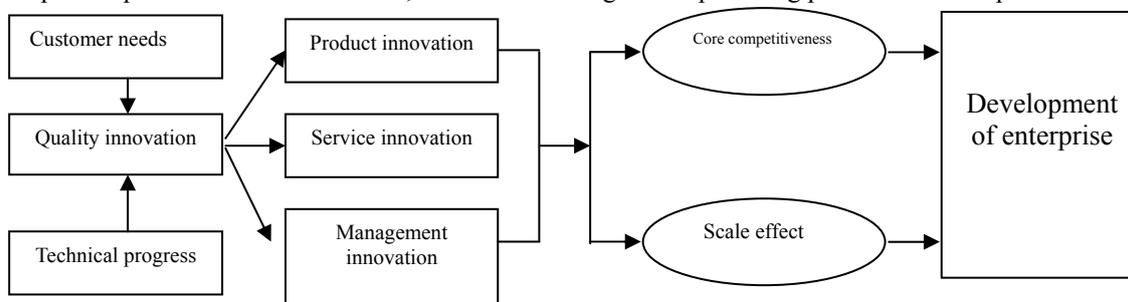

Figure 1 The Path of Quality Innovation Promoting Development of Enterprises

2.2 Geely automobile's popularity on overseas market

Geely Automobile went into the automotive field in 1997, and has been developing rapidly all these years by virtue of its technical innovation and talents training. In 2013, the total assets of Geely Holding Group reached RMB 126.162 billion, and the total turnover was RMB 158.429 billion. It has ranked in world's top 500 enterprises for two successive years, in China's top 500 enterprises for eleven successive years, in top 10 enterprises of China automotive industry for nine successive years, and has been awarded “Innovative Enterprise” and “National Automobile Whole-Vehicle Export Base Enterprise”.

In recent years, Geely Automobile is also actively exploring overseas markets, and has established knock down and semi knock down assembly factories in Egypt, Russia, Ukraine, Indonesia, Sri Lanka and Iraq etc... Presently Geely has more than thirty whole-vehicle products under three brands EMGRAND, GLEAGLE and ENGLON, and has DSI automatic gearbox research and development manufacturing center in Australia. Geely Automobile has nearly 200 sales service centers overseas. Up to the end of 2013, cumulative social retention of Geely Automobile has exceeded 3 million nos. In October 2014, the single monthly sales exceeded 12200 nos., creating the highest single month export volume in Geely Automobile history.

2.3 The reasons for popularity of Geely automobile on the overseas market

As a self-owned brand in China, why can Geely Automobile gain such good sales achievements on the overseas market, even more the sales achievement in some countries is no lower than that of international famous brand vehicles? The reason lies in constant quality innovation of Geely Automobile, which has brought to overseas consumers higher sense of satisfaction. The quality innovation of Geely Automobile mainly includes three major aspects: product quality innovation, service quality innovation and management quality innovation.

1) Product Innovation of Geely Automobile

Quality innovation centers on customers and gets to know customer needs any time. The objective of quality planning of Geely Automobile is to manufacture products that satisfy the customers. Geely Automobile launches new products every year to satisfy customer demand for cars. From Haoqing at the very beginning to the most popular one nowadays EC7, every single automobile is manufactured at the basis of consumer market demand. Product planning is to design automobile products with models and performance satisfying consumer preference in the market taking customer demand as a precondition.

2) Service Quality Innovation of Geely Automobile

Geely Automobile firmly holds to the service concept of “Care in details”, centering on customer satisfaction, and taking initiative to establish a sound high quality after-sales service system; improves consumer satisfaction by high quality after-sales services, thus to achieve the brand’s premium. Geely Group has got rid of the common failing of automobile enterprises “value sales but not after-sales”, and established a perfect after-sales service system on overseas market. The services of it include: ① convenient move & rescue services; ② thoughtful marketing services; ③ automobile care center.

3) Quality Management Innovation of Geely Automobile

First, Geely Automobile has established a strict quality system. In 2012, the business strategy of Geely Automobile products changed, and it brought up the strategic target of “quality management”, and developed a complete set of quality improvement and management system targeted on consumers, to conduct Omni bearing management and control on products in market quality, spare parts quality, manufacturing quality and design quality etc... Second, Geely Automobile has set a strict quality objective. It brings forward the quality objective of “To manufacture the most secure, most environment-friendly and most energy-saving vehicles, and make Geely run all over the world.” And improving product quality and product satisfaction becomes the core of Geely Automobile quality management system. Geely launched “2050 project”, meaning claims for one model decrease 20%, and failure rate in per thousand vehicles decreases 50%. Establishment of the enterprise quality objective improves quality consciousness of enterprise employees, and starts a comprehensive system reform centering on quality. Third, Geely Automobile has carried out quality culture construction. It encourages employees to take initiative to participate in innovative activities, promote total quality management actively and improve product quality in the whole process from design to manufacture, sales and services. Quality culture construction can improve quality consciousness of enterprise employees, establish proper quality values and make the enterprise always bear in mind “Quality First”.

3 Inspiration to Chinese Manufacturing Enterprises

3.1 Innovate on independent research and development

It can be observed from the success of Geely’s success that, success of an enterprise is indispensable to its independent innovative capability, which also plays a huge role in improving its own research and development capability. An enterprise should gain independent research and development capability, to have a say in independent intellectual property and technology, grasp core technology, and improve competitiveness; innovate and research and develop new core technologies on the basis of foreign technology, and construct a self-sufficient supply system, thus establish competitive edges in the international market effectively. On the overseas market, it is easy for enterprises with advantage of localization and independent innovative capabilities to break the monopoly of the international market and take up a share and win favor of customers.

3.2 Optimize quality management system

Product quality has been an issue with global focus, quality reflects product performance, and product is realization of quality. Product market competition in the 21 century is competition on quality, and quality is fundamental to products differentiation. In international competition, comprehensive quality management is the inevitable path for enterprises. The purpose of establishing a sound quality management system is to improve quality consciousness and product quality. Enterprises should put quality in the primary position of enterprise management. Quality management is to apply quality management tools to daily management of enterprises, to make quality control from the source.

3.3 Perfect after-sales service quality

The platform of after-sales service is one last means to test an enterprise. Perfect after-sales service can maintain customer relationship, and provide first-hand demand information for quality improvement and product development etc... Geely has penetrated quality service consciousness into every aspect of production. By strictly designing quality indices of products as per customers’ preferences, it ensures product quality popular among customers. After-sales service promotes “care in details”, and solves

customers' problems in all aspects. Wide coverage and convenient services of an enterprise marketing service network win the heart of customers. When providing services, remember to be customers-oriented, always pay attention to customer demand, establish a timely problem feedback system, provide high quality services to customers, thus to win customer loyalty. With high quality products and perfect after-sales service, Chinese enterprises will be capable of establishing international brands on the overseas market.

4 Conclusions

This essay makes analysis on the reasons of Geely Automobile's popularity on the overseas market from the perspective of quality innovation, product innovation, service quality innovation and quality management innovation. And the conclusion from the analysis is: 1) the main objects of quality innovation are enterprises, and the focus of study is quality of enterprise products; 2) the ways for quality innovation are product innovation, after-sales innovation and quality management innovation. The inspiration of this study for our enterprises in manufacture industry is: 1) innovate on independent research and development, to improve core competitiveness of enterprises; 2) optimize quality management system, and establish quality innovation consciousness; 3) perfect after-sales service quality, and improve satisfaction of consumers.

Research on the Biological Components and Evolution of the Innovation Ecological Environment of Cultural Industry

Liu Bingfeng, Yan Ningning

School of Business Administration, Jingdezhen Ceramic Institute, Jingdezhen, P.R. China, 333403

(E-mail: txcf2000@163.com, 595614432@qq.com)

Abstract: The insufficient innovation ability is one of the biggest bottlenecks for the upgrading of cultural industry in China. Thus, it is an important way to structure the good innovative ecosystem around perfecting the innovative chain for improving the innovation ability of cultural industry. From the ecological visual angle, this work aims at exploring the structural evolutionary mechanism of innovative ecosystem of cultural industry, in order to offer reference to the improvement of innovation ability and governance ability of cultural industry. Meanwhile, this paper analyses the self-organizing evolution mechanism and games evolutionary model of innovative ecosystems of cultural industry, studies three relations such as competition, intergrowth between the members of innovative ecosystem, analyses their evolutionary mechanisms respectively, and provides the balance condition. Results will help to perfect the innovative network of cultural industry and improve the innovative performance of cultural industry. It also helps to standardize the behavior of the local government further, raise the governance ability of the local government and perfect the innovative management theory, offer reference for the science and technology policy making.

Key words: Cultural industry; Biological components; Innovation ecological environment; Evolution; Industry innovation

1 Introduction

In recent years, the cultural industry research more and more, along with people also found that the appearing in the process of the development of cultural industries in many different phenomena, such as ecological environment is getting worse and worse, credit degree is not high, the innovation of the disorder, bad competition appears and the relative competitiveness of industry is on a downward trend and so on (ADNER R,2006). These phenomena make people have to take the ecology into the future development of the cultural industry, and gradually become one of the current hot topics of research. This study is based on the guidance of eco economic theory, trying to "innovation" to add to the "ecological environment" to compare research. But it should be noted that this study is not simply to create innovative environment as the ecological environment, but the use of the ecological environment of the professional words to build a cultural industry innovation theory (M.E. Porter,1998).

Different scholars from different angles on the innovation of the ecological environment in-depth study, so the definition of this definition also has a different focus, with great differences. Innovation of ecological environment is actually each other is related to the organizational culture and its external environment, with specific mechanisms influencing, interact with each other, and through this mechanism can promote the cycle energy use, promote information sharing and knowledge flows. At the same time, cultural innovation organizations and other organizations in the process of completing the process of innovation related to each other, to complete the exchange of resources and to a more systematic and network of new organizational model development (Porter, M. E,2000).

2 Analysis on the Biological Components of the Innovation Ecological Environment of Cultural Industry

From the main body of innovation in innovation activities carried out by the form to divide, can distinguish the main innovation for individuals, groups, and the main body of the country; from the point of view of the innovation of the main design innovation can be divided into the main theory innovation, culture innovation, system innovation (Machiel, V. and Nowalor, O,2000). Innovation subject is different, the quality requirements should not be the same, and the ability of innovation often depends on the strength of the quality of innovation. Therefore, the improvement of innovation ability mainly depends on two main factors, the main factors of innovation and the quality of the main body (Canines, C.J., Romijn, H. A,2000).

In general, the biological component of the cultural industry innovation of ecological environment mainly composed of government, educational institutions, scientific research institutions, enterprises,

intermediary agencies and other, through the cultural industry, it is the carrier of each biological component to use cash flow, knowledge flow, information flow and concentration and transfer to complete the progress of cultural industry innovation ability (Meine Pieter van Dijk,2005).

Governments, institutions such as the innovation subjects by means of cultural industry value chain and innovation chain play a respective influence, through the different forms of long-term innovation cooperation and communication, together with the completion of the progress of the innovation ability of industrial culture.

2.1 The government -- the main body of innovation system innovation

The government is mainly to support and promote innovative subjects to carry out useful innovation activities by means of injecting capital and providing policy. At present, China's innovation and the market mechanism is not perfect, so in the innovation activities of the culture industry. The impact of government is particularly important. It can support to many aspects of the culture of innovation activities, including the support of policy and legal support and resources and environment.

2.2 Innovative enterprises -- the main body of cultural innovation

The beginning and end of all innovation comes from the enterprise, the main supply of innovative enterprise funds and innovative technology, so it is the main body of technological innovation. And many of the same industry innovation enterprises constitute the cultural industry, they profit duty, independent production and management, has a certain market affordability and capacity for independent innovation.

2.3 University and other scientific research institutions: innovation of the original innovation

Universities and other research institutions are mainly to provide personnel and technology. University is a non-profit organization, it's first duty is to teach knowledge, training of personnel, the second is the scientific research. University of new knowledge and technology to actively develop, teach and use, is the most direct participants, which in the entire ecological environment showed a great spillover effect.

2.4 Innovation intermediary agency: the main body of innovation service

Intermediary organizations as the main body of innovation is mainly responsible for the transfer of information between the main body and intermediary business. Intermediary institutions to connect cultural innovation and cultural innovation side, as the role of the intermediary for the innovation of the main body of professional innovation advisory services.

2.5 Financial institutions - innovation investment subject

Financial institutions mainly invest a large amount of funds for the cultural industry. In the modern economic system, financial as the core strength, any cultural industry development and technological innovation and ultimately into it, and a stable financial market environment is the rapid development of the industry, to enhance the capacity of cultural innovation premise and guarantee. If the heart of innovative enterprises is innovative technology, then the financial is to support the innovation of life blood.

3 The Self-Organization Evolution Mechanism of the Innovation Ecological Environment of Cultural Industry

According to the above analysis, we can see that as a away from the equilibrium state of the opening self-organization system, ecological environment of cultural industry innovation in various nonlinear effects, spontaneously from a disordered state to ordered state of evolution, this process is the cultural industry innovation of ecological environment of self-organization evolution process. According to the theory of association, the dynamic mechanism of self - organization system is used to construct the self - organization evolutionary dynamic model of the cultural industry innovation ecological environment:

$$Z = az^2(1-z) - bz + \Gamma(t)$$

Among them, Z said the development of the ecological environment of the organization, Z said that the innovation maturity, a said the intensity factor, $-bz$ said the role of limiting factors on its change, $\Gamma(t)$ said the role of random fluctuations mechanism. The formula is transformed, and the evolution equation of the ecological environment development state can be obtained:

$$\frac{d\Pi}{dt} = -\Pi^3 + \mu\Pi + \nu + \Gamma'(t)$$

Among them, $\Pi = \sqrt{az} - \frac{\sqrt{a}}{3}$, $\mu = \frac{a-3b}{3}$, $v = \frac{2a-9b}{27}\sqrt{a}$, $\Gamma'(t) = \sqrt{\alpha}\Gamma(t)$

Make $v = 0, \Gamma'(t) = 0$, culture industry innovation ecological environment self-organization evolution model equation:

$$\frac{d\Pi}{dt} = -\Pi^3 + \mu\Pi + v$$

When the ecological environment is in a stable state, $d\Pi/dt = 0$, three solutions can be obtained:

So we can know: $\mu = 0$ is the bifurcation point of the ecological environment from the evolution of the organization, from the $\mu < 0$ state gradually increase and cross $\mu = 0$ this point, the ecological environment of the system will be a significant change in the nature, as shown in figure 1.

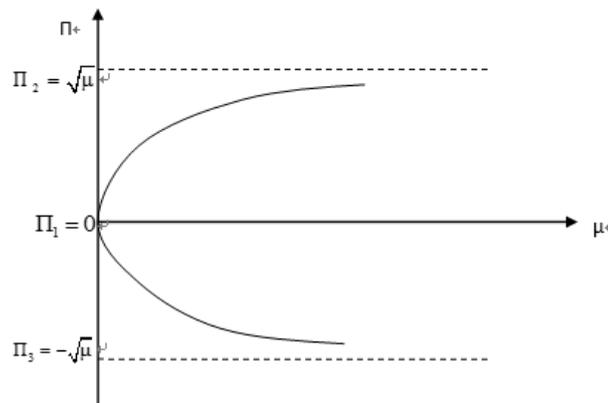

Figure 1 The Bifurcation Diagram of the Innovation Ecological Environment of Cultural Industry

From figure 1 it can be seen that the nonlinear interaction between the various elements of the system to promote the ecological environment change, the realization of the ecological environment from disorderly to orderly change. From the formula, we can see that the innovation process of cultural industry is nonlinear, and the value of $az^2(1-z)$ will directly affect the evolution path of the system.

In order to realize the innovation of the ecological environment, it is necessary to reduce the limiting factor coefficient b , or increase the strength coefficient a , which is the necessary condition to realize the system self-organization innovation.

4 The Concurrence Co-Evolution Mechanism of the Innovation Ecological Environment of Cultural Industry

In ecological environment of cultural industry innovation, every innovation organizational culture occupies different or similar ecological bit, which leads to the competition and cooperation of the organization members on ecological environment of innovation resources in possession, use, or recharge. It can be seen that the competition among the members of the organization is the main activity of the cultural industry innovation ecological environment evolution.

4.1 Competitive co-evolution mechanism

Assuming that only A, B two cultural innovation organizations in the industry, both innovation and the same ceramic cultural products, and thus there is competition in the market. At the same time, it is assumed that all kinds of innovation factors of regional space endowment are certain, so there is the upper limit of innovation income. Due to the limited size of the market, when A organizational innovation R & D products competitiveness is stronger than that of group B, A will be squeezed out B and win; on the contrary, group B will win. If the two sides cannot be completely squeezed out of each other, then the competition results will reach a state of equilibrium.

The logistic growth equation of two innovation organization respectively:

$$\frac{dN_1}{dt} = r_1(1 - \frac{N_1}{K_1})N_1, \quad \frac{dN_2}{dt} = r_2(1 - \frac{N_2}{K_2})N_2$$

Where N_1 and N_2 are A, B two groups of output level of innovation; r_1 and r_2 respectively A, B two organizations in ideal conditions, the output level of innovation of the maximum rate of change; K_1 , K_2 respectively represents two organizations determined by the environment of the maximum level of innovation output.

With competition coefficient to represent the degree of competition in the two organizations, let B organization the organization A competitive coefficient μ , B organization innovation earning convert organization A innovative returns ratio, $\mu = N_1 / N_2$, shows the in limited circumstances, the organization of B innovative returns to a tissue effect. Similarly, A tissue of group B competition coefficient ν , said the organization A creativity earning convert as the ratio B organization innovation profit. $\nu = N_2 / N_1$, showing the effect to organization B generated by the organization A benefits of innovation in the limited environment. As a result, the competitive equation is:

$$\frac{dN_1}{dt} = r_1 \left(\frac{K_1 - N_1 - \mu N_2}{K_1} \right) N_1, \frac{dN_2}{dt} = r_2 \left(\frac{K_2 - N_2 - \nu N_1}{K_2} \right) N_2$$

When the organization competition reaches the equilibrium state, there are: $\frac{dN_1}{dt} = \frac{dN_2}{dt} = 0$.

Obviously, in the case of competition, is not A organization to eat the B organization, is the B organization to eat A. Therefore, under the conditions of competition between cultural innovation organizations, to maintain the balance of the industrial ecological environment, cultural innovation organizations can not be completely homogeneous, it is necessary to maintain a certain difference.

4.2 Symbiosis co-evolution mechanism

There are only two cultural innovation organizations in the industrial ecological environment. They are symbiotic and cooperative relations, our can get a new logistic equation:

$$\frac{dN_1}{dt} = r_1 \left(1 - \frac{N_1}{K_1} + \alpha \frac{N_2}{K_2} \right) N_1, \frac{dN_2}{dt} = r_2 \left(1 - \frac{N_2}{K_2} + \beta \frac{N_1}{K_1} \right) N_2$$

Using α to express the contribution rate of B organization to the A organization innovation output level, β expresses the contribution rate of the A organization to the B organization innovation output level, $\alpha > 0$, $\beta > 0$.

When the organization competition reaches the equilibrium state, there are: $\frac{dN_1}{dt} = \frac{dN_2}{dt} = 0$.

Its solution is: $N_1 = \frac{K_1(1 + \alpha)}{1 - \alpha\beta}$, $N_2 = \frac{K_2(1 + \beta)}{1 - \alpha\beta}$

$\alpha\beta < 1$ is the condition that the cultural innovation organization should meet the equilibrium state.

From the equilibrium conditions can be drawn: in limited environment of culture industry innovation, improve on upstream of cultural innovation organizational innovation achievements conversion efficiency of middle and lower reaches of the organizational culture and organization of upstream innovation achievement purchase rate and downstream organization to reach equilibrium.

5 Conclusions

The exchange and flow of information, material and energy between different biological components in the innovation ecosystem of cultural industry promotes the development of the industry. In this paper, the integrated use of ecology theory, collaborative theory, game theory and other theories and methods, systematic study of the structure of ecological environment of cultural industry innovation, defines the basic connotation of ecological environment of cultural industry innovation, analysis the ecological environment government and innovation of enterprise, University and other science research institutions, innovation intermediaries, financial institutions, such as different subjects and interests, was constructed based on the equation of the dynamic mechanism of cultural industry innovation ecological environment dynamic model for the self-organization evolution, and ecological environment of cultural industry innovation collaborative innovation evolutionary game model. In addition, the competition, symbiotic relationships of predation and the three typical relationship of investigate the competition between members of the culture industry innovation of ecological environment organization synergy evolution mechanism, the coordination and Symbiosis Evolution Mechanism. This study argues that cultural industry innovation of ecological environment is an away from the equilibrium state of the open

self-organizing systems, it is in the changing external environment and the organization of the innovation in the system of nonlinear impact and innovation of ecological environment spontaneously from disorder to order, or the order to a higher order state transition process.

Abstract: In order to study the factors of economic growth in different regions of Guangdong Province, this paper uses data collected from 2005 to 2014 and makes regression analysis based on the TFP method. The contribution rate of capital input, labor input and technological progress to economic growth are calculated respectively, and the main motivation of economic growth in the four regions of Guangdong province is explored. It is concluded that economic growth depends largest on technological progress is the Mountain area; Economic growth depends largest on capital input is the Pearl River Delta, the East Wing and the West Wing; Economic growth depends on labor input's contribution rate is generally not high in all areas.

Key words: Total factor productivity; Economic growth; Contribution rate; Motivation

1 Introduction

TFP is total factor productivity, it's an important theory of analyzing economic growth and it divides increasing power into factor inputs and efficiency. The scholars of domestic and foreign on research of TFP and economic growth is extensive, they are mainly focused on the application of the TFP and the development study of TFP. The application of TFP method is mainly shown in: Li Xiaoning (2012) used the Solow model to estimate the rates for total factor productivity growth in China from 1978 to 2010. Hu Angang, Wu Qiong (2001) believed that only when China improves the TFP growth rate, will economic growth be sustained. Ding Xiaofei, Kang Shuo (2010) used the Co-integration regression model, Solow residual value to analysis economic growth factors and found that technological progress is the main driving force of economic growth in Guangdong Province. Dong Minjie (2013) researched on the motivation of China's economic growth source and the characteristics of time and space. Wu Peng, Zhang Ziran (2013) analyzed the contribution of TFP growth and other related elements to economic growth. Zhao Lijuan (2015) studied the contribution of economic structure change to TFP and China's economic growth. Jin Fei (2016) estimated the growth trend of total factor productivity in Germany in 1875~2013 using the capital share method and the measurement method. According to the construction of new urbanization quality evaluation index system, He Wenju (2016) analyzed the impact path of Hunan province's promotion of total factor productivity on the new urbanization quality.

The research on the development study of TFP is mainly shown in: Zhang Xueliang, Sun Haiming (2009) using the non-parameter method of DEA, dividing the Yangtze River Delta region's economic growth into four parts of the physical capital accumulation, efficiency improvement, technological progress and human capital input. Zheng Yuxin (2007) from the perspective of the popular TFP measurement method, discussed the limitation of total factor productivity of economic growth quality. Fu Chun (2012) using Romer's endogenous economic growth model and total factor contribution model to calculate the contribution value of the provincial natural resources and other factors on economic growth. With changes in TFP by innovation and technological progress, Hu Pei (2016) introduced variables of trade innovation and that innovation can reduce transaction costs which can promote the division of labor specialization and the total factor productivity of a country.

Guangdong province is China's Economic province with largest population and most open society and culture. Since the reform and opening up more than forty years ago in 1978, Guangdong has made great achievements in economic development, whose total amount of GDP is in the leading level of all the provinces. In the development of socialist market economy, Guangdong made creative practice and achieved a new progress in the economic field. Guangdong Province has a total of 21 urban areas which is divided according to the economic region into four parts as: The Pearl River Delta, East wing, West Wing and the Mountain. Cities included are in the following table 1. Although the overall level of economic development in Guangdong is at the forefront of the whole country, the development of its various regions is different. Previous studies focus on the whole country's or the whole province's TFP

measurement, the sub-regional research has not yet been carried. In order to study the actual development of the various regions of Guangdong, this paper using the total factor productivity method to analyze economic growth of Guangdong Province, explore the main motive factors of regional economic growth.

Table 1 Zoning of Guangdong Province

Regions of Guangdong	Including cities
the Pearl River Delta	Guangzhou, Shenzhen, Zhuhai, Foshan, Dongguan, Zhongshan, Jiangmen, Huizhou, Zhaoqing
the East Wing	Chaozhou, Shantou, Jieyang, Shanwei
the West Wing	Yangjiang, Maoming, Zhanjiang
the Mountain	Heyuan, Meizhou, Shaoguan, Qingyuan, Yunfu

2 Models, Methods and Data Collection

2.1 Total factor productivity measurement model

Total Factor Productivity is also known as the “Solow residual value” which is proposed by American economist Robert Solow in the earliest (1957). It is a measure of the total productivity index, the ratio of total yield and all the factors inputs ratio. The growth rate of total factor productivity is often regarded as the index of scientific and technological progress. TFP abandoned the traditional productivity analysis with only labor and capital two inputs, but taking the technological progress into account in the production function. Due to the widely use of total factor productivity to calculate the rate of economic growth, TFP has been a mature and universal method. Thus, the direct use of TFP combined with Douglas production function are to calculate the economic factor of different areas of Guangdong Province in this paper. Productivity function is:

$$Y_t = A(t)K_t^\alpha L_t^\beta \tag{1}$$

Wherein, Y represents total output, A represents technological progress, K is capital input, L is labor input, t is time, each variable is changing with time. α , β respectively represents the elasticity of capital output and elasticity of labor output. Note that it is generally assumed that technological progress is Hicks neutral, that is, for a given amount of human capital, the ratio of the marginal products remains the same, and technological progress is at a constant exponential rate. Take:

$$A_t = A_0 e^{\lambda t} \tag{2}$$

Wherein, A_0 represents the initial level of technology, t represents time, λ represents that technology advances at the rate of λ exponential growth over time. Take (2) into (1), we have:

$$Y_t = A_0 e^{\lambda t} K_t^\alpha L_t^\beta \tag{3}$$

Logarithmic:

$$\ln Y_t = \ln A_0 + \lambda t + \alpha \ln K_t + \beta \ln L_t \tag{4}$$

Assume constant returns to scale, we get $\alpha + \beta = 1$, then the formula transformed into:

$$\ln(Y/L)_t = \ln A_0 + \lambda t + \alpha \ln(K/L)_t \tag{5}$$

In the formula (5), λ is the growth rate of technical progress, t is the year sequence. Through the logarithmic processing, we eliminated the multiple collinearity and simplified the calculation, to make it easier to solve coefficients. According to the statistics of Y, K and L, we take the least square method of linear regression to obtain the value of A_0, λ, α , then calculate the value of β . And we get the growth rate of technological progress, the output elasticity of capital and labor.

2.2 Contribution rate of economic growth of input elements

According to the growth rate equation, we have:

$$1 = \lambda / y + \alpha k / y + \beta l / y \tag{7}$$

y, k, l represents the growth rate of total output, growth rate of capital input and growth rate of labor input. We give $S_r = \lambda / y; S_k = \alpha k / y; S_l = \beta l / y$, and S_r, S_k, S_l represent the contribution rate to economic growth of technological progress, capital inputs and labor inputs.

2.3 Data selection and explanation

This paper selects a panel data from 2005 to 2014 of four regions in Guangdong Province, the data

are collected from the 《Guangdong Provincial Statistical Yearbook》. According to the scientific and data available principle of total factor productivity model, we choose GDP of Guangdong province as the total output Y. In order to make the price comparable, this paper converted the GDP price of 2005-2014 years to the GDP price of year 2000. Capital input(K) selects the year's total fix assets, the same, converted into the 2000 price. Labor input(L) selects the employment population of the year.

3 Empirical Analysis

3.1 Parameter estimation and Interpretation

According to the data of four regions of Guangdong province from 2005 to 2014, this paper use EViews9.0 software to estimate parameter in model (5), we get regression equation of the Pearl River Delta region as follows:

$$\ln(Y / L) = -0.906572 + 0.10834t + 0.655045 \ln(K / L) \tag{8}$$

Se	(0.313281)	(0.049424)	(0.115669)
t	(-2.893796)	(2.392071)	(5.663114)

R2=0.987544 F=277.4912 P=0.000 DW=1.87

Upon examination, the above equation does not exist auto correlation, heteroscedasticity and multiple collinearity. As can be seen in the regression results, the overall fitting effect of the equation is good. When the level of significance is 5%, the coefficients of λ and α are significant, elasticity of capital output is $\alpha=0.655045$, elasticity of labor output is $\beta=1-0.655045=0.344955$. From the economic meaning, the stock of fixed assets of the Pearl River Delta region increased every 1%, the local GDP will increase by 0.655045 percent; Every 1% increase in employment, the local GDP will increase by 0.344955 percent; $\lambda=0.10834$, indicating that TFP annual growth rate is 0.10834 percent.

Similarly, we get the regression equation of the East Wing:

$$\ln(Y / K) = -0.796333 + 0.036273t + 0.599161 \ln(K / L) \tag{9}$$

The elasticity of capital output is 0.599161, and the elasticity of labor output is 0.400839, $\lambda=0.036273$.

The regression equation of the West Wing:

$$\ln(Y / L) = -0.979066 + 0.230767t + 0.386689 \ln(K / L) \tag{10}$$

The elasticity of capital output is 0.386689, and the elasticity of labor output is 0.613311, $\lambda=0.230767$.

The regression equation of the Mountain:

$$\ln(Y / L) = -1.266829 + 0.331278t + 0.303952 \ln(K / L) \tag{11}$$

The elasticity of capital output is 0.303952, and the elasticity of labor output is 0.696048, $\lambda=0.331278$.

3.2 Estimation of the contribution rate to economic growth

According to the regression results, the factors' growth rate and the contribution rate of the economic growth are calculated as follows.

3.2.1 Factors' growth rate and contribution rate of the Pearl River Delta calculated from formula (8)

Table 2 Data of Factor Growth and Contribution Rate of the Pearl River Delta

Year	y	k	l	S _k	S _l	S _r
2006	0.186372	0.119405	0.050072	0.419675	0.092679	0.487646
2007	0.187837	0.158458	0.048398	0.552593	0.088881	0.358526
2008	0.162494	0.133043	0.040225	0.536320	0.085392	0.378288
2009	0.073511	0.226660	0.055601	2.019721	0.260909	-1.280630
2010	0.178195	0.182458	0.046866	0.670715	0.090724	0.238560
2011	0.155112	0.089026	0.016294	0.375960	0.036236	0.587804
2012	0.093114	0.129984	0.002375	0.914418	0.008800	0.076782
2013	0.114659	0.147166	0.039918	0.840755	0.120094	0.039151
2014	0.081458	0.094287	0.016162	0.758209	0.068442	0.173349
Average Value	0.136973	0.142276	0.035101	0.787596	0.094684	0.117720

According to the data showed in the table 2, capital input in the Pearl River Delta contributes most

to the economic growth of Guangdong Province. The second factor is the technological progress whose contribution rate is 0.11772. And the lowest contribution rate to economic growth is the labor input with an average value of 0.094684. Technological progress, capital and labor inputs' contribution to the economic growth is fluctuating in a given period. Among them, technological progress and capital input remained a rising trend in constant fluctuation of contribution rate to economic growth, but fluctuation of the labor factor stays a stable state of the contribution rate to economic growth.

3.2.2 Factors' growth rate and contribution rate of the East Wing calculated from formula (9)

Table 3 Data of Factor Growth and Contribution Rate of the East Wing

Year	y	k	l	S _k	S _l	S _r
2006	0.144001	0.212213	0.045356	0.882977	0.126252	-0.009229
2007	0.180447	0.242082	0.006056	0.803817	0.013453	0.182730
2008	0.184740	0.220950	0.015072	0.716599	0.032703	0.250698
2009	0.106265	0.320365	0.028856	1.806325	0.108845	-0.915170
2010	0.157907	0.296811	0.024626	1.126222	0.062513	-0.188735
2011	0.170509	0.101183	0.005667	0.355551	0.013322	0.631126
2012	0.122393	0.163918	-0.006124	0.802444	-0.020056	0.217613
2013	0.119303	0.229947	-0.001840	1.154840	-0.006181	-0.148660
2014	0.092573	0.251290	-0.005954	1.626435	-0.025780	-0.600655
Average Value	0.142015	0.226529	0.012413	1.030579	0.033897	-0.064476

According to the data showed in table 3, capital input of the East Wing's contribution to economic growth rate is the largest, followed by labor input, the contribution rate of technological progress is minimum with an average value of -0.064476, indicating that technological progress has a slight inhibition to economic growth on East Wing in 2005-2014. Wherein the contribution of capital input to economic growth maintain the upward trend in recent years; labor input to economic growth showed a slow downward trend and technological progress contribution rate showed a negative tendency.

3.2.3 Factors' growth rate and contribution rate of the West Wing calculated from formula (10)

Table 4 Data of Factor Growth and Contribution Rate of the West Wing

Year	y	k	l	S _k	S _l	S _r
2006	0.181412	0.199992	-0.028047	0.426293	-0.094819	0.668525
2007	0.149245	0.065210	0.007027	0.168956	0.028877	0.802166
2008	0.185220	0.204562	-0.007843	0.427069	-0.025969	0.598899
2009	0.057093	0.326340	0.009784	2.210293	0.105102	-1.315395
2010	0.203967	0.353851	-0.000492	0.670847	-0.001481	0.330634
2011	0.198468	0.005092	0.025240	0.009921	0.077997	0.912082
2012	0.111941	0.341252	-0.000895	1.178822	-0.004903	-0.173919
2013	0.131139	0.385252	0.005344	1.135988	0.024991	-0.160979
2014	0.091854	0.232901	0.005652	0.980473	0.037740	-0.018213
Average Value	0.145593	0.234939	0.001752	0.800963	0.016393	0.182645

The data in the table 4 shows that the capital's contribution rate to economic growth of the West Wing is the highest with an average contribution rate of 0.800963. Followed by the technological progress whose average value is 0.182645. the lowest contribution rate to economic growth rate is labor input. Trends in capital and labor inputs are basically the same, the overall contribution rate is increased, while the contribution rate of technological progress is showing a slow decline in the overall dramatic fluctuations.

3.2.4 Factors' growth rate and contribution rate of the Mountain calculated from formula (11)

Table 5 Data of Factor Growth and Contribution Rate of the Mountain

Year	y	k	l	S _k	S _l	S _r
2006	0.211437	0.281273	0.005921	0.404346	0.019492	0.576162
2007	0.254640	0.374057	0.014926	0.446495	0.040800	0.512705
2008	0.201355	0.217372	0.000133	0.328130	0.000460	0.671410
2009	0.074102	0.244727	0.011558	1.003820	0.108566	-0.112386
2010	0.114680	0.034733	0.004846	0.092056	0.029413	0.878531
2011	0.170650	0.050470	0.011679	0.089895	0.047636	0.862469
2012	0.083806	0.001698	0.002404	0.006158	0.019968	0.973874
2013	0.102184	0.233955	0.004778	0.695911	0.032543	0.271546
2014	0.096201	0.217154	0.005735	0.686113	0.041493	0.272394
Average Value	0.145450	0.183938	0.006887	0.416992	0.037819	0.545189

According to the data in the table 5, the contribution rate of technological progress of the Mountain was the highest in 2005-2014 with an average contribution rate of 0.545189, which is the highest technological contribution value in the four regions in Guangdong Province. Contribution rate to economic growth ranked second is the capital input with an average value of 0.416992. At the bottom is still labor input's contribution to economic growth. Changes in capital and labor inputs is consistent, and the overall trend is rising, while the technological progress contribution rate is showing a general downward fluctuation.

4 Conclusions

4.1 The region in which economic growth depends largest on technological progress's contribution rate is the Mountain in Guangdong Province

Shaoguan, Heyuan, Qingyuan, Yunfu and other cities in the Mountain area is the gathering place of the industrial park. For those manufacturing enterprises, inputs in technology occupy a large proportion. Shaoguan, Meizhou and Yunfu are rich in mineral resources which may also need certain techniques for the exploitation of mineral resources. Yunfu City committed to education development and institutional innovation with 5 Industry-Academic-Research Innovation Alliances, 3 demonstration bases and implementing 110 provincial science and technology projects, which pushed up the overall technological contribution rate of the Mountain area of Guangdong Province.

4.2 The region with the highest contribution rate of capital input is the Pearl River Delta, the East Wing and the West Wing

Guangzhou, Shenzhen, Zhuhai, Shantou are China's earliest open coastal cities and special economic zones in the Pearl River Delta and the East Wing. The Pearl River Delta district is the most developed region in Guangdong Province, relying on its geographical advantage, the foreign trade and economic cooperation could be developed. It is also the world's well-known manufacturing exports and the most important world industrial transfer place, so the accumulation of capital is abundant. Among them, Guangzhou, Shenzhen, Foshan are significant commercial cities which are also comprehensive industrial manufacturing center and high-tech industrial bases. A large number of commodity circulation and products have also become an important part of capital accumulation in the Pearl River Delta; Jiangmen and Huizhou are rich in marine resources and fresh water resources. The West Wing area of Zhanjiang, Maoming, Yangjiang are the northern economic circle of Guangdong, although they are not so developed when compared with the Pearl River Delta's economy, they have rich marine resources, mineral resources, etc. It's primary industry such as agriculture is the most developed area in Guangdong Province, the capital is substantial.

4.3 The labor's contribution rate to economic growth in all regions of Guangdong province is generally not high

Guangdong Province's overall labor contribution rate is relatively low, considering that Guangdong

is located in the coastal zone, not only trade activities between various commodities are large circulation, but also marine resources and mineral resources are available which forming a natural accumulation of capital. In addition, due to the developed economy of Guangdong Province, advanced technologies have been applied to attract a large number of outstanding talents which enhance the overall innovation capability of Guangdong province. These two factors of capital input and technological progress made great contributions to the economic growth of Guangdong Province, crowding out the contribution of labor input. As a result, the labor input's contribution rate to economic growth is relatively low.

Detecting Hot Issues on Sports Management Research from Common Key words in Literature

Tian Huayun

Department of Physical Education, Wuhan University of Technology, Wuhan, P.R.China, 430070

(E-mail: 328020870@qq.com)

Abstract: In order to figure out the related results of China's sports management and its future trends, this paper aims to do keyword co-word analysis, clustering analysis and multi-dimensional analysis on 442 documents of CNKI (China national Knowledge Infrastructure). The result shows that China's sports management research includes four aspects: the development of sports management systems under the background of national policy; the present situation and countermeasures of the development of sport management in school especially in colleges; the reform and innovation of sports management as well as the corresponding problems; and the sports management and operation mechanism of community sports, college physical education and competitive sports.

Key words: Co-word analysis; Sports management; Hot issue

1 Introduction

Sports management refers to the process of activity that managers of certain sports organizations achieve established goals through carrying out the functions of decision-making, organization, administration, control and innovation, and so on (Zeng Yonghe ,2012). In the process of social and economic development, the development of sports management also experiences evolution. In the meantime, the researches concerning sports management have always been the important fields in the study of major academics in sports circle. Some scholars defined its' subject. For example, Wen Haiyan, Xiong Wen and Ji Liu (2012) positioned on the role that the subject of sports management played in the sports management in our country, and they also analyzed the management function of the administrative subject. Besides, Li Yuan and Wang Li (2014) studied on the process of development in structure of knowledge, theoretical evolution and its characteristics of Chinese sports management. From the sorting of the above-mentioned study results concerning to the sports management, we are easy to conclude that the method that the above researches adopted is traditional literature statistics method and it focuses on one aspect of relevant fields of sports management, which can reflect the research results of one aspect within a certain period, but it is difficult to clearly present the skeleton of the relevant research on sports management and can't grasp the profound relationship between the different aspects of the field, which are also the unavoidable defects of the traditional literature review study. With the application of analysis method of scientific measurement, the research of large sample documents becomes more and more convenient, and especially the development of mapping knowledge domain has profoundly changed the way of researchers' dealing with literature. Co-word analysis is one of the common methods of mapping knowledge domain and it is a method of utilizing the co-occurrence of vocabulary group or noun phrase in literature to determine the relationship between every subject of the discipline that literatures represent. It is generally acknowledged that the higher frequency of appearance of vocabulary group in the same document represents closer relationship between the two subjects. Therefore, through counting the frequency of occurrence of a group of subject terms in literature, it can form a co-word net consisting of the association of vocabulary group, and the distance between nodes in the net can reflect close or distant relationship of subject content (Guo Wenbin,2015). Generally, the co-word analysis of key words is most commonly used. In the aspect of application of methods, co-word analysis of key words is a kind of method that regards the subject terms as analysis object and adopts cluster analysis, multi-dimensional scaling analysis and other multivariate statistics methods and applies data visualization techniques to simplify the intricate relationship of co-word net so that it can be visually displayed in the form of graph and image (Wang Tingzhao, et al ,2015). Adopting the method of co-word analysis to deal with and analyze the research results in the field of sports management, we expect to find the research focus on the interdiscipline linked by sports management and to get the cutting-edge information in the field of sports management and also to detect the hot issues and direction of the following-up study on sports management.

2 Data Sources and Research Methods

2.1 Data sources

The first step is to look up relevant information. We choose the famous database, China Academic

Journal Network Publishing Database, as our main data sources. We adopt standard retrieval and confine the publication date to a certain interval, the date from January 1, 2011 to April 30, 2016. By inputting the Key words “sports management” on the database, we get 2,596 initial literatures. The second step is to choose the effective information. After excluding non-investigative articles, such as the repetitive literature, conference notice, call for papers, news report, personage introduction, book and film review and so on, we get 442 effective literatures. The final step is to standardize the information. With the effective literatures confirmed, we standardize the Key words to eliminate the meaningless Key words and unify the synonymous or near synonymous Key words, for example, we unify the keyword “university sports” as “college physical education”.

2.2 Research method

This paper uses Bicom (co-word analysis software) and SPSS20.0 as its' main research tools. In the paper, Bicom is especially used to count the Key words and to set up matrix of Key words. The specific operation is like the following: Firstly, run the software Bicom and extract the target text that is exported from CNKI. Secondly, standardize the Key words. Thirdly, count the Key words and extract the Key words whose frequency is greater than or equal to a certain number as the main Key words. Next, analyze the matrix of the main Key words and export it. Then, apply SPSS20.0 to make cluster analysis and multi-dimensional scaling analysis. The specific operation is like this: first of all, import the matrix of Key words to SPSS20.0, and adopt sample cluster analysis to get the tree graph of the cluster of Key words. Then, according to the result of cluster, make multi-dimensional scaling analysis towards the matrix of the Key words and make the graph of research hotspot of visual disturbance.

3 Research Results and Analysis

3.1 The analysis of high frequency Key words

Key words can make readers understand research topic in the most concise way, so the statistics of them can help us intuitively know the research hotspot in a certain field. After having a statistics towards the Key words of 442 research literatures, we get 1,872 effective Key words, among which the frequency is greater than or equal to 7 are extracted in table 1. Excluding the searching keyword, “sports management”, and the subject Key words, “management system” and “structural reform”, there are 18 Key words whose statistics of frequency are greater than 9. They are counted as follows: college (33), the system of sports management (24), mass sports (23), competitive sports (22), management (21), management models (19), college physical education (17), development countermeasures (17), sports management of school (16), school physical education (15), current situation (14), community sports (14), innovation (13), the system of the whole country (11), science of sports management (11), the management of community sports (11), problems (10), sports business (10).

Table 1 The Rank of 27 High Frequency Key words

number	Key words	frequency	number	Key words	frequency
1	Sports management	162	15	Community sports	14
2	Management system	41	16	Innovation	13
3	College	33	17	The system of the whole country	11
4	Structural reform	28	18	The science of sports management	11
5	The system of sports management	24	19	The management of community sports	11
6	Mass sports	23	20	problems	10
7	Competitive sports	22	21	Sports business	10
8	management	21	22	Sports management major	9
9	Management models	19	23	Sports management of college	8
10	College physical education	17	24	Operational mechanism	8
11	Development countermeasures	17	25	Professional sports	8
12	Sports management of school	16	26	The management of competitive sports	7
13	School physical education	15	27	Sports organization	7
14	Current situation	14			

3.2 Ochiai coefficient similar matrix of high frequency Key words

The analysis of similar matrix towards Key words can help to investigate the similarities between the Key words. This paper adopts the software, Bicomb, to analyze the above 27 Key words and generates the matrix of Key words. The next step is to import the matrix of Key words to SPSS20.0 and choose Ochiai coefficient and then convert it to a (27×27) similar matrix, as shown in table 2.

Table 2 Ochiai Coefficient Similar Matrix of High Frequency Key words (partial data)

	Sports management	Management system	college	Structural reform	The system of sport management	Mass sports	Competitive sports	management	Management models	College physical education
Sports management	0.000	0.951	0.713	0.881	1.000	0.885	0.966	1.000	0.964	0.943
Management system	0.951	0.000	1.000	0.705	1.000	0.837	0.634	1.000	1.000	1.000
college	0.713	1.000	0.000	0.934	1.000	1.000	1.000	0.886	0.920	1.000
Structural reform	0.881	0.705	0.934	0.000	0.807	1.000	0.879	0.918	1.000	1.000
The system of sports management	1.000	1.000	1.000	0.807	0.000	0.915	0.956	1.000	0.953	1.000
Mass sports	0.885	0.837	1.000	1.000	0.915	0.000	1.000	1.000	0.952	1.000
Competitive sports	0.966	0.634	1.000	0.879	0.956	1.000	0.000	0.860	0.902	1.000
Management system	1.000	1.000	0.886	0.918	1.000	1.000	0.860	0.000	1.000	0.947
Management models	0.964	1.000	0.920	1.000	0.953	0.952	0.902	1.000	0.000	0.833
College physical education	0.943	1.000	1.000	1.000	1.000	1.000	1.000	0.947	0.833	0.000

In the matrix, every numerical value tells the similarity and distance between the Key words in the row and its' counterparts in the column. The numerical value more approximates to one, the closer distance between the Key words in the row and its' counterparts in the column, so the more similarities they have. On the contrary, the numerical value more approximates to zero, the farther distance between the Key words, which indicates the more differences they have. According to the data in table 2, we can see that most of the numerical values approximate to one, which indicates that there is a close relationship between the research hotspots in the fields of sports management; meanwhile, it reflects that the disciplinary boundary of the relevant research is not very distinct and there are lots of cooperation of interdiscipline and overlapped hotspots.

3.3 The cluster figure of high frequency Key words and analysis

In order to further detect the connection between high frequency Key words, this paper adopts SPSS20.0 to make a systematic and successive cluster analysis, with the result of it shown in figure 1. According to the result of cluster analysis, we can classify 27 Key words into three main types. Type 1 is the operational mechanism of sports management as well as the relevant research of development situation and countermeasures, which consist of two subcategories. Subcategory 1 is about the research on operational mechanism of sports management, and the Key words it contains are professional sports, competitive sports management, mass sports, operational mechanism, management system, competitive sports, structural reform and the system of the whole country. Subcategory 2 is about the research on the development situation and countermeasures of sports management, which mainly consist of six Key words including problems, sports management of college, development countermeasures, current situation, the system of sports management and sports management of community. Type 2 relates to the research on sports management of school or relevant organization of sports business, which include five Key words: they are sports management, college, sports business, sports organization, sports management of school. Type 3 is the research on the management models and innovation of college or community sports, especially on the aspect of school sports management major, of which seven Key words are included: they are management models, innovation, college physical education, management, community sports, school physical education and sports management major.

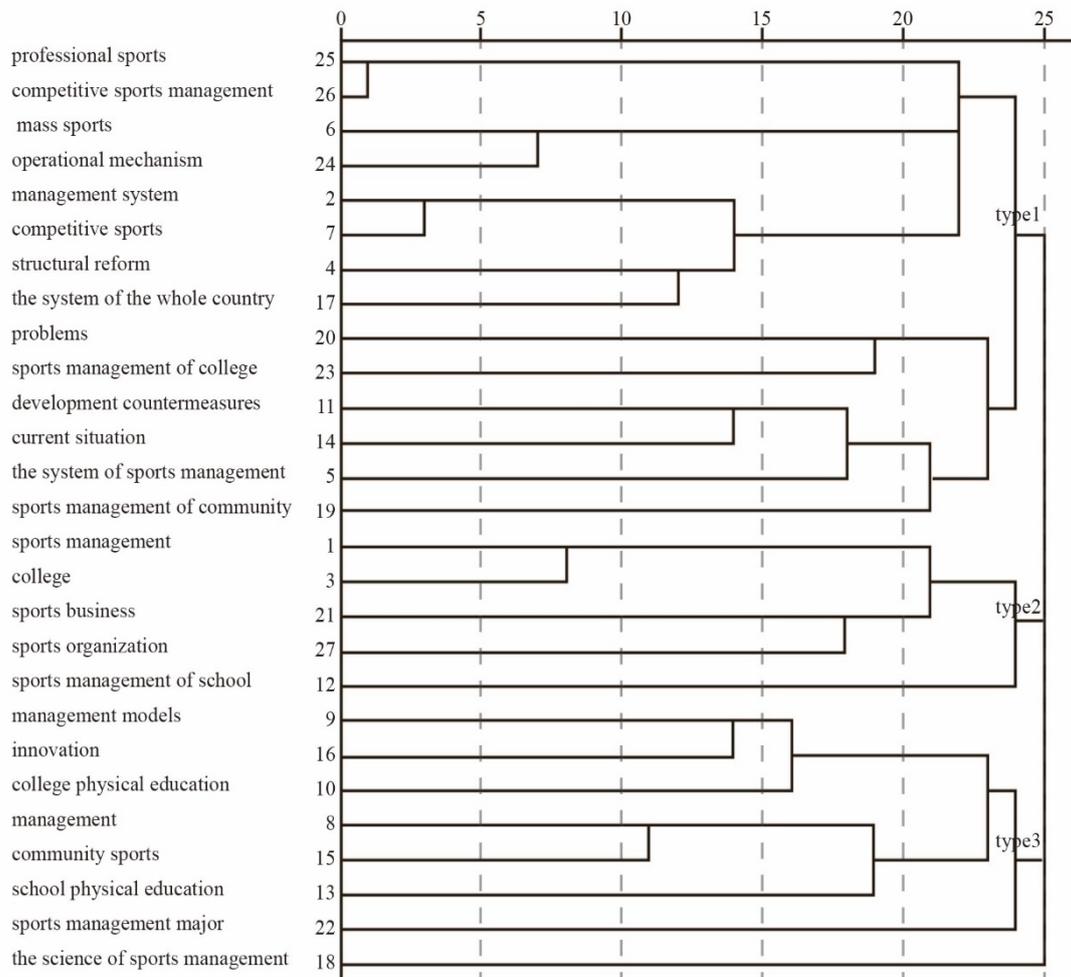

Figure 1 The Cluster Figure of High Frequency Key words about Sports Management

3.4 Mapping knowledge domain of hotspot and its analysis

Multi-dimensional scaling analysis can be regarded as a map of knowledge of a certain research field, which can vividly show the core structure, the history of development, the cutting-edge research and the overall structure of knowledge through its' visualized graph. Multi-dimensional scaling analysis can provide us with a strategic diagram, in which the Key words with high similarity gather together to form the research hotspot of discipline. Besides, the closer a keyword stands to the center, the more related Key words it has, and also the more important role it plays in the research fields. On the contrary, the further a keyword keeps away from the center, the less related Key words it has and the less important role it plays in the research fields. Therefore, multi-dimensional scaling analysis makes it easy to make out the position of academic hotspot and academic fields in research fields. Compared with the cluster figure, multi-dimensional scaling diagram can clearly show the close or far relationship between Key words through its' plane distance, so it is easier for us to judge the position of research domain in discipline (Cottrill CA, Rogers A M, Mills, T1989). In order to eliminate the negative effects that excessive numerical value "0" in the matrix has on the research results, we convert the similar matrix in table 2 into dissimilarity matrix. Then adopt SPSS20.0 to make multi-dimensional scaling analysis, and combine it with the result of cluster analysis to finish the mapping knowledge domain of the relevant research on the sports management fields, as shown in figure 2.

On the basis of the result of multi-dimensional scaling analysis and cluster analysis, and combine it with the relevant literatures about sports management research, we finish the mapping knowledge domain of research hotspots on sports management, as shown in figure 2, in which research hotspots on sports management include four main areas: area 1 is the development of sports management systems under the background of national policy; area 2 is the present situation and countermeasures of the

development of sports management in school especially in college; area 3 is the reform and innovation of sports management as well as corresponding problems; area 4 is the sports management and operational mechanism of three main fields—community sports, college physical education and competitive sports.

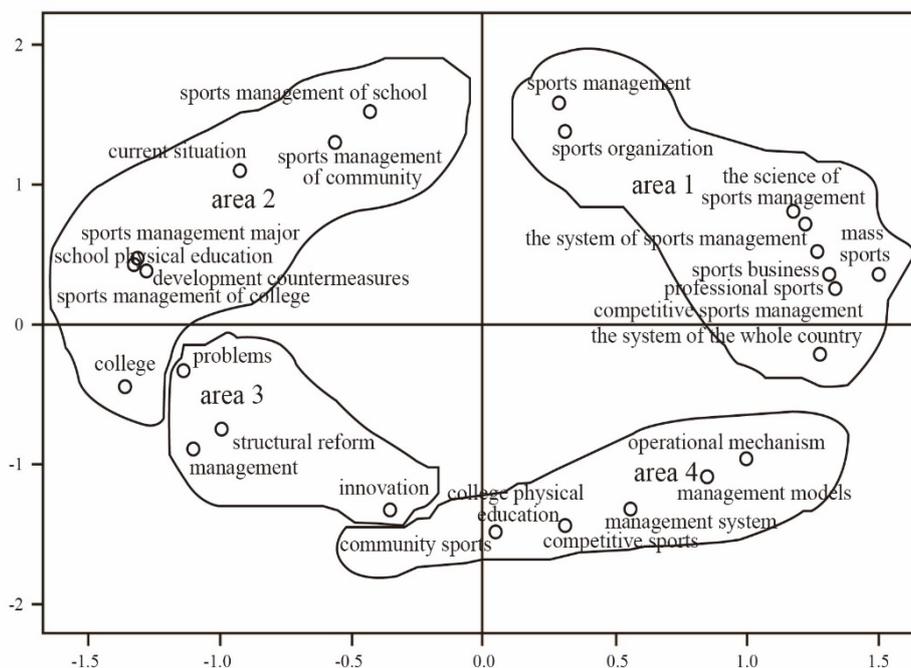

Figure 2 Mapping Knowledge Domain of Research Hotspot on Sports Management

Area 1 mainly involves the development of sports management systems under the background of national policy, which includes ten Key words. They are sports management, sports organization, the science of sports management, the system of sports management, sports business, mass sports, professional sports, competitive sports management and the system of the whole country, among which the keyword “the system of sports management” is in the centre position of the area, so the research of this area mainly focuses on it. Besides, in terms of the focus of literature aspect, it mainly includes competitive sports management, the research on the system of the whole country as well as the limitation and superiority of the system of Chinese sports management (Zhou Jian-xin,2014), and so on.

Area 2 mainly involves the present situation and countermeasures of the development of sports management in school especially in college, in which eight Key words are included: they are sports management of school, sports management of community, current situation, sports management major, school physical education, development countermeasures, sports management of college and college. The research topic on this area is very distinct, which mainly focuses on the sports management of school. Through combining the analysis with literatures, we conclude two main aspects: one is the development situation of spots management in school, the other is the research on the development situation of sports management major in Chinese university and its’ countermeasures (Zhang Mao-lin,2013).

Area 3 is mainly about the reform and innovation of sports management as well as problems caused by them, which contains four Key words: problems, the reform of the system, management and innovation. The relevant research of the reform and innovation of sports management as well as its’ problems mainly centre on the reform of the system. Besides, the impetus and trend of the reform of Chinese sports management become the focus of literature.

Area 4 mainly involves the sports management and operational mechanism of three main fields—community sports, college physical education and competitive sports, which include six Key words: they are operational mechanism, management models, and the system of management, competitive sports, and college physical education as well as community sports. According to the analysis of literature, there are more research results on the competitive sports management and operational mechanism, which shows the focus of research falls on them.

In the strategic coordinate, x-axis indicates centripetal degree and it can reflect the intensity of interplay between the areas. Y-axis indicates density, which reflects the intensity of internal relations within a certain area. The diagram divides the topic of area in two-dimensional space into four quadrants, and words group distributed in different quadrants indicate different meanings. Specifically speaking, in the first quadrant, both the density of words group and centripetal degree are in a high level, which implies the extensive connection between the words group and others, and of course, the words group is the core of the research. In the second quadrant, words group is in a position of the edge, but it has been concerned and well-studied. In the third quadrant, both the density of words group and the centripetal degree are in a low level, which indicates that the words group is in the edge of the research fields and the research is not very mature. In the fourth quadrant, the centripetal degree of words group is high, but the density of it is low, which means that the research area that the words group constitute is also the core of research; nonetheless, the research on it is immature. According to figure 2, we can find that the research of area 1 is the fundamental research that bases on the sports management itself, and it belongs to the past research hotspot, so the research of it is relatively mature. Besides, in the area 2, the relevant research on present situation and countermeasures of the development of sports management in school especially in college is in the edge of words group, but it has been concerned and has a large room to research in the future. The words group of the third quadrant is in the edge position and it belongs to immature research. In area 4, the Key words “college physical education”, “competitive sports” approach to the side of higher numerical values on x-axis, and the research of it is more mature.

4 Conclusions

In conclusion, in terms of Chinese sports management, we have made fruitful achievements in relevant research, and there are a large number of literatures and high frequency Key words. Additionally, the Ochiai coefficient matrix of high frequency Key words implies extensive cooperation of interdiscipline. The cluster figure and mapping knowledge domain clearly show the research hot spots concerning Chinese sports management. Particularly, mapping knowledge domain shows four main areas of research on sports management, which are as follows: the development of sports management systems under the background of national policy; the present situation and countermeasures of the development of sports management in school especially in college; the reform and innovation of sports management as well as corresponding problems; the sports management and operational mechanism of three main fields—community sports, college physical education and competitive sports. Overall, we should attach more importance to the research of sports management in various fields and enhance the cooperation of interdisciplinary research. Besides, the relevant research of sports management should be developed from the four main fields. We should deeply explore the research achievements of sports management, then based on that, making up the deficiency of the current research and promoting the vigorous development of the relevant research on sports management system.

Present Situation and Countermeasures of Universities' Technology Innovation in China

Li Lvcheng, Cheng Guoping

School of Management, Wuhan University of Technology, Wuhan, P.R.China, 430070

(E-mail: lilvcheng@126.com, Chenggp@whut.edu.cn)

Abstract: Based on the technology statistical data of colleges and universities published by the science and technology department and the ministry of education of China, this article argues that China's colleges and universities are the important force of technology innovation in China. However, the government's investment for scientific research of university is not enough and the scientific research achievements conversion rate of colleges and universities are not high. The support for application research is also insufficient. All of these restrained the development of technological innovation of China's colleges and universities. This article proposes that the government should attach more importance on universities' application research, set up the technology innovation promotion fund, increase the amount of funding for colleges and universities and establish reasonable and unified technology innovation evaluation system of colleges and universities.

Key words: Colleges and universities; Technology innovation; Situation analysis; Countermeasure research

1 Introduction

Science and technology is the motive power of the economic development. After the agricultural economy and industrial economy era, knowledge economy become the main subject in 21st century. Many countries in the world attach great importance to science and technology innovation. For example, as the world's strongest technological country, the United States has formulated a programmatic document of science and technology innovation "American innovation strategy" since 2009¹. The contribution rate of science and technology to social economy of America reaches up to 80%. After the world war II, Japan began to innovate rather than the technology imitation, which benefits from the implementation of the strategy of "technology based state". European science and technology innovation is successful. Germany has many global-level technological companies; Britain is the cradle of scientific and technological innovation; France formulated "the science and technology progress law" after world war II; Ireland believes that scientific and technological innovation is essential and it transforms from an agricultural country into the "silicon valley" in Europe; South Korea become a typical emerging industrialized country under the guidance of "the law of promoting technology", "technology development promotion law", "science and technology basic law" and other legal documents². All of these performance is closely related to the national innovation of colleges and universities. On the one hand, education in universities has cultivated a large number of innovative talents to realize the government policy goals and also become the technology providers of the enterprises (Zhao Hongzhi, Liu Fengchao, Jiang Binbin, 2014). On the other hand, universities are the cluster of scientific researchers and the origin of scientific achievements. The position and role of the colleges and universities in the national innovation system are very important.

There have been abundant researches on universities and colleges technology innovation up until now. Huang Haiyang (2013) used the regression analysis to obtain the equation for technology innovation diffusion in universities and give a predictive analysis based on bass model. Wang Zhejiang (2015) concluded that universities which undertake the task of research and teaching are the source of innovation and innovation system which regards the universities as the core is built under the dimensions of concept, structure and system. Guo Jinchao (2015) believed that it's necessary for the university to have a correct understanding for the combination between university-industry collaboration and technological innovation to reform the mechanism of technological innovation management system. Fu Liping(2015) hold the view that there is a spatial correlation and dependence between the innovation output of the universities and

enterprises. Liu Bin (2016) distinguished the difference of the cooperation categories and conducted the research on the influence of geographical distance to the collaboration between universities and innovation performance based on the patent data of domestic cooperation of colleges during 1985 to 2008.

2 Present Situation of the Technology Innovation of Colleges and Universities in China

2.1 Great scientific and technological innovation achievements of colleges and universities have been made in China

2.1.1 Colleges and universities are the major force of China's technology innovation

According to the 2015 compilation of science and technology statistics of colleges and universities issued by the ministry of education of China, in 2014, there were 1146 Chinese colleges and universities (including 109 "211" and provincial colleges and universities) with teaching and scientific research personnel 920007 person(including 884317 scientists and engineers); 369510 research and development personnel(including 362272 scientists and engineers); 221674 researchers and development full-time staffs(including: 217328 scientists and engineers); 44508 R&D achievements application and technology service personnel(including 43706 scientists and engineers); 26696 R&D achievements application and science and technology service full-time staffs(including 26211 scientists and engineers). According to 2014 R&D activity analysis of colleges and universities in China released by the ministry of science and technology of China, in 2014 China's R&D full-time personnel of colleges and universities was 335000, increasing 3.1% compared to the previous year, accounting for 9.0% of the total number of national R&D personnel; there were 10632 R&D institutions of higher learning, increasing 790 compared to the previous year. The data shows that R&D personnel in China's colleges and universities increases year by year since 2000. Chinese colleges and universities are the major force of China's technology innovation.

Table 1 Technology Human Resource in Colleges and Universities in China

	teaching and scientific research personnel (person)	research and development personnel (person)	researchers and development full-time staffs (person year)	R&D achievements application and technology service personnel (person)	R&D achievements application and science and technology service full-time staffs (person year)
Total	920007	369510	221674	44508	26696

(Data resource: 2015 science and technology statistical data collection of colleges and universities issued by the ministry of education of China)

2.1.2 Colleges and universities are the cradle of China's technology innovation

According to the 2015 compilation of science and technology statistics of colleges and universities issued by the ministry of education of China, in 2014 China's colleges and universities completed 421612 scientific research items and obtained 32 national natural science awards, 57 National technological invention prizes, 186 National science and technology progress prizes, 1135 Progress prizes in science and technology of the various departments of the state council and 3713 science and technology progress award of provinces, autonomous regions and municipalities; published 11804 scientific books, 829873 academic papers; accepted 3694 international projects; applied 144924 patents(including 92975 invention patents, 45079 utility models, 6870 appearance designs); had 82369 patent licenses(including 39294 invention patents, 39069 utility models, 4006 exterior designs); and signed 2257 patent sale contracts (the total amount is 750036000 Yuan and the actual income is 540280000 Yuan), 10517 all kinds of institution of higher learning technology transfer contracts (the total amount is 4012570000 Yuan and the actual income is 2602906000 Yuan).

Table 2 Scientific and Technological Achievements of the Colleges and Universities in China

	scientific books	academic papers	international projects acceptance
Total	11804	829873	3694
	Patent Application	Patent licenses	Patent sale contracts
Total	144924	82369	2257

(Data resource: 2015 science and technology statistical data collection of colleges and universities issued by the ministry of education of China)

2.2 Main problems of technology innovation in Chinese universities

2.2.1 Paying too much attention to basic theory research rather than application research.

For a long time, China's colleges and universities are the important part of national innovation system and they shoulder the task of the basic theoretical cutting-edge research. According to the "2014 R&D activity analysis of colleges and universities in China" released by the ministry of science and technology, universities and colleges ranked the first in terms of basic research activities since 2006, and the R&D funds for basic research was 32.86 billion Yuan in 2014, accounting for 53.6% of the funds of basic research. On the contrary, colleges and universities accounted for 34.1% of the application research funds. Basic research is the core of the national 973 project, 863 project and national natural science funds. It will inevitably lead to the situations that there are more and more frontier achievements of scientific research achievements in colleges and universities but less application achievements. Meanwhile, the economic benefit is not significant and the promotion of the achievement transfer is also difficult.

2.2.2 Scientific research output is large but conversion rate is low

According to the 2014 R&D activity analysis of colleges and universities in China published by ministry of science and technology, the number of patent applications of colleges and universities in China were up to 184000 pieces in 2014, accounting for 6% of the national patent applications, among them, the invention patent applications were up to 112000 pieces. However, the proportion of colleges and universities invention patent applications in the national invention patent applications hovered at about 12% since 2009 and the proportion in 2014 was 12.1%. The number of patent licenses were 92000 pieces, among them, the number of invention patent licenses were up to 38000, only accounting for 16.4% of the national invention patent licenses. Colleges and universities as the seller in the technology market signed 54000 contracts, falling by 5.6% over the previous year, accounting for 18.3% of the national technical contract volume; The turnover of technology contract was 31.51 billion Yuan, falling by 4.3% over the previous year. It accounted for only 3.7% of the national technology contract. It is not difficult to see that although Chinese colleges and universities make great contribution to china's science and technology, the transformation effect of achievements is not obvious.

2.2.3 Investment proportion for university scientific research is low.

According to "2014 China R&D funding characteristics analysis" issued by the ministry of science and technology, in 2014, China's R&D funds was 1.30156 trillion Yuan, and the total input intensity reached 2.05% which was higher than the average input intensity of 28 countries in European union (1.94%). R&D funding that came from enterprise funds was 981.7 billion Yuan, accounting for 75.4% of the R&D funds; Fiscal appropriations of science and technology reached up to 645.5 billion Yuan, accounting for 4.25% of the financial expenditure. Among the national R&D funds, colleges and universities was 89.815 billion Yuan, accounting for 6.9%; among the Colleges and universities R&D funds, the government funds were 53.65 billion Yuan, accounting for 59.7% of the colleges and universities R&D funds; In national R&D funding, government funding in 2014 accounted for 20.25%. The government R&D funding investment in 2014 was $13015.6 * 20.25\% = 263.56$ billion Yuan, and the colleges and universities accounted for only 20.3% of government R&D funding. On the contrary, the R&D funding of colleges and universities in the United States primarily comes from the government funds (90%) (Liu Fengchao, Jiang Binbin ,2013). In terms of human resources, among full-time personnel equivalent of the national scientific research (including basic research and application research), colleges and universities accounted for 49.1% in 2014. It is obvious that the government's investment into colleges and universities scientific research is relatively low.

2.2.4 Performance evaluation index of scientific research in university is biased

Chinese universities are the important force in the national scientific research. How to establish a reasonable performance evaluation system of scientific research has an important impact to stimulate the enthusiasm of teachers and researchers in universities. Currently, the evaluation system of universities in China mainly focus on statistical papers, all kinds of awards (including national, ministries and local government, etc.), the level and quantity of projects, the amount of funds and the number of patent applications. Some colleges and universities directly use these indicators for the assessment of the professional title and department annual assessment. This will inevitably lead to the formalism of technology innovation in colleges and universities. They attach more importance to theory but ignore the application research, which seriously impede the application and transformation of scientific and technological achievements in colleges and universities. Unlike China, other developed countries put more emphasis on the revenue of the technological achievements in the technology evaluation system. Many indicators have been taken into consideration such as transformation rate of scientific research

achievements, the revenue produced by the scientific research achievements, the number of spinouts from the universities, etc.

3 Countermeasures and Suggestions

3.1 Attaching more importance on application research

There are 1146 colleges and universities in China. However, it goes down to 109 when it comes to 211, 985 and national key universities and the rest majority are ordinary universities. From a perspective of staff structure, there are 920007 teaching and scientific researchers in total across Chinese universities in 2014, while only 40%(369510 person) are R&D staffs. The number declines to 4.8% and 44508 respectively when it comes to achievement application and technology service staffs¹. Therefore, there are still many people in Chinese colleges available for scientific research. Application research funds in universities nowadays makes up 34.1% of total Chinese application research funds. What's more, only a few colleges and universities can be called research university. 985 and 211 colleges achieve most national-level research projects. It is perfectly fine for those 985 and 211 colleges to undertake basic research projects. But benefiting people's livelihood and serving people's commonwealth is also the fundamental purpose of scientific research of colleges and universities. So scientific research in Chinese colleges and universities not only need to play a role in basic research for national scientific improvement, but also need to contribute to the development of the market and the economy for meeting the demands of time of "to face the world technological frontier, to face the state's major need and to face the key battleground of national economy". There are amount of talents in Chinese colleges and universities. It is essential to make a difference between the application talents and scientific talents. Both basic and application research should be focused on in colleges and universities. For an ordinary university, basic research should play a pivotal role so as to make full use of all sorts of talents.

3.2 Setting up technology innovation promotion fund

Nowadays Chinese colleges and universities tend to pay more attention to research rather than the technology transfer. All kinds of state-subsidizing research projects are aimed at research itself and do not cover technology transfer. But the technology transfer does need strong financial aid and it contains stages: small-scale test, pilot scale test and batch production. Research outcome is already hard to get. We should not abandon these research outcomes which are available. Although there is a sharp increase in patent application and authorization in Chinese colleges and universities, the quality of the patents is not high and the average life span of these patents is about 3 years meanwhile patent transfer rate is behind 5%². To deal with above problems, some suggestions are given as following: Firstly, the country should set up funds of technological achievement transfer for universities and colleges. At present, all kinds of Chinese research projects and financial aid are issued only after application and strict scrutiny. If promotion funds for technological achievement transfer are set up, it would undoubtedly play an active role in commercialization of research outcomes. Secondly, we should foster comprehensive talents who have both technological knowledge and commercial knowledge. They will become a crucial part of technological achievement transfer system and help to promote the transfer of the economic value of research outcomes. Thirdly, we should establish specialist technology transfer offices. These offices can bridge colleges with industries and accelerate the process of technology transfer.

3.3 Increasing financial investment for university scientific research

As the knowledge intensive institutions, universities have sufficient resource of talents as well as plenty of advance research facilities. They are no doubt the heaven for scientific research and important places for yielding scientific research achievements. However, the share proportion of universities in national R&D funding is declining annually though the strength of Chinese R&D is on the rise in recent years. In 2014 universities' share only made up 6.9%. The main sources of funds for colleges and universities are from governments but from the above analysis we know that the government only put 20% research investment into universities. This proportion is not high compared to other countries in the world. Therefore, it would be better to increase the amount of funding for universities, which is beneficial for scientific research.

3.4 Establishing unified evaluation systems of scientific research in universities

¹ Department of science and technology of the Ministry of education of the people's Republic of China. 2015 compilation of science and technology statistics of colleges and universities in China[M]. Beijing: Higher Education Press, 2016 (In Chinese)

²resource: Dong Bijuan. Why the patent conversion rate in university is lower than 5%. Chinese economic net-<<Economic Daily>>. (In Chinese). <http://ip.people.com.cn/GB/15494208.html>

The evaluation system of scientific and technological innovation involves standard of scientific research level, which influences the direction of university scientific research. Considering the evaluation standard of scientific research in Chinese universities is non-uniform, non-normative and none-reasonable at present, it is urgent to establish a unified and reasonable college research evaluation system and set up scientific evaluation indicators. Firstly, we should pay appropriate attention to scientific publications but do not judge the scientific outcome solely by publications. Secondly, we should tell the difference between the patent application and the patent authorization and do not consider the number of patent application as performance evaluation indicators for teachers in universities. Thirdly, we should make the revenue created by technology transfer into evaluation system so as to truly make scientific research meet the requirements of market.

4 Conclusions

There are plenty of scientific research talents, resources and solid research foundations in Chinese universities. They can be the cradle and base for Chinese scientific and technical innovations. The innovation of Chinese colleges and universities also has great influence on the development of Chinese nation. We can promote the technological innovation of universities and colleges in China by: (1) putting more attention to application research; (2) setting up technology innovation promotion fund; (3) increasing financial investment for research in universities; (4) building reasonable and unified research evaluation system.

Analysis on Coordinated Development of Sports Tourism Resources in Western Hubei

Liu Mingming

Physical Education Department, Hubei Sports Career Academy, Wuhan, P.R.China, 430074
(E-mail: lmm1021@163.com)

Abstract: Based on the investigation of the sports resources of the ecology-culture tourism in Western Hubei and the theories of growth pole, industrial distribution, pint-axle-level, industrial chains, industrial structure, sustainable development, non-balanced development as well as practice. This paper tentatively intends to analysis the current situation, goals, distributions and products design of the coordinated development. As the results indicate, sports tourism sphere consisted of several major mature tourism districts, such as Shennongjia ecology tourism area, the Great Three Gorges area, Wu Dang cultural tourism area, Enshi minorities' sports tourism area, Jingzhou-Jingmen-Suizhou ecology tourism area, the sports tourism resources can be intensively allocated by optimizing spatial structure.

Key words: Coordinated Development; Industry Convergence; Sports tourism

1 Introduction

Sports tourism, booming in recent years, develops very quickly. The tourism production continuously increases in many countries, like USA, Germany, Britain, Italy, Japan and Korea. There are many sports tourism spots abroad, such as, the Alps, Disney amusement park in USA, expenditure of the Amazon and the climbing of the Himalaya(Harryman, 1997).Sports tourism is one crossed Portion which blends of sport and tourism(Canestrelli,1991).It also embodies the sociality of sport and tourism(Zhang Xueying,2001).Sports tourism is a kind of Special tourism and belongs to tourism as an important component(Shen Yuting,2014).Sports tourism is an interdisciplinary subject and a rising and grafting compound Industry which is one organic and interactional social system including sports tourists-sports tourism destination-sports tourism Products-sports tourism consumption(Cao Guoxin,2009).

Equipped with unique geographic surroundings and natural sightings, the ecology-and-culture tourism sphere in western Hubei obtains large quantities of high qualified tourism resources and holds much potential. Sports tourism, the formal product of the change from appreciating-tourism to participating-tourism, derives lots of high-quality tourism resources like whitewater drifting, delta wing, fire balloon, spelunking, paragliding, camping, skiing, recreation and rehabilitation, outward bound, golf, bungee jumping, prompt drop, shooting and parachute, which greatly encourages the development of the sports tourism. This essay, on the grounds of relative theories and practice, did a deeper analysis on the dynamic mechanism, spatial arrangement and development track of the sports tourism development in western Hubei, aiming to provide it a clearer way and more effective suggestions.

2 The Goals of Coordinated Development of the Sports Tourism Resources in Western Hubei

With its vast landmass, rich resources, diversifying cultures and many excellent sports tourism resources, the ecology-tourism sphere embodies its unique characteristics, among which include scenic areas of Wu Dang mountain, the three Gorges, Enshi canyon, Jingzhou ancient cities and Shennongjia covering large amounts of sports tourism resources on the mountains, under the water, and being competitive. Having invested 42,000,000 yuan on the commercials which are shown on the CCTV and propagandized Wu Dang mountain via slogans like 'Wu Dang, a place for Taoism; Tai Ji, a place for regimen', 'Wu Dang, Tai Ji, the paradise for regimen', the special economic zones of Shiyan Town also licensed some TV series and films like 'Dragon Buster', 'Myth of hunters' diaries', 'teenagers in Wu Dang', 'Dream of Kung fu', which motivate the martial arts culture to spread rapidly (Ke ru liang,2004)

On the basis of fully taking advantage of the rich resources, favorable policies, scenic spots and prominence in products, the coordinated development should insists on the strategies of meeting the diversified market, focus on the exploitation of the sports tourism products, mainly construct several special destinations like the martial arts culture tourism, expedition of Shennongjia and the drifting of Three Gorges, positively deepen the coordinated development between sports and tourism, and greatly explore various sports activities, such as regimen, eco fallow, drifting expedition, healthcare, forest bath,

matching sightings, and going alongside the river on foot while coring the ecology and environmental protection.

3 Strategic Procedures of the Coordinated Development

3.1 Dispersion phrase (2009-2013)

In the primary phrase, the ecology-tourism sphere including cities like Yichang, Xiangfan, Shiyan, Shennongjia, Enshi and so forth did not integrate and economic activities were isolated and scattered. Being dispersed, the sports tourism products were at a loss and there was an urgent demand for a correct selective strategy to decide on the targets and the exploitation of the resources.

3.2 Aggregation phrase (2013-2017)

After the primary phrase, the coordinated development basically formed, the second phrase, aggregation phrase, will take the measures of the point-to-axle and the march-along-axle, focusing on the major sports programs like hiking on foot, through the forest, delta wing, rock climbing, motorcycling on water and whitewater drafting. In addition, by fulfilling the functions of the center cities like Shennongjia, Yichang, Shiyan and Enshi to form a sighting circle of large scale and high quality, the second phrase is to finish the primitive aggregation.

3.3 Diffusion phrase (2017-2021)

To realize the strategy of point-to-axle. The core sightings where there have already formed stable tourist resource, consumption aggregate and brand effects have been created by rich sports tourism resources in this phrase. Main targets at this phrase is to progressively promote sports tourism products in areas like Enshi minorities area and Jingzhou culture area.

3.4 Mature phrase (2021-2025)

To carry out the strategy of integration of unbalanced districts. At this phrase, with the successive improvement of infrastructure and brand value and the appearance of scale benefits little by little, the popularity of the economic chain of sports tourism will gradually increase. The ecology-culture tourism sphere in western Hubei progressively becoming the center scenic spot of the central area of China, the industrial cluster effect will have a positive influence on the drive of other fields, for instance hotels, culture, transportation and inns.

Table 1 Procedures of The Development of the Sports Tourism in Western Hubei

phrase	period	schema	goals
Phrase I	2009—2013	Key development, spatial arrangement	a correct selective strategy to decide on the targets and the primary exploitation of the sports tourism sphere
Phrase II	2013—2017	Point-to-axle, march-along-axle	to mainly construct core sightings, like the three Gorges, Shennongjia and Enshi canyon
Phrase III	2017—2021	Point-and-line, all-in-whole	the extension and deepen of the sports tourism resources; the reasonable arrangement of sightings with three core attractions
Phrase IV	2021—2025	Mature system, industries drive	to become one of the most important attractions in China and to extend the market scale step by step; to form brand effect and a mature sports tourism market system

4 Spatial Structure of Coordinated Development of the Sports Tourism in Western Hubei

The coordinated development operates in a schema of point-axle-layer, which specifically stands for center cities for the concept of point, transportation routes for the concept of axle, and hinterland for the concept of layer (Ruan Han, 2001). Together with the regional economic cooperation integration development which includes the futurity of some sports tourism towns like Yichang, Shiyan, Shennongjia, Xiangfan, Enshi, Danjiangkou, Jingzhou and Suizhou is the exploitation of the sports tourism resources. Absolutely winning over other cities in infrastructure, talents and resources, these cities, acting as the center towns of the ecology-culture tourism sphere, can further classify the schema into three different levels when taking the practical situation of the western Hubei (Liu Mingming, 2008). The three levels can be as follows: axle level 1 from Xiangfan to Chongqing; axle level 2 from Shiyan to Yichang(2 routes); axle level 3 with National Highway 209, 318 and some other high ways and the expressway from Yichang to Huangshi.

Table 2 Spatial Structure of the Sports Tourism in Western Hubei

factor	level	Areas / Scales
point	Center level 1	Yichang Shiyang Shennongjia
	Center level 2	Xiangfan Enshi Danjiangkou Zhuxi Fangxian Zigui Zhijiang Dangyang
	Center level 3	Jingmen Wuhan Jingzhou Suizhou Huanggang E'zhou
axle	Axle level 1	Xiangfan—Shiyang—Yichang—Shennongjia—Xingshan—Badong —Chongqing
	Axle level 2	Shiyang—Xiangfan—Jingmen—Yichang, Shiyang—Xiangfan—Suizhou—Wuhan—Jingzhou—Yichang
	Axle level 3	National Highway 209,318, expressway of Yichang and Huangshi, some other highways
layer	Kernel layer	Yichang
	Hinterland layer	Shennongjia, Xiangyang, Shennongjia
	Fringe/edge layer	Enshi, Jingzhou, Jingmen, Suizhou
	broaden layer	Nanchang, Changsha, Xinyang, Chongqing
	Internal layer	Areas and districts straight access to by airplane, train and ship
	External layer	Countries and states straight access to by airplane, train and ship

5 Spatial Arrangement of the Coordinated Development of the Sports Tourism Resources in Western Hubei

Table 3 Spatial Structure of the Sports Tourism in Western Hubei

sphere	areas	Center town	resources	Core product
Kernel layer	Great Three Gorges	Yichang	Boating ,fishing, rock climbing, golf, hiking, horsing, farm house	Products for entertainment and game-watching
Hinterland layer	Shennongjia	Shennongjia	Rock climbing, driving, expedition, along river, fishing, spelunking, skiing, field survey and so on	Products for expedition
	Wu dang culture	Shiyang Xiangfan	Martial arts, regimen, climbing, mountain biking, rock climbing, overhead cables, martial arts performance and so on	Products for recreation
Fringe layer	Enshi minorities	Municipality of enshi	Cycling, expedition, bungee, horse race, sailing, folk sports dancing and so on	Products of folk tradition
Diffusion layer	Ecology-tourism of Jingmen, Jingzhou and suizhou	Jingmen, Jingzhou and suizhou	Self-driving traveling, hiking, boating, parachuting, rowing, horse race, mountain climbing, spelunking, hot spring, boating, diving, Nongjiale, country traveling	Products for culture and travel
Abroad layer	Jiangxi(partly)	Nanchang	Mountain climbing, hot spring, diving and so on	Products for water activities
	Hunan(partly)	Changsha	Outdoor rock climbing, folk sports and so on	Products for mountainous and watering sports
	Henan(partly)	Xinyang	Martial arts, sports performance and so on	Products for martial arts culture
	Chongqing(partly)	Chongqing	Expedition, outdoor camping, sports entertainment and so on	Products for expedition in canyons

The sports tourism sphere is consisted of the Wu Dang cultural sports tourism area, the Three Gorges sports tourism area, Shennongjia ecology sports tourism area, Jingzhou-Jingmen-Suizhou ecology-culture sports tourism area and Enshi minorities' sports tourism area. The three Gorges area, centered in Yichang, develops products for boating, fishing, rock climbing, golf, hiking, horsing, and Nongjiale. Shennongjia, centered in Shennongjia forest, develops special products for crossing forest, mountain climbing, rock climbing, driving, expedition, along river, fishing, spelunking, skiing, and outdoor survey. Wu Dang culture sports area, centered in Shiyang and Xiangfan, develops sports tourism

products for regimen, mountain climbing, overhead cables, martial arts performance. Enshi minorities' sports tourism sphere, centered in unship municipality, develops the products for minorities resources like hand dancing. Jingzhou-Jingmen-Suizhou sports culture area, centered in the three cities as its name and combing culture of the three Kingdoms, the state of Chu, Yan emperor and Shen Nong with Jingzhou ancient city, Songziweishui beauty spot, Honghu fishing holiday spot and Shishou swan mi-lu national protection area, majorly develops products for drifting, mountain climbing, spelunking, self-driving traveling, hot spring bath, fishing, dragon boat race.

6 Conclusions

Currently, there is great relation and interaction between sports and tourism for the common ground of the convergence. If we can reasonably combine sports and tourism, take advantage of each other and fully realize the merits of both two industries, there will be great brand effect, competition effect and creation effect. Sports tourism sphere consisted of several major mature tourism districts, such as Shennongjia ecology tourism area, the Great Three Gorges area, Wu Dang cultural tourism area, Enshi minorities sports tourism area, Jingzhou-Jingmen-Suizhou ecology tourism area, the sports tourism resources can be intensively allocated by optimizing spatial structure.

Empirical Research on Quality of Hubei Province Urbanization

Xu Peng, She Wenhao

School of Management, Wuhan University of Technology, Wuhan, P.R.China, 430070
(E-mail: 490092104@qq.com, 309470873@qq.com)

Abstract: With the advent of the third wave of urbanization, the development of urbanization level of quality, began to conclude urban economic and social development, quality, degree of coordinated urban and rural development, urbanization, efficiency, and so on. In this study, focusing on the quality of urbanization in Hubei Province, regional data in 2013, use factor analysis, rotation matrix and other models, to analysis the quality of urbanization in Hubei Province comprehensive evaluation. Finally have three conclusions: First, urbanization is low overall quality of Hubei Province, is the medium level in the China. Secondly, the quality of urbanization contained within the town's economic development and the quality of living standards for the quality of urbanization greatest contribution. Third, the three aspects of the quality of urbanization is a unified whole, in promoting the development of mass urbanization, the need to achieve coordinated development. At last, combining the characteristics of Hubei Province, focusing on how to improve the quality of urbanization in Hubei Province, we have to put forward some countermeasures and suggestions.

Key words: Hubei; Factor analysis; The quality of urbanization; Evaluation system

1 Introduction

The 18th Report of the CCP treat urbanization part as one of the new four modernizations, the annual Central Economic Conference has put "actively and steadily promote urbanization, and strive to improve the quality of urbanization," as one of the six tasks as China's economic work, "urbanization "has become one of the most famous word in China. Since the reform and opening up, Chinese urbanization rate has improved significantly, it increased from 17.92% in 1987 to 51.27% in 2011, an average increase of more than one percentage point per year. Just a few years,

However, there are still many problems of Chinese urbanization process, especially when the urbanization rate has reached about 50% of the time, the development of urbanization will occur more frequently and more serious conflicts. Like: The size of the structure is not reasonable in towns、 cities and towns of external radiation are still relatively weak; macro-regional and urban internal spatial layout and other issues led blindly expand outside town, like a pancake, become the "Village in the city" and also cause other phenomena; urban environment shift into rural will cause environmental pollution, to provide rural to urban ecological environment harmful food; widening gap between urban and rural areas, landless peasants serious problem of basic public services failed to achieve equalization.

Urbanization - first appeared in the Spanish designer's urban planning works named "basic principles of urbanization, "Rossi (2016) definition "Social Science Dictionary" for the first time in his book, made a comprehensive urbanization connotation of explanation, in his view, the meaning of the term urbanization should include four aspects the propagation of the rural hinterland of urban centers affected and the whole society gradually accept the process of urban culture; third, the process of concentration of the population, including increased focus on expanding each point and focusing on each point; Fourth, the proportion of the total urban population sociodemographic improve the process. Zhou De(2015) think Urbanization quality assessment is a test of land space, industrial economy, institutional politics, social and cultural reconstruction, and eco-environmental sustainability. Results showed that the urbanization quality was strongly influenced by system structure and function and their relationships. Zeng Chen (2016) think Urbanization in China has been closely associated with urban sprawl, rural migration and the role of government has been more direct and powerful in setting it in motion. And found out that both non-agricultural population and urban land exhibit significant spatial autocorrelation and the superiority in the city center is evident. Tan (2016) think in China, studies across different scales and types of cities, each of which would have implications for understanding of theory relating to sustainable urbanization.

Domestic urbanization quality-related concepts presented is accompanied with " New Industrialization" as the first proposed strategies at the beginning of the 16th by the National Congress Party. After that, with the increasingly prominent urbanization of quality problems, studies have ever main focused on the quality of the urbanization, all the social problems that connecting with this topic have become ongoing concern. Clearly concern of earlier mass urbanization was came up by Ye Yumin

(2001), she made earlier in quantitative methods to study the quality of urbanization, and the core of the city is the quality of urban modernization, the ultimate goal is the integration of urban and rural areas. Other scholars thought the quality of urbanization has multidimensional manifestations to explain mass urbanization, Aping Chang (2005) use factor analysis, analyzing the quality of the urbanization of 30 provincial capitals and municipalities, she thought this can be used as the basis for urbanization analysis. Some scholars preferred to reflect the level of integrated of urban development of urbanization quality, main focusing on empirical research and evaluation.

2 Index System Construction

Evaluation the regional urbanization quality level, we need to consider the quality of urban development, urbanization and urban and rural development to promote the efficiency of these three areas.

2.1 rating index set

According to this, we have set five secondary indicators they are: the quality of economic development, the quality of social development, spatial development quality and efficiency of urbanization and urban and rural level; we also have six of three indicators: economic level, the level of economic structures, health care and public services and population, infrastructure, energy efficiency, investment income and expenditure of urban、rural differences and ecological environment; we have 14th four indicators: per capital gross national product, registered urban unemployment rate, the proportion of non-agricultural industries, the per capital public libraries book volume, number of beds per thousand medical institutions, population urbanization rate, every million people have buses, urban per capital road area, green space per capita, life garbage treatment rate of urban water penetration, city gas penetration unit energy consumption and GNP fixed assets realized GNP.

2.2 Data collection and collation

In order to accurately the quality reflect of urbanization in recent years of Hubei Province, the provincial urbanization compare the quality difference, this paper select 2013 year as the mainly statistical data, the data are mainly from the provinces and the national statistical yearbook.

First of all, given the differences in the development of different parts of the area will be totally different, such as Xinjiang, Tibet, Qinghai, western region, which did not include relevant indicators, this article is the comparison of the 24 provinces and four municipalities (Beijing, Shanghai, Tianjin, Chongqing) related index. Secondly, in the collection of some indicators, due to the statistical yearbook of the province when the year is not updated, so choose the 2012 annual Yearbook indicators, and after some modifications, it is used to describe the situation in 2013, such as Hebei, Jilin, Yunnan region.

3 Empirical Study

For the evaluation of the quality of urbanization There are many ways, and factor analysis method is a commonly used multivariate statistical methods to objectively evaluate the object.

3.1 KMO factor test, variance analysis and matrix analysis

In this paper, using the SPSS software, put the data into the provinces of KMO factor test analysis. First, the data were normalized, then put the sample data into spss17.0 do KMO to test correlation analysis, KMO value is higher than 0.5, in line with the conditions of factor analysis.

Table 1 KMO and Bartlett Test

Adequate sampling of the Kaiser-Meyer-Olkin measure		.632
Bartlett test of sphericity	Chi-square approximation	282.274
	df	120
	Sig.	.000

At the same time begin the factor analysis, then have the ANOVA table. The data can be seen, the first five characteristic root factor are higher than 1, the cumulative contribution rate of 77.356%, can be relatively completely reflect most of the information of the original data.

Obtained by matrix analysis, factor 1 covers the per capital GDP, the proportion of non-agricultural industries, public libraries per capital amount, population urbanization rate, every million people have public transportation vehicles, urban water penetration, gas penetration rate of fixed assets achieve GDP,

it can be seen as the town's economic development level and living situation. Major urban per capital road area covered by a factor of two, the per capital green area of the park, reflecting the construction of infrastructure and ecological environment of the city. The main factor of 3 million people covering every medical institution number of beds per unit GDP energy consumption. Load factor 4 larger urban and rural Engel coefficient index is the difference between the income gap between urban and rural residents ratio. Load factor 5 larger main indicators for the registered urban unemployment rate.

Table 2 Rotation Matrix Ingredients

index	ingredient				
	1	2	3	4	5
Per capita GDP	.922	.026	.056	.115	.154
The registered urban unemployment rate	.093	.069	.227	-.118	.865
The proportion of non-agricultural industries	.863	.077	-.190	-.146	.116
The amount of per capita public libraries	.771	-.409	-.043	.006	-.225
Number of beds per thousand medical institutions	.124	-.090	-.782	.104	-.093
Population urbanization rate	.939	-.131	.057	.065	.176
Every million people have public transport vehicles	.604	.093	-.023	.097	.540
Urban per capita road area	-.151	.795	.233	.380	-.103
The per capita green area park	-.007	.792	-.144	-.057	.199
Life garbage treatment rate	.363	.433	.379	-.410	-.161
Urban water penetration	.659	.313	.424	.068	-.048
(City gas penetration rate)	.686	.288	.423	.232	.044
Energy consumption per unit of GDP	.282	-.305	.666	.139	.294
Fixed assets investment to achieve GDP	.758	-.413	.122	-.128	.124
The difference between urban and rural Engel coefficient difference	.027	.159	-.079	.843	-.085
Income gap ratio	.603	-.092	.242	.584	.005

3.2 Ranking Analysis

Based on ANOVA tables and factor score coefficient matrix, select variance contribution rate as weights, obtained comprehensive evaluation score model: $F = (37.198 \times F1 + 14.874 \times F2 + 10.066 \times F3 + 8.503 \times F4 + 6.715 \times F5) / 77.356$. This can be obtained for each factor and factor integrated ranked.

Factor 1 covers the characterization of urban economic development and living conditions of residents in Hubei Province at the general level; the common factor 2 covers the characterization of infrastructure and ecological environment construction in Hubei Province in general backward bias level; common factor 3 mainly covers the number of beds per thousand medical institutions, energy consumption per unit of GDP, also in Hubei province in this regard the general level; the common factor 4 covers characterize of the development of urban and rural, in the provinces of Hubei province in this regard ranking moderate front, greater impact on the ranking boost. 5 common factor larger load index mainly urban registered unemployment rate, this indicator Hubei poor, reflecting the unstable employment situation.

Comprehensive factor scores, Hubei provinces in the country compare the quality of urbanization, the middle level, we need to take further measures, targeted to enhance the quality of urbanization.

Table 3 Composite Score Table

Provinces	comprehensive factor score	ranking	province	comprehensive factor score	ranking
Beijing	1.093678145	1	Hubei	-0.060307002	15
Tianjing	1.002176584	2	Jiangxi	-0.0698877	16
Jiangsu	0.759513538	3	Hainan	-0.09650593	17
Zhejiang	0.682525533	4	Shanxi	-0.102410602	18
Shandong	0.641336535	5	Shanxi	-0.176208294	19
Shanghai	0.622533798	6	Hunan	-0.32682533	20

Ningxia	0.090635132	12	Yunnan	-0.875011533	26
Chongqing	0.070661187	13	Gansu	-0.888096502	27
Anhui	0.048209457	14	Guizhou	-1.043663621	28

4 Conclusions

This paper introduces the background of mass urbanization, then draw domestic and foreign scholars on the quality of urbanization, mass urbanization in Hubei. Based on this, defines the concept of urbanization and mass urbanization, and analyzes the theoretical basis related.

1) For an overview of the development process of urbanization and the development of urbanization in Hubei province were analyzed. Description of the situation in Hubei Province urbanization development, and find the problems in the development.

2) On the basis of evaluation of previous scholars build, combined with the actual situation in Hubei province, constructed urbanization quality evaluation index system and evaluation model. Using factor analysis model of urbanization to evaluate the quality of various regions of the country, pointing out in all aspects of the development of each of Hubei Province, and the influence of factors aimed at finding factors that affect the quality of cities and urbanization and cities exists in the development of urbanization The problem.

3) To make recommendations to improve the quality of urbanization in Hubei Province from three aspects, preferably combined with the results of the factor analysis.

Abstract: "To exercise" is the Hubei sports bureau launching the sports projects, and it is an important measure to implement the national policy to promote national fitness. Hubei College Stadiums have abundant resources, rich human resources, colleges and universities. To understand the development situation of "to exercise" APP in colleges and universities, this paper gives the 'to exercise' APP a comprehensive analysis, the conclusions, and propose development strategies with the SWOT analysis in Hubei Province .

Key words: Hubei Province; College and University; "To exercise "APP; Analysis

1 Introduction

Literature search indicates that more problems about the development of the sports venues and research abroad, operation strategy and management system of the venue construction will have a lot. They not only pay attention to the function of the venue construction and long-term development, also pay attention to the operation management of the venue, many scholars research the problems in the operation and management of sports venues.

Jon A (1998) on American stadium facilities such as statistics, analyze the operation and management mode of the venue, found that 33% of large sports entertainment facilities, both in the form of commissioned to carry on the operation and management, operation management for sporting events and infrastructure, and, in most of the sports facilities to accept government financial support, and its management has gradually realized the trend of the privatization

Matthew Brown (2004) benefit to study the development of sports venues, such as, by tracking survey, found that sports venues to entrust way, most of the income situation has improved significantly, the benefit of the venues has increased, is worthy of reference.

Robert A. (2006) believes that the development of the sports venues in the fierce competition environment, using a variety of means, can successfully operate sports venues are very important; For the long-term development of the large sports venues, the creation of a good brand to prepare the way for the sustainable development, there are many factors affecting the development of venues, from the perspective of marketing is the key.

Domestic research is mainly focused on the sports facility operation status quo of research in colleges and universities, colleges and universities sports venues management system research, problems existing in the sports facility operation and management of university research, etc. Overall, Hubei University sports facility operation and management of the related research less, not enough depth. Due to the time factor, political background, artificial conditions, etc., function, operation and management of colleges and universities sports venues situation is changing, some new problems to be solved.

2 Analysis for the Development of “To Exercise” APP in Universities of Hubei Province

2.1 SWOT analysis

SWOT analysis is a method of management in organizational strategic planning by the organization and the external opportunities and threats facing the organization's internal strengths, weaknesses comprehensive analysis to identify organizations to better adapt to the changing external environment development strategy. Hubei College "To exercise" the SWOT analysis, that colleges and universities "to exercise" APP Hubei internal strengths (Strengths), weaknesses (Weaknesses), opportunities for external facing (Opportunities) and threats (Threats) analysis performed, draw relevant conclusions and propose Hubei Province, "to exercise" in the future strategic vision and development plan (Lou Jinhai,2013).

Table 1 "To exercise" in Universities in the Development of Internal and External Conditions for Comprehensive analysis

Internal conditions	Internal advantage (S)	Internal disadvantage (W)
	Sports facilities resources very much rich	Caused by competition for resources
	Abundant human resources	Venue unsubscribe and reservation of inconvenience
	To improve the using and management efficiency	Charges owed
	For economic and social benefits	
External conditions	External opportunity (O)	External threats (T)
	Relevant government policy support	Supervision mechanism is inadequate
	Sports consumption demand	The addition of venue is limited
	The convenience of the internet information	To improve the financial management level
	The needs of the sports venues scientific management	

2.2 SWOT analysis of the college "To exercise" development

2.2.1 Strengths

1) Sports venues and facilities are rich in resources

Many colleges and universities in Hubei Province, has rich resources stadiums. In Wuhan City, the number of surveyed 12 stadiums College statistics, the number of the many various sports venues. This will not only meet the school teaching, training needs, and can undertake large-scale sporting events, large-scale commercial performances, but also to meet the sports consumption, physical fitness needs of the community residents and business units. Compared with other stadiums, sports grounds at universities in terms of quality and quantity have a huge advantage, able to provide a solid material foundation for the "To exercise" development.

2) Abundant human resources

According to the first number of the central Hubei Province, the number of college students, the number of college students in Wuhan increased year by year, in 2012 the number of college students is nearly a million (Wang lu,2007). While teachers generally higher level of college sports, sports teachers is strong, it has a good sports infrastructure. Physical Training College atmosphere is good, college talents as a new era, a strong ability to accept new things, spread fast, play the advantages of university students, facilitate rapid development "to exercise" APP.

3) Improve the utilization and management efficiency of venues

"To exercise" APP end reservation by phone customer venues, on-line in a month, more than 500,000 people benefited from Wuhan, more than one million registered members. Currently, running nearly a year, "to exercise" APP platform has been signed with the province more than 100 stadiums, at least 5000 free low-cost sports daily, open to the public. By the end of 2015, "to exercise" internet contract stadiums respectively grown to more than 1000, members of users reach 50 million or more, free and offers sports and fitness opportunities every day can provide the more than 20,000; by the end of 2018, the platform contracted venues will reach more than 2000, membership development to more than 200 million users, providing at least one hundred thousand free and offers daily sports and fitness opportunities. Venue increased distribution channels and broaden public understanding of information sources and venues enable people to obtain timely information on the site, to understand site usage, convenient public venues booking, improve the utilization of venues.

"To exercise" facilitate the application of modern information technology, the Internet, information resources integration stadium, the venue can publish information quickly and efficiently, timely and unsubscribe to accept reservations, so easy and convenient management, improve the efficiency of management and reduce the cost of facility management to improve the management efficiency.

4) Access to economic and social benefits of double

Improve the utilization of venues, naturally led to an increase in economic income, a venue to maximize the use and improve the economic benefits. This will not only ease the government and school stadiums in terms of financial pressure, but also can stimulate the efficiency and management of university stadiums vitality, to get rid of under-funding situation venues.

At the same time, "to exercise" APP social workers provide a convenient platform for fitness, to

keep abreast of the venue information, access to health services they have a great opportunity to help; this model is also fully implement the national policy for the national fitness campaign services benefit the residents of the surrounding community schools, improve school stadiums influence.

2.2.2 Weaknesses

1) Caused by resource competition venues

Limited venues resources to compete with the school teachers and school staff. School teachers and the demand for space can not be guaranteed. "To exercise" APP is an open service platform, not only teachers and students can book and school personnel can also be booked. Under conditions of limited resources tennis stadium, venue of resources will be scarce, teachers, students and school personnel to generate competition. University stadiums must meet the teachers and students under normal usage, it can be reasonably open; but "to exercise" APP mode so that everyone in the same position, could easily lead to the demand for teachers and school site can not be guaranteed.

2) Cancellation and booking venues inconvenience

Under "To exercise" APP provisions venue Book unsubscribe you have to be two hours before, in the face of rain, snow and other external factors and personal emergencies, venues and booking unsubscribe inconvenient, not only affects the use of the site rate, could easily lead to unused space, and that space fees paid can not be returned to normal, resulting in personal economic losses.

On site reservation privileges, having been clearly defined for each client free reservation only twice a week (one-hour), but some groups through the application of multiple clients to book venues, hoarding space. Causing venues resource monopolies, could not get a fair public access to government benefits, so that the site in the hands of a few people, not only can not allow more people to benefit, on the contrary, will make the venue more resource shortages. College tennis venues monopoly, not only affects the normal requirements of teachers, students and school personnel, but also disrupt the normal teaching and training, which is the original purpose contrary.

3) Non-Standardized Charge

After a year of development, "to exercise" app gradual reduction in the free online booking, paid to charge, but charges are not unified. Some sites charge significantly higher, the student population is difficult to bear the cost of the site, some of the sites charge less but booking difficult. The primary target is to serve the College Tennis school students and teachers, the higher the cost of the venue can not allow students to participate in tennis fitness, but also with a comprehensive fitness program, low-cost open space and other relevant national policies are in conflict, causing teachers and students and the community fitness enthusiasm waned, is not conducive to the development of national fitness campaign.

2.2.3 Opportunities

1) Government policy support

The Ministry of Education, General Administration of Sport has issued a number of policies to promote sports venues opening up, the development of the sports industry, driven by sports consumption; Hubei Province, issued a series of policy documents the development of sports, to promote management measures stadiums reform and development.

2) Internet information is convenient

With the convenience of Internet information age, through mobile phones, computers and other multimedia tools to quickly receive and disseminate information, so modern access to information, more and more time getting faster and faster.

3) High demand for sports consumption

With the stability and prosperity of China's sustained economic growth and social development, sports consumption demand of residents will be started on a new basis, China will appear the size of a very ambitious sports consumer market, this should be the development trend of sports consumption of.

4) The need for scientific management of sports facilities

Management stadiums and services are relatively backward, it requires the application of modern scientific management to improve management efficiency, improve service levels. Through institutional reform and the integration of staff to adapt to the new development needs, provide new development path for college stadiums.

2.2.4 Threats

1) Oversight mechanisms is imperfect

"To exercise" APP is launched by the Hubei Provincial Sports Bureau projects that benefit the sport, from September 2013 to date. There is a problem in the implementation of policy, management and supervision "to exercise" APP. First, government policies may not be implemented, some of the venues

do not follow the requirements for facility management and operation in the pre-launch free booking venues, sports consumers cannot properly book, cannot qualify for government benefits. Second venues reservation management, facility management personnel individual, privately hoarding space, resulting in resource constraints venues. Third, the lack of venues and Sports Bureau manager third party monitoring mechanism, in the face of a contradiction between the two, a third party can not communicate quickly and resolved.

2) Inadequate investment in venues

Hubei Province, the number of sports venues rich in resources stadiums universities account for a large part of it. According to the survey, added to the existing "to exercise" a limited number of venues, only part of it, there are many stadiums so far not joined. There are differences in the various projects, currently badminton, tennis, table tennis and other ball games in the majority, followed by swimming and the gym. Quantity and quality of stadiums affects the development of university sports development "to exercise" the need for adequate resources as a guarantee stadium, currently limited added "to exercise" the number of venues, it is not conducive to long-term planning and development.

3) The Level of financial management to be improved

"To exercise" APP Sports Bureau commissioned by the mining company management, that is, from Hubei Sports Science and Technology Co., Ltd. love sports management (Liu Xueqian Feng Yunhui,2010). Sports stadiums consumers booking through the customer service end of all funds into the company's financial, and then returned to the various venues manager. Among the problems: First, consumers unsubscribe stadium funding can not be refunded. Second, the company to return funds are not timely venue managers, venue managers cause cash flow problems. Low corporate efficiency, low level of service and financial management is a big issue currently exist.

3 Measures and Suggestions

3.1 Enhance the level of management services

Implementation of scientific management, promote the improvement of service levels. First, to improve conditions for software, scientific and standardized management services, improve the operational capacity of managers, strict examination system, a clear incentive measures to improve "to exercise" APP function. The second is to improve the hardware conditions, venues and facilities must be standardized hardware equipped with changing rooms, sports equipment and sports drinks for sale at the sports meet the general needs of consumers. Third, improve the financial management system, financial expenditure norms, and timely refund management (units) in operating income, to ensure the normal flow of their funds.

3.2 Giving full play to the advantages of university talents

University Human Resources rich, there are different high-level professional personnel, integration and use of professional advantages and absorbing management professionals, physical education, sports training personnel, changing the stadium management level is low, weak, poor status of service. Change management thinking, colleges and universities to hire staff as a manager, play to their professional advantage, improve management, reduce operating costs, so that "people do their duty, the best use."

3.3 Specifically targeting

College stadiums is always to meet the teaching, training, mainly in the venue management must ensure that the use of teaching and training, and then combined with the actual situation of the school's external operations. When targeting venues, one needs to ensure that our students and teachers venues, give priority to the learning and training needs of our students and teachers. The second is to develop a reasonable, open plan, develop effective venue use plans according to different time periods, to ensure maximum venues operating revenues.

4 Conclusions

"To exercise" APP is the innovation of the sports venues management, is an important way of nationwide fitness campaign, is the national requirements stadiums low-cost opening to the outside world.

In colleges and universities in Hubei province "To exercise" APP development main advantage is that the venue and rich human resources, help to raise the utilization ratio of university stadium, social gap gain economic benefits. There is also a resource competition, venue unsubscribe inconvenience, the problems such as nonstandard charges. With the aid of the convenient and scientific management of the information age, play advantage, make up the shortfall, seize the opportunity to resolve the threat, to

guarantee the overall effective development of "To exercise" APP.

"To exercise" APP mode in colleges and universities in Hubei province selection strategy: Give full play to the resource advantage of talents in universities and colleges, venues, clear objective, improve the level of management services.

Abstract: This article aims to promote a discussion on environmental issues from the perspective of Evolutionary Theory (Nelson & Winter, 2005; Hodgson, 2007). Some evidence regarding carbon market has been used, which is a common proposal for the reduction of Greenhouse Gases. An interdisciplinary and systemic perspective was developed based on areas of production, administration and economy as a background for the discussion of production and consumption conventional processes that seems to show that market solutions are not effective. Moreover, it is emphasized that the issues that motivate evolutionary theorists may help in the search for solutions closer to reality presented in this early twenty-first century. Thus, the forms and organizational routines are focused to understand the reasons to keep on a behavior harmful to the environment.

Key words: Evolutionary Theory; Environment; Carbon Trade; Sustainability

1 Introduction

From the Industrial Revolution until the mid-twentieth century the economy functioned on the basis of an extractive paradigm. Countries believed that economic growth depends exclusively on the free exploitation of resources (Coelho et al., 2008; Lombradi, 2008). An example of this way of thinking may be seen in operating cycles going on in Brazil during what is called the Brazil Empire Period (exploration: Pau Brazil, Rubber, Gemstones etc.).

The mechanized production, mainly introduced with the steam engine, no doubt brought benefits to productivity, but also an increasing consumption of natural resources. After this period began a permanent search of energy for industries to keep and improve production processes, helping companies and countries to increase their competitiveness. The main resources extracted from the environment to provide power for these new production processes have been fossil fuels. First burning coal, and then with technological advances there has been switching to oil, and going to natural gas.

Seiffert (2009) points out that this process of industrialization was largely responsible for imbalances in biogeochemical cycles of carbon, nitrogen and sulfur in different ecosystems, since the burning of these fuels over time released large amounts of gases in the atmosphere. Thus this process is recognized as the main cause of climate change and hence the greenhouse as was mentioned at the recent COP 21 in Paris. Frondizi (2009) confirms that the intensification of the greenhouse effect is directly linked to human activities resulting from the burning of fossil fuels what is now being identify as the Anthropocene. It is noteworthy that this burning occurs in domestic as well as commercial area, in transportation activities in power generation, industry and agriculture.

Therefore, the problem of climate change is directly linked to energy options adopted at each country in addition to the consumption pattern of people (Seiffert, 2009). This discussion has led to several agreements on how to deal with the problem of emissions of greenhouse gases (GHGs), which are considered the main sources responsible for global warming.

The society at the beginning the twenty-first century is still polluting the environment by its industrial processes, agricultural activities, inadequate waste treatment and increased deforestation. However, with the establishment of the Kyoto Protocol it was possible to reinforce the desire to protect the climate system and preserve the quality of life for future generations. Teixeira et al. (2010) said that Kyoto Protocol was aimed to control the rise of the planet's temperature by decreasing the emission of carbon dioxide (CO₂) and other five other greenhouse gas effect. For this purpose developed the idea of a carbon credit market that could charge for the emissions of GHGs.

CO₂ as commodity is currently the physical-spatial product that stands out in these transactions. Each ton of the five greenhouse gases are converted to tCO₂ (ton equivalent CO₂) which is the standard

measure of the negotiations. Thus, the market sets a price for tCO₂ according to supply and demand of emissions in the international market (Nápravník Filho, 2006).

Nonetheless, this type of business is uncertain since does not establish new general rules for carbon trading mainly because the rules established by the Kyoto Protocol were worth only until 2012. Nevertheless, the COP 21 that took place in France in 2015 had as one of their objectives to discuss the problems of production and consumption, as well as carbon credit trading (COP-21, 2015).

In this context searching for a sustainable planet and market solutions makes sense since we are globally in an Open System so CO₂ (carbon dioxide) acts globally and its impact on the environment is also global. Thus, the solutions based on the carbon market offer a general control that is independent of who is the company or the country that is polluting. An important aspect of this system is that there is compensation in the generation of greenhouse gases on the planet, in a debit and credit relationship.

This article aims to propose a distancing from these assumptions. Logic does not solve environmental problems because the search for a balance in the market becomes a paradoxical activity, since maximization of the firm's results may be adversely affected by the externality factors of production. Moreover it could be mentioned the criticism of evolutionary researchers on the static nature of the problems and Neoclassical models (Nelson & Winter, 2005).

Therefore, it is necessary to rescue the open, dynamic and evolutionary nature of the economy (Nelson & Dosi, 1994; Conceição, 2007). It is worth highlighting that the evolutionary theorists oppose assumptions as equilibrium optimization and substantive rationality, and this is an important to be considered on this paper. Another important aspect to point out in addition to the dynamic nature of society is the focus on forms and routines given by evolutionary theorists. Thus, the behavior of social actors becomes the object of activity and not commercial transactions.

2 Carbon Trade from the Perspective of Evolutionary Theory

2.1 Climate change and the Kyoto protocol

At the end of 1960s, some researchers began to notice an intensification of global warming. Teixeira et al. (2010) explained that the greenhouse effect is produced by a layer of gas existing in the atmosphere that prevent heat from dissipating to levels that make the planet cool down. Lombardi (2008) reports that according to observatory data from Mauna Loa NASA in 2007, there was an increase in more than 100 ppm of CO₂ concentrations in the last 175 years, and an increase of approximately 0.7 C° in the planet's surface average temperature.

This global warming promotes the melting at the poles, which causes the flooding of coastal areas; biodiversity elimination of the planet; increased desertification areas; savannization of tropical forests; increase the frequency of droughts and floods; reduction in crop yields; damage to the health of populations as a result of heat waves; increased occurrence of hurricanes and cyclones; among other so extreme events and calamities that the people of this planet are likely to face.

In 1988 in Toronto, during the Conference on the Changing Atmosphere, it was created the International Panel on Climate Change (IPCC). In 1990 he was presented the first IPCC report, and the reports started showing historical events of the last decades, providing scientific information with higher quality and reliability. So it was created the UNFCCC (United Nation Framework Convention on Climate Change), which was approved during the ECO 92 and came into force in 1994 (UNFCCC, 2012).

The Conference of the Parties (COP) met for the first time in early 1995, in Berlin. The COP meetings had as main objective to find solutions to the environmental problem of global warming. The conference had the greatest highlight was the COP-3, held in December 1997 in the city of Kyoto in Japan. At COP-3 was established the Kyoto Protocol, which set quantified commitments for industrialized countries to reduce or limit the combined anthropogenic emissions of GHGs (Protolo de Quioto, 2012).

The Kyoto Protocol has also created a system for controlling emissions of GHGs, and was fixed a target of 5.2% reduction of greenhouse gases by the year 2000. Developed countries, which already were in accordance with its obligations reductions, argued the need for financial mechanisms that may allowed the fulfillment of these goals. Three forms of cooperation were negotiated: a) the emissions trading; b) joint implementation, whose different parts of entities could implement activities together, sharing the reduction of emissions; and c) the Clean Development Mechanism - CDM (Lombardi, 2008).

The Clean Development Mechanism (CDM) aimed to achieve sustainable development in developing countries through the implementation of cleaner technologies (Delgado & Altheman, 2007; Teixeira et al., 2010). Paragraph 5 of Article 12 of the Kyoto Protocol lists the essential requirements for CDM projects result in obtaining documents as Certified Emission Reductions (Coelho et al., 2008;

Protocolo de Quioto, 2012).

The CDM is a mechanism based on the development of projects that have to be responsible to private enterprise. CDM project activities must be related to the reduction in GHG emissions or at least influence the incidence of CO₂ (Fronidizi, 2009). Therefore, CDM projects may involve replacement of fossil energy by other renewable sources, energy use rationalization, afforestation and reforestation activities, more efficient urban services, among other possibilities.

The processing of a CDM project follows a similar logic to the Management System Certification, according to ISO model to ensure the credibility of the certification process of Carbon Credits. In addition, governments interested in implementing the CDM project, should designate by the UNFCCC (United Nations Framework Convention on Climate Change) an institution responsible for the evaluation and approval of CDM projects (Lombardi, 2008; Fronidizi, 2009; Seiffert, 2009).

The CEMDL is the last and final instance for approval of a CDM project. At this stage it will be up to the Council officially accept or not the CDM project activity (Seiffert, 2009). The certificate issuance of CERs (Certified Emission Reductions) is the later stage to check that analyzes over a period of time, the project activity achieved the reduction of GHG emissions or removals of CO₂. After these steps the Carbon Credits are issued. Seiffert (2009) reports that the CERs are carbon credits certificates from a CDM project registered with the UN (United Nations organizations). These issued certificates may be negotiated on the global market (Delgado & Altheman, 2007; Fronidizi, 2009).

In April 2000 it was launched the Prototype Carbon Fund, which was a partnership between seventeen companies and six governments managed by the World Bank. The purpose of this fund was to bring together, on one hand the money of the participants and on the other CDM projects (Lombardi, 2008; Institute Carbon Brazil, 2012). Thus began an effective carbon market through a marketable commodity for GHG emission reductions.

The negotiations on the carbon market became more sophisticated over time and some financial systems began to operate in that segment like traders and as a CDM project financiers (Lombardi, 2008; Institute Carbon Brazil, 2012). Thus, it may be seen that while it came to reduce global GHG emissions, has increased profitability and investment in new forms of sustainable production (Nápravník Filho, 2006). This process is correlative to the Polluter Pays Principle (Pigou, 1932), because with the purchase of emission rights (allowances), the country that need help to meet their emissions targets will pay for it, so it can finance the implementation of mechanisms to generate new URE (Ministério da Ciência e Tecnologia, 2012; Alvim & Goularte, 2011).

The logic of this market is that the CO₂ (carbon dioxide) operates globally and its impact on the environment is similar to all over the planet, so just seeks emissions to drop below the predetermined limit. Thus, for control purposes, no matter who is the company or the country that is polluting more or less. The important aspect of this system is that there is compensation in the generation of GHGs in the world.

After the evolution of this Carbon Market new interested actors have emerged, so there was a supply and demand increase. Of course this made prices arise. In February 2005, when the Kyoto Protocol begin running, the ton of carbon price was USD\$ 5.00. Many projects holders indexed the prices of carbon credits according to the European market, where the permissions had a system known as Cap-and-Trade (Lombardi, 2008).

The Cap-and-Trade system had government regulators that indicate companies with GHG emission allowances, so they may reach a certain level of emissions. Permissions (allowances) can be acquired plants that may even reduce their emissions beyond the authorized level. Being a market mechanism, any interested party may acquire and / or transact permissions. Each facility could use up to 8% of total emissions (Lombardi, 2008).

Carbon market activities started on January 1st 2005 and already in 2008, 404 million tons of carbon were traded, for a total of US \$ 6.5 billion (Word Bank, 2015). The evolution of the projects and negotiations have caused prices rose with greater speed and consistency (Robles Jr. & Bonelli, 2006). The existing carbon prices vary significantly—from less than US\$1 per tCO₂e to US\$130 per tCO₂e. It is worth highlighting that 85% of emissions are priced at less than \$ 10 per tCO₂, which is considerably lower than the price that economic models have estimated is needed to meet the 2 ° C climate stabilization goal recommended by scientists (World Bank, 2015). In 2015 in Tokyo the price per ton of CO₂ was already USD \$ 38.

Since the entry into force of the Kyoto Protocol, CDM projects had their lowest level in 2010, during which retreated to about \$ 1.5 billion. In addition, the carbon market has brought uncertainty about its course after 2012, and this scenario is influenced by a series of crises and social, political and economic conflicts across the globe.

At COP-21, in France, the so-called Paris Agreement established as a ceiling a Global warming of 2 °

C. In addition, it was also indicated that US \$ 100 billion per year should be used to help the poorest countries meet their reduction targets of GHGs. Nevertheless, it is necessary to deepen the discussion on the effectiveness of market or taxation by governments to adjust the emission GEES.

2.2 The evolutionary theory and the limits of market

The formal orthodox economic theory tries to explain the determination of equilibrium prices, inputs and products with regard to various conditions underlying the demand for goods and the supply of factors of production (Nelson & Dosi, 1994; Nelson & Winter, 2005). Moreover, it can be said that the law of scarcity and substantive rationality are part of the postulates of the orthodox argument, where the agents involved in the production and consumption process have their behaviors oriented to maximize individual well-being in an exclusive utilitarian perspective (Stark, Jakubek & Kobus, 2015; Kitchel, 2016).

However, we emphasize here that is quite questionable this market ability to allocate effectively the scarce resources, because as points out Hodgson (2007), and is also exposed in the theory of Transaction Costs by Williamson (1971, 2000), the agents do not develop a rational choice able to control the resources in a context of scarcity. These authors, as well as Coase (1998), reinforce the idea that this positive relationship between increased social welfare and efficiency and effectiveness of the production process are only obtained on a real transaction zero cost.

Also in the same line of reasoning on transaction costs, these costs depend on the institutions involved; and it may be said that the institutions are not rational optimization mechanisms of allocative efficiency, which can only arise from the dynamic and continuous interactive process between the actors, and this process is relatively uncertain and inseparable from technological and social changes (Nelson, 1995; Conceição, 2007; Braunerhjelm & Svensson, 2014). Furthermore, there are micro and macro environmental factors that constantly change routines firms (Becker, 2004).

North (1993) stresses that the institutions are not necessarily designed to be socially efficient; moreover they often are created to serve the interests of those with bargaining power to create rules (Williamson, 1979; Williamson, 2000). Veblen (1989) pointed out that the evolution of institutions is directly associated with a circular causation process. Thus, it is worth mentioning that the evolutionary theorists oppose equilibrium assumptions, optimization and substantive rationality hence being necessary to strengthen the fact that the three supporting pillars of orthodox models of the firm are: i) maximizing objectives (profit or present value); ii) the set of things that the firm can do (routines); iii) the optimizer choice rationally based on the market.

Hence, the search for a balance in the market is more a paradoxical activity because the maximization of the firm's results may be adversely affected by the factors of production. Thus, when giving emphasis to rational market mechanisms, a simple relationship of transaction is based on the Pareto optimal vision (Prescott & Townsend, 1984; Fleischer, 2003), forgetting the reality in obtaining and allocation of resources by agents. That is, do not take into account the pragmatism of the real world, where resources are not available or the same amount or in same value for all.

Moreover, the evolutionary theory takes as the unit of analysis not the market, especially in the rational bias understood by the orthodox, but the forms and routines of organizations to understand better the functioning of organizations and society (Nelson & Winter, 2005; Hodgson, 2007). By the same way, processes are analyzed and diagnosed in order to understand the routines and organizational forms that have been institutionalized and recognized as benchmark.

2.3 Evolutionary theory to discuss market rationality

Market-based views actually encourage expansionists, extractive and exploitative activities that contribute to achieving the firm's goals and exceed their profit expectations (Chi, 2010; Teixeira, Koufteros & Peng, 2012). Meantime, the economic model based on "extract, transform, discard" depends on economies of scale, low-cost materials and easy access to goods and services by consumers. However this orthodox model of production and consumption is reaching its physical limits, leading for the need to search for new paradigms of production and consumption (Macarthur, 2012).

Ying and Li-Jun (2012) argue that the economy should be based on reducing, reusing and recycling inside the production and consumer cycle of activities, circulation and consumption of goods and services. Moreover this new paradigm in production and consumption should adopt regenerative and restorative aspects of resources. Therefore, the goal is to keep products, components and materials at its highest level of utility and value for a longer time (Zhu, Geng & Lai, 2010) as is the case of the Led Lamps. This model runs off the rational logic of the exploration market, and aims to mitigate market inefficiencies.

Pigou (1932) explored how the tax could help solve inefficiencies in the functioning of markets and the behavior of economic agents. Pigou said that the costs of the damage that an agent in carrying out an economic activity imposes on third parties should be internalized in the cause of the activity cost. In its

turn Coase (1960) argued that the solution to the problems of the damage caused by economic activities comes from the market itself, or property rights. Regan (1972) points out that the Coase argument may be valid and applicable in an ideal context in which rationality is the dominant logic and negotiation between the agents is an achievable goal, a win-win kind of economy which is not easily found.

These two ideas moreover gives an important question about the problem of social costs such as pollution and the environment protection, because it can't be solved simply by paying a fee or negotiating a simple economic equation of the type: "I pay, so I have the right to pollute ". In this scenario of how to deal with the damage caused by the decisions of production and consumption in the formulation and analysis of the polluter pays principle it should be established the need to internalize the social and not only the environmental costs of pollution. A document should be signed by the polluter regarding the social costs of pollution caused by it, which must prevent, compensate and mitigate the damage, not only to goods and people, but also to nature.

In this line of reallocating resources to mitigate the damage to the environment, some countries receive aid funds and subsidies that could theoretically solve problems arising from polluting processes as may be shown in Figure 1.

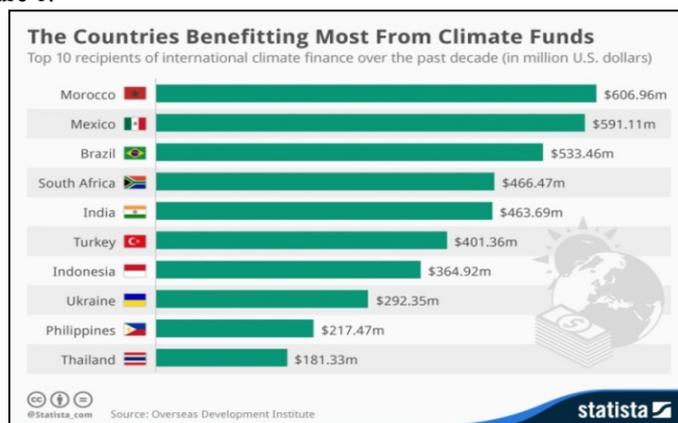

Figure 1 Countries Benefitting from Climate Funds

Source: International-Climate-Finance, 2016.

Therefore to protect natural resources, environmental economics proposes the evaluation of resources, the correction in prices and the accountability of environmental impacts. Therefore, its vision for sustainable development may be understood as the internalization of external costs helping countries to change their activities and processes that may harm the environment.

Moreover although the monetization of the problems is not the best solution, we may have to deal with the use of resources in a systematic and interdisciplinary way and not only by taxation (Pigou) or free trade certificates that allow polluting or using natural resources (Coase).

As it's shown in Table 1 a reduction in GHG emissions over time didn't happen in countries receiving such financial support, on the contrary, we may even see increases in emissions and inefficient public policies that could have help in the sustainability of the planet.

Table 1 Total of CO2 per Capita Emissions Coming from Fossil Fuels

Country	2011	2010	2009	2008	2005	2000
África do Sul	2,51	2,41	2,56	2,54	2,24	2,25
China	1,80	1,66	1,55	1,43	1,21	,73
Ucrânia	1,70	1,80	1,53	1,83	1,94	1,79
Tailândia	1,24	1,22	1,15	1,09	1,05	,81
Turquia	1,20	1,13	1,06	1,11	,95	,93
México	1,07	1,03	1,06	1,13	1,12	1,04
Indonésia	,63	,50	,52	,48	,41	,34
Brasil	,61	,59	,52	,55	,51	,51
Marrocos	,48	,48	,46	,47	,41	,32
Índia	,46	,44	,45	,42	,34	,31
Filipinas	,24	,24	,22	,23	,24	,26

Source: Fossil-Fuel CO2 Emissions by Nation, 2015.

Moreover we could also mention that in global terms, the total value of the carbon market grew 11% in 2011, reaching the figure of \$ 176 billion, according to the report "State and Trends of the Carbon Market", published by the World Bank.

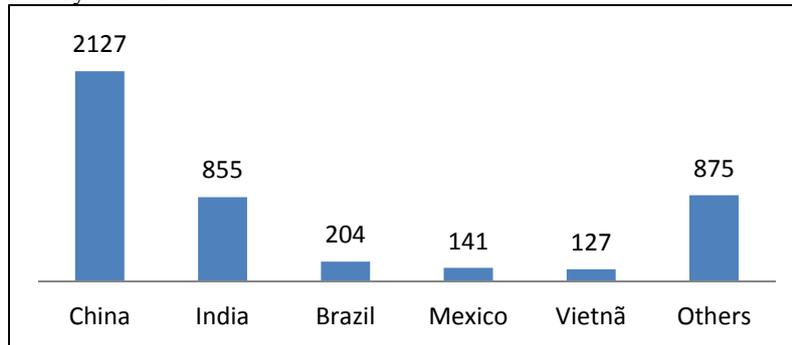

Figure 2 Number of MDL Projects Registered by 2012
Source: UNFCCC, 2012.

On this Figure 2 we one could see the countries with the largest number of CDM projects registered by 2012. Therefore, it's necessary to question the capacity to regulate market GHG emissions. Moreover, if we compare the maps of Figure 2 one may see that there were no reductions in GHG emissions from 2005 to 2011, and even in countries like India that were benefited from the CDM projects the situation was even worsened.

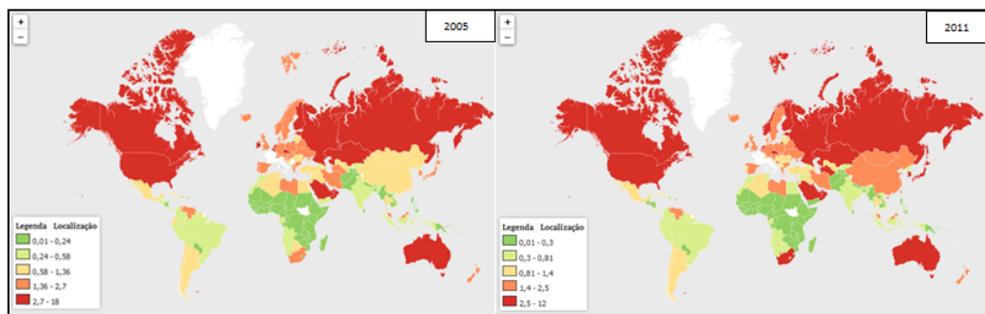

Figure 3 Changes in Total of CO2 per Capita Emissions Coming from Fossil Fuels
Source: Fossil-Fuel CO2 Emissions by Nation, 2015

Therefore a shift in perspective in discussions on the production and consumption processes is really needed; a change that moves away from orthodox economic models adopting concepts of the evolutionary theory to deal with the global problems of sustainability focusing in particular forms and organizational routines in search of a more sustainable planet and the welfare of the population.

3 Conclusions

To deal today with the question of global sustainability there is an increasing need to consider a new perspective in the treatment of production and consumption processes since the orthodox way so far being used is not given satisfactory results in solving the problem of emissions of GHGs; and there is now a need to consider the assumptions of evolutionary theory denying the rationality of the market to solve social and environmental problems.

To be realistic a solution based on Pigou or Coase's view it may work only when the situation presents itself as the Pareto optimal, which it's hardly a case since it will need that all agents have all the needed information and resources to make decisions with respect to production and consumption; and this is may be hardly find in this complex and dynamic early twenty-first century. Therefore to assume as a fact a substantive rationality of agents in their relationships may lead to paradoxical realities for the sustainability of the planet in the middle and long run. For this reason there is a need to consider an approach of evolutionary theory to lead with the environmental and social problems involved in particular in relation to the sale of carbon emissions, which are actually sealing our health and the health of our planet.

As a matter of fact, as we could see, many of the countries that benefited from subsidies or CDM negotiations did not solve the GHG emission problem, and even some had their situation worsened; so a pure market logic won't solve social and environmental problems. Hence one may see a need to study forward two main issues of Evolutionary Theory, namely: a) Could a pure market approach solve the resource allocation issues? b) Are actually the organizational structures that determine the allocation of resources?

Abstract: This paper describes the Japanese education system improvement for the local development. We make an analysis on what kind of function to offer as a local educational institution to the social big changes. We, the Japanese are facing on the birthrate decline, the growing proportion of the elderly, the population decrease, the popularization of higher education, and the population concentrated in the large city. We focus on the role of the professional high school in this paper. As a result, the role of the professional high school should achieve as the mechanism to maintain the local society are analyzed from the result of the self-evaluation system. Then, we make an interview to the administrative staff of the school for extracting their intention by text mining. This time, we stressed on their motivation. From the result of analysis, Training is an important issue for their motivation. Based on the findings, we will make further research on not only the local government policy study on the population decline measures, but the analysis of the needs consistent with the local industry as our future work. This is the progress report on this kind of the complex social issue.

Key words: Education; High school; Local economics; Local development; Educational system re-design; Knowledge extraction; Morphology analysis; Text mining

1 Introduction

This paper handles the Japanese education system improvement for the local development. Under the current environment of the Japanese educational system, a significant improvement of the university enrollment rate can be noted. On the other hand, those who get a job after the high school graduation, they try to get better working opportunity. This makes the graduate students rush into the large city, outside of their home town.

One of the school for the age from 16 years old, the industrial high school in the Japanese educational system is prepared. This educational institution is aiming to foster the human resources who are active in the manufacturing fields. The educational systems for the school continues the revision such as the training of future specialists and the local industry leader. With the improvement of the university enrollment rate, not only the technical high school enrollment number is decline, but the regular course enrollment is increased. For example, one-thirds of the industrial high school graduates go on to the university and among the rest of them, only the one-thirds stay and work at their home town. Therefore, the educational positioning of the professional high school has changed from the training of the local industry leaders. This is one of the complex problem not only the re-definition of the educational agenda for the technical high school, but include the challenge on the human resource development and the workplace secure. Furthermore, this issue is in common for the local community except of the large cities.

In this paper, the re-designing policy of the education system is considered, in order to explore the ideal education system for the minimum local human function maintenance under the declining population. At first, the educational environment is overlooked from the government statistics. Then, the provision from the school and the requirement from the parents and students about the education is examined. Finally, knowledge extraction is examined using text mining to capture the teachers' motivation to make one of the important elements in the education system design. From this outcome, the management point of the education side for the education system re-design is considered.

The rest of the paper is organized as follows: Section 2 discusses the backgrounds of the research, Section 3 describes related work; Section 4 briefly describes the analytics of the data and presents analytical results; and Section 5 gives some concluding remarks and future work.

2 Back Grounds

In this chapter, in order to reconsider the educational institutions role, the current high school

condition is described from the Japanese statistical social environment. The overview of the high school enrollment is described. Table 1 shows the trends of the 15 years old population from 2010 to 2020. The 15 years old population will decrease the population of 103,000 in 2020 compared to the year of 2010. Next, the high school enrollment status is described. Table 1 shows the enrollment condition in 2014 and 2015¹. In 2015, about 77 percent of the students are going on to the senior school, such as the university and the specialized training college. On the other hand, only 18 percent of the high school graduates get their jobs. This number includes the non-full time employment.

Then, the Japanese population density is described. Table 4 indicates the population concentration around the Tokyo metropolitan. From the result of the Census, the aging, the population decrease and the concentration of population are occurred simultaneously in the large cities. Next, the working condition is described. Table 5 shows the employment condition outside of the living prefecture in 2014 and 2015. Table 6. shows the work place destination dominance. Table 7 indicates the age group transition by 3 categories such as under 14, age from 15 to 64, and over 65. Basically, work force is regarded as from the age of 15 to 64, it can be seen that the large cities act as the destination of employment. From those tables, Tokyo metropolitan has accounted for one-third of the outside prefecture employment.

3 Related Work

Then, the school evaluation is described. The school evaluation is carried out with the self-assessment method by the Ministry of Education, Japan. The questionnaire to the parents or guardian, to the student and the opinion hearing from the teaching staff are main evaluation method¹. The fundamental competencies for working persons is the indicator proposed as the fundamental competencies work with a variety of people at working place and in the local community. This is prepared by the Ministry of Economy, Trade and Industry. The concept of the indicator is composed the three forces such as step forward, think through, and work with the team and include the lower 12 capacity elements. The national technical high school principal association conducted a survey in the fundamental competencies for working persons. It was evaluated by the questionnaire in the achievement of this indicator to their students from the view point of the school management. From the results, it was revealed that the force of think through is more required (2013). Mitsumaru et al. conducted the feature analysis on the school evaluation (Mitsumaru, H. et al. 2014; Mitsumaru, H. et al. 2014). A gap among the beneficiary and the provider was found in the educational function. The specific request function was found to be the development of the future local industry leaders. As a result, the efforts to eliminate the divergence increase the training time of subjects close to the local industry. Thus, in the educational fields, the flexible operation of curriculum fits to the social needs based on the evaluation is performed. In addition, the demand from the industry must be taken into consideration. As for the needs consistent with the local industry, in relation to aging, population decline, and urban concentration, it is necessary to re-design the educational system.

The environment for the Japanese high school is described. It is necessary to understand the requirement as the educational institution with the change such as the population concentration, the aging, the declining birthrate, and the educational popularization. The complex issue is found including not only the issue of the educational goals re-definition for the specialized high school, but the regional

industrial policy such as the working opportunity secure, the work force promotion for the future local industry leaders.

Then, the application of text mining is explored. Takeichi et al., analyzed the relationship between each the self-evaluation and final grade intended for all students who took a class one in the university using text mining. From the result revealed the students were classified into 9 clusters by their score performance¹. Masuda analyzed the local city council of the conference proceedings, to visualize the primary issues in the city assembly (Masuda, T., 2012). Yukihiro is also analyzed a free answer in the questionnaire survey from the fisheries high school students, and captured the word impression of fishermen. As a result, as the grade of the fisheries high school goes up, it was found that the image of against fishermen has been complicated (Yukihiro, M., 2011). Sakuyama was analyzed the interview contents to the social worker using text mining. From the result of the study, the focus of social work was made by the people, the environment, and the relationship (Sakuyama, F., 2012).

From the result of the related work, since text mining is one of the method to extract knowledge to the target. Knowledge extraction is examined using text mining to capture the teachers' motivation to make one of the important elements in the education system design. From this outcome, the management point of the education side for the education system re-design is considered.

4 Morphographical Analysis

We made an intensive interviewing survey to the high school teachers in Fukuoka, Japan. Table 8 indicates the outline of the interview. As for the interviewing contents to the teachers, we tried to bring out the words or experiences made your education motivation raised. Next, describing the procedure for the analysis.

First, the interviewing document was made from the interview, then morphological analysis was made.

Semantic analysis was also made by creating word frequency and co-occurrence graph, respectively. Morphological analysis was uses a Groovy². Figure 1 indicates program source. From the result of analysis, the 16,220 words in total were generated and among them, the 5,333 words were used for the analysis. Nouns, Adjective, and Conjugation of the verb "suru" were used in this analysis. As for the term "suru" in Japanese means "Do" in English.

From the result of term frequency analysis, they were frequently used the word such as "Students" or "Teacher". Furthermore, "Research" and "Training" were one of the characteristic words. This was because they thought the training and the research prepared for the teacher as one of the important activities, they consider to rise teachers' motivation through the evaluation of the research and the training. Furthermore, From the words of "Innovation", "New", "Risk", and "Responsibility", they were exploring not only the something new, but considering the risk and the responsibility at the same time.

Then, from the analytical result of term frequency, the co-occurrence graph was made. Figure 2 indicates the co-occurrence graph. From the analytical result of the co-occurrence graph, the effort content to increase the teachers' motivation were analyzed as follows; 1) Senior teacher is involved to the teacher's effort as the coordinator, 2) Share the information each other, 3) Achieve the goals of the department supported by the senior teacher, 4) Promote new initiatives, 5) Perform the training of teachers step by step.

Table 8 Survey Outline

Survey Term	April, 2015-May, 2015
Survey Method	Interviewing
Respondent	6 Administrative staff

From the result of analysis of the term frequency and the co-occurrence network graph based on the target domain heuristic knowledge, the school administrative staff were considered to be an important of the training. Furthermore, motivation of teacher and the will of teaching are increased with the training results evaluation. The administrative staff are seeking something new effort to break the current status

5 Concluding Remarks

This paper handles the analytics on the high school environment based on the Japanese social circumstances. The sufficient functions as the educational institution were analyzed to the major changes such as the aging, the declining birthrate, the educational popularization, population concentration. The professional high school role as a mechanism to maintain the local industry was analyzed. In particular, the attention was paid to the technical high schools as a source of providing the labor force in the manufacturing and the construction. As a result, the flexible operation of the educational curriculum related to the local industry was made from the analytical results. This flexible operation was based on the educational evaluation performed by the school.

Our future work includes; investigating the local government policies for the human resources and the needs analytics from the local industry, local needs survey for the educational system re-design with text mining, execute a trial study for the new lecture fit for the local.

Abstract: Corporate Greening and Organizational Behavior (OB) fields of studies pay an increasing attention on voluntary green behavior of employees, which is referred to as Organizational Citizenship Behavior towards Environment (OCBE). The objective of this paper is to identify antecedents of OCBE among university academics in South Asian developing country context. In the light of Social Exchange Theory (SET), researchers conceptualized that Perceived Organizational Support (POS) and Affective Commitment (AC) in a chain of relationship determine OCBE. Researchers employed an online questionnaire among university academics in Pakistan and Sri Lanka and received 136 effective responses. The results indicates a direct impact of POS on OCBE and a mediation effect of AC between the relationship of POS and OCBE. Investigation of the POS, AC and OCBE chain of relationship in South Asian context by the application of theoretical rigor of SET makes this study unique in corporate greening and OB literature. Further, this study sheds new lights to practitioners in order to develop appropriate conditions in encouraging OCBEs at work.

Key words: Organizational Citizenship Behavior towards Environment; Affective Commitment; Perceived Organizational Support; Social Exchange Theory

1 Introduction

In order to succeed in corporate greening “organizational actions need to go beyond technical fixes and embrace new environmentally responsible values, beliefs and behaviors” (Harris & Crane, 2002, p.215). Since Employee Green Behaviors (EGBs) are decisive for effective corporate greening, EGBs receive a greater attention by practitioners as well as scholars. Organizations mandate required EGBs by prescribing in job descriptions and/or communicating explicitly to employees. Interestingly, in practice, required EGBs comprise only a limited scope of green behaviors (Ones & Dilchert, 2012) and are not sufficient to effective and efficient achievement of organizational environmental performance (Boiral, 2009; Daily, Bishop & Govindarajulu, 2008; Ramus & Killmer, 2007) Thus, the necessity of voluntary EGBs cannot be undermined for any organization in achieving environmental performance. These voluntary behaviors of employees towards the environment are recognized as a form of Organizational Citizenship Behavior (OCB) and coined as Organizational Citizenship Behavior toward the Environment (OCBE) (Boiral, 2009; Daily et al., 2008; Lamm, Tosti-Kharas & Williams, 2013) OCBE, the newest addition to OCB literature, refers to “discretionary acts by employees within the organization not rewarded or required that are directed toward environmental improvement”(Daily et al., 2008, p.246). Thus, OCBE is individual, informal, discretionary behaviors that are not directly and explicitly recognized by the formal reward system of the organization and contribute to corporate greening (Boiral, 2009; Daily et al., 2008; Ramus & Killmer, 2007; Lamm et al., 2013).

OCBE is growing as a sub field of OCB and the most of the existing empirical studies on OCBE were conducted in European and American contexts (Lamm et al., 2013; Boiral, Talbot & Paillé, 2015; Ramus, 2002; Ramus & Steger, 2000; Temminck, Mearns, & Fruhen, 2015). Consequently, still, though the attention on greening is growing in developing South Asia, the reality of the concept of OCBE in the region is at dark. Contrasting economic, social, and cultural characteristics between developed world and developing South Asia suggest a conceptual query as to whether the existing knowledge can reveal the reality of OCBE in developing South Asian context? Therefore, the aim of this paper is to uncover the antecedents of OCBE in Pakistan and Sri Lanka, two developing South Asian nations. This study is unique and innovative since it uncovers the reality of OCBE in South Asian context by fulfilling the dearth of knowledge of the phenomenon in developing country contexts with the theoretical rigor of

* Corresponding author.

Social Exchange Theory (SET). Thereby, this paper expands the OCBE stock of knowledge beyond its present contextual boundaries. Further, it provides insights for practitioners to promote voluntary employee behaviors which help environmental sustainability of the organizations.

The rest of the paper is organized as follows. First, it examines the literature related to OCBE, antecedents of OCBE and derives hypothesis based on Social Exchange Theory. Thereafter, the methodology is described. Then, researchers provide results and discussion. Finally, conclusion and future research prospects are provided.

2 Theoretical Background and Hypotheses

2.1 Organizational citizenship behavior towards environment

Voluntary individual environmental behaviors at work place that are not prescribed by job requirements or explicitly recognized by the organization can be considered as OCBEs (Daily et al., 2008). OCBEs, in aggregate, through the combined efforts of individual employees, help to make the organization more sustainable (Lamm et al., 2013). Based on core construct of OCB, Boiral and Paillé (2012) introduced OCBE as a three dimensional construct including eco-initiatives, eco-civic engagement, and eco-helping. Eco-initiatives are employee-driven environmental actions in the workplace, such as recycling, saving water, saving energy, and other voluntary initiatives that benefit the environment. Eco-civic engagement involves actions such as participation in environmental events organized by the company. Eco-helping involves employees taking the initiative to help colleagues work to become more environmentally friendly.

2.2 Social exchange theory

SET is one of the key social theories that explain human exchange relationship at work. The core argument of the SET, the norm of reciprocity, suggests that an inner obligation to repay towards another party arises within a person since he or she is taken cared by that particular party (Saks, 2006) This suggests that, at organizational set up, employees' readiness to pay back to the organization to achieve its goals increases as a result of the organization's support towards them. Employee discretionary actions and extra role behaviors are relevant to social exchange and SET provides a strong rationale, specifically, in explaining employee engagement in discretionary voluntary behaviors (Saks, 2006). Consequently, SET is used to describe the motivational basis for employee behaviors that are neither formally rewarded nor contractually enforceable (Settoon, Bennett, & Liden, 1996). Owing to its discretionary nature and non-recognition in the formal reward system, OCBE clearly relates to social exchange. Hence, drawing from all the above evidences SET is used as the theoretical ground to understand the factors affecting OCBE of employees.

2.3 Perceived organizational support, affective commitment and OCBE

Perceived Organizational Support (POS) is the employee's global beliefs concerning the extent to which the organization values his or her contributions and cares about his or her well-being (Eisenberger, Huntington, Hutchison, & Sowa, 1986). POS reflects two focal areas of perceptions. The first is the perceived value given to the one's contribution. The second is the perceived caring about one's well-being by the organization. Reciprocal norm of SET proposes that employees with higher levels of POS are likely to be more committed and possibly more willing to engage in organizational citizenship behaviors than the employees who feel that the organization does not value them as highly (Lamastro, 1999; Organ, 1988). Since OCBE is a kind of OCB, it is argued that once employees perceive that they are supported by the organization they reciprocate it by getting engage in OCBE which in turn help the organization. At the same time, recent empirical evidences support that POS has a direct link to OCBE (Lamm et al., 2013; Boiral et al., 2015; Ramus, 2002; Ramus & Steger, 2000; Temminck et al., 2015). Based on the above, researchers develop the following hypothesis.

Hypothesis 01: Perceived Organizational Support positively impacts on OCBE.

Affective Commitment (AC), one of the dimensions of the core construct of organizational commitment, refers to "the employee's emotional attachment to, identification with, and involvement in the organization" (Meyer & Allen, 1991, p.67) SET proposes that employees who perceive a high level of organizational support are more likely to feel an obligation to repay the organization in terms of affective commitment (Eisenberger et al., 1986) Empirical studies also provide evidences of influence of POS on favorable attitudinal outcome of AC (Rhoades & Eisenberger, 2002)¹. Further, organizational behavior literature has widely acknowledged that AC relates to OCB (Podsakoff, MacKenzie, Paine & Bachrach, 2000). Since OCBE is based on the core construct of OCB and AC influences OCB, AC is more likely to influence OCBE. Further, empirical findings in European context also have shown the

impact of AC on OCBE (Lamm et al., 2013). Moreover, empirical studies on OCBE in Western context suggest that POS leads to the attitude of affective commitment and then affect the pro environmental voluntary behavior at work (Lamm et al., 2013; Temminck et al., 2015). Therefore, apart from the direct effect of POS on OCBE, there supposed to be an indirect relationship of POS through AC on OCBE. Thus, researchers posit:

Hypothesis 02: Affective Commitment mediates the relationship between Perceived Organizational Commitment to Environment and Organizational Citizenship Behavior towards Environment.

The above derived network of relationship between POS, AC and OCBE based on SET is illustrated in the figure 1.

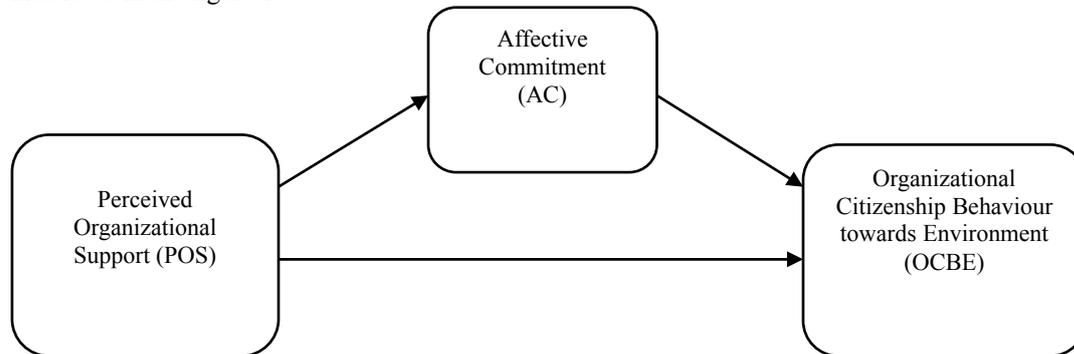

Figure 1 The Conceptual Model

3 Research Design

3.1 Participants

Researchers used online survey strategy supported by a self-administrative questionnaire. An online survey form was created by using Google forms and the permanent academic staff members of universities in Pakistan and Sri Lanka were invited to respond. Researchers collected data during the first quarter of 2016. The questionnaire consisted of two parts. The first part of the questionnaire provided the purpose of the study, contact details of researchers, assurance on confidentiality of the data and the demographic variables. The second part of the questionnaire included measures of key variables (OCBE, POS, and AC). Convenience sampling method was used and the URL of the online questionnaire was emailed to respondents. Researchers received total of 136 effective responses yielding an overall response rate of 41.46% from Academics representing 72 and 64 respectively from Pakistan and Sri Lanka.

3.2 Measures

OCBE was measured by using the 10 item OCBE scale developed by Boiral and Paille (2012) POS was measured by using four high-loading items from the POS scale developed by Eisenberger et al. (1986). Three-item scale developed by Bentein, Stinglhamber, and Vandenberghe (2002) was used to measure AC. Respondents were asked to indicate the extent to which they agree or disagree with the statements in a seven point Likert scale, where 1 denotes 'Strongly Disagree' and 7 denotes to 'Strongly Agree'.

3.3 Data analysis methods

In order to test the set hypotheses the three-step procedure posited by Baron and Kenny (1986) was employed. Additionally, the mediation effect was examined by conducting bootstrapping analysis in SPSS by using the PROCESS macro developed by Preacher and Hayes (2008). This approach does not assume the normality of sampling distribution. Accordingly, 1,000 bootstrap samples with 95 percent confidence intervals were used.

4 Results and Discussion

4.1 Factor analysis

Researchers used KMO and Bartlett's test to measure the external validity of the study. The actual value of KMO was 0.613. It exceeds the threshold limit of .5. Hence, sample adequacy of the study is acceptable. Confirmatory factor analysis, using AMOS 23, shows that all the factor loading estimates were above .5 indicating the convergent validity of the measurements. Further, the model was evaluated with absolute fit indices of Root Mean Square Error of Approximation (RMSEA) and Goodness-of-fit statistic (χ^2/df). As a threshold level, RMSEA below .08 and χ^2/df less than 2 indicate an acceptable fit

(Hu & Bentler, 1999). RMSEA of the model was .078 and χ^2/df was 1.96. Comparative Fit Index (CFI), Normed Fit Index (NFI) and Tucker Lewis Index (TLI) approaching or greater than 0.9 reveal a good fit (Hu & Bentler, 1999). The present model reported .913 of CFI, .907 of NFI, and .887 of TLI indicating an acceptable fit. Hence, the results of CFA revealed the validity of the factor structure.

4.2 Descriptive statistics, correlations and reliabilities

Table 1 presents the means, standard deviations, and correlations. The results showed that POS correlates with AC ($r = .559, p < 0.01$) and OCBE ($r = .293, p < 0.01$). In addition, AC is related to OCBE ($r = .415, p < 0.01$). All scale reliabilities were highly acceptable with Cronbach’s alpha values exceeding the accepted threshold value of .70 (Kline, 1999) (POS: $\alpha = .933$; AC: $\alpha = .843$; OCBE: $\alpha = .928$).

Table 1 Descriptive Statistics and Correlations.

	Mean	SD	1	2	3
1. POS	4.85	1.28	(.933) ^a		
2. AC	5.12	1.23	.559**	(.843) ^a	
3. OCBE	4.68	1.19	.293**	.415**	(.928) ^a

Notes: ** $p < 0.01$ one tailed. ^aReliabilities are shown in diagonal.

4.3 Test of hypotheses

The results of simple regression analysis reported a positive impact of POS on OCBE ($\beta = .280, p < 0.01$). Therefore, the *H1* was supported. This shows that the higher the POS the higher the OCBE. Similarly, POS also positively impacts on AC ($\beta = .559, p < 0.01$) and AC positively impacts on OCBE ($\beta = .403, p < 0.01$). *H2* suggested that AC mediates the relationship between POS and OCBE. The standardized regression coefficient between POS and AC was statistically significant, as was the standardized regression coefficient between AC and OCBE ($\beta = .354, p < 0.01$). The results demonstrated that when AC was added in the equation, the relationship between POS and OCBE was insignificant ($\beta = .083, p = 0.389$). Further, the bootstrap analysis corroborated the mediating role of AC since the bias corrected confidence interval of specific indirect effect does not contain zero (from .0881 to .3349). Thus, the indirect effect was statistically proven and it indicates that AC serves as a full mediator between POS and OCBE. This result supported the second hypothesis that AC mediates the relationship between POS and OCBE. These results are shown in the figure 2 below.

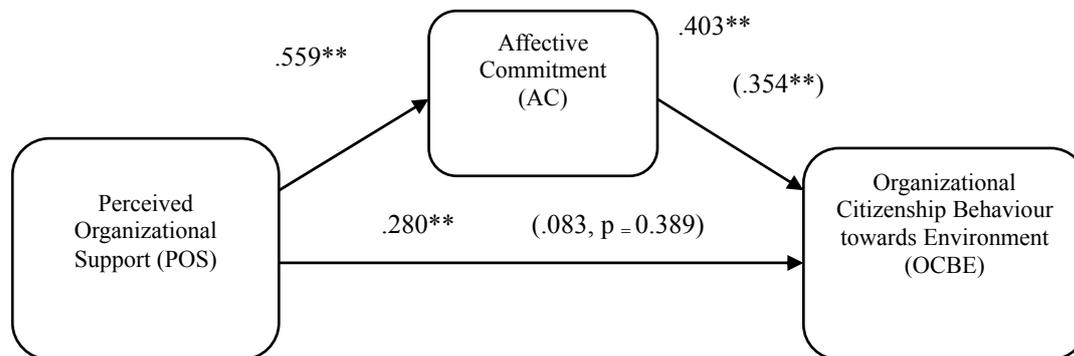

Figure 2 The Tested Model

Notes: ** $p < 0.01$, Coefficients in the parentheses represent indirect effect of multiple regression.

4.4 Discussion

Researchers set out to uncover the determinants of OCBE among university academics in Sri Lanka and Pakistan. Informed by SET, POS was expected to predict OCBE and it was also expected that affective commitment mediates the relationship between POS and OCBE. It was found that POS impacts on OCBE and affective commitment fully mediates the POS and OCBE relationship. Accordingly, the present findings are in line with previous empirical findings by Lamm et al. (2013) and Paillé, Boiral, and Chen (2013) that POS impacts positively on voluntary green behaviors of employees. Further, consistent with the findings by Lamm et al. (2013) and Temminck et al. (2015), AC plays a full mediating role in explaining the association between POS and OCBE. The reciprocity principle of SET

provides the rationale for the above relationship between POS, AC and OCBE. When POS is experienced by respondents, they reciprocate it through the attitude of AC. In the next phase, positive attitude of AC influences the voluntary behavior of OCBE. Thus, it can be asserted that perceived organizational support is a significant variable in determining OCBE of Academics and higher POS by academics will result in higher affective commitment towards the organization and, in turn, will demonstrate elevated level of OCBE.

In general, the findings signify the role of organizational support and AC in bringing voluntary pro-environmental behaviors at workplace. Findings indicate that employees are more likely to display OCBE (Eco initiations, engagement in and helping others to engage in pro-environmental behaviors at work) when they interpret that they are being supported by the organization. Accordingly, POS-AC-OCBE relationship suggest that, in the endeavor of promoting OCBE, managers need to create an environment that employees feel that their efforts are noticed and valued while their wellbeing is looked after.

The fact that data were collected from two South Asian contexts, Pakistan and Sri Lanka, makes the study unique in terms of contextual application of the study findings. However, this study is not without some limitations common to field research. First, the cross sectional nature of the study limits the ability to establish causality among the studied variables. Second, data were collected by using self-reports from a single source and, therefore, respondents may have inflated the responses. Third, the respondents represented only one profession in a single industry. Therefore, broader generalization of the study findings is difficult to reach. However, despite concerns of the nature of data and broader generalization, this study facilitates further investigations in this developing research area.

5 Conclusions and Future Research Prospects

In the emerging research area of employee green behaviors, this study attempted to find out the determinants of OCBE based on SET. The results suggest that POS is a predictor of OCBE and AC plays a crucial mediating role in promoting OCBE when POS present. POS appears to create affective commitment, which, in turn, is associated with increases in OCBE. Thus, the role of AC and POS can be identified as vital factors in predicting OCBE of Academics in two developing South Asian nations of Pakistan and Sri Lanka.

Findings of this investigation set the stage for uncovering further psychological, organizational factors that determine OCBE in South Asian context. Future researchers are encouraged to pursue a longitudinal and multi sector study with multiple sources of data. Additionally, discretionary behaviors at work place are complex. Thus, model with only two variables will not serve the purpose of properly understanding the phenomena those results in OCBE. Hence, the existing model needs to be strengthened by testing other possible variables at multiple levels (individual, group and organizational) for a better understanding of the network of associations leading to OCBE.

Research on the Stability of Cultural and Creative Industries Ecological Environment

Yan Ningning

School of Business Administration, Jing De Zhen Ceramic Institute, Jingdezhen, P.R. China, 333403

(E-mail: Lsemail2008@163.Com)

Abstract: With the continuous expansion of the China's economy scale, the resource depletion, environmental pollution and other issues that rose have increasingly become the bottleneck restricting the development of industry. In recent years, the research on the ecological economy by metaphor research method has become a hot topic. In the research of industrial ecological economics, the stability of the ecological environment is a key factor to the self-perfection, self-repair and self-development of the industrial ecosystem system. Therefore, the research on the influence factors of the stability of the cultural creative industries ecological environment has great theoretical and practical significance. By using the empirical methods to investigate the relationship among complexity, diversity and stability of cultural and creative industries ecological environment; constructing the relation model among complexity, diversity and stability of cultural and creative industries ecological environment. The results showed that the complexity of cultural and creative industries ecological environment had limited effect on the stability of cultural and creative industries ecological environment, the diversity of cultural and creative industries ecological environment had the key effect on the stability of cultural and creative industries ecological environment.

Key words: Cultural and creative industries; Ecological environment complexity; Ecological environment diversity; Ecological environment stability; Empirical research

1 Introduction

The meaning of stability has different interpretations in many subjects. From the more common understanding in the control subjects for the definition of the stability of the stability is response to outside interference, if small interference has a little influence on the movement, is undisturbed movement can be considered to be stable; if the interference on the motion of the impact is large, then the undisturbed motion is considered to be unstable (Anja-Katrin Fleig, 2000).

The resistance of cultural and creative industries ecological environment is mainly to ecological environment of cultural and creative industries in resisting external complexity of interfering factors, making the industry environment is in a state of ecological balance, to maintain the structure and function of a kind of comprehensive ability. The restoration of the ecological environment of the cultural and creative industries refers to a comprehensive ability to restore the ecological environment of the cultural and creative industries to the original ecological balance after the destruction of the external disturbance factors. Obviously, the cultural and creative industries, the stronger the resistance of the ecological environment, the better the ecological balance, the recovery of the same situation in this case. Cultural and creative industries is a complicated and diversified system, the ecological environment is an open, stable, inclusive, dynamic. Therefore, only in the resistance and resilience seek some balance to ensure the stability of the ecological environment of the whole. Sumita (2001) research shows that the system, technology, economy, information, organization, law, cognition, and other seven factors hinder the stability of the industrial ecosystem. Heeres (2004) showed that the government intervention in Holland was less stable than the United States. Obviously, the research focus of domestic and foreign focuses on the relationship between complexity, diversity and ecosystem stability. Ecological system is too complex would undermine the stability of the ecological system; diversity can lead to stability, but the formation of the relationship of driving force may not ecosystem diversity, but ecological communities of species.

2 Research Hypothesis

The existing research reflects many factors influence the stability of the ecological environment, because of the particularity of the cultural and creative industries, the industrial ecological environment and the meaning of the stability is very complex, especially as a cultural creative industry which is a special form of industrial organization, the stability of ecological environment and its ecological environment the complexity and diversity of very close at present, the study involved less, this study

intends to use the information platform construction, member diversity, key competence and external support, members of the matching degree of 5 dimensions as the direct factors influencing the stability of the cultural and creative industries of the ecological environment, and the cultural and creative industry ecological environment complexity and diversity as the description of influence the indirect factors of the stability of the ecological environment of cultural and creative industries. Based on the above analysis, the following assumptions are put forward:

Hypothesis 1a: the complexity of cultural and creative industries has a significant positive impact on the construction of information platform.

Hypothesis 1b: the complexity of the cultural and creative industries has a significant positive impact on the member structure.

Hypothesis 1c: the complexity of cultural and creative industries has a significant positive impact on the key enterprise capacity.

Hypothesis 1d: the complexity of the cultural and creative industries has a significant positive impact on the external support.

Hypothesis 1e: the complexity of cultural and creative industries has a significant positive effect on the matching degree of members.

Hypothesis 2a: the cultural and creative industries have a significant positive impact on the construction of information platform.

Hypothesis 2b: cultural and creative industries have a significant positive impact on the member structure.

Hypothesis 2c: the cultural and creative industries have a significant positive impact on the ability of key enterprises.

Hypothesis 2d: the cultural and creative industries have a significant positive impact on the external support.

Hypothesis 2e: the cultural and creative industries have a significant positive effect on the matching degree of the members.

Hypothesis 3: the construction of information platform has a significant positive impact on the stability of cultural and creative industries.

Hypothesis 4: members of the structure of cultural and creative industries have a significant positive impact on the ecological environment.

Hypothesis 5: the key enterprise ability has a significant positive impact on the stability of the cultural and creative industries.

Hypothesis 6: the external support has a significant positive impact on the stability of the cultural and creative industries.

Hypothesis 7: members' matching degree has a significant positive impact on the stability of cultural and creative industries.

Based on the above assumptions, this study proposed to cultural and creative industries ecological environmental complexity and diversity of cultural and creative industries ecological environment of initial variables and to the construction of information platform, a member of the structure and key enterprises, external support, members of the matching degree of the five factors as the intermediate variable, to cultural and creative industries ecological environmental stability as outcome variables, the establishment of the relevant theoretical research model.

3 Research Design

This study through the different types, different levels of cultural and creative industry executives, middle, creative project managers, engineers, experts and scholars conduct on-site investigations and by mail questionnaire in the form of questionnaire to obtain the data to the relevant personnel. This study in the collection of data set up a questionnaire before the experts also asked the experts to the validity of the questionnaire and the issue should be paid attention to the issue of a specific comments and suggestions. The recovery rate and the effective rate of the questionnaire are relatively ideal. A total of 519 questionnaires were distributed, 397 questionnaires were recovered, 366 questionnaires were valid. The recovery rate and effective rate were 76.49% and 70.52%, respectively. The scores were by method of Likert Scale.

1) Measurement of initial variables. Literature (Scott, A.J,1988) in this study, measure the initial variable from the, which complexity of ecological environment of the cultural and creative industry specific measurement items include: between the member enterprises of connection degree, members of the enterprise scale, industry supply chain path lengths, within the industry cooperation enterprise

mutual dependence. Cultural and creative industries, the diversity of the ecological environment of the specific survey items include: the number of members of the enterprise, industry supply chain channel width, member enterprises in the industry, etc.

2) Measurement of intermediate variables. In this study, the measurement of the intermediate variables using the direct method, the specific item from the scale of literature (Isaksen, A, 2000) and literature (Ross Brown, 2000). The information platform construction of the measurement items: information value degree, information network construction situation; for the structural members of measurement items: situation of communication among the member enterprises of the mutual distance, between the member enterprises, member enterprises the main business of similar, members of the corporate management environment; enterprise key ability measurement items: manufacturing of key enterprises quantity, scale, production capacity, ability of market development; external support for the efforts of the measurement items: government support policy, advocates, specialized agencies, government support; members matched the measurement items for: member enterprises related to the degree of, the existence of industry and common language.

3) The measurement of the outcome variable. This study directly asked the cultural and creative industries in the enterprise managers, creative design and development engineers, scholars and experts to measure the level of industrial ecological environment stability.

4 Research Results

4.1 Factor analysis

Due to the others in the factors of influence on the stability of industrial ecosystem design scale is used for reference in this study. Therefore, it is necessary to explore factor analysis, to help us to judge the scale design effectiveness of the amount of the table. Using SPSS16.0 statistical analysis software provided by factor analysis method respectively to the initial variables and intermediate variable principal component extraction. The results showed that the initial KMO value was 0.922, the KMO value of the intermediate variable was 0.961, and the significant probability of the Bartlett spherical test was 0, which indicated that the questionnaire data was suitable for factor analysis. At the same time, the statistical analysis showed that the initial variables can better be explained by a factor of 2, all factor loadings are above 0.821, factor accumulation contribution rate reached 79.99%; intermediate variables can better be explained by a factor of 5, all the factor loadings are above 0.877 and for sub cumulative contribution rate reached 89.61%. Therefore, according to the common features of factor, two initial variables named for the cooperation of cultural and creative industries ecological environmental complexity and cultural and creative industries ecological diversity of, five intermediate variables named for the construction of information platform, a member of the structure and key enterprises can force, the external support, members of the matching degree. The results of exploratory factor analysis are consistent with the expectation of the theoretical model.

4.2 Questionnaire reliability and validity test

This study uses the coefficient as the test standard to observe the internal consistency of each item in the questionnaire. Through calculation, the coefficient of variable initial is 0.929; the cultural and coefficient of creative industries ecological environment complexity is 0.912, coefficient of cultural and creative industries ecological diversity was 0.933; coefficient of intermediate variables is 0.956, in which coefficient of information platform construction is 0.966, coefficient of structure member is 0.946, coefficient of key enterprise capability is 0.890, coefficient of external support strength coefficient is 0.977, coefficient of the matching members is 0.935; the coefficient of stability of cultural and creative industries ecological environment variables is 0.896, all the coefficients are greater than 0.8 standard, which indicates that the reliability of the items in the questionnaire are quite ideal.

The validity verification, because the questionnaire items are from previous studies of relevant scholars at home and abroad, so the content validity can guarantee. At the same time, from the exploratory factor analysis, due to the initial variables, intermediate variables, the results of the survey items of the common degrees are more than 0.6, so the construct validity of the questionnaire is also acceptable.

4.3 Regression analysis

In this study, multivariate statistical regression method was used to test the above hypothesis. In order to avoid the interference of multiple co linearity, the stepwise regression method is used to build the regression model.

1) Regression analysis of initial and intermediate variables. This study first discusses cultural and creative industries ecological environmental complexity and cultural and creative industries ecological

diversity and information platform construction, a member of the structure and key enterprise competence, external support, members of the matching degree between the relationships. At the 0.05 significant level, the relationship between the initial and intermediate variables is shown in table 1. There exists linear regression relation between the variables of the concomitant probability value less than 0.001 in the table of variance analysis.

Table 1 Regression Analysis of Initial and Intermediate Variables

		Information platform construction	Member structure	Key enterprise ability	External support intensity	Membership matching degree
Complexity	Regression coefficient	0.520	0.237	0.098	0.121	0.533
	Sig.	0.332	0.000	0.571	0.000	0.000
Diversity	Regression coefficient	0.137	0.388	0.612	0.012	0.713
	Sig.	0.000	0.000	0.000	0.171	0.000

From table 1, we can see that the complexity of cultural and creative industries has a significant positive effect on the structure of members, the strength of external support, and the matching degree of members, that is, there is a significant causal relationship between them. The diversity of cultural and creative industries has a significant positive effect on the construction of information platform, the structure of members, the ability of key enterprises and the matching degree of members, that is, there is a significant causal relationship between them. Therefore, assuming 1b, assuming 1d, assuming 1e and assuming 2a, assuming 2b, assuming 2c, assuming 2e was established, assuming 1a, assuming 1c, assuming 2d does not set up.

2) Regression analysis of intermediate variables and outcome variables. This study is to explore the correlation between information platform construction, member structure, key enterprise capabilities, external support, and member matching and cultural and creative industries. In the 0.05 significance level, the regression analysis between the intermediate variables and the outcome variables is shown in table 2.

Table 2 Regression Analysis of Intermediate Variables and Outcome Variables

		Information platform construction	Member structure	Key enterprise ability	External support intensity	Membership matching degree
Stability	Regression coefficient	0.129	0.531	0.371	0.416	0.376
	Sig.	0.000	0.000	0.000	0.000	0.000

From table 2, we can see that the hypothesis 3, the hypothesis 4, the hypothesis 5, the hypothesis 6, the hypothesis 7 are established. Information platform construction, a member of the structure and key enterprises, external support, members of the matching degree of cultural creative industry ecological environment stability performance of a significant positive influence, which member structure affect larger, the information platform construction impact to a minimum.

Through the above analysis, the cultural and creative industries to get the stability of the ecological environment factors model (figure 1), and draw the following conclusions:

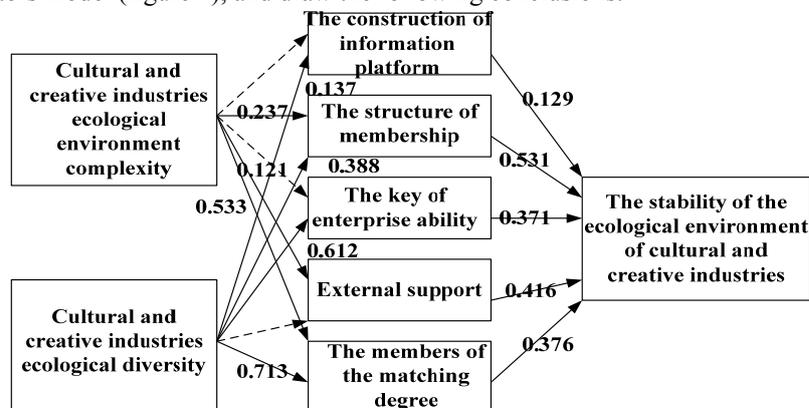

Figure 1 The Relationship Model of Cultural Creative Industry Ecological Environment Complexity, Diversity and Stability

5 Conclusions

The complexity of the ecological environment in the cultural and creative industries is simply the description of the abundance of species, the correlation degree among species, the interaction of species in the ecological environment of the cultural and creative industries. From the perspective of energy flow and ecological environment of the cultural and creative industry belongs to the high complexity of industrial ecological communities, the ecological industry chain and industrial network is more complex, the members of the enterprise can accept a variety of ways, the energy input, can also to other members of the power output of a variety of ways. That is to say, in the cultural and creative industries ecological environment inside the energy exchange in many ways, if a way is disturbed, then industrial community will be through other means to compensate, in this sense and complexity influence its stability. But the complexity of energy compensation based on key information platform construction and to help the enterprise to enhance the ability is irrelevant, the ecological environment for cultural and creative industries complexity affects the members of the structure, the external support strength and members of the matching degree thus affect the stability of the ecological environment.

The ecological environment of the cultural and creative industry diversity refers to the diversification of enterprise ecological environment for cultural and creative industries forms, levels and the industrial complex, say simply, ecological diversity is the sum of the cultural creative industry and environment form the ecological complex, and the correlation of all kinds of ecological processes. Diversity means that the complex structure of the ecological environment, a high degree of network, strong heterogeneity, energy, material and information input and output channels are numerous and dense, crises crossing, uninterrupted, so that the flow is large, fast velocity, high productivity. Even if the individual pathways is destroyed, industry itself will due to varied between allelopathy, mutual compensation and alternative and to ensure that the energy flow, material flow, information flow of normal operation, industrial structure was destroyed part of the rapid repair, restore ecological environment of cultural and creative industries the original steady state, or the formation of a new stable state. In this sense, we say that the ecological environment for cultural and creative industry diversity and stability exists some degree of correlation, in the process of the development of cultural and creative industries, through increase the diversity of the ecological environment, promote the stability of the industrial environment.

Abstract: The intangible assets occupy a special role in the competitiveness of companies. Because of the high level of ambiguity surrounding intangible assets, their complementary nature, and possible legal barriers to imitation, competitive advantage based on immaterial assets are perceived to be particularly sustainable and thus of high strategic relevance. However, companies possessing a competitive advantage based on immaterial assets are facing problems resulting from the special characteristics of intangible assets. The intangible assets are accompanied by the central problem of appropriation that results from their public good characteristics. This paper discusses the key importance of the appropriation of economic returns stemming from competitive advantage. The intangible technical assets are a company's strategic reasoning. This discussion leads us to a more holistic view of the term appropriation and points out the key significance of the discussion about appropriation in the management of technology.

Key words: Intangible assets; Sustainable competitive advantage; Patent rights; Economic returns

1 Introduction

In the past, the discussion of the appropriation of intangible technological assets has predominantly concentrated on the analysis of patent and trade secret protection. However, as broadly recognized, these protection modes show significant shortcomings and limits which put their importance in safeguarding the competitive advantage in question. In addition, the current language and focus used in writing patent documents has to be thought over and companies have to take their strategy into consideration in determining the most adequate protection mode and in formulating the patent document.

Then, the company specific resources and competencies must be protected by imitation barriers in order to be of strategic importance for a company. Such a strategic advantage that is appreciated by customers and sustainable relative to competitors can represent a significant source of revenue for the company in question. However, the final economic rent a company can generate with a certain competitive advantage depends on the possibility to appropriate the returns generated by the advantage in question. It is often mistakenly assumed that the possession of a strategic advantage inevitably leads to an economic return for its holder which lies above the level currently assumed to be normal for a certain industry or branch. There are, however, four main factors that influence the appropriation of the returns generated by a certain sustainable competitive advantage:

- 1) Relative bargaining power;
- 2) Ownership rights and embed of resources and capabilities;
- 3) Existence of complementary assets;
- 4) Regulatory influences (Grant RM, 1997).

2 An Example

The first factor which has been identified to crucially influence the appropriation of the returns generated by a certain competitive advantage. It is the relative bargaining power of the holder and owner of the competitive advantage. If a certain competitive advantage can be clearly attributed to one single employee, the employee can reap off a substantial part or even the totality of the revenues. The bargaining power and thus the extent of the revenue stream which the individual can appropriate, depends on his mobility and if the skills offer the same productivity in another company. The existence of specific complementary assets outside the company holding the competitive advantage represents another factor which can significantly influence the appropriation of the returns generated by a certain sustainable competitive advantage. The company holding the specific complementary asset has the power to appropriate a better part of the returns generated by an advantage, although the advantage itself is owned by another company.

The prominent industry in which companies, even though bestowed with resources and

competencies showing the characteristics of strategic advantage, however, unable to appropriate the returns generated by their advantages due to established firms holding specialized complementary assets, represents the Internet Service Provider industry (ISP). Some Companies offering all-inclusive services, also referred to as flat-rate, such as 'AT&T', 'T-Mobile', 'Verizon', 'Sprint', etc. which offer clients a portal to access the Internet via established telephone lines, may possess a strategic advantage in terms of a high commitment of the customer to a certain ISP due to high switching costs, the distinctive service offerings provided on the portal, but also because of the extremely high set up costs of such a service what server capacity, global presence, software development etc. However, these companies cannot fully appropriate the returns generated by their strategic advantage due to the existence of the complementary assets of the telephone connection. For example, France 'T1ecom', Germany 'Deutsche Telekom', British 'British Tel-com', Spain 'Telefonica', etc. (Geroski P, 2015). (see table 1) These operators can turn appropriate a better part of the returns generated by the ISP advantage because of the connection fees the ISP have to pay for their customers which have to use the infrastructure provided by the operators in order to access the provided service. Thus, a company has to control all specific complementary assets and activities in order to be able to appropriate the returns of its strategic advantage

Table 1 The Customer Loyalty of EURO'S Telecom Companies Offering All-Inclusive Services

Telecom Industry Brand	Non-all-inclusive services fees	Customer loyalty (Before)	All-inclusive services fees	Customer loyalty (after)
France T1ecom®	0.56 euro/min	23.36%	30 euro/month	31.66% ↑
Germany Deutsche Telekom®	0.68 euro/min	32.14%	28.99 euro/month	42.12% ↑
British British Tel-com®	0.69 pen/min	21.12%	23.99 GBP/month	39.88% ↑
Spain Telefonica®	0.82 euro/min	28.39%	28.79 euro/month	40.66% ↑
Italy TIM®	0.50 euro/min	40.01%	29.92 euro/month	62.31% ↑

Source: TIM®(Italy, Telecom Italia Mobile) annual report (2013).

3 Methodology and Analyze

The general conclusion which can be formulated on the basis of the discussion of the factors determining the appropriation of returns of a certain advantage. It is that companies have to increase the embed of the resource and obtain ownership rights on the resource or competency, reduce the bargaining power of the agent holding the resource, and try to integrate or generate the necessary specialized complementary assets. A company can, for example, reduce the mobility of employees by long lasting contracts or equity participation and thus increase the embed of the resource. Another, perhaps more efficient method, it is to extract the knowledge constituting a competitive advantage from the individual employee by codification and spreading of the knowledge over several different employees within the firm and consequently increase the connectivity of the intangible asset to the company and reduce the bargaining power of the individual agent (Hausman J,1984). The paper has merely considered the appropriation of the returns generated by an existing competitive advantage.

3.1 The model of the appropriation of intangible assets

The paper has merely considered the appropriation of the returns generated by an existing competitive advantage. This point of view does, however, not account for future strategic assets and completely neglects the central importance of appropriation in the management of technology. In this part section therefore expands our contemplation and presents the appropriation of technology as a key component in the model of the appropriation of intangible assets. The appropriation of returns stemming from an existing company specific advantage considerably determines the profit earning potential of the business enterprise. However, in order to fully account for the strategic role of the appropriation of intangible assets in the field of technology management, we have to enlarge our understanding of the term appropriation. Because of the broad literature available on the general subject of technology management, we have to concentrate our discussion and do merely present the model developed by Morin (Klaus Jennewein, 2011). The particular relevance of the model for our discussion is due to its explicitness about the centrality of appropriation of intangible assets. Morin has identified six central

functions of appropriation of intangible assets: (1) Optimization; (2) Enrichment; (3) Safeguarding; (4) Stocktaking; (5) Evaluation; (6) Surveillance. (Lucchi, N., 2005) (see figure 1)

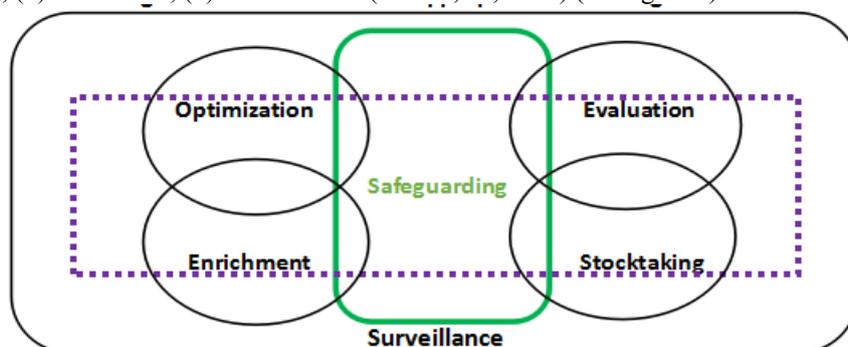

Figure 1 The Model of the Appropriation of Intangible Assets

3.2 The analyzed on the model of the appropriation of intangible assets

These six functions can again be distinguished in three active functions optimization, enrichment, and safeguarding and three supporting functions stocktaking, evaluation, and supervision. As the author has clearly pointed out, the six functions have to be managed in accordance and the efficiency of the entire system of technology management would be endangered by the negligence of any one function. In this system of technology management, the function of safeguarding technological resources and competencies corresponds to what commonly is understood under securing assets and associated returns and thus substitutes for the term appropriation. However, appropriation must not only concern the safeguarding of a company's existing technological patrimony and its returns, but also of potential future technological resources and competencies that may be a source of competitive advantage in the future (Srivastava RK, Shervani TA, 1998). Morin subsumes under the term optimization the verification if all resources and capabilities are efficiently employed. In order to be able to confirm if all resources and capabilities are used to their best potential a company has to access and evaluate its current stock of technological assets and this stocktaking might reveal hidden treasures so far neglected by the company. This stock of resources and competencies has to be enriched and upheld in order to oppose depreciation and to avert obsolescence of these resources and competencies due to the fast progression of technological development. However, has to evaluate the individual resources and competencies in order to be able to efficiently manage the assets and enhance their value. According to Morin, the safeguarding and supervision functions represent the central axes which link the different key functions of the technology management system (Mossinghoff GJ, 1984). The basic model and the interrelation of the different functions of technology management are visualized in the model of appropriation of intangible assets.

4 Results

Consequently, the system of technological management established by Morin clearly points out the central importance of safeguarding and hence of appropriation of technological resources and competencies in the management of technology. However, the management of technological resources does not only concentrate on currently existing resources and competencies but has to include future resources and competencies which can be generated with the existing set of company assets. In respect to the importance of future technological resources and competencies, Morin has referred to the technological diversification of companies and pointed out that companies have to consider in their technology management future technologies, which are in the process of emergence and evolution, and cannot only bear in mind established technologies already existing in the company. (Ernst H, 2007) Therefore, a company has to consider in the strategic management of technology, and hence in the appropriation of its intangible technological assets, not only currently existing resources and competencies, but also future resources and competencies that can be generated with the existing corporate strengths.

Moreover, we do not consider the R&D, production, and intellectual property departments as the key divisions within the model of appropriation of intangible assets presented. We rather include any function of a company in the system and all functions of the company have to perform the six functions of technology management presented above. So is, for example, the personal management department

extremely important in recruiting employees that fit to the current or envisaged corporate culture and add to the current stock of human capital (Chesbrough HW and Teece DJ, 1998). Thus, the company must be able to attract not only employees with the needed technical skills and know-how but which also show the required social characteristics and needs. Consequently, the personal management has to work in close interrelation with the marketing, R&D, production, and any other functions within the company. Hence, we can affirm, a company that wants to efficiently manage its current and potential future stock of intangible technical assets, and thus appropriate its technological assets, has to integrate any function of the company in its technology management system and a flaw in any one function results in the weakening of the whole system.

5 Conclusions

We can hence summarize, the appropriation of the immaterial technological assets which is encapsulated in the notion of safeguarding in the model of appropriation of intangible assets, represents a central aspect of technology management interfering with any of the other five functions. Moreover, the management of technology does not only concern existing technological resources and competencies, but includes future assets, which might not currently exist or are even considered as achieved (Klaus Jennewein, 2011). Last but not least, the technology management with its six principal functions has to be implemented and considered in any acting of the company reaching from top management to the individual employee on the production floor.

Importance and Evolution of Productive Transformation with Sustainable Innovation at the Ibero-American Countries

Arnoldo Jose de Hoyos Guevara, Leda Honorato da Silva Reis
Pontificia Universidade Católica - São Paulo, Brazil
(E-mail: arnoldodehoyos@yahoo.com.br, ledahsreis@uol.com.br)

Abstract: Industrial Revolution, World Wars and the Great Depression contributed to foster Productive Transformation and Sustainable Innovation of Ibero-American countries. The Technological progress was more intense from 1948 and beyond, when a UN Economic and Social Commission ECLAC was created to help development in Latin America; and later on also the Development Bank of Latin America. The sustainable development, inside of a modern approach, is that capable of supply the needs of the current generations, without compromising the capacity of answer the needs of future generations. The importance of Productive Transformations and Sustainable Innovation it is already noticed by governments that are seeking among other things: Better work conditions, Social inclusion and formation of a fairer society. The successful models of Productive Transformation and Sustainable Innovation go beyond the technology with machines, and require a higher level of human capital as already recognized by groups like the Lemann foundation, Erasmus Plus and Instituto Ibero Americano of TIC. The present study presents the rankings on Productive Transformation and Sustainable Innovation for Ibero-American countries based on a study of a sample of 132 countries from the Sustainable Development Observatory for The Iberoamerican Region ORIBER.

Key words: Transformation; Innovation; Ibero-American; Sustainable; Development

1 Introduction

The productive transformation and Sustainable Innovation of countries in the Ibero-American axis began in meaningful events of world history like the Industrial Revolution, World Wars and even the financial crash of 1929. From 1948 on when it was created the UN Economic and Social Commission ECLAC for Latin America the help develop economic relations among Latin America countries. Portugal and Spain the Ibero-American countries, outside of Latin America axis, by their location, they had economic integration and development with other European countries.

The Development Bank of Latin America – CAF, founded in 1970, loans resources to the development of the region, normally from developed countries, providing better integration between Latin America and these developed countries. However there is a growing concern for the productive transformation to be executed in sustainable way, once that, the inefficient use of the natural resources of Latin America may cause worldwide impacts in the climate and biodiversity.

The Productive Innovation normally contributes to the improvement of production, of development of new materials, of creation of new sales channels, of new process techniques, of marketing and even new administrative processes. Successful Models for Productive Transformation and Sustainable Innovation go beyond applied equipments since requires better prepared people.

The Sustainable Development also promotes the economic development, the environmental care, better work conditions and better Jobs, creating a fairer society. From this context, this research seeks to describe the importance of the development of Ibero-American countries regarding Productive Transformation and the Sustainable Innovation and the anticipatory need to invest on Human Capital considering the value of technological education to the progress.

2 The Productive Transformation and Sustainable Innovation

2.1 The historical conditions regarding the industrial development of countries in the Ibero-American region from the industrial revolution

The process of industrialization has its origin by mid-century XVIII, in England, with the Industrial Revolution, that generated important social modifications, economic and technical, starting the use of technology. The technological expansion, already from the XIX century, extended itself to other European countries, like Germany, France, Italy, Belgium, Netherlands, and even countries outside the European axis, like Japan and USA, that came to be called industrialized countries and of capitalist economy. The Latin American countries, considered not industrialized were not industrialized countries until World War I that created conditions for a discrete industrialization of the region. According to and

Medeiros (2013) and Trepadini and Stedile (2011) until 1917, the Latin American countries got involved in the European wars only as suppliers of raw materials and food to the countries in the conflict, that were the capitalists economies at the time.

According to BEM (2005) the capitalists countries, involved in World War I, started to have difficulties to export industrialized goods to the Latin-American countries, that now having the feeling of the scarcity of industrialized goods started to develop its own industry to attend inner demand.

The financial Crisis of (1929) and World War II from 1939 to 1945 also contributed to the industrialization and scarcity of industrialized goods. The largest Latin American countries, mainly Brazil and Mexico, continued the industrialization process at the beginning of 1970, with the oil crisis that created a slowdown of the industrial process.

According to BEM (2005) and SILVA (2010) the process of industrialization had a retreat in 1970 with the oil crisis and in 1982 by the moratorium decreed by Mexico and Chile. The oil crisis contributed for the emergence of a 3rd Industrial Revolution, with the development of technology of information and transport.

The Latin America countries started having a UN contribution, which provided the entrance of foreign investments to the technological development of Latin America with the creation of the ECLAC an organism of ONU, founded in 1948, seeking to strengthen the economic relation between countries in the Latin America axis and countries in other regions of the world. In 1984, the United Nations council decide that the commission will be called now on *Comissão Econômica para a América Latina and the Caribbean* since 1956 had its headquarters in the city of Mexico, and in 1966 was founded a sub-headquarters in Porto of Spain for development of Caribbean region .

The United Nations has promoted sustainable development through the coordination of regional development actions mainly from the AL, where there is still much to do in this region. According to Cardoso (1993) the Latin America – AL counted with the collaboration of ECLAC, supporting the need for industrialization, tax reforms, land and State actions for national development. This important step towards industrialization, contributed to the creation of a technological culture on the region.

According to the Program to Development and Modernization (2014), there is a consensus among governments and public opinion that in order to achieve sustainable development there is a need to have good policies covering science, technology and innovation; and hence investment in science, technology and higher education is growing in almost all Latin American countries, and most of them have begun to formulate and implement policies to stimulate innovation. Some countries in Latin America have grown at high rates, and is expected to continue growing in the years to come.

The productivity of Latin America, despite being a little better, is lower than the productivity of Asia, as well as a disadvantage regarding the informal economy. The Latin America has positive points concerning full employment, the expansion of human resources at work and domestic credit, which proposes improvements in productivity and increase the GDP.

According to Exame Magazine publication (May, 2014), among the 29 countries with high growth rates for the period 2011 to 2013, were Peru with 6.5 percent, followed by Ecuador, Chile and Bolivia with growth above 5%, on average, for the same period. Despite the high growth in these countries, the current concern for Latin America is still the low growth of most of the countries.

It's important to mention here that Portugal and Spain, despite belonging to the Ibero-American region, are the only countries located outside of Latin America. Its geographical location allows for better integration with the countries of Europe, in addition, those countries participating in the European Economic Community and makes use of the Euro as the currency of the country. However, these countries as well as rest of the PIIGS that have been suffering from debt management and unemployment already for some time, recently they suffer the impacts that reach much of the European Community with the problem of the BREXIT. Also due to its geographical location, do not benefit from the programs of the UNITED NATIONS and Latin America Development Bank – CAF intended for loans for Latin America.

2.2 Sustainable innovation

The term sustainable innovation was created from the productive innovation with Sustainable Development.

The OECD- Organization for Economic Cooperation and Development (2005) considers innovations in four major categories: (a) Product innovation; (b) Innovation processes; (c) Organizational innovation and; (d) Marketing innovation.

The productive innovation, typically, is the engine of development of an organization in the face of its competitors. Innovation is present in the improvement of production, in the development of new

materials, creating new sales channels, new process techniques, and marketing to new administrative processes.

According to BRITO, BRITO and MORGANTI (2009), innovation in successful companies, has been touted as a source of competitive advantage.

As the Program for El Desarrollo (2014), sustainable development appears as an alternative to rampant development and challenges in the areas of science and technology, to pursue renewable energy, low or no emissions, as well as take care of distribution and better use of that energy as a way to control the growth of wisdom.

Sustainable development within a current approach that is able to meet the needs of the present generation without compromising the ability to meet the needs of future generations. The development does not exhaust the resources for the future. This definition came about in World Commission on environment and development, established by the United Nations to discuss and propose ways to reconcile two objectives: economic development and environmental conservation.

The idea of sustainable development arises from the urgent need to promote sustainable development, but Recoverable development seeking to reconcile economic development with environmental preservation and the end world poverty and social justice. The fast-changing world of the industrialized countries brought environmental crises as a result of a development that often contemplated the future effects on environmental sustainability.

More recently (2015) the UNDP established the new 17 Sustainable Development Goals - SDG for the next 15 years, that it's expected to have a greater impact on Sustainable development around the world, in particular through Sustainable Innovation.

2.3 The influence and the premises of the productive transformation and sustainable innovation in Ibero-American countries

The Ibero-American countries, many of which are in the development stage, cause concern to developed countries with regard to sustainability. This concern is due to the location and extent of the social and natural heritage almost untouchable, when compared to developed countries. A disorderly development of Ibero-American countries can lead to climate changes and have serious environmental and bioma impacts.

Moreover the Ibero-American countries may become essential to help overcome the global systemic challenges of the so called Anthropocene. For example: in relation to climate change and forests, and also compared with the wealth of its biodiversity, and preservation of the wisdom of ancient traditions. However, the development with sustainability has to meet the social and economic challenges involving the region; and in addition should foster the creation of better jobs and socio-economic development of developing countries.

As is mentioned on the Program for Development (2014), the biggest challenges are to: (a) achieve a productive profile with higher added value; (b) increase fairness in distribution, with cohesion and citizenship; (c) offer quality education and extensive coverage; (d) achieving the environmental balance; (e) cooperate in the construction of regional spaces; (f) strengthening the capacity and technology.

The driving force of jobs, formed by the set of individuals belonging to a country, allied to the qualities of the policies of his Government, the economic condition of the country, the productive and technological development, in addition to sustainable innovation, contribute to the quality of life of its people and allows better working facilities these individuals, who exchange the use of its time and individual effort for financial resources.

Industrialization is necessary to absorb the growing workforce in the light of urbanization and population growth, the increase in productivity due to the growth of the regions and self-support of manufactured products. According to the OECD (1996), production is externally influenced by knowledge and technology. The term "knowledge-based economy" is the result of the recognition of the role of knowledge intrinsic to human beings and technology center of economic development.

As mentioned at the Program for Development (2014), through disseminating technology in the universities, it is possible to achieve a knowledge-based economy, forming researchers and highly qualified workers and creating scientific knowledge that is transferred to companies.

Hence the Ibero-American countries need to strengthen scientific and technological capacity in order to achieve success for the development challenges. Moreover the main contribution to generate productive transformation and sustainable innovation must come from public-private partnerships focused on research and development activities; in addition, companies must be able to adopt

innovations in processes and products, in order to improve the conditions of work and the distribution of resources.

It is necessary that science contribute to the productive activity, creating positive relationship between research and development. In Brazil in 1951, the Ministry of science, technology and innovation created the Conselho Nacional de Desenvolvimento Científico e Tecnológico-CNPq that has as main objective to encourage scientific and technological research with universities and companies, as well as promote the recognition of such research by the international scientific community.

As Maculan and Carvalho (2009), Governments have promoted the interest for development through the interaction between University and company. In Brazil, from the years 90, efficiency in business management and innovation has been the emphasis of economic development model.

Another important and synergically complementary initiative comes from the World Business Council for Sustainable Development – WBCSD, that has representatives in countries in the region, that elaborated its Manifesto Vision 2050 indicating changes that are necessary, feasible and may offer business opportunities that could turn sustainability into strategy.

3 Models of Productive Transformation and Sustainable Innovation

Successful models for the Productive Transformation and sustainable innovation go beyond equipment within school or under production. Achieving success in the medium and long term it is necessary invest in Human Capital, capable of internalizing and develop new technologies able to improve productivity with sustainable development; and this is now becoming more possible as we move from the III to the IV Industrial Revolution .

Is on this context of Human Capital and Productive Transformation models and existing sustainable innovation that one may mention some initiatives:

a) The Lemann Foundation, which was created in Brazil in 2002, develops, and supports innovative projects on education and research in public policy. The contribution of the Lemann Foundation, that counts with the support of the Khan Academy, and seeks to improve the quality of education that may form leaders transformers, then acts strategically in the areas of innovation, management, educational policies and talent.

b) The Erasmus programme Plus, which as described by the program para El Desarrollo (2014), reaches every country in the world with academic flexibility in university cooperation projects.

c) The Ibero-American Institute of ICT and education, IBERTIC, based in Buenos Aires, develops research, training, evaluation and knowledge transfer or virtual courses through conferences, workshops and presentation of search results the 19 Latin American countries.

There is also the need in the region to develop a culture of University&Business partnership, based on Open Collaborative frameworks, since leaving private companies the responsibility with innovations ends up in high costs of development and implementation of innovations.

4 Methodological Procedures

For analysis of the present study its being considered a group of 21 countries of the Ibero-American region - AIBER, namely: Argentina, Bolivia, Brazil, Chile, Colombia, Costa Rica, Cuba, Dominican Republic, Ecuador, El Salvador, Guatemala, Honduras, Mexico, Nicaragua, Panama, Paraguay, Peru, Portugal, Spain, Uruguay and Venezuela. This focus group belongs to data bank consisting of 132 countries that includes 3 regions: AIBER (21 countries), Advanced Economy Countries – AVECO (28 countries) and OTHERS (84 countries); as it may be found at the Observatory for Sustainable Development of the Iberoamerican Region – ORIBER of the PUCSP.

The subject Productive Transformation and Sustainable innovation (Basic Features: Productive Transformation and Sustainable Innovation), is one of the 15 dimensions of the Guide for Public Sustainable Development Guide – GPS of the PUCSP, and considers monitoring the following 18 variables:

- Eight Synthetic Indicators: index of Social progress (Social Progress Index), index of Ecosystem Sustainability (Ecosystem Sustainability), Combustible renewables and waste (renewable fuels and wastes), the human development index-HDI, published by UNDP-UN, Susceptibility (susceptibility), Environmental Protection index-EPI (Environmental Protection Index), the Happy Planet Index (HPI), and the index of GINI for selected countries.

- Ten Analytical Indicators: Global Innovation Ind (global industrial innovation), Institutions (institutions), Human Capital and Research (resources and Human Capital), Infrastructure (infrastructure),

Market Sophistication (Sophistication), Knowledge and Technology (knowledge and technology), Creative Outputs (creative solutions), International Cooperation (International Cooperation), Effective use of support (effective use of support) and Regional Cooperation (Regional Cooperation).

In table 1, the description of the 7 more relevant variables selected for this study from the 18 previous ones, after some statistical analysis.

Table 1 Productive Transformation and Sustainable Innovation Selected Variables

Variable	Meaning
HDI-2013	The human development index (HDI) measures the progress of a nation from three dimensions: income, health and education.
Global Innovation Ind	Recognizes the key role of innovation as an engine for economic growth and prosperity, and recognizes the need for a wide horizontal view of innovation, which is applicable to both: developed and emerging economies.
Human Capital and Research	(a) education-quantitative and qualitative aspects of education and information in both the present workforce, as well as the future workforce. (b) Health and wellness-physical and mental well-being of a population, from childhood to adulthood. (c) the labour force and employment experience, talent, knowledge and training in the active age population of a country. (d) enabling environment-infrastructure and other factors that enable returns on human capital.
Infrastructure	Investments in water, sanitation, energy, housing and transport and new information and communication technologies to support social and cultural advances.
Market Sophistication	(a) Availability and accessibility of financial services (b) funding through the local stock market (c) ease of access to loans (d) the provision of risk capital (and) restriction on capital flows (f) Soundness of banks (g) the regulation of stock exchanges and (h) legal rights index.
Knowledge and Technology	Directed to the activity of inventions and innovations, including: (a) Creation of knowledge. (b) About the impact of knowledge: (c) dissemination of knowledge:
International Cooperation	This issue aims to assess the willingness and ability of political leadership in developing good neighbourly relations and cooperate with neighbouring countries in international and regional organizations • support regional and international integration.

20	Very Low	Nicaragua	9.0	117
21	Very Low	Venezuela	0.0	124

Source: the author

The AIBER countries located in Europe showed better performance in comparison to the countries of Latin America. Brazil, ranked 4th place, presents significant difference of 15.4 points to the third placed, Chile, indicating the need for improvements. The differences between the best and worst ranked country demonstrates highly significant differences exist in the development of ibero-American countries; and hence the need to seek new and better ways to foster open collaborative partnerships in the region.

6 Conclusions

Based on the study, was possible to identify the heterogeneity of the developing countries of the Ibero-American Region and not only in terms of geographical and socio-cultural characteristics. The countries in Europe, Spain and Portugal, are the first in the ranking defined for Productive Transformation and Sustainable Innovation, while if you consider only the countries of Latin America, there is a great difference between the development of Chile, best classified in Latin America in Productive Transformation and Sustainable Innovation, when compared to the worst ranked country, Venezuela, also in Latin America which every day is getting worst for political reasons..

Already almost 70 years ago were founded the ECLAC and the Latin America Development Bank, to help in the development of the Latinamerican Region but still there seems to be a lot that needs to be doing to so that in general the Iberoamerican countries get closer to the Advanced Economy Countries stage of development concerning the important issue of the every day so much needed Productive Transformation and Sustainable Innovation.

It is worth mentioning that the Ibero-American countries is slowly starting to promote partnership between companies and universities, which helps to decrease research costs and bring better innovations, and the development of human capital and the formation of scholars on the topic. But still there is a long way to go and as it was shown the differences between the best and worst ranked countries are highly significant, and hence there is a need to seek new and better ways to foster open collaborative partnerships in the region regarding Productive Transformation and Sustainable Innovation, particularly as we move from the so called Third to the Fourth Industrial Revolution.

Analysis on Coordination Function of Intellectual Property Rights in Networking Firm Organizations Open Innovation

Ma Yaokun, Li Ming

School of Arts and Law, Wuhan University of Technology, Wuhan, P.R. China, 430070

(E-mail: 369411664@qq.com, 424420936@qq.com)

Abstract: This paper analyzes the coordination function of intellectual property rights in the networking firm organizations open innovation which is coordinating the relationship among the organization members of network enterprises to reduce production and organization costs and improve the allocation of resources, discusses the relationship between coordination function and traditional function including incentive/defensive function and offensive function.

Key words: Networking Firms; Open innovation; Intellectual property; Coordination function

1 Introduction

In the era of knowledge economy, the traditional enterprise organization form by which represented the traditional hierarchical enterprises has been unable to adapt to the market demand. With increasingly fierce market competition, and enterprise organization changes in the environment. New type of enterprise organization form ----Networked organization arises at the historic moment, gradually replace the traditional hierarchical organization. (Wang Fang, et al, 2015) Nowadays, more and more enterprises begin to pay more attention to build networked organization structure to achieve the target market. The managers of enterprises are focused on the one link of the industry value chain, all the capital delivery to the business with core competitiveness, and based on contractual relationship, will not be good at or gains little business outsourcing or form strategic alliances to other enterprises, so as to better play its role in presenting their own advantages in order to enhance market competitiveness.

In recent years, at home and abroad ,massive research results have had a dialogue about the related problems of networked enterprises organization, analyzes the function of intellectual property in enterprise innovation also is more, and the networked enterprise intellectual property rights in the open innovation function analysis needs to be further expanded. , studied aiming at the problem of the intellectual property in the network enterprise organization function of construction of innovation network. Based on intellectual property can promote enterprise network organization efficient allocation of resources, this article explains the open innovation of intellectual property in the network enterprise organization coordination function, namely the intellectual property effectively dealing with the relationship between network organization members to reduce the cost of production and organization, improve the function of resource allocation ability. In addition, this paper also studied the network organization coordination function and intellectual property rights in intellectual property rights incentive, attack/defense functions such as the relationship between the traditional functions.

2 Networked Organization Overview

Network organization is a kind of present network in the form of enterprise organization structure, is the U type, linear function, H, M type enterprise organization structure following a new type of enterprise organization. Networked organization arose in the late 1970 s and early 80 s, companies in the United States of "outsourcing" contract model and Japanese companies "lean manufacturing"(Liu Weijun, 2013). In the 1990 s, along with the information technology and Internet technology is widely used in enterprise production and management, in the true sense of networked enterprise organization form. (Su Huishuang, et al, 2013) At this point, the networked enterprise basic forms of organization operation to realize the enterprise internal network and external network close integration.

Inspection network enterprise organization the cause of the rise, mainly including the production mode of ford a crisis, the government, market deregulation, and information technology is widely spread, etc. (Kapás, 2008)

In the late 1960 s, the production mode of ford crisis. Fordism production pattern became prevailing among the public after the second industrial revolution, to mass production and standardization, a single variety of products and services, the organization form of vertical, oligopolistic market structure is typical. Along with the social public demand for products and services has become increasingly diverse, ford socialist mode of production has been unable to meet the market demand. In a

more open market environment, based on the production mode of Ford's functional large-scale integrated enterprise bear the growing "cost", lead to such enterprises face increasingly severe competition in the market. In order to adapt to change and diversity of market demand, the enterprise will be the basis of competition from Fordism price into flexible mode of production mode of innovation (Potočník, et al, 2015), for the network social condition on the formation of enterprise organization.

Since the late 1970s, represented by the governments around the world gradually relax for goods, services, Labor and the regulation of the financial markets, the increasingly open and free market environment to create opportunities for enterprises to develop new markets. Among them, the new environment for the enterprise multinational business and cooperation to create unprecedented conditions, the enterprise can not only create or buy a new subsidiary in different countries implement transnational operation, can also with suppliers and subcontractors are located in different countries signed a contract to reach a cooperative relationship, for the network on the formation of enterprise organization economic conditions.

With the development of information technology and the widespread, real-time global enterprise production management possible. In fact, scattered in the department of information technology will enterprise closely linked together. The use of modern information technology to reduce the cost of data transmission, will help you in positioning the foreign departments, enterprises and promote the relationship between the domestic and international partners. In addition, the integration of scattered with diversified forms of local knowledge and ability, information and communication technology also plays a fundamental role, for the formation of the network organization has created good technical conditions. (Klein, et al, 2015)

In the production mode of the Fordism a crisis, the government, the market deregulation and the advent of information technology widely spread and so on various factors, integrative enterprise group gradually developed into a large production purposes together around the products and services of network organization. Networked organization of some function units by the core enterprise, while the activities of the other functional units by contractual relationship (partnerships, subcontract licensing and franchising) together. Core business only their best business, focus on the core competitiveness, surrounding to enhance innovation ability and achieve strategic goals better realize enterprise globalization. At the same time, the core enterprise by building enterprise network, through a contractual relationship, the product of the production and commercialization, and other are not good at or poor earnings of outsourcing to other companies do. Among them, the transaction costs as the main measure of network enterprise development, and compared with the tangible assets, the value of the networked enterprise organization increasingly rely on intangible assets such as intellectual property.

Compared with the traditional enterprise organization form, network organization can be more flexible to adapt to the change of market demand and the social environment, have more flexible features, concrete manifestation for external and internal flexible two kinds. Internal flexibility refers to the networked enterprise organization members when dealing with the enterprise internal management work more flexible, focus on research and development, the core management staff in financial and administrative department, and based on different forms and other types of employment contract management work. External flexibility refers to the networked enterprise organization members at the international level management capital the choice of more diversity, free flexible management of human, financial and technology assets.

3 Open Innovation and the Composition of Networked Enterprise Knowledge Capital

3.1 The open innovation

Innovation plays an important role in the process of enterprise development. In response to the increasingly severe economic pressure and market environment, innovation creates a huge value for enterprises to gain market competitive advantage via providing a new developing perspective, meanwhile becomes an important driving force to promote the development of enterprises. Not only that, nowadays, innovation has become an important propeller to accelerate national economic growth and social development, and plays a key role in all aspects of modern life. (Rubera, et al, 2016)

In recent years, a new mode of innovation, which is called *the open style innovation*, has become more and more popular, and has gradually dominated the innovation ecosystem. (Saguy, Sirovinskaya, 2014) To investigate the existing knowledge creation process, a typical open innovation model, is the co-creation of each functional unit of the network enterprise. (Xu Ruiqian, Gong Limin, 2011) The

concept of open innovation pioneered by Henry Chesbrough in *Open innovation: the new rules proposed*, he believes that open innovation is "from within or outside the organization or enterprise value idea, and this idea can be from the organization or enterprise internal or external to the market" (Mladenow, et al, 2014). Subsequently, Henry Chesbrough and Wim Vanhaverbeek coauthored *A new paradigm of redefining*: "Use purposeful knowledge to flow in and out to accelerate internal innovation, and to expand the market for external use of innovation" (Naqshbandi, et al, 2015). According to Henry Chesbrough, since the end of twentieth Century, open innovation has replaced the closed innovation, which has become the main innovation model for enterprises. In the closed innovation mode, the financing, creation, development and sales are carried out in the closed internal logic. This innovation model is a linear innovation model and was once popular back twentieth Century, that is, innovation is the result of a series of steps separation. At the end of twentieth Century, with the increasing mobility of highly skilled workers, booming private investment firms, ideas of new internal market possibilities, external suppliers growing ability, open innovation gradually obtained popularity. (Wu Qiang, 2010)

In the open innovation model, the knowledge creation and the whole innovation process of enterprises are promoted by the research, design, manufacture and marketing services. In this innovation chain model, innovation is the result of the interaction between knowledge and market, and the systematic connection. The open innovation model emphasizes the importance of the organization network in the enterprise development, and thinks that the enterprise organization network is the factory and the booster of knowledge creation. (Schroll, Mild, 2012) Moreover, it is in the organization network, that enterprise has gradually formed its own innovation potential, the knowledge capital. It can be seen that the formation and development of network enterprise organization is based on the open innovation model.

In recent years, open innovation has become the key to competitive advantage, enterprises through a combination of internal and external ideas, open access to knowledge, the use of external technology and solutions, purchase or license inventions, and gradually expand the market share.

3.2 The composition of knowledge capital in networked enterprises

Knowledge capital is the collection of science and technology knowledge, a combination of information from several companies for production purposes and creation, acquisition, combined with systematic together. Intellectual Capital is a dynamic concept, with the gradual dissemination of information, intellectual capital will become increasingly rich. Knowledge capital knowledge relating to a plurality of associated enterprises accumulated or is used in the production process and the value creation process. Value creation is the enterprise knowledge into the main objective of capital. In the process of value creation, corporate capital by way of knowledge include the following two: First, the use of its intellectual capital in the production process; the second is to sell knowledge manner intellectual capital transferred to other companies, so that later knowledge companies can use the library of intellectual capital in the production process. In such cases, intellectual capital is an important resource production or to improve product and service quality, is an important tool for companies to reduce production time.

In recent years, with the increasing popularity of open innovation, networked organizations paid more and more attention to the construction of knowledge capital. In the promotion of innovation in economic development, one of the challenges faced by enterprises is how to build an organization network, as the innovation and development of organizations is deeply affected by the interaction network of each functional unit. (Kovács, 2015) In order to expand intellectual capital accumulated, the networked enterprise organization of each functional unit is usually adopted to create, to seize the scientific and technical knowledge of the strategy, mainly including internal and external ways. Internal mode refers to the investment and management of human resources, R & D, tangible and intangible resources by network enterprises. The external method is divided into two types: the network enterprise organizations each functional unit in the form of joint venture to establish equity relations, in the form of contract and more informal relationship established non-equity relationship. The purpose of these strategies is to reduce the cost, risk and time of technological progress, so as to improve the return on investment in the field of science and technology. With the process of the development of technology is increasingly complex, the external way to achieve this goal has become increasingly obvious, which shows that collective innovation helps to save innovation costs and reduce the risk of innovation. In another word, the networked organization of each functional unit will be based on a low cost, low risk way to develop external knowledge capital, out of the purpose of profit.

4 The Transformation of the Traditional Function of Intellectual Property Rights to the Coordination Function

4.1 The traditional functions of intellectual property rights

Intellectual property rights include patent right, trademark right, copyright and trade secret right and so on. The patent right is the temporary monopoly power of the inventor. As long as novelty and creativity is involved, and can be used for industrial, all the product or process can become a patented invention. The trademark rights protect commercial products and services from their products and services in producing or selling the logo, it includes source of commodity's name, symbol, three-dimensional symbols, sound, color or the combination of elements above. Copyright protects the works of creators, including the expression of the existing form of writing, music, art, etc. The right of trade secrets is to protect individuals and enterprises from other 's taking improper means to steal trade secrets.

By saying that intellectual property has two kinds of traditional functions, the general theory defines them as incentive / defense and offensive function. The incentive / defense function refers to the legal system of intellectual property rights that granted enterprises' temporary monopoly to recover its investment in the development of new products and services, and encourage enterprises to innovate the new functions, and ensure the enterprise to defend their rights in tort cases. The offensive function is an important source for enterprises to use the intellectual property to realize their own value. It refers to the enterprise actively license others to use its intellectual property rights to seize or maintain the market competitive advantage, and to obtain the largest market share. It usually operates through the development of basic patent technology, active lawsuit against competitors or strategically charge of patent licensing fees, (Zhan Ailan, 2012) so that they can build a market entry barrier which helps to improve the threshold of competitors' entering the market and beat the competitors. In addition, with the gradual popularity of network organizations, the another function of intellectual property rights is becoming increasingly important, that is, the coordination function we are going to talk about, the following will be for this function in detail.

4.2 The coordination function of intellectual property rights

Modern economic theory emphasizes the function of property right in coordinating the activities of enterprises and the allocation of resources. In Kos's theorem, it is believed that the coordination of corporate relations will help to realize the effective allocation of resources in the context of the definition of the property rights and the absence of transaction costs. (Cheng Chengping, 2009) Transaction cost theory and incomplete contract theory point out that in the case of the existence of the specific assets and incomplete contracts, enterprises adopt vertical integration strategy to present a more efficient transaction and organizational form. (Yang Hongli, 2012)

Different from the traditional enterprise organization, the development of network enterprise organization involves the introducing products and services into the market. Influenced by imperfect competitive factors like information retrieval ability, supplier selection, contract negotiation and execution, the development of the network enterprise organization reveals the transaction cost of the enterprise. In addition, taking the importance of the ownership of intangible assets in the network enterprise organization into account, I prefer the opinion that intellectual property plays an important role in coordinating the activities of network enterprises.

Network enterprise organization can help to clarify the relationship between the enterprise organization and network with the help of the intellectual property rights, and can reduce the transaction cost between the core enterprise and other functional units. It is because of the existence of patent right, trademark right, copyright and other intellectual property rights, that the core enterprise can build its own reputation which indicates the quality of the enterprise's products and services based on its intellectual property rights. In the subcontract and the franchise contract cases, core enterprises can all others functional units use patent including trademark rights, copyrights and other intellectual property rights, in form of licensing intellectual property rights, which promote the diffusion of patented products, intellectual property investment and innovation, and promote the development of complementary inventions. The spread of intellectual property rights in the enterprise encourages the production of specific assets. In the development of partnership situation, due to the fact that the specific asset is co-creative and the core enterprise and other functional units share the patent assets, reduce the opportunism behavior between partners may exist.

In short, the network enterprise organization can make full use of the coordination function of intellectual property rights and reduce transaction costs, so that the transaction between core enterprise

and functional units of network enterprise organization can be promoted.

4.3 The relationship between traditional function of IPR and coordination function of networking firm organizations

Though the coordination function of IPR plays an increasingly important role in the development of networking firm organizations, the coordination function of IPR does not hinder the achievement of the traditional function, it even promotes the improvement and development of traditional function. In the process of implementing open innovation for networking firm organizations, coordination function of IPR helps to practice its incentive/defensive function and offensive function.

4.3.1 The relationship between coordination function and incentive/defensive function

In networking firm organizations coordination function (reducing transaction costs) and incentive/defense function (creating new knowledge) are closely linked. From the perspective of coordination function, the networking firm organizations can be able to allocate resources more efficiently by means of IPR. From the perspective of incentive/defensive function, by granting ownership of trademarks, patent right, copyright and trade secret right to the owner of IPR, the legal system motives innovation, and providing possibilities for a new round investment of networking firm organizations. Besides, IPR also helps stimulate enterprises to invest in knowledge production while facilitating the allocation of effective resources. The former belongs to the category of incentive function of IPR while the latter belongs to the category of coordination function of IPR. Thus, it is clear to see that the coordination function is beneficial to the implement of incentive function. With the rise of open innovation model, the two parts would enjoy an increasingly close relationship.

Collective creation of knowledge capital in networking firm organizations concerns the coordination of relationship between core enterprises and other functional units in networking firm organizations, and IPR plays an important part in the process of coordination. This point can be proved by the growing licensing agreement of IPR in recent years. According to relevant research, the volume of patent licensing agreement signed by 60% interviewed enterprises is on the rise, over 70% interviewed enterprises incline to sign more licensing agreement in 5 years ahead.¹ Some other empirical studies also show the importance of IPR protection in the cooperation strategy, including outsourcing, adopted by networking firm organizations, which thereby demonstrates the function of reducing transaction costs of IPR. To be specific, IPR's coordination function illustrates the relationship among functional units of networking firm organizations, thus facilitating the decrease of transaction costs of networking firm organizations and stimulating the collective creation of knowledge capital. Therefore, IPR not only coordinate the relationship among functional units in networking firm organizations, but urge the cooperative investment of functional units and an inside transfer of technology.

Besides, coordination function of IPR is beneficial to solve issues caused by traditional incentive function. IPR system based on incentive theory inclines to strengthen IPR protection, taking powerful IPR protection as an important guarantee to encourage innovation. However, over-protection of IPR may lead to monopoly of knowledge capital, hindering the spread of knowledge of science and technology, and finally doing harm to innovation. The most typical demonstration is that overwhelming IPR protection would bring a bulk licensing agreement signed among functional units in networking firm organizations, thereby increasing innovation costs of networking firm organizations accordingly. Therefore, in order to deal with issues caused by over-protection of IPR efficiently, networking firm organizations should bring coordination function of IPR into full play and thus reducing transaction costs, achieving optimal allocation of resources in a better way.

4.3.2 The relationship between coordination function and defensive function

In networking firm organizations, the structure of knowledge capital illustrates contractual relationship between core enterprises and other functional units in networking firm organizations. Other functional units in networking firm organizations may focus on SMEs in certain fields, but in general, these functional units are more possible to compete against large size enterprises and core enterprises. To reduce development period, core enterprises and other functional units of networking firm organizations try to share R&D costs of new products and new process, which contributes to the main reason of the formation of networking firm organizations. This shows the system of networking firm organizations usually involve a large number of IPR owned alone or partly, by different cooperative

¹ Sheehan J, Martinez C, Guellec D. Understanding Business Patenting and Licensing: Results of a Survey in Patents, Innovation and Economics Performance [EB/OL]. [2016-06-20].https://www.researchgate.net/publication/250615299_Understanding_business_patenting_and_licensing_results_of_a_survey

enterprises, under such circumstances, coordination of IPR become especially important. Following would detail with an example of patent right.

With the emergence of new technology and development, the enterprises typically promoted the development of patented technology in dealing with the change of market environment and tried to obtain patent competition advantage in the fierce market competition, so a large number of patent technology appeared. In the process of the development of new technology, each functional unit of networked organization usually involves obtaining patent authorization and permission problems. In view of the existence of a large number of patented technology, the functional units of networked organization, especially the subcontracting enterprise may get into trouble of “patent jungle”, which means the subcontracting enterprises may need to obtain the licensing of all patent technology they need that belonged to different people, in order to use the new patent technology. In this case, the subcontracting enterprises must find all the intellectual property owner and signed a large number of expensive patent licensing agreements, in order to use the new patent technology. The existence of the “patent jungle” obviously unfavorable to subcontracting enterprises to use patent technology, and even hinder the spread of patent technology and the development of the industry. Not only that, “patent jungle” has also led to a trend of gradual growth of the quantity of patent infringement and patent litigation.

Academic and practical circles put forward a lot of plans to solve the problems above, including the exploitation of the patent compulsory licensing system and non-proprietary licensing system, adjusting the patent protection period and protection scope and so on, which in an attempt to coordinate the relationship between the innovation and spread knowledge.(Zhang Weijun, 2009)In addition, some research results put forward the solution for the construction of a patent pool(Zhu Xiangyu,2015), which is typical embodiment of advocating network enterprises and playing intellectual property rights coordination function. A patent pool is a consortium of at least two companies agreeing to cross-license patents relating to a particular technology, organization members between each other enjoy their one or more patent licenses, or to a third party license one or more patents (Wang, 2016). Nowadays, patent pool has become quite common in the countries all over the world. However, as the patent pool is growing stronger, there are more and more controversy. Supporters thought that the patent pool could eliminate patent authorization in disorder, reduce the transaction costs in the patent license, reduce patent disputes and lawsuit cost, etc. (Li Yan, et al, 2013) Opponents argued that the patent pool seriously hampers free competition, causing market monopoly and unfair competition. Before clarifying the positive role and negative effect of patent pool, the author thinks that we should distinguish the role of the patent pool on the basis of the composition of the patent pool.

Firstly, if the patent pool involved in a competitive patent (alternative patent), so this kind of patent pool could trigger monopoly and unfair competition behavior, such as making high licensing prices, making high profits with invalid patent technology. Secondly, if the patent pool is only consisting of obstacle or complementary patent, then the patent pool can have obvious positive effect, which not only helps to remove obstacles authorization of patent implementation, also helps to reduce the transaction costs in the patent license and reduce patent disputes and reduce litigation costs at the same time.

Since the 1980 s, the discussion of the patent pool positive influence emerges in endlessly. The most typical events is the guidelines released by the U.S. justice department and the federal trade commission in 1995 named Antitrust Guidelines for the Licensing of Intellectual Property, and the guidelines admitted “the beneficial effects on competition of patent pool”^[23], And the guidelines indicated specifically that Intellectual Property policy is beneficial to the competition in the situation of integration of complementary technology, saving transaction cost, eliminating the obstacle patent, avoiding high infringement lawsuit and promoting the knowledge dissemination. Therefore, the patent pool in favor of competition is closely related to intellectual property rights coordination function, which contributes to eliminate the obstacle patent problems, reduce intellectual property licensing transaction costs and reduce the risk of the enterprises, thus helps to encourage further innovation.

Furthermore, in addition to intellectual property rights coordination function, and patent pool is closely related to intellectual property attack function. In fact, all types of patent pool are likely to strengthen the oligopoly of knowledge capital. The formation of knowledge capital increasingly relies on interdependent relationship between the enterprises or organizations, and only a few enterprises can get high profits from knowledge capital, because only these enterprises separately or jointly enjoy patent while other companies need to get license from these companies. In addition to enterprise members

¹ Clark J, Piccolo J, Stanton B, Tyson K. Patent Pools: A Solution to the Problem of Access in Biotech Patents? [EB/OL]. [2016-06-20]. <http://www.uspto.gov/web/offices/pac/dapp/ola/patentpool.pdf>

enjoyed the intellectual property rights individually or jointly, other members of the network enterprise organization are not intellectual property owner, and they must pay licensing fees to use intellectual property rights. Not only that, the relationship between the network enterprise organization members have been identified since the patent pool forming, which formed in the network enterprise level while the enterprise members enjoyed the intellectual property rights individually or jointly become leaders in the network organization. The enterprises built market barriers to entry in order to maintain the highest standards of enterprise network and improve the competitor barriers to entry by controlling with the authority of the ownership of intellectual property rights. At the same time, these enterprises can also keep the market competitive advantage through taking capitals from intellectual property rights into a new round of technology research and development.

5 Conclusions

This paper analyzes the traditional intellectual property rights incentive/defense function, attack function and growing coordination functions on the basis of clarifying the networked enterprise organization and open innovation. In view of the development of network organization which depending on intangible assets rather than tangible assets, this paper concluded that the intellectual property rights have become an important tool to coordinate the development of the enterprise instead of tangible property rights, and further discussed the relationship between the intellectual property rights coordination function and incentive/defense function, the offensive function. First of all, through the analysis of the open innovation strategy of network organization, this paper concluded that the intellectual property rights coordination function helps to intellectual property rights incentive/defense function implementation and solve the problem derived from the incentive function. Secondly, based on this kind of special type of intellectual property rights to use patent pool as an example, analyzes the coordination of intellectual property and attack, the relationship between the points out that the intellectual property rights coordination function has become a part of the networked enterprise leadership strategy, create conditions for the realization of the function of intellectual property offense. Secondly, this paper uses the patent pool of this kind of special type of intellectual property use as an example, analyzed the relationship between Intellectual Property Rights Coordination Function and attack function, pointed out that the intellectual property rights coordination function has become a part of the organization leadership strategies of network, create conditions for intellectual property rights offensive function.

Water Governance: The Future of Grow with Food and Water

João Almeida Santos, Maria Cristina Sanches Amorim, Arnaldo Jose de Hoyos Guevara
School of Management, Pontifical Catholic University of Sao Paulo, Sao Paulo, Brazil
(E-mail: professoralmeida@ig.com.br, cris.amorim@pucsp.br, arnoldodehoyos@yahoo.com.br)

Abstract: Forecasts for the next four decades are warning about shortage of water and food, particularly in developing economies. The demand for food will increase because of population growth, especially in developing economies. The problem is compounded by the lack of water and reduction in food production. Today the consumption of water for food production is high because people do not realize that this is a scarce resource and that can definitely missing. We must create a policy for the management of water and that people are informed that it is not possible to use the feature without any control. The governance of water is important to establish ways and use control mechanisms and implementation of the resource in the various production processes. The waste during the manufacturing process is very high because: a) there is no control on the amount that should be applied to each type of agricultural product; b) the irrigation process is still done by equipment spraying water in large quantities; c) as water is still abundant for the current agricultural production in producing countries, there is no investment in machinery or equipment that can reduce water consumption; d) government authorities in developing countries do not plan and do not make any kind of control on the use of water or water governance; e) the food production process is carried out intensively and in large areas, it produces a single product and this requires large amounts of water.

Key words: Water governance; GDP; Food; Water shortage

1 Introduction

This article proposes a discussion around the issue of water use, today without any control by the consumer. The world population is now close to 7.5 billion and continues to grow. Population growth must accompany the increase in food production and this presses the use of available resources, water is perhaps the most basic resource; and already in countries like Yemen 50% of the population struggle daily to find or buy enough clean water to drink or grow food (Ward, 2014).

The waste during the manufacturing process is very high because: a) there is no control on the amount that should be applied to each type of agricultural product; b) the irrigation process is still done by equipment spraying water in large quantities; c) as water is still abundant for the current agricultural production in producing countries, there is no investment in machinery or equipment that can reduce water consumption; d) government authorities in developing countries do not plan and do not make any kind of control on the use of water or water governance; e) the food production process is carried out intensively and in large areas, it produces a single product and this requires large amounts of water.

In recent decades there has been more frequent climate change. Regions where the climate was defined by periods of regular rainfall began to have problems with the lack of it. This issue generated a pressure on this water resources, with consequent change in behavior the people because the water shortage is inevitable.

The statistics on the theme: water, are still alarming. We are the XXI century, the figures indicate that at least 780 million people do not have access to clean drinking water; some 2.5 billion people lack access to safe sanitation systems. In developing countries the problem primarily affects children. With a simple solution to provide clean water and sanitation systems this problem could be avoided every year (Cooley *et. al.*, 2013).

2 GDP – Gross Domestic Product

GDP - Gross Domestic Product should increase to keep pace with population growth. To maintain this growth in population was produced more food, clothing, medicine and other goods necessary for their survival. With this growing population will need to produce more and more food and other products. This growth will require greater use of all available resources, especially water for food production.

The agriculture sector is the largest consumer of water worldwide and water is a key ingredient either directly or indirectly in almost every good produced. After the global financial crisis in 2008, the world has recovered and the movement of goods between the countries increased. This confirms that globalization is still present, by such production and circulation of goods and services around the world

(UNESCO, 2015).

When a country imports food from another country, it is also buying the water that was used to produce that food. So, when consumers buy food that country imported, he is taking home some of the water that the exporting country used to produce that food.

The countries think of expanding world trade for the economy world is strengthened. The concern is the Increase in GDP and the higher the production of goods and services, higher will be the power of its economy.

When negotiations are made between nations for the import and export of goods and services, the concern with production factors as technology or machine, for example, has been introduced. So, this is a common negotiation process has been repeated over very many years. We did not find a concern with the water that will be used for direct production or indirectly of products that are at stake (Cooley *et al.*, 2013).

Table 1 GDP, Current Prices (billion USD)

Country	2013	2014	2015
United States	16,663.2	17,348.1	17,947.0

Source: Irrigation water requirement and water withdrawal by country, November 2012 - <http://www.fao.org/3/a-bc824e.pdf>

The USA is the country that produces more goods and services in their territory and imports various products to supply the domestic market. The GDP has a value 70% higher than the second place is China in 2015.

Whereas agriculture uses 40% of water resources, we note that this volume of GDP is able to use a high amount of water for the production of goods and services both in the direct production process as in the indirect process.

Show the table 2 an estimated global water withdrawal (km³ per year, m³ per capita and as a percentage of total withdrawal) for Northern America the Water requirement ratio a 57%.

GDP growth will consume a greater amount of water for the production of food and other goods. If water consumption is not done within its own territory, the food that will be consumed by the population will have to be imported. When this food is imported, the country is buying indirectly certain amount of water that has been used where the food was grown (FAO, 2012).

3 Population and Foods

Food production will be sufficient to support a global population of 9 to 10 billion in 2050, although food and nutritional insecurity will persist in many regions. With this sentence with a bit of doubt content that The United Nations World Water Assessment Programme (WWAP) under the theme *Water for Sustainable Development* (2015) wants the world to prepare for a possible shortage of water and food.

The lack of food will not be because there are no resources to produce as seed or machinery and equipment, for example. Lack of food can happen because of population growth and, especially, because in many areas there is no water to produce the food.

The population is growing worldwide and can achieve a total of 10 billion people in 2050. Many of these people will live in urban areas by pressing the production sector of goods and services to increase production.

The production of goods and services use water both directly and in an indirect way. If not created policies of water management, it is possible that a region has problems with water shortages, while in another region may be a spare in sufficient quantity to export to.

Table 3 Population Density – Ranks (people per sq. km of land area)

Country	2014	2011	2010	2009	Country	2014	2011	2010	2009
Macao SAR, China	19073,1	18283,7	18000,9	17674,7	Mauritius	621,1	616,9	616,0	614,5

Source: <https://knoema.com/search?query=Population%20density>

The city of Macau in China has a territory of 30.3 sq. km, i.e. little land space for many people, according to the Table 3. Data the population density in 2009 was 17.675 people per sq. km, rising to 19.073 people in 2014 with growth trend because the results of the GDP of China (even though below expectations) projects average growth of 7% annually.

Population growth causes an urban concentration because people need work and goods and services. As shown by the table data, the population density is growing every year and the need for water does not appear in statistical data or issue being discussed in the political environment or in the form of water management policies.

In Burundi country the problem is aggravated by the size of its limited territory to 27.830 square kilometers and a population density of 421 people per square kilometer. This represents a total of 10,816,860 inhabitants in 2014 and 11.8% were urban population. The increase in urban population is inevitable. If government officials do not prepare for managing water, the problem is greater because

there is also a lack of food (IMF, 2016).

4 Food Demand and Water

By 2050 the world population expected to gain over 2.3 billion people. This means that the global demand for food will be pressed to increase grain production, for example. Although the growth rate of the population is decreasing, this represents an increase of almost two-thirds of the world population today (FAO, 2009).

Because of a number of influencing factors in the degree of development of some countries, a larger part of the total world population increase will be in developing countries. As the FAO report (2009), sub-Saharan Africa's population would grow the fastest (+114 percent) and East and Southeast Asia's the slowest (+13 percent).

The economic data projected by analysts to the growth of world GDP show that the developing countries will get a growth rate higher than the developed countries (The World Bank, 2014). This does not mean that the rates of malnutrition or starvation, especially for children in these countries will be lower than today.

With this population growth trend, an increase in GDP of developing countries and reducing malnutrition levels and hunger, it is natural that there is a higher demand for food for both people and for animals. Then the Demand for cereals is projected to reach some 3 billion tons by 2050, up from today's 2.1 billion tons today.

Table 4 World Water Distribution and Countries Fresh Water Supply

	Water volume (million km ³)	Percent of freshwater	Percent of total water	Countries fresh water supply
Total water	1 386		100.00	Brazil, Russia, China, Canada, Indonesia, U.S., India, Colombia, Peru, European Union and the Democratic Republic of Congo.
Freshwater	35,0	2.53	100.00	
Glaciers and ice caps	24.4	69.7	1.76	
Groundwater	10.5	30.0	0.76	
Lakes, rivers, atmosphere	0.1	0.3	0.01	
Saline water	1 351		97.47	

Source: FAO, 2002; World Bank, 2014

Water is a key chemical for the life of most living organisms. It is used at the beginning, during and at the end of a production process. It is estimated that the world contains about 1 400 million km³ of water. Of this water, 35 million km³ (2.5 percent) are freshwater (FAO, 2002).

The table shows that around 2.53% is fresh water, concentrated in large quantities in countries revealed in the last column. In many areas this feature is not easy to achieve because it depends on the geographical location (mountains and valleys) and the distance where the river or lake and the city, which in general are great consumers.

For example, the large amount of available water in the polar ice caps or glaciers or deep underground soil is not accessible for use. To remove the water from great depths, it is necessary to invest in machinery, equipment and workers to remove this water.

Table 5 Approximate Crop Water Requirements to Produce Food Harvested

Crop/Food	Water Requirement (kg of water per kg of food produced)
Potato	500–1500
Wheat	900–2000
Alfalfa	900–2000
Corn/maize	1000–1800
Sorghum	1100–1800
Soybeans	1100–2000
Rice	1900–5000
Chicken	3500–5700
Beef	15000–70000

Source: Kirby; Bartram; Carr, 2002

Agriculture is the production sector that consumes more water, around 93%. The industry consumes about 4% and the rest is consumed by the population. The values shown in the table are approximate, possible variations with reality is because of the irrigation process employed in the specific region, what kind of care with the handling of the product grown and the creation of animals (FAO-AQUASTAT).

The table shows that the production of meat consumes 15,000 to 70,000 kg of water per kg of food produced. This consumption is high because the production method should be considered since the birth of the animal, the process of killing and final marketing (Kirby; Bartram; Carr, 2002).

The cultivation time, i.e. how long it takes to get the product ready for consumption, is crucial to the volume of water consumption. The greater the time between planting and harvest, the greater the amount of water needed to make the product ready to be taken to the consumer market.

5 Water Governance

The purpose of this article is to discuss the need for water governance because the consumer has to be informed that water is a scarce resource and the use must be rational and controlled. This feature, which is essential for the survival of people and animals, may be missing and problems for society will be compounded with the possibility of food shortages.

The reasons for the effective implementation of water governance are essential today because:

- The growth of world population continues fast and could reach 10.0 billion in 2050, with an increase of almost two-thirds of the world population today;
- Urbanization grows at the same rate of growth of the world population. For example, the least developed countries will be those with the greatest contingent of people who will live in cities and this presses the consumption of food and other products;
- The growth rate of GDP in developing countries will be higher than the rates of other countries, on average between 4-6% annually;
- Consumption in developing countries will continue to grow, even if malnutrition and hunger are not eradicated. The increase of people living in cities, the growth of GDP and population growth, are sufficient indicators to increased consumption of goods and services;
- Increase in income because of the intensification of globalization, the expansion in relations between governments, bilateral and multilateral trade agreements and ease of mobility features;

These factors were selected for the discussion of water governance. There are other factors that affect the economic order, some contribute to the generation of positive results on the quality of life, while others produce negative results.

The governance of water must be formulated by a number of measures that governs the use of this feature, making the application in the most rational and economical production process, both as regards the volume and the cost of the production process, as can be seen in table 6.

Table 6 Some of the Key Pathways of Water Governance

pathways	discussion
water agreements and laws	establishing international water agreements and laws;
water resource management	financing water resource management and service delivery efforts
establishing and socializing minimum	establishing and socializing minimum and best practices for water resource development and management
technology and knowledge transfer	facilitating technology and knowledge transfer and conducting education and outreach programs;
evaluating water-related data	collecting, monitoring, and evaluating water-related data

Source: Cooley *et. al.*,2013, p.13.

For the purpose to be achieved, the suggested measures should be practiced by all involved. The governance of water must have the participation of all countries because international trade of food, a lot of water is exported while imported by countries in the form of a type of agricultural product, for example, what is called virtual water. In fact to produce 1 kg of cow meat, 15400 lts. of water are needed (water footprint).

The transfer of technology and knowledge to transform brackish water or non-potable water in a water of enough quality for human and animal consumption should be the goal of all countries. When this water governance measure is implemented in its entirety, the amount of diseases decrease.

Agriculture consumes large quantity of water (97% on average), it is also responsible for contamination and spread of disease through the use of contaminated water during the process of agricultural production. Kirby; Bartram; Carr (2002) the concern about the impact of agriculture on the quality of water resources is often related to diffuse sources – contamination by agro-chemicals, nutrients and hazardous microbes (pathogens) in particular.

Countries need to come together to create guidelines for the governance of water as a way to reduce the impact on the prices of agricultural products in periods of lack of rain or climate change in the producing regions.

The climatic phenomenon El Niño and others of the same nature, has caused injury to the production of various agricultural products to countries like India, East Africa and Malaysia. Sugar and palm oil prices have increased because of a drought in India and Malaysia. An adverse market reaction occurred in East Africa, where in the region the prices of agricultural products remained stable because of high inventory levels prior (IMF, 2016). Even in California the period between late 2011 and 2014 has been the driest in California history since record-keeping began and very severely affecting food production in the US.

When the stock of agricultural products diminishes, the price increases and losses for the world economy because imports will be more expensive. The price increase should reduce the volume of international trade and recession in countries that depend on export income of agricultural product.

The governance of water is important as a means to reduce the impact of natural phenomena and other problems caused by consumption without water control. Create control policies consumption, impose measures to reduce withdrawal of water from rivers and other sources of drinking water and facilitate the exchange of knowledge to treat brackish or salt water; are some policies that should be part of the governance of water and should be shared and applied by all countries.

6 Conclusions

The water governance must be made by all involved, both producers and final consumers and governments of the countries.

The actors involved must recognize their role in the process. The producer and the final consumer are polluters and should be charged to use water as a scarce resource and that has a social cost for their production and application in the production process.

Prior to the implementation of water governance, the people involved in the primary production process and final consumers should use rationally and avoid waste in all stages.

The agricultural sector is the largest consumer of water. In many regions, the equipment used for irrigation is not appropriate, increasing the waste. Use the proper equipment, know the geography of the area to know the amount of water available and where it is located, how much rain and at what time it happens; these are some simple steps and does not depend on water governance, but the awareness of users. Increased efficiency in the use of water at all stages of the production process and in day to day tasks of the people, is an important step to avoid total shortage.

The water governance should be implemented because people should be charged for their mistakes. The countries should unite to establish water governance together because the growing international trade, with import and export of products that use water directly and indirectly. The water used in a given country ends up being exported at a low price in the form of an agricultural product, for example.

Forecasts for 2050 indicate that GDP growth of less developed countries will be higher than the other countries. Thus, the demand for goods and services is expected to grow with the same intensity and this is not only by increasing the supply of products or per capita income, the other justification will be the growth of the world population is expected to reach 10 billion.

Unlike the growth forecasts of GDP, the increase in world population and urbanization, the existing drinking water on the planet is a little over 2.5%. Much of it is salt water or is in the form of polar ice cap, therefore, difficult access. To turn sea water into drinking water is needed the use of technology and knowledge. Countries need to come together to undertake the transfer of technology and knowledge for the benefit of all. This is also another issue that the governance of water can handle.

(E-mail: jhz0314@126.com, smileinlove@qq.com)

Abstract: This paper constructs a measuring index system on migrants' population development and resource and environment support system of Three Gorges Reservoir Area, based on the data of Hubei Reservoir Area (2007-2010), it puts objective weights on the indices using Entropy Method, calculates comprehensive development index of population development and resource and environment support system using linear weight sum method, and measures the coordination degree between migrants' population development and resource and environment of Three Gorges Reservoir Area. Through empirical analysis, this essay holds that the coordination degree between two systems of migrants' population development and resource and environment of Three Gorges Reservoir Area is increasing, and the overall level of coordinated development is also on the rise. The study may provide guidance for formulation of policies on regional development.

Key words: Migrants of Three Gorges Reservoir Area; Population development system; Resource and environment support system; Coordination degree

1 Introduction

The Three Gorges Project is one of the largest hydraulic projects in China or even in the world, which involves not only huge construction scale, but also tremendous quantities of migrants. Presently, sustainable development of migrants' population and migrants' communities of Three Gorges Reservoir Area is the focus of current work. The migrants have settled in the current residence from their previous residence. To make them live a better life than previously, it is pointed out by support work of post Three Gorges Project that the income level of migrants shall be improved by way of economic development. Life activities and economic activities of the migrants need support from ecosystem, and will reversely impact operation of the ecosystem. Since support of the natural resources stock to habitation and economic activities of the migrants is not unlimited, beyond a certain carrying capacity, the support function of ecosystem services will get weakened, which will exert a significant impact on surviving environment and living standard of the migrants, and will make the target of sustainable development even more impossible. Therefore, the coordination degree of ecological environment and human activities in the process of migrants making use of natural resources need to be considered. Variation in coordination degree will reflect directly the sustainable development level of migrants' population in the reservoir area. At present, the key difference of the evaluation method of coordinated development evaluation is the difference of evaluation index system. In previous studies, some scholars adopt the "driving force state pressure" (DSR) index system framework proposed by the United Nations Commission on Sustainable Development (Zhao Jingzhu, 1995). Ceng Rong et al (2000) of the Chinese Academy of Sciences constructed a system consisting of three levels of internal, relevance and regulation to evaluate the coordinated development of population, resources, environment and economy in Beijing. Ma Qianhua (2006), Majun (2009), Xie Zhizhong etc. (2012), and Cao Bingru (2015), in different periods, from the perspective of sustainable development review the indicators of the economy, population, resources and environment system. In view of this, based on selection of reasonable indices from the perspective of systematic theory, the paper measures the coordination degree between migrants' population development and resource and environment of Three Gorges Reservoir Area with coordination degree evaluation method.

2 Index Processing

2.1 Index selection

Population development system and resource and environment support system are involved in

measurement on coordination degree between migrants' population development and resource and environment of Three Gorges Reservoir Area. Since both population development and resource and environment are multidimensional, one single index is difficult to reflect all aspects of the two systems, thus, this essay designs an index system based on the principles of comprehensiveness, operability and availability etc.

Migrants' population development system measuring indices are constructed in consideration of four aspects: population pressure, population structure, population quality and quality of life. Population pressure mainly consists of five indices: total population at the end of year, natural population growth rate, fertility rate, birth rate and density of population; population structure includes three indices: urbanization rate, proportion of practitioners of secondary industry and proportion of practitioners of tertiary industry; population quality consists of two indices including number of enrolled students among per 10,000 people and education expenditure per capita etc.; and quality of life includes six indices: GDP per capita, urban and rural residents savings, per-capita disposable income of urban residents, per-capita net income of rural residents, Engel coefficient and per-capita health expenditure.

Measuring indices of resource and environment support system consists of two parts, in which the resource support system is measured by six indices: per capita arable land area, arable land area at end of year, per capita output of grain, total crop sown area, utilization ratio of forest resources, and forest coverage rate; the environment support system is measured by six indices: discharge of industrial waste water, discharge of industrial waste gas, output quantity of industrial solid wastes, discharge standard-meeting rate of industrial waste dusts, domestic sewage treatment rate and the proportion of pollution control input to GDP.

2.2 Determination of index weight

There are many ways to determine index weight, and this essay is prone to adopt objective valuation, thus entropy method is used to determine the index weight of population development system and resource and environment system. The process is:

First, standardize indices by $x_{ij}' = (x_{ij} - x_j) / s_j$. In the formula, x_{ij}' is the value of index after standardization, x_j is the average value of j index, s_j is the standard deviation of j index; then, use coordinates translation (to eliminate the impact of negative number). $x_{ij}'' = A + x_{ij}'$ in the formula, x_{ij}'' is the value of index after translation, A is translation range; at last, calculate and determine the index weight by using the formula of entropy method.

3 Method

First, to determine whether the two systems coordinate with each other, comprehensive development level of the two systems need to be calculated. Linear weight sum method

$$s_i = \sum_{j=1}^m w_j \bullet p_{ij} \quad (i=1,2,\dots,n)$$

is adopted in this essay for the calculation. So the comprehensive score of migrants' population development indices $f(x)$ and the comprehensive score of resource and environment support indices $g(y)$ are gained.

Then, construct coordination degree formula. Comprehensive development index of population development system $f(x)$ and comprehensive development index of resource and environment system $g(y)$ gained by linear weight sum method can construct the coordination coefficient of population development-resource and environment system.

$$C = \left\{ \frac{f(x) \cdot g(y)}{[f(x) + g(y)]^2} \right\}^k \quad (\text{make } K=2)$$

It is known from the definition of coordination degree that the closer C is to 1, population development system $f(x)$ is more coordinated with resource and environment system $g(y)$.

$$T = \alpha f(x) + \beta g(y)$$

$$D = \sqrt{C \times T}$$

T is comprehensive evaluation index of population development and resource and environment, indicating the overall benefit or level of population development and resource and environment; α, β are undetermined coefficients, since it is held in this essay that population development and resource and environment are equally important, we make $\alpha = \beta = 0.5$. D is coordinative development degree (coefficient).

It is important to note that coordination degree itself only indicates the degree of coordination of

the system, but not reflects the level of system development. Therefore, coordination degree and system development level need to be considered comprehensively to determine D-the coordinative development degree of system.

Table 1 Evaluation Criteria of Coordination Level and Coordination Degree

Coordination level	Extreme disorder	Major disorder	Moderate disorder	Mild disorder	On the edge of disorder
Coordination degree C	0-0.09	0.1-0.19	0.2-0.29	0.3-0.39	0.4-0.49
Coordination level	Reluctant disorder	Primary coordination	Intermediate coordination	Good coordination	Quality coordination
Coordination degree C	0.5-0.59	0.6-0.69	0.7-0.79	0.8-0.89	0.9-1

4 Measurement and Evaluation

4.1 Index weight determination and standardization

Use entropy method to determine the weights of indices in the system based on the measuring index system on population development and resource and environment which has been constructed. And the result is as follows:

Table 2 Index Weight Table of the Population Development and Resource and Environment System of Three Gorges Reservoir Area

Target Layer	Function Layer	Index	Unit	Weight	
Comprehensive Index of Population Development System	Population pressure	Total population at end of year	Person	0.074	
		Natural population growth rate	%	0.07	
		Fertility rate	%	0.064	
		Birth rate	%	0.066	
	Population structure	Density of population		Person per km ²	0.071
			proportion of practitioners of secondary industry	%	0.034
			proportion of practitioners of tertiary industry	%	0.042
			Urbanization rate	%	0.099
	Population quality	number of enrolled students among per 10,000 people		person	0.06
			education expenditure per capita	Yuan	0.062
		Quality of life	GDP per capita	Yuan	0.065
			urban and rural residents savings per-capita disposable income of urban residents	Yuan	0.063
	Comprehensive Index of Resource and Environment System	Resource situation	per-capita net income of rural residents	Yuan	0.063
			Engel coefficient	%	0.05
			per-capita health expenditure	Yuan	0.055
			arable land area at end of year	Mu	0.084
Environment situation		per-capita arable land area	Mu	0.047	
		per-capita output of grain	Person per ton	0.101	
		total crop sown area	1,000 hectare	0.1	
		forest coverage rate	%	0.071	
Environmental governance		utilization ratio of forest resources		%	0.083
			discharge of industrial waste water	10,000 ton	0.075
	Environmental governance potentiality	discharge of industrial waste gas output quantity of industrial solid wastes	10,000 standard m ³	0.081	
		discharge standard-meeting rate of industrial waste dusts	%	0.104	
Environmental governance potentiality	domestic sewage treatment rate	%	0.082		
	proportion of pollution control input to GDP	%	0.078		

4.2 Calculation and analysis

In this essay, calculation is based on the data of Hubei Reservoir Area of Three Gorges Project from 2007 to 2010. After analyzing on the data, we can see the coordination degree between migrants' population development and resource and environment during this period changes from 0.393 to 0.907, the coordination level presents a good state. From the perspective of coordinative development degree, it changes from 0.2276 to 0.4381; the level is in continuous improvement. In accordance with the criterial of judgement in table 1, population development and resource and environment development of Hubei Reservoir Area of Three Gorges Project have reached relatively coordinative state, yet the coordinative development is still at low level stage. As analysis shows, between 2007 and 2010, all population development comprehensive scores are lower than 0.3, and all resource and environment comprehensive scores are lower than 0.2. This suggests that during the four years, population development and resource and environment development of Hubei Reservoir Area of Three Gorges Project are at low-level good-coordination state. In the meantime, compared with population development status, utilization rate of resources and environment pollution control efficiency have relatively lagged behind. The coordinative development trend between population development and resource and environment development of Hubei Reservoir Area of Three Gorges Project is shown in Graph 1. In the graph, resource and environment indices are lower than population development indices, indicating that population development level has been higher than resource and environment improvement level along these four years.

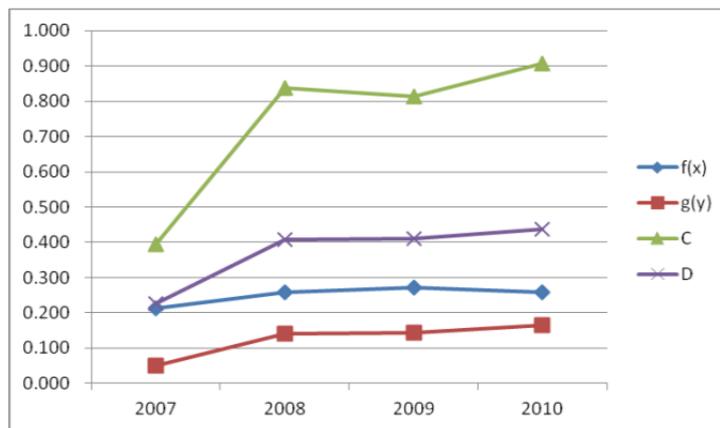

Figure 1 Coordinative Development Trend Between Population Development and Resource and Environment Development of Hubei Reservoir Area of Three Gorges Project

Compared with coordination degree, coordinative development degree is more reflective of the development level of population development and resource and environment system. Coordinative development degree is a static reflection of the coordinative development degree between population development and resource and environment, which cannot show the overall coordinative development trend of the system. And coordinative development trend index can be further calculated. The formula of coordinative development trend is:

$$\beta(t) = \frac{D(t)}{\frac{1}{t-T} \sum_{i=T}^{t-1} D(i)}$$

In the formula, D(t) is the coordinative development degree between population development and resource and environment system at the moment t, $\frac{1}{t-T} \sum_{i=T}^{t-1} D(i)$ is the overall average coordinative development level of a period between population development and resource and environment system from the base moment T to moment t-1. If $\beta(t) > 1$, it suggests the overall average coordinative development level of the system from T to t is in an increase trend; if $\beta(t) = 1$, it suggests the overall average coordinative development level of the system from T to t is in a stable trend; if $\beta(t) < 1$, it suggests the overall average coordinative development level of the system from T to t is in a fading trend.

Based on the above formula, through calculation we get the overall coordinative development trend index between population development and resource and environment system of Hubei Reservoir Area

of Three Gorges Project is 0.652 and 0.975 respectively in 2007 and 2008. And results show that the overall coordinative development level between population development and resource and environment system is in an increasing trend. The conclusion is in consistence with the data state of coordinative development.

5 Conclusions

Since 2007, both population and economy of Hubei Reservoir Area of Three Gorges Project have developed to some extent, as it can be seen that both of the comprehensive evaluation indices have a certain degree of improvement, but the coordination degree between them was at a stage of mild disorder at the beginning of 2007, and then rose gradually. The reason might be implementation of helping policies at the later stage of large and medium sized water resources reservoir area in China bring about economic growth in later years, which results in improvement of population quality, thus improving the coordination of the two systems; or it could be the environmental protection policies at Hubei Reservoir Area of Three Gorges Project has started to work gradually. In general, the coordination degree between population development and resource and environment of Hubei Reservoir Area of Three Gorges Project is continuously strengthened in recent years, and the overall coordinative development level is also increased. To further consolidate the achievement that has been gained, a road of green ecological economy should be stick to in Hubei Reservoir Area of Three Gorges Project in future. Grasp population development with one hand, and green economic development with the other, so that attention may be paid to improvement of population quality while economic development is stressed, also control over population size should earn due to attention, and only in this way can population development and resource and environment of Reservoir Area move towards the sound track of coordinated development.

Abstract: Authors such as Brown (2009) and Sachs (2010) have been discussing the importance of biodiversity and the need to build a harmonious relationship between social capital, natural and economic. Thus, the aim of this study is to make an analysis of the Ibero-American region (AIBER), in which concentrate the greatest biodiversity on the planet. The 21 countries of the Ibero-American region were grouped using an analysis of variables with high explanatory power by principal component analysis. We conclude that there is an imbalance between the variables, noting a preponderance of the capital to the detriment of natural capital.

Key words: Biodiversity; Social; Ibero-American

1 Introduction

Many authors have discussed the importance of biodiversity for human well-being and the need to work it. Moreover, these questions have to work with a harmonious relationship between natural capital, social and economic as well. Scharmer et al. (2014) discusses the passage of a self-centered awareness for an ecocentric consciousness, especially regarding the organizational and social leaders in which this harmony is increasingly present. Thinking about it the aim of this paper that it is to analyze the countries of the Ibero-American region (AIBER). These countries concentrate the greatest biodiversity on the planet, namely Natural Capital and Social. Additionally, the purpose to this research was verifying the degree of relationship between the variables of interest.

The data offered by the Ibero-American Millennium Project - RIBER aims to: promote the study of foresight in Latin America through a community with skills, concepts, methods and prospective practices for analyzing and exchanging information about the different countries. These study also contribute to the collective learning of regional actors to develop skills in prospective, providing references of best practices in the region and the world as a whole.

The sample of study were the 21 Ibero-American, six are among the 17 top most mega-diverse countries, with 70% of the planet's biodiversity are: Brazil, Colombia, Ecuador, Mexico, Peru and Venezuela. Brazil is considered the country with the greatest biodiversity in flora and fauna with 15 to 20% of the biodiversity of the planet, so it can be said that the greatest biodiversity is concentrated in Latin American countries (MARQUES, 2014).

2 Theoretical Framework

Bloch (2005) states that biodiversity is the result of a process that began 3.5 million years ago, at the time that complex molecules began to multiply in the waters of the primordial sea. On the other hand, Franco (2013) based on Wilson (1997); Meime, Soule and Noss (2006), Sarkar (2002) and Lewis (2007) mention that the concept of biodiversity is a recent phenomenon that was set during the forum planning on Biological Diversity, National Forum on Biodiversity, held in Washington, 21 the September 24, 1986 by Walter G. Rosen in 1985, came the Society for Conservation Biology (SCB) and in 1987 published the first Conservation Biology journal issue, which has become the main vehicle for scientific communication on biodiversity.

According to the Convention on Biological Diversity - CBD (2000), biodiversity can be understood as the variety among living organisms from all sources including, inter alia, terrestrial, marine and other aquatic ecosystems and the ecological complexes of which they are part; this includes diversity within species, between species and ecosystems. Schaller (2007 apud Franco, 2013) points out that when the subject biodiversity emerged, It was associated with the preservation of species and their habitat, however, the author also said that these issues are directly related to natural, social and economic issues.

Guide Sustainable Public Management (GPS, 2014) brings the idea that is placed to the maintenance and preservation of biodiversity is settled by capital that group together, developing

networks and rules governing properly actions or events affecting biodiversity; The market is a short-sighted and invisible nature of both the social, as the green (Sachs, 2010).

Sachs (2010) believes that the relationship between society and nature promotes efforts to: the social is in charge, while the ecological assumed restraint and economic reattached in its instrumental role (GUIA GPS, 2014). Brown (2009) proposes, from his book "Plan B 4.0", a global mobilization to save our civilization building a global economy to able to sustain economic progress and the creation of an honest market. It based on three interdependent goals: to stabilize climate and population eradicate poverty and restore natural stands of nature, such as water, soil and air. According to the author it is necessary to restructure the tax system by reducing taxes on labor and increasing on carbon emissions and other environmentally destructive activities.

To understand the relationship between social and environmental is necessary to understand Maslow's theory, she in that behavior is motivated by basic needs based on two groups: (1) deficiency, which are the needs: physiological, safety, love and esteem; and (2) growth, which are needs related to self-development and self-fulfillment of human beings. With that he tried to comprehend and explain what energizes, directs and sustains human behavior.

Maslow (1975) can only move from one level to another if that level is minimally satisfied, that is, when unsatisfied physiological needs of the individual organism is fully focused to meet them being unable to think of other needs. For example, a hungry person think about meeting their security needs is impossible, but as soon as satisfied minimally seeks to meet the need for security, then emotional-social, then self-esteem and last the need located at the top of the pyramid requires full satisfaction, it is the self-realization related to the need of every human being to grow and fully realize their potential.

Thereafter, Maslow added to his theory, the desire of every human being to know and understand and help others realize their potential. Demonstrating a natural human need to seek the meaning of things in order to organize the world in which they live. They are called cognitive needs and include the desire to know and to understand, organize, organize, analyze and seek relationships and meanings.

From needs as described by Maslow, Barrett (2006) developed a model with seven levels of consciousness to measure the values of an organization / company. According to the author the companies and firms with more self-performance are those that establish and preserve a worshiper guided by shared values, which all seek the same future vision, personal fulfillment and meet their physical, emotional, mental and spiritual needs. Barrett (2006) reveals seven levels of personal and social consciousness described in Figure 1.

Source: Barrett Values Center, 1997.

Figure 1 The Seven Levels of Personal and Organizational Awareness

Sen (2000) mentions that the poverty is seen such as deprivation of basic needs. Moreover, privation that causes premature death, malnutrition, illiteracy and other disabilities, according to the author, poverty affects not only the developing countries but also in affluent as Europeans who suffer from the fall in jobs that generates "social exclusion", with loss of freedom, autonomy, self-confidence, physical and mental health. Thus we see the influence of the pyramid of Maslow's needs and the seven levels of Barrett.

3 Data and Methodology

This study aimed to carry out analyzes of the Ibero-American region (AIBER) the main theme Biodiversity - Natural and Social Capital, and verify the degree of relationship between the variables of interest.

The data in this analysis included, the 21 countries of the Ibero-American region (AIBER), it is shown in Table 1. These data are represented by synthetic and analytical indicators most relevant to allow analysis and conclusions on the theme Biodiversity, Natural and Social Capital, and assist those involved in ORIBER Project - Observatory RIBER.

The Ibero-American Millennium Project - RIBER aims to promote prospective studies in Iberoamerica through a community with skills, concepts, methods and prospective practices for analyzing and exchanging information about the different countries of the region; and contribute to the learning collective regional actors to develop skills in prospective, providing references of best practices in the region and the world as a whole.

Table 1 Countries of Ibero-American

Argentina	Dominican Republic	Panama
Bolivia	Ecuador	Paraguay
Brazil	El Salvador	Peru
Chile	Guatemala	Portugal
Columbia	Honduras	Spain
Costa Rica	Mexico	Uruguay
Cuba ¹	Nicaragua	Venezuela

This research topic submitted a total of 33 (thirty-three) variables, three categorical - Country, Country code and REGION; and thirty quantitative variables. However, this study only will use the 9 variables identified as high explanatory power, as shown in Table 2.

Table 2 The Variables of Interest for This Work

Variable	Description	Type
Opp (Opportunity) Nominal-Quantitative	Measures the degree to which a country's citizens have personal rights and freedoms .Opportunity also includes the degree to which advanced forms of education are accessible to those in a country who wish to further their knowledge and skills, creating the potential for wide-ranging personal opportunity.	Capital Social
Waterw (Water withdrawals as a percent of resources) Nominal-Quantitative	The ratio of total withdrawals to total renewable supply in a given area. Water available to agricultural, domestic, and industrial.	Capital Natural
Immi (Tolerance for immigrants) Percentage-Quantitative	The percentage of respondents answering yes to the question, "Is the city or area where you live a good place or not a good place to live for immigrants from other countries?"	Capital Social
Relig (Religious tolerance) Nominal-Quantitative	A measure of 13 types of religious hostility by private individuals, organizations or groups in society, including religion-related armed conflict or terrorism, mob or sectarian violence, harassment over attire for religious reasons or other religion-related intimidation or abuse.	Capital Social
Hdi (Human Development Index) Nominal-Quantitative	Measures of average achievement in key dimensions of human development: a long and healthy life, being knowledgeable and have a decent standard of living.	Capital Social
Gov (Governance) Nominal-Quantitative	Consists of the traditions and institutions by which authority in a country is exercised.	Capital Social
Epi (Environmental Performance Index) Nominal-Quantitative	Measures of average achievement of Environmental Health: Child Mortality (probability of dying between a child's first and fifth birthdays), Air Quality, Access to Drinking Water and Sanitation. Ecosystem Vitality: Wastewater Treatment, Agricultural Subsidies, Pesticide Regulation, Change in Forest Cover, Coastal Shelf Fishing Pressure, Fish Stocks and Biodiversity and Habitat.	Capital Natural

¹Note: As stated, Cuba that was originally classified as a country in the Caribbean region, has been integrated in AIBER for analysis and results of this work.

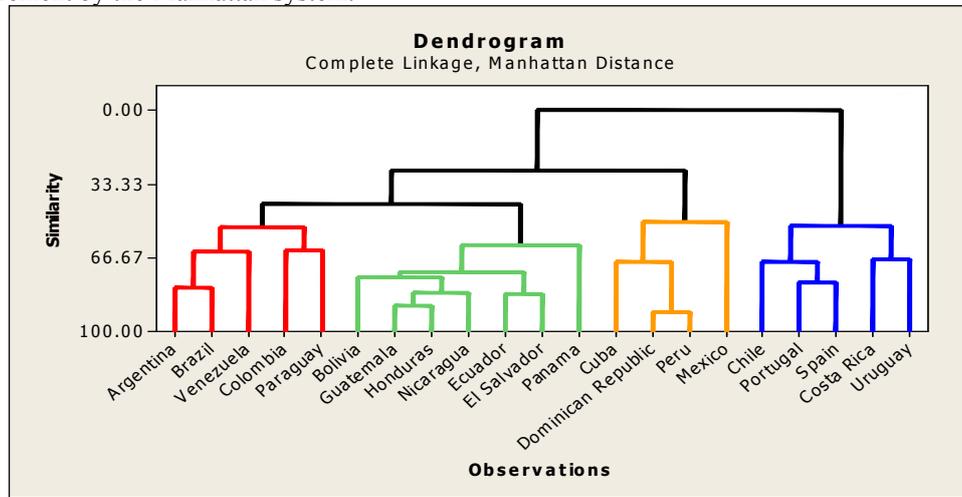

Hpi (Happy Planet Index) Nominal-Quantitative	The HPI measures what matters: the extent to which countries deliver long, happy, sustainable lives for the people that live in them. The Index uses global data on life expectancy, experienced well-being and Ecological Footprint to calculate this.	Capital Social
Democ (Democracy Index) Nominal-Quantitative	The Democracy Index is based on five categories: electoral process and pluralism; civil liberties; the functioning of government; political participation; and political culture.	Capital Social

Source: Made by the authors, based on GPS Guide, World Bank, UNDP, WRI, SPI and Yale informations.

The data were compiled by the World Bank. The statistical software used in this study was Minitab and through him the following analyzes were performed: grouping by similarity (Dendrogram), Principal Component Analysis (dimensionality reduction) and One-way ANOVA (analysis of variance).

4 Data Analysis

The groups were conducted to demonstrate the degree of relationship of the variables presented in Table 2. The best packing arrangement was 4 clusters, using the method and complete the distance measurement by the Manhattan system.

Source: by authors, 2016.
Figure 2 Dendrogram

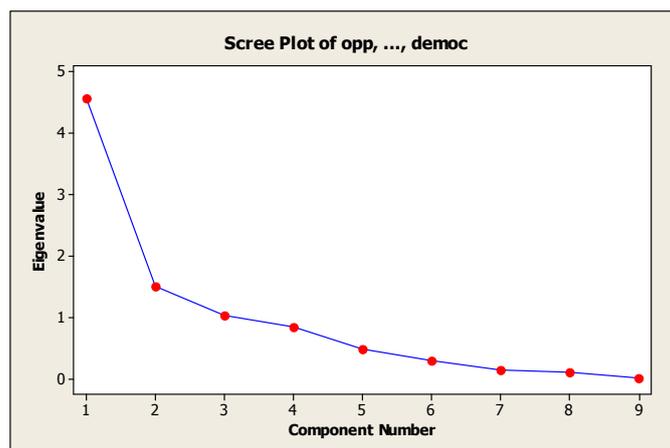

Therefore, with the defined groups and set each country as a member of their respective cluster, was performed the One-way ANOVA analysis to understand the variability between groups and assist in the classification of countries. A second ANOVA was generated and ordered from lowest to highest average, according to Table 3.

Table 3 Clusters of the Average Order

Level	N	Mean	StDev	Color Cluster
1	7	54,346	10,462	Green
2	4	66,377	4,008	Orange
3	5	67,532	9,720	Red
4	5	79,098	7,065	Blue

Source: by authors, 2016.

Thus, to analyze which variables has been high explanatory power, an analysis of the main components was made, according to Hair (2009) the goal to this analysis is to find a way to condense the information contained in various original variables into a smaller set of statistical variables with loss minimum information.

Source: by authors, 2016.

Figure 3 Principal Components Analysis

In the analysis, we see that the PC1 components, PC2, PC3 and PC4, explain 88.1% of the variability of the data. Las Casas and Guevara (2010) show that by convention components must only be considered with a contribution equal to or greater than 1. The AIBER countries were ranked in descending order by PC1 values, which led the ranking:

Table 4 Classification of the Ibero-American Countries-AIBER

COUNTRIES ORD	RANKING	PC1-NORMALIZADA
Spain	HIGH	100.000
Portugal	HIGH	93.662
Chile	HIGH	77.400
Uruguay	HIGH	75.803
Costa Rica	HIGH	62.569
Argentina	MEDIUM	55.208
Brazil	MEDIUM	49.868
Panama	MEDIUM	39.209
Mexico	MEDIUM	36.565
Peru	MEDIUM	34.660
Dominican Republic	MEDIUM	33.901
Colombia	MEDIUM	31.318
Paraguay	LOW	30.862
Bolivia	LOW	20.620
El Salvador	LOW	19.783
Ecuador	LOW	18.680
Venezuela	LOW	18.599
Cuba	LOW	9.896
Nicaragua	LOW	2.564
Honduras	LOW	0.045
Guatemala	LOW	0.000

Source: by authors, 2016.

We can say that due to closeness of the results in the ANOVA analysis, grouped to the countries of the clusters 2 and 3 in the table 4, it shows as "MEDIUM" on the ranking scale of countries AIBER. Figure 4 shows the map with the classification countries.

Source: by authors, 2016.

Figure 4 Classification Map of the Countries of Ibero-America-AIBER

In the analysis of the Ibero-American region, Spain and Portugal are classified in the top of the list (dark green), with the best results. On the other hand, when considering only the Latin American countries was positive especially Chile, Uruguay and Costa Rica. Seven countries were in the middle range of the table (medium green), notably Argentina, Brazil, Panama and Mexico. And in the bottom of the list (light green), with the lowest performances were highlighted, Guatemala, Honduras, Nicaragua and Cuba.

5 Conclusions

This study was carried out analyzes of the Ibero-American region (AIBER) Biodiversity thematic area - Natural and Social Capital, to check the degree of relationship between the variables of interest. Using an integrative view, it was considered here the theme of biodiversity widely, covering not only natural resources, but also considering the social and economic agents in this analysis.

Therefore, It is observed that as the pyramid of Maslow's needs and the seven Barrett's levels of consciousness, so that the individual has the capacity to engage in issues related to the environment, health of the planet and decreased injustice in the world, it needs first have their basic needs gotten.

With the results of analyzes, the countries of the region were classified according to their ability to manage and promote actions to take care of your assets from natural capital and social capital. Thus, countries such as Spain and Portugal made the top of list with the best results, and followed by them, are Chile, Uruguay and Costa Rica. Moreover, seven countries are in the middle range of the table, especially in Argentina, Brazil, Panama and Mexico. And at the bottom of the list with the lowest performances were highlighted, Guatemala, Honduras, Nicaragua and Cuba.

Sen (2000) points out that poverty is seen as deprivation of basic needs, these needs will vary according to the level of poverty in each country and how it is in the pyramid of Maslow's needs and range of awareness levels Barrett. Besides that, countries such as Portugal and Spain, are in a better row position of Chile, Uruguay and Costa Rica, they are countries with a higher HDI, namely that already have well-resolved way dimensions related to: Health (long and healthy life: life expectancy), education (years of schooling for adults and children) and income (standard of living measured by Gross National Income - GNI).

In conclusion, we can said that Guatemala, Honduras, Nicaragua and Cuba appear at lower levels need to care more care of these most basic questions. It was observed that the 9 most important variables for biodiversity only 2 "epi" and "waterw" are related to natural capital; while the other seven variables "opp", "IMMI" "Relig" "hdi" "gov", "hpi" and "democ", are more focused on the capital. So, this can strengthen the theories of Maslow and Barrett, however, fade the placement of Sachs and Brown that the

natural and social capital must go together in equal importance so that we can ensure biodiversity on the planet, as the authors state, a change in social paradigm it is necessary, we need to put the B4.0 plan in place as well as demystify the idea that, as stated Sachs, "the market is a short-sighted and invisible nature of both the social, as the ecological".

A Research on Urban Households Potted Greening Product-Service System Design

Lu Jiangyan¹, Hu Chengyi¹, Zhang Yuanke²

1 School of Art and Design, Wuhan University of Technology, Wuhan, P.R.China, 430070

2 Cannon School, Concord, North Carolina, USA, 28027

(E-mail: Lu7747@sina.com, 315530249@qq.com, kellyz114@163.com)

Abstract: This paper analyzes the current situation of potted greening products of urban households and concludes the problems and requirements of customers to purchase and consume greening products. By using the design method of product-service system, a service system of potted greening products for urban households is built. It provides service related to potted products for urban households. It also helps customers solve related problems in hopes of bettering the current situation of potted greening products and promoting the development of urban greening.

Key Words: Product-service system; Greening for urban households; Potted greening product; System design

1 Introduction

Home greening has a long history and continues impacting on people's daily life. With the popularity of pot culture, more and more people choose to purchase potted greening product to decorate their home. However, it is very common that potted greening products lose their values as time goes by. The reason is complicated. Different plants have different characteristics, such as vital signs, varieties and habits, but consumers are always lack of professional knowledge about it. Therefore, the solution is worth exploring.

As a newly rising way to provide more services to consumers, Product-Service System (PSS) has been paid widespread attention by researchers. As a result, possible solutions related to urban households potted greening product can be discussed through the design of PSS.

In foreign countries, many industrial design experts had started the exploration of PSS design. They have established related theories, research direction and hypothesis. Such as Sustainable Product-Service Systems (Robin Roy, 2000), Product-Service Systems and Sustainability: Opportunities for Sustainable Solutions (Ezio Manzini et al., 2002), A Strategic Design Approach to Develop Sustainable Product Service Systems: Examples Taken from the 'Environmentally Friendly Innovation' Italian Prize (E Manzini et al., 2003), Introduction to Product Service-System Design (Sakao et al., 2009), Product-Service System Design for Sustainability (Carlo Vezzoli et al., 2014). Many successful design cases have also been completed. In China, however, research on PSS design is in the initial stage, and there are few successful design cases. Some influential literatures include Service Design (Luo Shijian et al., 2011) and Service Design and Innovation (Wang Guosheng, 2015). Service Design focuses on the theory, process, method and practical experience of service design. It also states briefly about some strategies and methods of service system design. Service Design and Innovation reveals a new path to China industrial design as service design contributes new ideas to the design development in China. On the other hand, most academic references about potted greening product focus on garden art design, interior design or phytology. There is hardly any research on the actual needs of households potted greening product consumers. The research is much less on how to use the theory and method of PSS to design urban households potted greening product. Accordingly, this paper possesses quite significant sense in both theory and realism by discussing the problems related to urban households potted greening product from the point of view of PSS design.

2 Product-Service System Design

PSS is a new type of service-oriented system which focus on satisfying consumers' basic needs including health, transportation, entertainment, etc. PSS is defined as a system of products, services, networks of actors and supporting infrastructure that continuously strives to be competitive, satisfy customer needs and have a lower environmental impact than traditional business models (Mont, 2004). The efficiency of PSS comes from the value of functional service rather than the product itself. PSS can be classified into three models based on the proportion between product and service. They are product-oriented PSS, use-oriented PPS and result-oriented PSS (Wang Guosheng, 2015).

Product is the core of product-oriented PSS. The product is made available in a different form to the customer, is sometimes shared by a number of users, but stays in the ownership of the provider. It is the usage of the product (so a service) rather than the product itself that is invoiced, without transfer of ownership. Use-oriented PSS means the separation of product possession and product use. Consumers can receive service without fully own the product. Result-oriented PSS is to provide final result for consumers based on their needs. The seller no longer sells a product to the customer but sells the desired result rendered by the product¹.

Urban households potted greening product is in the model of product-oriented PSS, since consumers receive services through possessing potted greening product.

3 Urban Households Potted Greening Product

3.1 Characteristics

Households potted greening product refers to greening product that grows in pot for indoor decoration. It is mainly consisted of planting container, cultivated substrate (soil or soilless substrate), and plants (flowers, vegetables, etc.). The following are four important characteristics of such products:

1) Life Sign

Since plants have life sign, households potted greening product is characterized by life sign. This makes consumers spend time and effort taking care of it in order to preserve its functional value.

2) Universality

Following the accelerated development of urbanization, more and more urban residents desire to a hint of green at home to bring themselves closer to nature. It can not only beautify the house but also improve the quality of life (Dai Jie, 1999). Consequently, a large number of potted plants have become a part of people's life.

3) Complexity

The complexity of urban household potted greening products are mainly embodied in three aspects. Firstly, it is hard to be systematized because of the varieties and classification of plants. For example, succulent plants which is popular with the public recently belongs to dozens of families. There are 50 families and 334 genus are known so far (Ye Fengjuan, 2013). Secondly, containers and tools related to greening product are various (such as flower pot, garden tool, etc.). Thirdly, Environmental factors that influence the growth of plants are complex. Besides the quality of cultivated substrate and the size of planting container, factors like permeability, temperature, lightness, water, nutrition, etc. can also impact on the growth of plants.

4) Uncontrollable lifecycle

The complexity of environmental factors directly leads to the lifecycle uncontrollability of potted plants. Once the environment is not suitable, the plant may die and the value will lose as well.

Household potted greening products are part of the flower industry. There are three main sales channels in China. The first one is flower market. It is also known as plants and pet market where most potted greening products are sold. It is located throughout medium sized cities and covers much area offering various products. The second one is supermarket. Supermarket becomes one of the main marketing channels in recent years. However, because of its limited space, it can only provide small sized potted plants that are popular among most people. There is less variety of potted plant in supermarket (Duan Yun et al., 2007). The last sales channel is retail flower shop. Potted greening products can also be found at scattered flower shop in cities. Even though the flower shop sells popular potted plants, cut flowers and bouquets are usually major selling products. Retail flower shop lacks of the variety of potted plants.

3.2 Current situation

Lacking of plants caring knowledge is always a pain point for urban households potted greening product consumers. They access to little assistance that can guide them in purchasing and caring the plants properly. The complexity of potted plants products also causes problems within after-sale service. Even though the products have an issue after purchase, customers can hardly blame sellers. Since consumers usually take the consequences, there is barely any after-sale service.

To solve this problem, many functional potted plants emerge in the market recently. Classified by the existence of electronic component, they can be divided into "lazy" potted plants and "intelligent" potted plants.

¹ Christophe Sempels, Jonas Hoffmann. The role of value constellation innovation to develop sustainable service systems [EB/OL]. 2010 (<http://www.unep.fr/scp/design/pdf/pss-brochure-final.pdf>)

“Lazy” potted plants product uses siphon principle to keep the soil moist helping consumers who forget to water the plants. Although it has low price and high sales, it can only solve watering problem over a period of time.

“Intelligent” potted plants product uses electronic components to provide automatically watering, fertilizing and artificial light. The more intelligence the product has, the more electronic components it has. This may lead to some problems about energy consumption and service life. Considering the construction of the product, it is usually applied on small potted plants. Accordingly, it cost more and has less sales.

Whether it is a “lazy” potted plant or an “intelligent” potted plant, it can never replace a man completely to take care of the plants. Most functional potted plants can only solve simple problem like watering rather than eliminating the pain point of consumer.

There are some service platforms related to potted greening plants, such as online plants forum. It gives plant amateur an opportunity to communicate plants issues and help each other. Since such service providers are not producer or seller, they can't provide professional services or solve consumer's problem efficiently.

4 Potted Greening PSS Design Conception

To deal with above problems, this paper conceives a service model of household potted greening products from the point of view of PSS design. This model focus on connecting customers, service providers, product sellers and professional gardeners together through a service forum. It will help consumers access to assistance related to potted greening products.

4.1 Target user and related service providers

Urban residents who are fond of potted plants are the core customers of household potted greening products service system. They are also the target population and main service objects of household potted greening products service system.

In the service system of household potted greening products, the main service providers are the developer, operator and enforcer of the service platform. Potted plants sellers, registered gardeners, and logistical organizations are the stakeholders that directly relate to the service providers (Figure 1).

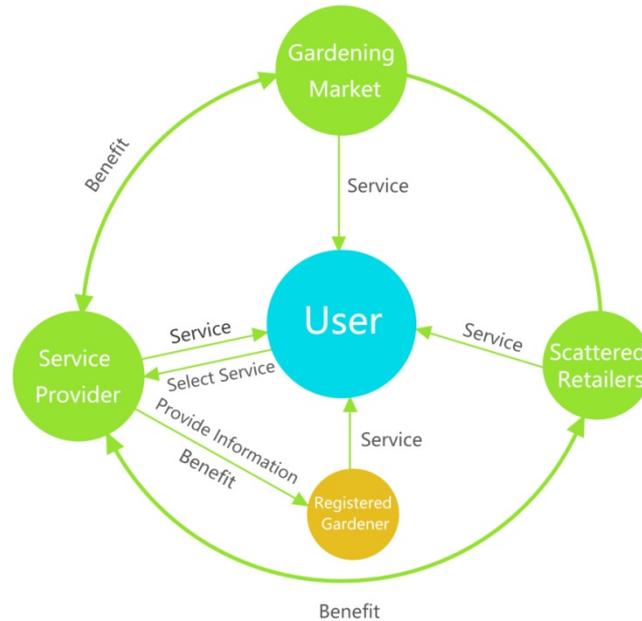

Figure 1 The Relationship of Target User and Related Service Providers

4.2 Service system requirements analysis

The requirements of customers will be elaborated and analyzed by function, interaction and emotion.

1) Functional requirement

Based on the pain points of household potted greening product consumers, the functional requirement for service system includes potted plants caring education, online consulting service,

door-to-door service booking and potted products accessories recycling. It will be convenient for customers if related caring knowledge are popularized, such as the habits of plants and basics on how to care plants. Online consulting service offers online assistance from professional gardeners to customers when they have planting questions. door-to-door service booking applies to problems that can't be solved by online consulting. Professional gardeners will serve customers in person after an appointment. Potted products accessories recycling is when service providers buy idle stuff related gardening from customers. Then professional gardener may clean up or transform them and bring them back to the markets. This will be a benefit for sustainable development of potted greening products.

2) Interaction requirement

Interaction requirement refers to the need between people and service system when they interact. Customers is served through the service forum that supported by software and hardware. If the forum with characteristics of potted plants products is easy to understand, the process of interface operation and other interaction will be smooth and satisfying. These are important aspects of the interaction requirement. household potted greening product service system must provide a cheerful interaction experience for costumers and help them solve problems.

3) Emotional requirement

Emotional requirement refers to the emotion generated during the process of using products or providing service (Luo Shijian et al., 2011). Household potted greening products service system design should focus on understanding the emotional needs of customers. For example, when costumers look for caring information of their potted plants, they can access to accurate solution in a short time, finding a sense of achievement and satisfaction.

4.3 Determination of service contents

Household potted greening products service system is designed to help urban household solve potted plants problems and promote the development of urban household potted greening products. Service content is defined through an analysis of the needs of costumers based on PSS design (Figure 2). This includes potted plant maintenance knowledge query, suggestion of purchasing potted products, online consulting service, door-to-door service booking, planting experience communication, recycle of potted products accessories, etc.

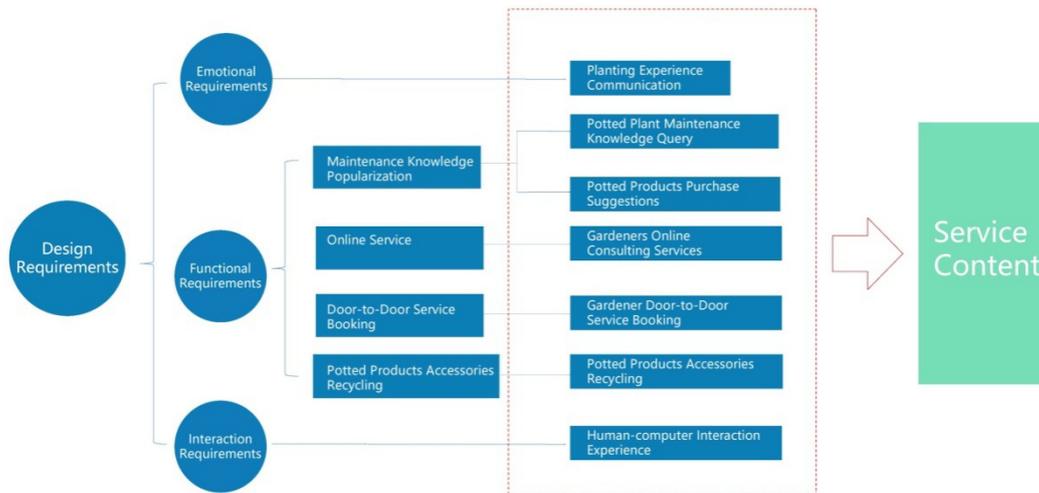

Figure 2 The Analysis of Service Contents

4.4 PSS platform design

The figure below is the representation of urban household potted greening products service system. The figure demonstrates the relationship among urban household user, gardening market or florist's, service provider, and system registered gardener. The figure also points out information flow, material flow, fund flow and service flow (Figure 3).

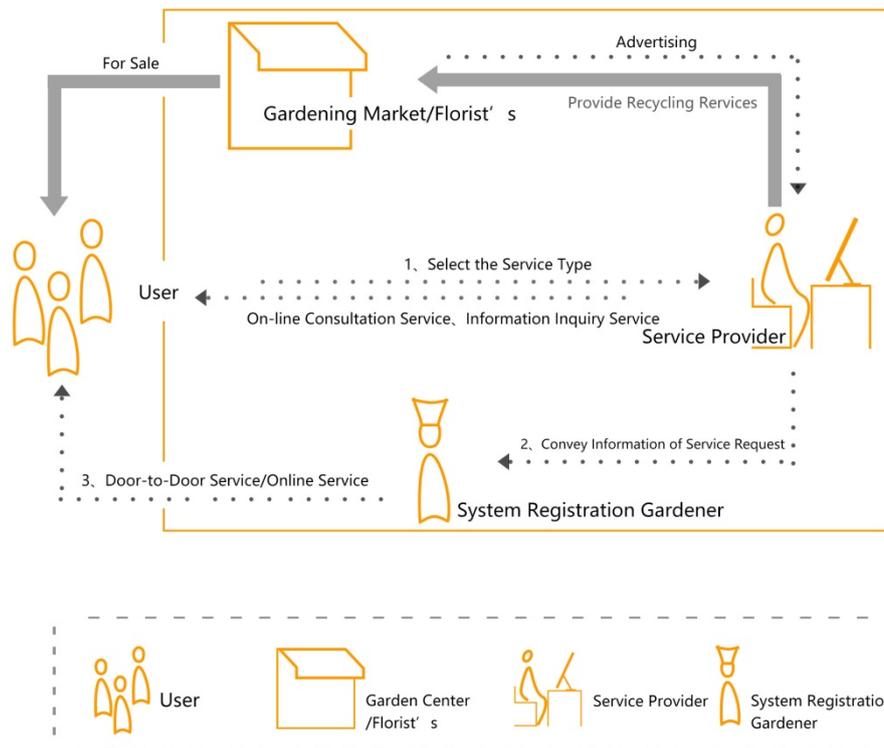

Figure 3 The Analysis of Product-Service System

Customers choose the type of service based on self-requirement and service provider serve the customers based on their selections. If customers choose online consulting service or door-to-door service booking, service providers will contact professional registered gardeners. Gardeners will continue to help the customers with their problems. Service providers will buy recycled garden products from customers then sell them to sellers who will post product information on the forum. The information will be used for other customers' purchase.

Online consulting service or door-to-door service booking connect registered gardeners and customers together. Professional gardeners will improve authority and effectiveness of the entire service. The suggestion for potted plants purchase will provide customers with related gardening market or florists to connect consumers and sellers together. Exchange of experience and plant lover community will enable customers to help each other and promote the development of community culture. Personalized potted plants are designed to meet the need of personalization. This can not only satisfy consumers' emotion requirements but also leave memories.

Accordingly, the service forum of urban household potted greening products is the core that connects all the stakeholders together and meets the need of customers. It is the main approach to realize the value of the products.

5 Conclusions

The problem of losing potted greening product value is very common in urban household in China. Depending on functional products can no solve the problem. Therefore, it is necessary to build a new service model by using PSS design theory and method. It provides services related to potted greening products for urban families. By solving the problems of customers, current situation of urban household potted greening products will be changed and urban household greening will be improved.

Abstract: National innovation demonstration zone has become an important force to promote regional independent innovation and high-tech industry development. Regional innovation demonstration area to implement innovation leading strategy, and it makes the leading and demonstration on the development of the region in the policy reform, industrial development, technological innovation, economic contribution and innovative environmental construction. This paper takes the Donghu Innovation Demonstration Zone as an example, selects enterprises, universities and research institutions, experts, government agencies and intermediary financial institutions as the research objects, using the analytic hierarchy process to examine the effectiveness of innovation demonstration zone for the construction of the regional innovation environment, from the reform and opening up in advance, capital construction zone, personnel construction, science and technology new town construction and innovation a culture construction. Through the performance evaluation of the demonstration zone construction of innovation environment, it concludes that the construction of innovation environment effect of Donghu innovation demonstration zone is better, but the transformation of scientific and technological achievements, the superiority of resources utilization and evaluation aspects need to be further enhanced.

Key Words: Innovation demonstration zone; Analytic Hierarchy Process; Construction of innovation environment; Performance evaluation.

1 Introduction

With the rapid development of economic globalization and technology, technological innovation has gradually become the focus of economic development in the country and region. (Porter M E,1990) Chinese government stressed that the essence of the competition in comprehensive national strength is the competition of innovation. In order to improve the comprehensive national strength, we need to in-depth implementation of the strategy of innovation driven development, continue to promote science and technology, industry, enterprise, market, products and management of all aspects of innovation, accelerate the innovation for the formation of mainly to lead and support the economic system and mode of development. The construction of national independent innovation demonstration zone is conducive to improve the innovation system of science and technology, and it has certain radiation and leading role in accelerating the development of emerging industries and promoting innovation and development.

European innovation environmental research group (GREMI) put forward innovation environment is an important place to cultivate the creativity and innovation oriented enterprises, in the environment, whether enterprises is able to get technical know-how, local contact and local investment, close to the market, can get high-quality labor force, that decides the regional innovation factors. On the one hand, the evaluation of the innovation environment can help we find the effects of the environmental construction measures on different objects, on the other hand, it can provide the direction for the improvement and perfection of the innovation environment. Many scholars have studied the impact of the innovation environment construction on the regional innovation efficiency, and concluded that the innovation environment has important influence on the innovation activities. Braczyk and Cooke (2004) pointed out that the gap of regional innovation capability is related to the institution of the area. Li Xibao (2007) concluded that innovation environment such as industrial clusters, the support of local government on science and technology has a significant effect on innovation validity. Li Meng and Cai Jianfei (2012) set up the evaluation system of urban innovation environment based on the four subsystems of the policy law environment, the innovation foundation environment, the humanities environment and the innovation service environment. Zhou Mi, Liu Binglian et al. (2013) pointed out that the innovation environment can optimize the innovation process. Hou Peng, Liu Si Ming (2014) studied the impact of innovation environment on regional innovation capability from the system environment, factor conditions, demand environment and industry environment, and concluded that the

innovation environment has a positive impact on China's regional innovation capability.

According to the project measures of Donghu demonstration zone that in order to speed up the pace of innovation and promote economic development of the region, the Donghu demonstration area construction of environment of innovation performance was subdivided into five aspects: the performance of reform and opening up, the performance of construction of the special zone of capital, talent zone construction performance, the technological characteristics of the metro construction performance and the atmosphere of innovation culture. Select the main policies and measures from each aspect, we regard enterprises, universities and research institutions, experts, government agencies and intermediary financial institutions as the object to evaluate the effects of policies. Different people have different feeling in perception of the effect of the policy implementation, the degree of the policy and the degree of grasp of the subject. By using analytic hierarchy process to calculate the weight of each type of object to evaluate the problem, we can make a more comprehensive, reasonable and objective evaluation.

2 The Performance of Construction of Innovation Environment of Donghu Innovation Demonstration Zone

This paper adopts questionnaire method and AHP method on the innovation of Donghu demonstration zone construction environment drive performance evaluation. The questionnaire was divided into five dimensions according to the direction of environmental construction in Donghu demonstration zone: the performance of reform and opening up, the performance of construction of the special zone of capital, talent zone construction performance, and the technological characteristics of the metro construction performance and the atmosphere of innovation culture. According to the effect of the implementation of the relevant policies, the 5-6 problem is proposed for each dimension. Using the Likert-type Scale, the answer is divided into seven levels, denoted as 1-7 points, 7 points for the full agreement, 1 points to completely disagree. The survey is divided into five categories: enterprises, universities and research institutions, experts, government agencies and financial intermediary institutions. In these five categories, we select a certain number as representatives, participate in the questionnaire survey, and then sort out and analyze the results of the survey, as the basis for the evaluation of the performance of environmental construction.

2.1 Basic circumstance of the sample

170 questionnaires were distributed in this survey, 150 questionnaires were recovered, and 147 valid questionnaires were collected. There were 56 enterprises, 41 universities and research institutions, 17 experts, 15 government agencies, 18 intermediary financial institutions, the proportion of sample distribution as shown in Figure 1.

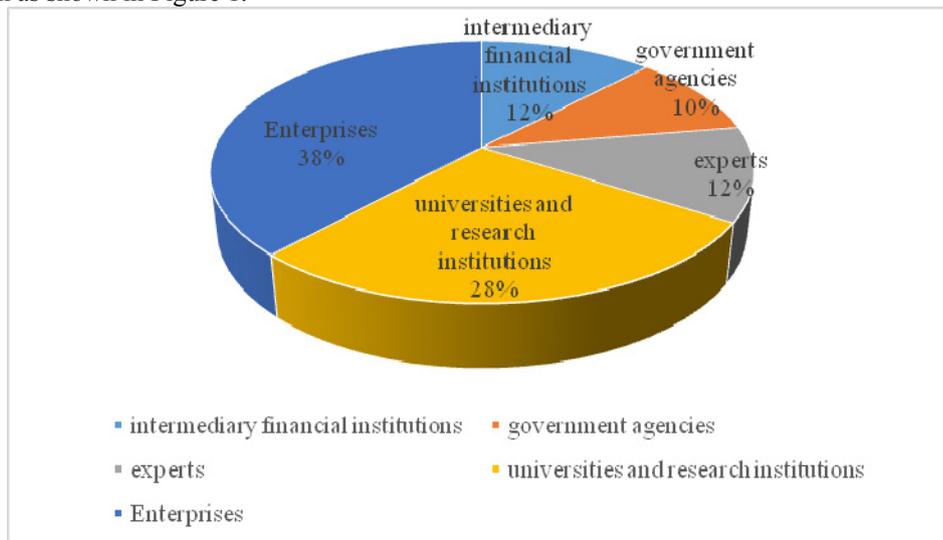

Figure 1 The Proportion of Sample Distribution

2.2 Performance evaluation of innovative environmental construction in Donghu demonstration zone based on analytic hierarchy process

- 1) Build the model. The innovation environment construction effect evaluation of Donghu

demonstration area as the target, the mark of the respondents as the basis for assessment, setting the actual perception of the policy, policy assurance and examining precision as a rule, the hierarchical structure model is established. (Figure 2)

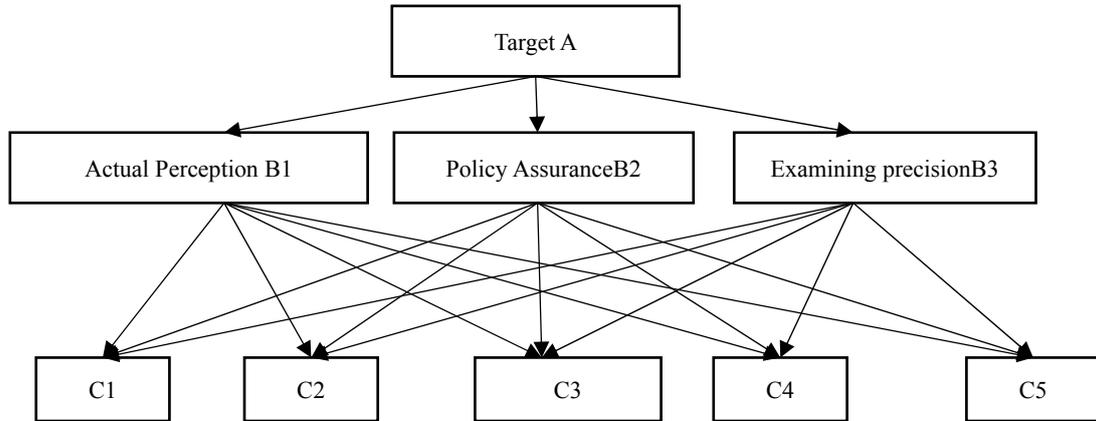

Figure 2 The Analysis Model of Donghu Demonstration Zone Innovation Environment Construction Performance Evaluation Level

2) According to the analytic hierarchy process, the results of the data are sorted out, and the performance evaluation results of innovative environmental construction in Donghu demonstration area are shown in table 1.

Performance Evaluation = \sum (The evaluation scores from each organization \times Weight value of each organization)

Table 1 Performance of Innovative Environmental Construction in Donghu Demonstration Zone

	reform and opening up in advance	capital construction zone	personnel construction	science and technology new town construction	innovation a culture construction
	5.9798	5.8098	5.8312	5.7161	5.7794
Overall Evaluation	5.8226				

From Table 1 can be drawn, Donghu demonstration area of environmental innovation effect is recognized by the public, especially in the construction of the reform and opening up in advance, the registration system optimization, the administrative process simplification, the management system reform, platform sharing, etc. These policies provide more convenient and quality services for the various departments, and plays a positive role to promote the opening of the Donghu demonstration zone. The demonstration area plays a very good role in promoting to encourage demonstration area innovation activities by supporting high-tech enterprises preferential risk compensation fund guarantee policy support. In the culture of innovation and entrepreneurship, Donghu demonstration zone promotes enterprise innovation and Entrepreneurship by making the cultural atmosphere of "encourage innovation, tolerate failure". Organizing the Optics Valley Sports Culture Festival, Optics Valley Music Festival and other special activities to promote the exchange and learning between enterprises and talents.

3 Conclusions

This paper takes the Donghu Innovation Demonstration Zone as an example, selects enterprises, universities and research institutions, experts, government agencies and intermediary financial institutions as the research objects, using the analytic hierarchy process to analyze the effectiveness of innovation demonstration zone for the construction of the regional innovation environment, from the reform and opening up in advance, capital construction zone, personnel construction, science and technology new town construction and innovation a culture construction. According to the comprehensive analysis of the effect evaluation of the innovation environment construction in the demonstration area, it can be concluded that the overall innovation environment of Donghu demonstration zone has been widely recognized, and it also need strengthen and improve the scientific and technological achievements, the use of resource advantage and evaluation.

In order to improve the Donghu innovation demonstration zone elements aggregation and the

efficiency of the transformation, it can take the following measures:

(1) Innovative talents training mechanism. Donghu independent innovation demonstration zone is located in Wuhan which has rich educational resources and intensive universities, personnel factors have obvious advantages. In this paper, it is suggested that to improve the "Talent + Project + Platform" the innovative talents training mechanism based on the higher education institutions and scientific research institutes. According to the needs of the actual innovation of enterprises, set up the teaching mode and teaching content (Li Xiyuan, Zhou Can;2012), cultivate practical and high-end technical personnel, promote the development of public entrepreneurship.

(2) Quickening the transformation of Science and Technology achievements. Establish the intellectual property creation system that the enterprises as the mainstay, market-oriented, and production-study-research cooperation. Make full use of the effect from universities and research institutes in the creation of intellectual property in the forefront of new and high technology (Zhong Sheng, Wang Min; 2015). Focus on the establishment of incentive mechanisms for intellectual property rights, to increase the inventor of the patent incentive policies and independent intellectual property rights products government procurement policy. Establish intellectual property protection and service agencies, create a cultural atmosphere of respect for intellectual property rights and protection of intellectual property rights, it can improve the creativity of intellectual property rights of the demonstration zone.

Research on the Management and Development of Canada's Arctic Fisheries Resources

Ye Jing

School of Foreign Languages, Wuhan University of Technology, Wuhan, P. R. China, 430070

(E-mail: yjwhut@126.com)

Abstract: Canada is one of the most important Arctic countries. The weather change makes its management and development of Arctic fisheries resources the focus of attention. The thesis, through searching and comparing the related articles in home and abroad, analyses Canada's current situation of fishery resources management, summarizing the effective methods of Canada exploring and utilizing its Arctic fishery resources. The research will not only improve the marine management process of Canada, but it also provides valuable reference for other Arctic nations managing their fisheries resources at Arctic, which will serve the purpose of constructing the system of sustainable development of Arctic fisheries resources.

Key words: Arctic; Fisheries resources; Exploring and utilizing; Sustainable development

1 Introduction

The Marine is becoming the focus of attention in the 21st century because the national and social development of every country is closely related to marine activities and marine management. Thus the whole world begins to set up, or have set up their marine policy for the new century.

Canada has the longest coastline in the world, most of which are located in Arctic and the abundant fisheries resources make Canada one of the most important countries among Arctic nations. Therefore, it is very significant to formulate and implement correct and effective management policy in Arctic region, protect Canada's Arctic environment and maintain the healthy and stable development of its Arctic ecosystem.

There are many essays relating the management and exploration of marine resources in Arctic. Angela C. Angell and John R. Parkins's paper lays the foundation for an informed and critical discussion regarding the unprecedented industrial development in the Canadian north and the corresponding socio-cultural health and wellbeing of northern people (Angela C. Angell and John R. Parkins, 2011). Kathleen A. Miller states that among the most important sources of 21st century stress for marine ecosystems will be the impacts of climate change, ocean acidification, and potentially growing competitive pressure on marine capture fisheries (Kathleen A. Miller, 2013).

And there are also some researches in China concerning fisheries in the Arctic. Jiao Min analyzes the status of Arctic Fisheries resources, and suggests strategies for developing fisheries. (Jiao, 2015) Chu Xiaolin claims that it is difficult to change the existing Arctic management pattern, but strengthening and expanding cooperation is a new path to achieve sustainable utilization of Arctic fishery resources and promote the healthy and stable development of the Arctic (Chu Xiaolin, 2016).

And recently, the ecosystem-based fisheries management (EBFM) has stirred an upsurge of the research for related theories and practice. Though people vary in defining the term of "ecosystem-based fisheries management", its final purpose is to construct a sustainable marine ecosystem. E. K. Pikitch believes that the overall objective of EBFM is to sustain healthy marine ecosystem and the fisheries they support (E. K. Pikitch, 2015). Zhang Yi-long introduces the concept, objective and principles of the ecosystem-based fishery management, and puts forward some opinions about how to improve the actual system of fishery management of China (Zhang Yi long, Mu Yong tong, 2006). Ecosystem-based fisheries management is not the transform but the improvement of the traditional fisheries management methods, which is of practical significance to Canada managing its fisheries resources in Arctic.

2 The Demarcation of Arctic Waters

Before the 19th century, the Arctic was only an untraversed and ice-covered continent, known for its vile weather. However, with the global warming, the ice in Arctic has been increasingly melting. Records show that within the past fifty years, the depth and the breadth of the Arctic ice covers reduce sharply and become more and more fresh. Even some scientists forecast that in the future thirty years, ice will not be seen in Arctic in summer. This phenomenon will obviously shed unprecedented influence to the Arctic fisheries resources and ecosystem, and at the same time, it will also enhance an opportunity for exploring and making use of the Arctic fisheries resources.

2.1 The geographical range of the Arctic and the Arctic waters

The Arctic usually refers to the Arctic region. According to geography, the Arctic region refers to the wide area centered on the north polar, which is within the Arctic Circle (66.33-degree north latitude). This is an area of 21 million square kilometers covering the Arctic Ocean, numerous islands, and the tundra among the north part of Asia, Europe and north America, of which the acreage of land and islands is 8 million square meters.¹

The Arctic waters, from the point of view of the Arctic Council, refer to the water areas within the Arctic Circle.

There are more than 150 different fishes in the waters, among which gadus, the Arctic trout and the Arctic halibut are most common. Various prawns and plankton attract schools of whales to feed here.

While with the increasing melting of the Arctic ice layer, the exploration and management of Arctic fisheries resources is becoming a practical issue for many countries, especially those Arctic nations.

2.2 The Arctic waters of Canada

Canada is one of the most important Arctic nations, who holds two fifths of the land in Arctic and two thirds of the coastline, with a gross area of 3.5 million square meters and one hundred and ten thousand people living in the Arctic region. Thus, exploring and utilizing the Arctic fisheries resources is of great importance for Canada.

Figure 1 Canadian Arctic²

Figure 2 Canada Fishing Zones³

¹ Xinhuanet.com. http://news.xinhuanet.com/ziliao/2006-07/13/content_4826007.htm

² Office of the Prime Minister. <http://www.pm.gc.ca/>

³ Fisheries and Oceans Canada. <http://www.dfo-mpo.gc.ca/regions/index-eng.htm>.

Canada is one of the countries which possesses most abundant fisheries resources around the world. It is also one of the most important countries exporting fisheries resources. Till now, Canada has been commercially exploiting more than 45 marine fishes and algae.

There are generally six fishing zones in Canada, Newfoundland and Labrador; Maritimes-Scotia-Fundy; the Gulf; Quebec; Central and Arctic and Pacific.

The central and Arctic region is the largest of Canada's six fishing zones. Comprised of northwest territories, Nunavut, Alberta, Saskatchewan, Manitoba, and Ontario, it would be the 7th largest nation in the world if it was a country.¹

2.3 Canada and AC

Because of the abundant fisheries resources and the specialty of the area, it's very urgent and significant to manage and keep a healthy development of the fisheries resources in the Arctic.

Till now, there are many fishery organizations in this area, such as AC (Arctic Council), NEAFC (North East Atlantic Fisheries Commission), NAFO (Northwest Atlantic Fisheries Organization), NASCO (North Atlantic Salmon Conservation Organization), etc.

AC is the most important one among those organizations which is a high-level forum among international governments. It was established at Ottawa in 1996, composed of eight members: Canada, Denmark, Finland, Iceland, Sweden, Russia and United States of America. The Arctic Council is not a treaty-based international organization but rather an international forum that operates on the basis of consensus, echoing the peaceful and cooperative nature of the Arctic Region. The Council focuses its work on matters related to sustainable development, the environment, and scientific cooperation; its mandate explicitly excludes military security.²

It is Canada that first put forward the idea of constructing the Arctic Council. From Canada's point of view, AC must be an international organization that deals with politics, economy, military, diplomacy and environment. In 1996, Canada held the presidency when AC was established, and AC has been playing more and more increasingly important role among international affairs.

Canada has been participating in various multi-corporations in order that AC can be able to work through different kinds of challenges and opportunities in Arctic to enhance nations profits. On one hand, Canada practices actively in the affairs of AC and commits to improving the influence of AC among international affairs. On the other hand, AC is the main route for Canada appealing its Arctic sovereignty and exploring and utilizing the Arctic resources.

3 The Current Situation of Canada Exploring and Utilizing Arctic Fisheries Resources

At present, because of extremely harsh working environment and the cold weather, Canada is still at the lower level in exploring and utilizing Arctic fisheries resources. But with global warming, Canada holds more opportunities in making use of the resources. Thus, it is becoming one of the most important affairs of Canada government to explore and utilize Arctic fisheries resources correctly and effectively.

3.1 To establish a firm foundation to promote the maritime consciousness for exploring and utilizing the Arctic fisheries resources

Maritime consciousness is also ocean conception, which is the general understanding and basic point of view of the sea world. It is the overall cognition for human beings to their own survival and development in the process of marine constitution. Maritime consciousness plays a decisive role in enacting national marine policy, and it is the ideological basis and the premise for a government to formulate and implement its marine policy. Alfred Thayer Mahan indicates that "A nation's mightiness and development depends on its construction of marine culture and the strength and weakness."³

In 1970, the awareness of protecting Canada's Arctic sovereignty and Arctic ecosystem has been increasingly promoted, which directly results in the introduction of *Arctic Waters Pollution Prevention Act*

In 1982, *Canada Constitution Act* became formal effective, making Canada an independent country with integrated sovereignty. Since that time, Canada's maritime consciousness has been unprecedented booming and Canada being to identify itself as a marine country. At the third UN Conference on the Law of the Sea, strong maritime consciousness prompted Canada to raise proposals such as protecting

¹ Fisheries and Oceans Canada. <http://www.dfo-mpo.gc.ca/regions/central/index-eng.htm>.

² U. S. Department of State. <http://www.state.gov/e/oes/ocns/opa/arc/ac/>.

³ Alfred Thayer Mahan. *The Influence of Sea Power Upon History, 1660-1783*[M]. Dodo Press, 1889, 12.

continental shelf in Arctic Ocean and marine environment, etc.

From 1997 to 2009, Canada has laid down a series of laws and regulations, such as *Canada Oceans Act*, *Canada's Oceans Strategy and Our Oceans*, *Our Future: Federal Programs and Activities*, etc. All the documents focus on educating the youth to increase nation's maritime consciousness and improve their awareness of the importance for private contribution to protect the oceans.

On July 16, 2015, five countries that ring the Arctic Ocean, Canada, Denmark, Norway, Russia, and the United States, signed a declaration in Oslo, designing to prevent unregulated fishing in the central part of that ocean. The signatories therefore committed to permitting commercial fishing from their coasts only once an international mechanism has been adopted to manage the activity. Furthermore, they have agreed to cooperate in joint scientific research on the region's ecosystem.¹

All the laws and regulations, to a degree, indicate that Canada has increasingly realized the importance of defending its Arctic sovereignty, protecting Arctic ecosystem and concordantly exploring and utilizing Arctic fisheries resources.

3.2 To lay down laws and regulations to provide strong guarantee for exploring and utilizing Arctic fisheries resources

Canada has the longest coastline in the world, most of which are located in Arctic. Canada possesses abundant fisheries resources in Arctic, thus it is vital to lay down a series of laws and regulations to protect Canada Arctic environment and maintain a healthy ecosystem.

AWPPA of 1970 is regarded as the first statutory document that Canada laid down to protect Arctic ecosystem. Canada began to make use of laws and regulations to implement its ocean management policy.

After signing the *United Nations Convention on the Law of the Sea*, Canada starts the stage of managing seas according to laws and regulations. Canada begins to lay down and implement marine-related laws and regulations, through which to institutionalize its marine policy. Because of Canada's increasingly perfect marine policy, Canada develops a marine integrated management system, centered on sustainable development.

Canada Oceans Act of 1997 makes Canada the first country that lays down and implement integrated marine legislation. The focus of the Act is to reiterate the importance of oceans to Canada and protecting Arctic ecosystem and realizing the final goal of sustainable development.

Canada's Oceans Action Plan of 2005 expounds its target in oceans actions plan is to coordinate and implement effective marine activities in order to successfully deal with the environmental pollution in Arctic area.

To lay down laws and regulations is the premise for implementing effective marine activities. Reinforce ocean-related legislation provide strong guarantee for Canada managing its Arctic fisheries resources.

4 The Future of Canada Exploring and Utilizing Arctic Fisheries Resources

Arctic possesses abundant fisheries resources and with global warming, the possible navigation of Northwest Passage provides both opportunity and challenge. Like all the other Arctic nations, Canada attaches more and more importance to the development in Arctic. Therefore, it is practically significant to implement effective methods to explore and utilize and manage its Arctic fisheries resources.

4.1 It is an important measure for Canada to reinforce international cooperation to explore and manage Arctic fisheries resources

From the international point of view, UNCLOS is the most important basis to normalize and coordinate global fishing activities and resources protection. Thus UNCLOS holds definite binding force for exploring and utilizing Arctic fisheries resources.

The Article 63 and 64 clearly stipulates the exploration of straddling fishes and migratory fishes, which apply to the management of Arctic fisheries resources.

In 1995, *Agreement for the Implementation of the Provisions of the United Nations Convention on the Law of the Sea of 10 December 1982 relating to the Conservation and Management of Straddling Fish Stocks and Highly Migratory Fish Stocks*² pays close attention to the fishing of those fish species, encouraging nations to lay down laws and regulations, or others measures to protect Arctic fisheries

¹ Library of Congress. <http://www.loc.gov/law/foreign-news/article/canada-denmark-norway-russia-united-states-fishing-declaration-covering-central-Arctic/>.

² Brill Online Books and Journals. <http://booksandjournals.brillonline.com/content/journals/10.1163/221160096x00418;jsessionid=i0k8ovn0vh65.x-brill-live-02>.

resources.

In 1998, the Task Force on Sustainable Development was established in Iqaluit, Canada. Canada cooperated with Iceland and Denmark, issuing *Arctic Human Development Report* in order to improve people's understanding of Arctic.

Five countries that ring the Arctic Ocean, Canada, Denmark, Norway, Russia, and the United States, signed a declaration in Oslo on July 16, 2015, designed to prevent unregulated fishing in the central part of that ocean.

By cooperating with international organizations, Canada has been guaranteed strong reference for its Arctic sovereignty. Therefore, international cooperation has become the most effective measure to explore and utilize the Arctic fisheries resources.

4.2 It is a valid approach to construct ecosystem-based fisheries management for Canada exploring and managing Arctic fisheries resources

From the day Canada realizes the importance of Arctic, Canada begins to protect the ecosystem in Arctic from the start point of environmental protection even though its previous purpose was to appeal and maintain its Arctic sovereignty. Obviously, the ecosystem-based management does avail to Arctic ecosystem and management of Arctic fisheries resources.

Exploring and utilizing Arctic fisheries resources is of great importance to the economy of the northern part, even the whole country. So the government of Canada realizes the urgent need to take effective steps to maintain the Arctic and national sustainable development of fisheries resources. Therefore, it is especially essential to adopt ecosystem-based fisheries management.

Since 1970s, EBM has been widely concerned because it improves the depth and breadth of the traditional marine management, whose object of study turns from single species to the whole ecosystem, and the short-term target changing into long-term target. EBFM is the effective method of applying EBM to managing fisheries resources.

EBFM provides Canada with valuable references on managing Arctic fisheries resources and all the act and studies on EBFM, on the other hand, contributes to maintain the healthy development of the ecosystem in Arctic, which lays the foundation for the final target of sustainable development.

It is clearly to see that Canada's exploring and utilizing Arctic fisheries resources linked closely with EBFM. Sustainable development on fisheries resources is tightly based on the stable and healthy development of the ecosystem. It is a valid approach to construct ecosystem-based fisheries management for Canada to explore and manage Arctic fisheries resources

5 Conclusions

With global warming, it becomes increasingly significant for Canada to explore and utilize Arctic fisheries resources. Canada is one of the most important Arctic nations and it is the key factor to adopt effective measures to make use of the resources for Canada's economic development and social stability. With international cooperation, Canada tries its outmost to protect Arctic fisheries resources and ecosystem. Above all, the ecosystem-based fisheries management will absolutely improve the sustainable development of Canada's Arctic fisheries resources.

Abstract: The goal of this study was to evaluate how professionals holding high and medium management positions, understand the importance of environmental sustainability. This objective unfolds in three specific objectives: 1) evaluating the manager's perception about the importance of environmental sustainability for the business management; 2) evaluating their perception regarding the importance of environmental sustainability for the business competitiveness; 3) evaluating the manager's perception on the importance of environmental sustainability for their own employability. A survey was conducted through an exploratory questionnaire organized into three sections: introducing the main topic of the survey, characterizing the respondents, gathering the data on their perceptions respecting the influence of environmental sustainability on the business management and competitiveness, as well as on the professional's employability. The survey was conducted in two companies, a mining and steel company, located in southeastern Brazil. These companies have similar management levels and invest in awareness of environmental sustainability of its managers and employees. The total sample consisted of 98 managers, 63 of the steel company and 35 of mining one. Of this total of surveyed professionals, 24.49% were part of the senior management and 75.51% belong to the medium management positions in these companies. The questionnaire was delivered by the companies and was answered directly by the respondents by e-mail and internet. Data analysis included a descriptive analysis of the surveyed sample, followed by an exploratory factor analysis and the estimation of non-parametric tests, aiming at verifying the validity of the hypothesis derived from the specific objectives of this research. We conclude that the surveyed managers valued environmental sustainability as being very important to company management, for business competitiveness, and for their own employability and, in this order. The research allowed also for testing the data collecting tool and to identify how it could be improved in order to be used by other companies to evaluate the effectiveness of their management awareness programs on environmental sustainability.

Key words: Environmental sustainability; Management; Competitiveness and employability

1 Introduction

1.1 Context

In his encyclical "on the care of our common home"– "Laudato Si'", Pope Francis talks about the Earth (Francisco, 2015: 1): "We grew up thinking we were its owners and rulers, allowed to plunder it." When plundering, it came to pass the scarcity of natural resources, which put us on the fear for the future of the human species on planet Earth. According to Laszlo (2001), this situation, aggravated by the continuous increase in human population, puts us in a suicide route. Never has humanity had such awareness of the mistakes made in relation to the Earth. The fear caused by the continued and uneven pressure on resources and environmental services - 20% of the world population consumes 80% of all available natural resources (Leemans & Solecki, 2013) reminds us of the Malthusian prophecy (McCleary, 1955). Despite knowing and recognizing the importance of ecosystem services and biodiversity for human well-being, the degradation and destruction of ecosystems remain implacably (Madureira, 2010) in a true march of foolishness.

However, the serious environmental issues, which are facing humanity, have promoted the rapid awareness of the urgency to find solutions that allow us to live within the natural limitations that the Earth imposes.

The growing awareness of environmental problems at the beginning of century result in pressure, which affects businesses, forcing them to adopt the values of sustainability, which will influence how

they survive and remain competitive in an increasingly conscious market on environmental risks we face and solve (Meyer & Rowan, 1977).

1.2 Purpose and relevance of study

The main objective of this study was to evaluate how the high and middle management members of a mining company (identified as Company A) and steel (identified as Company B), subject to institutional awareness programs, realize the importance of environmental sustainability. This central objective was broken down into three specific objectives:

1) Evaluation of the perception of the importance of environmental sustainability for business management;

2) Evaluation of the perception of the importance of environmental sustainability to business competitiveness;

3) Evaluation of the perception of the importance of environmental sustainability for employability;

The assessment referred to the main objective was accomplished through a survey that used an exploratory questionnaire as a way of data collection. This study also evaluated the adequacy and reliability of the questionnaire.

The research was focused on professionals who exercised (then) high and middle management positions. Lubin and Esty (2010) addresses the need to involve higher hierarchical levels to create new paradigms. Although they are not new, or current concerns about pollution and its consequences on the planet's ecosystems, as discussed Riechmann & Buey (1994), environmental sustainability still remains in Brazil, the status of the new paradigm.

Brazilian companies, especially larger ones, before the determination to adhere to the paradigm of environmental sustainability, choose to start this path (towards sustainability) the awareness of its employees, from management levels - high and medium - usually. For this, invest in awareness programs and training and must assess if: 1) really can make their managers realize environmental sustainability as a value for the companies and for themselves? 2) The investment has the desired return in terms of personal awareness of the importance of environmental sustainability? If this matter is highly perceived, it is clear that awareness brought desirable results and business investment had expected return. This study is important because it seeks to provide a means of systematic evaluation of the results of these awareness programs enabling thus the correct direction and the optimization of resources, for the awareness of environmental sustainability in the management levels of the companies.

2 Sustainability, Management, Competitiveness and Employment

Labuschagne, Brent and Van Erck (2005) tell us that the concept of corporate sustainability has grown in recognition and importance. This happened according to the changes and evolved social expectations, changing the social context in which they are based the relationship between society and business (Borger & Kruglianskas, 2006).

It can be observed by the available literature that word sustainability still lacks a precise definition. Károly (2013) came to classify it as a corporate buzzword (word that appears with great noise / impact in the corporate world), which was eventually used to denote all that is good, positive and desirable. Morelli (2011) reminds us that in 2010, the US Federal Trade Commission issued a list of five terms that should not be addressed in its guidelines and "sustainability" headed this list with the claim that there was a clear understanding of expiration among experts. Nevertheless, the term sustainability has become widely used by governments, businesses, NGOs and society in general, popularizing in the world.

The most accepted concept, widespread and referenced concept of sustainability is the Triple Bottom Line, proposed by Elkington (1999). Through it, sustainability is seen from three dimensions: economic, environmental and social. Tambellini (2009) speaks of harmonization of economic efficiency, social equity and ecological prudence. Hockerts (1999) states that the optimal decisions can only be taken when economic, social and environmental consequences are taken into account. It appears increasingly that companies subscribe to the principles of corporate sustainability, which is often described as the integration of economic, environmental and social dimensions (Hansen, Grosse-Dunker & Reichwald, 2009).

Porter and Kramer (2006) address the need for companies to adopt strategic social responsibility through actions that bring benefits both for society and for the company itself. These authors have the view that any company can solve all the problems of society and not bear the costs arising from this intention, but should focus on issues that have some intersection with their area, enabling thus the strategic social responsibility.

To incorporate the principles of sustainability to the management of companies, there is a path to be followed. Dunphy, Griffiths & Benn (2007) show the stages of this trajectory (which allow managers to place their companies on this evolutionary path towards sustainability). Such stages have the following general characteristics:

Phase 1: the total lack of interest in environmental and social issues;

Phase 2: the company sees the deal as it always was, admits the positive environmental consequences and refuses to admit the negative;

Phase 3: managers meet the minimum legal requirements for safety, health and environment;

Phase 4: operational efficiency becomes originated the practices of sustainability and managers are aware of the advantages of sustainability;

Phase 5: sustainability is seen as a competitive advantage and as part of long-term strategy;

Phase 6: there is full awareness that the organization should work to make a sustainable world.

Whereas it is not enough to recognize the importance and the need for sustainability, but also incorporate it into the corporate management, a large proportion of companies around the world, even if they recognize the importance of becoming sustainable, must still ask how to deploy sustainability?

The question of the above paragraph was answered by Lubin and Esty (2010), which tells us that sustainability is a megatrend that will profoundly affect the competitiveness of companies and even their survival and should be treated as other recent megatrends - IT (Information technology) and quality.

Remember that both the implementation of quality programs as information technology There was the need to involve the leaders of the companies and the wide diffusion of knowledge. In other words, there was the need to create an organizational culture that supported such new paradigms.

Currently we know that sustainability when determining uncooperative with the competitiveness of enterprises. The protection and improvement of the environment are a social concern and a new key factor for the strategy and the competitiveness of enterprises (Galdeano-Gomez, Cespedes-Lorente & Martínez-del-Rio, 2010). It is important to consider when looking relating competitiveness with sustainability, to manage a company without social commitment can be expensive, depending on the risks involved (Dunphy, 2003).

The escalation of sustainability promoted the environmental debate to a new level, indicating that the change in the sense of valuing the environment and social welfare is promoted by the innovation of products targeted to the market and new technologies and no more, simply by force of environmental legislation (Berger, Cunningham & Drumwright, 2007). It is more a paradigm that can change the way the competition will need to be perceived and treated by the companies.

We have reached a time when educated consumers (environmentally conscious) and organized force companies to become sustainable. This pursuit of sustainability is already beginning to transform the way companies compete and change the way they think about products, technologies, processes and business models (Nidumolu, Prahalad & Rangaswami, 2009: 1). Finally, sustainability becomes, according to these authors, "the key driver of innovation". There is no doubt that competitiveness associated with environmental sustainability is dependent on innovation - sustainable - and has consequences on the image of the companies, to the extent that environmental sustainability becomes more and more a requirement of society.

One of the focuses of this study was to verify how the surveyed managers perceived the influence of knowledge on sustainable employability. Hillage and Pollard (1988) address the relationship between knowledge and employability in stating that, for the individual, employability depends on knowledge, skills and attitudes that have, so you can use these assets and present them to employers.

Despite several international surveys recognize the importance of managing people for effective environmental management, little is known about the dynamics of this interaction (Rothenberg, 2003). Similarly, despite the elapsed time, do not have much information about the interaction between employment and sustainability. There is more information on the teaching of sustainability than its influence on the labor market and this is particularly noticeable in Brazil.

According to Rosini, Guevara Silva Calado and Rodrigues (2011), education should be used to rescue values such as citizenship, cooperation, solidarity, responsibility and ethics that make up the sustainability and provide a culture for Development sustainable. These values form the basis for awareness for sustainability and must be present in both academic teaching as well as in corporate programs for the transmission of knowledge about sustainability to employees.

The interest in sustainability has been responsible for the emergence of courses on the subject around the world and in various academic levels. Mascarelli (2013) analyzes on sustainability courses and presents options in several countries. In Brazil in PUC-SP (Pontifical Catholic University of São

Paulo), for example, there is the Lecture Series I. Sachs (NEF, 2016), whose goal is to study and disseminate the echo social development.

The search for projects, products and environmentally sustainable processes establishes the need for conscientious professionals and able to face these new challenges, which makes the field of theory and practice of environmental sustainability is a determining factor in people's employability.

In order to impart knowledge and begin the process of incorporating sustainability into business management, big Brazilian companies invest in training programs on sustainability. As a consequence, become poles of irradiating sustainable knowledge. This happens, for example, in companies where was conducted this case study, where their employees know the concepts of sustainability.

3 Methodological Procedures and Results

In this work we used the case study method - which is widely used for data collection in the field of organizational studies (Cesar & Valentini, 2005) - in 2015, into two companies, located in the southeastern region of Brazil, with following general characteristics, shown in Table 1:

Table 1 General Characteristics of the Case Study Companies

Companies characteristics	A- Mining company (* ₁)	B- Steel company (* ₂)
Capital	Privately held	Privately held
Business	Production of iron ore pellets for export	Steel production for the domestic and foreign markets
Production capacity	31.000.000 t/year	7,500,000 t / year - 3% of the world total volume traded. Third largest iron Brazilian producer
Number of employees	Own employees: 3.000 Outsourced employees: 3.500	Own employees: 4.500 Outsourced employees: 6.000
management systems registration	ISO 14001; ISO 9001; OHSAS 18001	ISO 14001; ISO 9001; OHSAS 18001

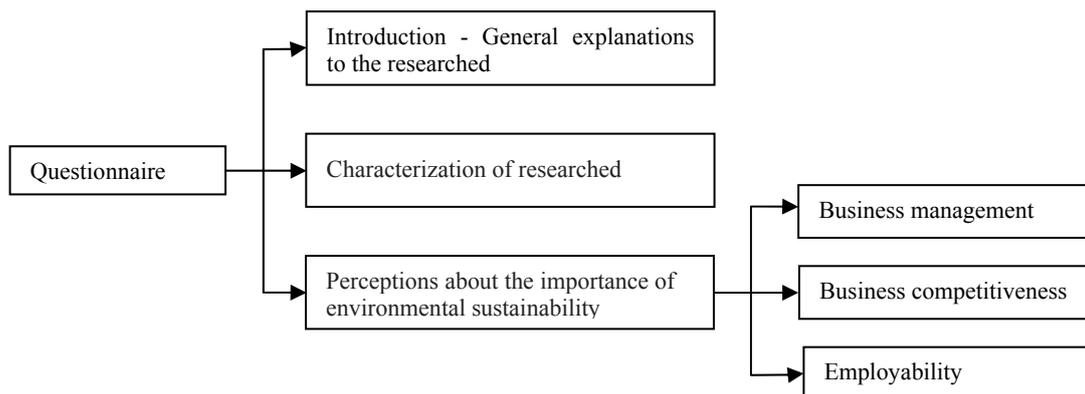

Source: Produced by authors

(*₁) – 2014 data, taken from the company's website . Retrieved on 07/04/2016.

(*₂) – Data from HTTP://tubaro.arcelormittal.com/. Retrieved on 07/04/2016.

The study explains causal hypotheses and used a questionnaire, with answers provided on a Likert scale, in order to allow a quantitative evaluation. It was adopted, therefore, a mixed methodology, it is recommended to develop researches in which the operation of phenomena is the focus, or the application of more than one search method enables increasing the potential analysis (Creswell, 2003).

The questionnaire was built as shown in Figure 1, shown below:

Source: Produced by authors

Figure 1 Construction Scheme of the Survey Questionnaire

The sample was composed of the data coming from the two companies (98 responding) and has the characteristics shown in Table 2 and Table 3, shown below.

Table 2 Sample Composition

Researched by company		
Sample identification	Absolute frequency	Relative frequency
A- Mining Company	35	35,71%
B- steel company	63	64,29%
Total	98	100%

Source: Produced by authors

Table 3 Percentage of Adherence to Research by Hierarchical Level and by the Total of Managers

Hierarchical level			
Sample Identification	Top management	Middle management	Total of researched managers
A- Mining Company	100%	68,0%	81,4%
B- steel company	60,0%	67,9%%	67,0%

Source: Produced by authors

The sample was considered to be sufficient since the lower sample fraction observed in its entirety (the rightmost column in Table 3.) was 67%. Thus, adopting a single sample and a 95% confidence interval, the obtained sample (n = 98) leads to a sampling error of 5.3%.

The more important results of Descriptive Analysis are presented in Table 4:

Table 4 Results of the Total Sample Descriptive Analysis

Descriptive variables	Comments on the statistics
Genre	91,84 men
Age	71.13 % have more than 40 years
Worked time in the company	86.73 % work the company for over 10 years
Work area	68,37% - production and 31,63% - administrative area
Hierarchy position	75,51% - middle management and 24,49% - top management
Education degree	71,43% Specialization / MBA
Knowledge degree on environmental management	97,9% - Basic / satisfactory or High knowledge
Knowledge degree on environmental sustainability management	99,0% - Basic / satisfactory or High knowledge

Source: Produced by authors

The factor analysis showed the following results, shown in Table 5 (where we highlight the three resulting factors) and Table 6 (where we presented the *Bartlett's Sphericity Test results*):

Table 5 Factors Characterization

Factor		
Dimension	Identification	Name
Management	F1	Importance of environmental sustainability for business management
Employability	F2	Importance of environmental sustainability for employability
Competitiveness	F3	Importance of environmental sustainability for business competitiveness

Source: Produced by authors

Table 6 Bartlett's Sphericity Test

Test statistic	Degrees of freedom	P-value
342,183	36	0,00001

Source: Produced by authors

We obtained 0.732 for the KMO index, indicating median suitability, but acceptable (Friel, 2009), of data to Factor Analysis, and we must also consider that Hair et al. (2006) suggest 0.5 as an acceptable value.

The variability explained by Factor Model is shown in the Table 7, presented below:

Table 7 Variability Explained by Factorial Model

Factor analysis results	Factor 1 (Management)	Factor 2 (Employability)	Fator 3 (Competitiveness)
Eigenvalues	3,323	2,040	1,181
Sum of squares of factor loadings	2,520	1,739	1,086
Proportional variance	0,280	0,193	0,121
Accumulated variance	0,280	0,473	0,594
Proportion of explained variability	0,471	0,325	0,204
Proporção da variabilidade acumulada	0,471	0,796	1,000

Source: Produced by authors

According to the above table, it can be noted that factor 1 and factor 2 are bearing most of the data variability load, indicating a higher importance of these attributes (79.6% of the total variance explained). The model showed a value of $R^2 = 0.594$, that is, it explains approximately 60% of the variability of the data, which can be considered an acceptable percentage of explanation, given the reduced number of factors.

4 Conclusions

In the total sample, 98.98% of the managers who responded to the survey believe they have knowledge about environmental sustainability between satisfactory (44.90%) and high (54.08%). This allows us to conclude that it is a homogeneous sample.

By taking the frequency of assessments assigned to the variables that make up the factors we have the following Table 8, shown below:

Table 8 Frequency of Ratings Assigned to Variables Composing the Factors

Factor	Ratings Assigned to the Associated Variables Factors						
	(VI)	(I)	(VI + I)	(M)	(LI)	(VLI)	(LI + VLI)
	Very important	Important	Subtotal	Moderately Important	Little Important	Very Little Important	Subtotal
F1- Management	56,12%	40,05%	96,17%	3,32%	0,51%	0,00%	0,51%
F3- Competitiveness	33,16%	46,95%	80,11%	11,73%	8,16%	0,00%	8,16%
F2- Employability	7,82%	36,39%	44,21%	40,48%	13,27%	2,04%	15,31%

Source: Produced by authors

The subtotal column (VI + I), in above Table 8, allows us to conclude that managers attach importance to environmental sustainability for the management and business competitiveness and employability, in that order. Such order of attribution of importance seems logical, since these are companies that promote the incorporation of sustainability efforts of the management and are exporters are subject (in terms of competitiveness) evaluations of customers with environmental requirements. As for employment, one would assume that knowledge about environmental sustainability, when seeking a replacement on the market or a job promotion, is less important than the technical knowledge and experience - especially for the Brazilian employer at this time.

The results allow us to say that have been successful efforts of the companies investigated, in order to promote awareness of its managers in relation to environmental sustainability.

We conclude also that the questionnaire provides sufficient validity, since the RMSE statistic value was 0.08. From the exploratory factor analysis, we obtained three components, which account for approximately 60% of the total variance ($R^2 = 0.594$). The values of Cronbach's alpha for the three factors were, respectively, 0.853, 0.651 and 0.630, considered acceptable for an initial study like this.

The questionnaire can be improved and become an easily applicable tool to measure the results of awareness programs on sustainability, with regard to environmental pillar.

The society expects its sustainability requirements are met by the attitudes, behaviors and business operations of companies. Only then they (companies) may increase their reputation and credibility levels and, consequently, also increase economic performance and own longevity.

Came into existence a global fear in relation to anthropogenic environmental problems also observed in Brazil, in proportion never before seen. This fear causes environmental sustainability walk with long strides to become a consensus in the country, but the road is long and hard. Already there is talk in the Age of Sustainability (J.D. Sachs, 2015) and you can watch the effort to bring sustainability into the school curricula worldwide. In the near future, it will not make more sense to research the

influence of knowledge of sustainability employability, as it will be fully disseminated and general domain.

It is suggested that future research can be carried out in order to:

The expansion of this study to other companies, industry areas and hierarchical levels;

The questionnaire improvement using, for example, a scale purification according to Parassuraman, Zeithaml and Berry (1988);

The creation of an awareness level on Environmental Sustainability;

Carrying out studies relating environmental sustainability and employability;

Carrying out studies on the influence of the level of awareness about environmental sustainability in the number of projects and actions for the improvement of sustainability.

It is expected that the results obtained with this research, can arouse interest in larger and deeper exploration of how environmental sustainability is perceived in organizations. And also about how this perception may influence the achievement of truly eco-efficiency, sustainable organizations, committed to the eco-development (I. Sachs, 1986) and with life - in all its dimensions.

Does not lack academic knowledge on sustainability, does not lack disclosure of its importance, does not lack membership of international organizations does not lack statements of major business leaders and heads of government in their favor, but may lack time to mankind to reverse the current unsustainability.

Environmental sustainability is nowadays a precondition for the future of humanity - nothing more.

Research on the Correlation Between Ecological Vision Library and Innovation in Science and Technology

Zhang Ziyue

School of Management, Wuhan University of Technology, Wuhan, P.R.China, 430070
(E-mail:374625103@qq.com)

Abstract: Library has been showing a multi-level and multi-direction development trend. With the development of digital technology, the library is facing new challenges and opportunities. Improving the competitiveness of the library itself is a major issue in the future development of the library. The most obvious dependence on knowledge and technology is the development of science and technology. Therefore, this article collects some index data of library and innovation in science and technology from 2004 to 2014, with the help of SPSS statistical analysis software to carry on the correlation analysis. The result shows that the development of library and innovation in science and technology is a significant positive correlation. For further study, the article also carries on the regression analysis and use the EVIEWS statistical analysis software to carry on the Granger causality analysis. And then puts forward recommendations for library development.

Key words: Ecological library; SPSS; Scientific and Technological innovation

1 Introduction

With the improvement of the network of laws and regulations, the Internet has become essential to our lives things, mobile Internet technology has attracted wide attention, has increasingly become a topic of concern. According to "China Internet Development Statistics Report" shows that, until December 2015, Chinese citizen reached 688 million, Internet penetration rate of 50.3%. This presents a challenge to the development of library.

Library as an integrated carrier of knowledge, its relationship with innovation in science and technology more closely, effectively grasp the intrinsic link between ecological vision library and innovation in science and technology is the focus of the development of library.

And by using SPSS and EVIEWS statistical analysis and application software for empirical research, conduct innovation in science and technology and ecological vision library quantitative analysis, so as to formulate relevant policies to promote the development of innovation in science and technology to provide reference and recommendations for our government, to promote education career development and innovation in science and technology has certain practical significance.

Ecosystem was by the British plant scientist Tansley proposed; Donley suggested that the library is an organic ecosystem, library development influenced by the ecosystems; Zhao Yinghong (2014) from the perspective of ecological system to verify that the library with material flow, information flow and energy flow of the different forms and social support system to produce exchange; Liu Junxia, Guo Peiyong (2015) put forward the library is a movement of the whole ecosystem.

Lv Xiangqian (2011) proposed university library plays an important role in the University Science and technology innovation service function; Zhao Yinghong (2012) used econometrics to prove that China's economic growth and the public library's comprehensive development is highly positive correlation, and presents Granger causality; Liang Jihong (2015) put forward to strengthen the construction of university library, first of all pay attention to the status and role of management innovation in the library.

Alice B. Ruleman (2012) thought that as mobile technology is exploding in both our personal and professional lives, libraries should begin to implement mobile services; Brian Real, John Carlo Bertot, and Paul T. Jaeger (2014) thought that the development of the library is affected by the technical infrastructure, staffing and funding; Mrs. Manisha Yogesh Rane (2015) thought in terms of technological development of digital library, librarians play an important role.

2 Index Construction and Data Collection

2.1 Index construction

Library under the ecological perspective and technological innovation capability indicators construction follow operability, representativeness and weak correlation principle. Reference to the library index established by Zhao Yinghong, established five secondary indicators including

infrastructure, library resources, financial indicators, customer service, human resources, and includes 25 three indicators. Science and technology innovation two 2 level indicators, including science and technology input and output indicators, and 21 three indicators.

2.2 Data collection

A total of 46 data three indicators, given the limited space, choose the index representative, library indicators selected number of institutions, number of employees, total reserves, books circulation trips, the publications borrow books five indicators, indicators of innovation of science and technology selected research and test development staff full time equivalent, expenditure on research and development, published scientific papers, published works of science and technology, scientific and technological achievements registration number, National Technology Invention Award, the patent application number of accepted, the technology market turnover, a total of eight science and technology indicators. To ensure the accuracy of statistics, data are from China Statistical Yearbook. Due to lack of science and technology statistics before 2004 are more, so select the 2004 to 2014 data for the study.

3 Research

3.1 Correlation analysis

Using SPSS statistical analysis tools for correlation analysis of library index and technological innovation indicators, the results obtained in the following table.

Table 1 can be concluded that the research and test development expenditure indicators and the indicators of the library show a high correlation, which shows that strengthening the investment in science and technology is conducive to promoting the development of the library. Scientific papers published indicators showed high correlation, and correlation index published scientific works is relatively low, due to the use of digital resources in the wider application of scientific research, literature review, and collected through the library network can be achieved, that is not published works does not affect people obtain resources. This is also the reason why the correlation between publications borrow books and the science index is relatively low.

Table 1 Pearson Correlation Analysis

	research and test development staff full time equivalent	expenditure on research and development	published scientific papers	published works of science and technology	scientific and technological achievements registration number	national Technology Invention Award	patent application number of accepted	technology market turnover
number of institutions	.982**	.988**	.895**	.586	.994**	.866**	.997**	.989**
number of employees	.987**	.976**	.956**	.659*	.963**	.862**	.973**	.952**
total reserves	.984**	.982**	.938**	.652*	.989**	.850*	.983**	.968**
books circulation trips	.982**	.994**	.900**	.629	.982**	.827**	.990**	.996**
publications borrow books	.905**	.928**	.803**	.585	.916**	.724*	.918**	.941**

*. Correlation is significant at the 0.05 level (1-tailed).

** . Correlation is significant at the 0.01 level (2-tailed).

3.2 Regression analysis

We come to ecological vision library and innovation in science and technology is highly correlated, in order to quantify this relationship, we have taken regression analysis, trying to explain the use of quantitative expressions.

On the basis of the selection of relevant analysis indicators, due to limited space, the three groups were randomly selected for regression analysis.

1) Regression analysis of number of institutions and research and test development staff full time equivalent:

Table 2 Coefficient

model	Non-standardized coefficients		Normalization factor	T	Significance
	B	Standard error	Beta		
(constant)	2521.620	25.639		98.351	.000
1 research and test development staff full time equivalent	1.593	.102	.982	15.584	.000

From the above table we can conclude: $Y = 2521.620 + 1.593X$ (Y = number of institutions; X = research and test development staff full time equivalent), the regression coefficient of 1.593 shows the research and test development staff full time equivalent each 1% increase, number of institutions will increase 1.593%.

2) Regression analysis of number of employees and expenditure on research and development:

We can conclude that: $Y = 49096.255 + 0.587X$ (Y = number of employees; X = expenditure on research and development).

3) Regression analysis of total reserves and scientific and technological achievements registration number:

We can conclude hat: $Y = 42236.178 + 4.786X$ (Y = total reserves; X = scientific and technological achievements registration number).

3.3 Granger causality

Due to limited space, through the sequence of ADF test and correlation test, in the case of the lag length of 2, select three groups Granger causality analysis.

1) Publications borrow books (Y) and research and test development staff full time equivalent (Q) causal analysis:

Table 3 Causal Analysis

Dependent variable: Y			
Excluded	Chi-sq	df	Prob.
Q	6.521075	2	0.0384
All	6.521075	2	0.0384
Dependent variable: Q			
Excluded	Chi-sq	df	Prob.
Y	2.936580	2	0.2303
All	2.936580	2	0.2303

Conclusion: at the 5% level test, research and test development staff full time equivalent is the cause of publications borrow books change.

2) Number of institutions and scientific and technological achievements registration number causal analysis:

Conclusion: In 10% of the test level, scientific and technological achievements registration number is the cause of number of institutions change.

3) Number of institutions and expenditure on research and development causal analysis:

Conclusion: at the 5% level test, expenditure on research and development is the cause of number of institutions change.

4 Conclusions

1) From the correlation analysis, it is concluded that the library is highly correlated with scientific and technological innovation, which indicates that the development of science and technology is closely related to the development of the library.

2) By regression analysis, we can get the three regression equations of Library and science and technology innovation index, which shows that there is a linear relationship between the library and science and technology innovation can be discussed by regression coefficient.

3) By the Granger causality analysis concluded that science and technology innovation on library development there is a one-way causal relationship. That is to say, science and technology innovation is to promote the important factors of the development of the library, but library of science and technology

innovation reverse impact is relatively small.

In short, to increase investment in research and development, and vigorously develop scientific and technological innovation, can effectively promote the development of the library. Therefore, we should strengthen the development of library and better use of library resources for the development of the library and science and technology innovation to provide a more broad space for development.

(E-mail: hemy.aoki@384.jp, ishino.y@yamaguchi-u.ac.jp)

Abstract: So-called health food has attracted attention for more than two decades, since its market has been steadily expanding. However, there are no world-wide studies on relationships between the health food market and the economic or social situations. This is because the definitions and regulations about health food differ from one country to another, so that it is difficult to compare various countries at once. We focused on Asia, since several Asian countries have established the rules and regulations of health food to date, and this area contains various countries in terms of economic situations. We executed multiple regression analysis, in which the per-capita health food expenditure and other six variables were respectively set as the objective variable and the explanatory variable candidates. As a result, it turned out that we can estimate the per-capita health food expenditure with considerable accuracy by using only two explanatory variables: the per-capita GDP and the population aging rate. The regression function obtained in this research enables us to quantitatively predict the health food market size. This can greatly contribute to making a global marketing strategy of health food.

Key words: Health food market; Multivariate analysis; GDP; Population aging rate

1 Introduction

Currently, the concept of "functional food" or "health food" has been widely accepted in Asia, America, Europe and elsewhere in the world (Siró, I., et al,2008). The word "functional food" was used first in Japan in the 1980's. In 1984, the Ministry of Education, Science and Culture of Japan classified the functions of food into three categories: nutritional function as a primary function, palatability trait as a secondary function, and disease prevention by biological regulation as a third function. Among these functions, the third function received a special attention and new food products with this function were called functional food. An original regulatory system of Food with Health Claims (FHC) was established in 1991. Since then, the health food market in Japan has been steadily expanding. In particular, the health food market hovered at a high growth rate from the 1990's to 2005. After that, although the growth rate slowed down due to a labeling regulation of the Pharmaceutical Affairs Act in 2006, the health food market in Japan kept growing and the market size reached 1.21 trillion yen in 2013. During that time, several institutional reformations were executed and the newest category "Food with Function Claims (FFC)" was established in 2015. It is generally believed that the main factor of the market growth of health food would be the growing health awareness due to an increase in lifestyle-related diseases and an acceleration of demographic aging.

From a perspective of Management of Technology (MOT), a development of health food is certainly a product innovation, and it is often the case of a material or ingredient innovation. Developing innovative materials to achieve innovative functions has often occurred in the functional food area. For a product to survive in such environment, a business organization must understand consumer needs precisely. Although the very idea of functional food has been accepted in many countries to date, the kinds of functional food widely spread among people depend on their culture, religion and environment (Siró, I., et al,2008). For example, a fortified cereal and various supplements are very popular in USA, while ginseng powder is a favored product in South Korea. Perhaps for that reason, the previous studies about health food entirely focused on the individual differences of health food instead of shared trends.

On the other hand, various media have already reported that the dietary life changes in accordance with the economic growth. The main changes are that people prefer processed food to fresh food, and they eat more meals outside their home. Also, it is thought that the growth of the health food market would be related to the economic situation change. However, there are very few studies on relationships between the health food market and the economic situation till now, though a lot of studies on the regulations of health food have been performed (Coppens, P., et al,2006; Charalampopoulos, D., 2002; Bech-Larsen, 2007). This must be because research across countries was not easy since the products, regulations, and rules of health food are different depending on country.

This research was conducted based on the hypothesis that the growth of the health food market would be related to the change of economic and social situations. We focused on Asia, since this area

has various countries in terms of per-capita Gross National Income (GNI). Typical cases are India and Indonesia as lower middle income countries, Thailand and China as higher middle income countries, and Japan, Singapore, South Korea and Taiwan as high income countries. The main purpose of this research is to clarify whether the market size of health food can be predicted using economic and other social indices, and if so, which indices should be used, by using data of Asian countries. This research aims to provide a concrete method to quantitatively predict the future market size of health food. This can greatly contribute to making a global marketing strategy of health food.

2 Previous Research

A lot of studies on health food have been performed. However, most of them were conducted regarding each ingredient (or material), the characteristics, or the national regulations of health food. There has been little research about the relationships between the growth of the health food market and the economic indices. However, they have already studied about the relationships between per-capita Gross Domestic Product (GDP) and other social or health-related indices. Some of typical researches are as follows.

- The relationship between per-capita nominal GDP and product diffusion was reported: (1) the sales amount of daily necessities, such as hair-care and oral-care products, increases when the per-capita GDP reaches 4,000 US dollars or more, and (2) the sales amount of luxury items including skin-care products increases when the per-capita nominal GDP reaches to a level of 4,000-10,000 US dollars (Takato, N., Mototani, T., 2013).

- The strong correlation between per-capita nominal GDP and medical expenditure was reported (Hiroi, Y., 1994). Also, the proportion of the medical expenditures is considered to rapidly increase when the per-capita GDP is greater than approximately 10,000 US dollars.

- It is considered that when per-capita nominal GDP increases, the modern-type retail sales increases, and moreover, when per-capita nominal GDP exceeds 10,000 US dollars, the modern-type retail sales reaches approximately 80% of all trade (Takato, N., Mototani, T., 2013).

- It is found that an average life-span increases as the per-capita GDP increases (Todo, Y., 2015; Kojima, K., Ogata, H., 2008). Also, an average life-span increases as the per-capita medical expenditure increases (Hiroi, Y., 1994).

- There is a deep relationship between an average life-span and an aging population (Ota, M., 2009), and an aging population is believed to be one of the factors to increase medical expenditures¹.

3 Definitions and Coverage of Health Food in Each Country

The definitions of health food differ among countries. The definitions and coverage of health food in eight Asian countries (Japan, India, Indonesia, Thailand, China, South Korea, Taiwan and Singapore) of which data was used in this research are as follows. The data was derived from the report published by a Japanese market research company.

1) Japan

According to the Ministry of Health, Labor and Welfare, there is no legal definition of so-called "health food," and the health food indicates the whole range of products which are sold and used for the general purpose of health improvement. However, the health food which meets the government's safety and efficacy standards can be referred to as "Food with Health Claims (FHC)." FHC's efficacy and functions can be officially publicized under the government's rules. FHC can be broken down into three categories, Food with Functional Claims (FFC), Food with Nutrient Function Claims (FNFC), and Food for Specified Health Uses (FOSHC)². FFC, which was established in April 2015, is the newest category. This research targeted the broad health food including FHC: supplements, drinks and others (fortified biscuits, concentrated extracts, etc.).

2) India

In India, the Food Safety and Standards Authority of India (FSSAI) has been working on the establishment of standards and criteria of health food. However, "Food Safety & Standards Regulations 2011" established by FSSAI did not contain the regulations about the health food. This research targeted the following health-related foods and drinks: supplements, drinks, Ayurveda and others (fortified

¹ White Paper on Aging Society 2014, Cabinet office, Government of Japan, http://www8.cao.go.jp/kourei/whitepaper/w-2014/zenbun/s1_1_3.html

² Health Food Homepage, Ministry of Health, Labour and Welfare, http://www.mhlw.go.jp/stf/seisakunitsuite/bunya/kenkou_iryuu/shokuhin/hokenkinou/

biscuits, concentrated extracts, etc.).

3) Indonesia

In Indonesia, there is no legal definition of health food. However, so-called health food is categorized as specific processed food. This research targeted the following health-related foods and drinks: supplements, drinks and others (concentrated extracts, herb products, etc.).

4) Thailand

The Food and Drug Administration Thailand (Thai FDA) defines and controls the regulations of food, drug, and dietary supplements. The supplements include all the following forms: tablet, capsule, powder, flake and liquid. This research targeted the following health-related foods and drinks: supplements, drinks and others (fortified biscuits, concentrated extracts, etc.).

5) China

The China Food and Drug Administration (CFDA) defines and controls the regulations of food, drug, and cosmetics. Health food is defined as a part of food, which has the specified health efficacy or aims at supplying vitamins and/or minerals to human. Also, the health food is defined as food that enables some sort of people to get themselves in shape by eating it. This research targeted the health-related food and nutrient-enhanced food including supplements, drinks and others.

6) South Korea

The Korea Food and Drug Administration (KFDA) defines and controls the regulations of food, drug, medical equipment, functional cosmetics and so on. KFDA defines the functional health food as food that contains materials (or ingredients) with beneficial functions for human bodies. The functional health food is divided into two types: one is a standard license type and the other is a license type on a case-by-case basis. This research targeted the following health-related foods and drinks: supplements, drinks and others (fortified biscuits, concentrated extracts, unprocessed materials for herbal medicine, etc.).

7) Taiwan

The Taiwan Food and Drug Administration (TFDA) defines and controls the regulations of food and drug. Food is categorized into three types: regular food, health food, and special nutritive food. The health food is defined as food which has some sort of health efficacy and displays it on the package or endorses it in the advertising media. This research targeted the following health-related foods and drinks: supplements, drinks and others (fortified biscuits, concentrated extracts, unprocessed materials for herbal medicine, etc.).

8) Singapore

Health Science Authority (HSA) takes control of the regulations of health-related products including dietary supplement, drug, medical equipment, cosmetics and so on. The dietary supplements are to be consumed for improving human's health or enhancing the nutrition of a meal. This research targeted the following health-related foods and drinks: supplements, drinks and others (fortified biscuits, concentrated extracts, etc.).

4 Method

Through literature research, the authors developed a hypothesis that the growth of the health food market would be related to the change of economic and social situations. The research method was designed to verify this hypothesis. First the economic and social indices considered important were selected, and then the data of such indices were collected, and finally the multiple regression analysis was performed using the data.

4.1 Variables used in research

The economic and social indices selected are as follows. Henceforth, these indices are called variables.

- Per-capita health food expenditure

This is the value obtained by dividing the size of the health food market in each country by the number of population of the country. In this research, this variable is measured in Japanese yen. This is used as an objective variable.

- Per-capita GDP

This is the value calculated by dividing GDP (US dollar), which is a total amount of added values of products or services produced in the country within a certain period of time, by the number of population of the country. In general, the larger the per-capita GDP is, the higher the living standards are. This is one of the most representative economic indices. Note that, when comparing countries,

purchasing power parity (PPP) of GDP is used to cancel out the difference of price levels between countries, where PPP is calculated using the exchange rates between two currencies.

- Per-capita medical expenditure

This is the value calculated by dividing the total amount of medical expenditures for treatment in a year by the number of population of the country. In this research, this variable is measured in US dollar. For countries that have the publicly funded health system, the value of the per-capita medical expenditure is calculated after the expenditures of the system are added to the out-of-pocket expenditures.

- Engel's coefficient

This is the proportion (expressed as a percentage) of food and drink expenditure in household consumption expenditure. In general, Engel's coefficient, one of the living standard indicators, is considered to decrease as the living standard improves (Arai, Y., 2010). However, it was found in some cases in developed countries that, even when the living standards improve, the Engel's coefficient does not decrease (Yoshimoto, 2015). This variable sometimes behaves differently among some social groups that have different social customs from other groups. Since the Engel's coefficient has an opposite correlation with the economic affluence, "100 Engel's coefficient" was used in this research.

- Ratio of the modern retail sales (mail-order, Internet sales, and door-to-door sales)

This is the proportion (expressed as a percentage) of the sales amount obtained by the modernistic retailing (the door-to-door selling, the mail/catalogue order, and the Internet selling), against the total retail sales. In the processed food market, the traditional retailing including over-the-counter sales has a high proportion at the earlier stage of the market, and then the modernistic retailing extends according to the growth of the market (Kaneko, S., et al, 1996).

- Average life-span

This value, which is measured in years, means the average number of years a person born in a given country expected to live if mortality rates at each age were to remain steady in the future. This variable, which is measured in years, is one of indices showing the comprehensive level of health and welfare.

- Population aging rate

This is the ratio (expressed as a percentage) of elderly people (the age of 65 or older) against the total population in a country. A high value of this variable indicates that the population is aging.

4.2 Multiple regression analysis

Multiple regression analysis is an extension of simple linear regression analysis. In general, regression analysis is a statistical process for estimating the relationships among variables. Multiple regression analysis is executed to answer how large a change of the dependent variable (or objective variable) is when any one of the independent variables (explanatory variables) is varied, while the other independent variables are fixed. The estimation target of multiple regression analysis is a function of the independent variables called the regression function. Multiple regression analysis also answers the overall fit (variance explained) of the model and the relative contribution of each of the independent variables to the total variance explained.

In this research, the "per-capita health food expenditure" was set as an objective variable, while other variables described above were regarded as the explanatory variable candidates. The following procedures were performed. First we computed correlation and partial correlation matrices using all the variables to understand each relationship. Then, after removing the variable suspected of having high multicollinearity, the multiple regression analysis was performed to obtain the regression function. In this stage, the 2009 data of aforementioned eight Asian countries was used, although only as to the average life-span the 2011 data was used instead because of data unavailability.

5 Results

Figure 1 shows the value of the per-capita health food expenditure (Japanese yen) of eight Asian countries in 2011. The per-capita health food expenditures widely varied depending on the countries. Singapore had the highest per-capita health food expenditure and India had the lowest.

Then, to examine the relationships between two variables in all combinations, we calculated correlation and partial correlation matrices as shown Table 1 and 2. As shown in Table 1, most of the correlation coefficients are more than 0.7. This means that the variables are strongly associated with each other. Only the "ratio of the modern retail sales" had a weak correlation with the "per-capita health food expenditure (=Y)." The following three variables, "per-capita medical expenditure," "100 – Engel's coefficient" and "average life-span," showed strong positive correlations with Y as shown in Table 1.

However, the partial correlation coefficients of these three variables were negative values shown in Table 2. This would be the evidence that there is high multicollinearity among six explanatory variables.

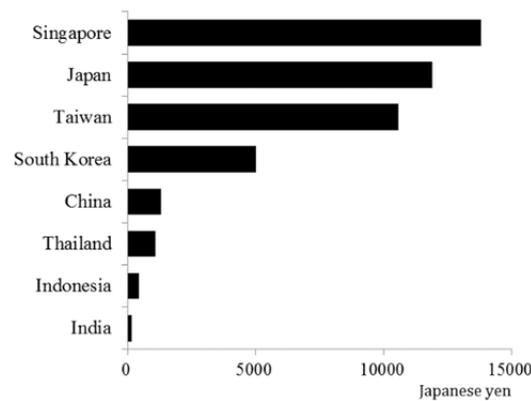

Figure 1 Per-Capita Health Food Expenditure of Asian Countries (2011)

Table 1 Correlation Matrix between Variables

	Per-capita health food expenditure	Per-capita GDP	Average life-span	100 - Engel's coefficient	Per-capita medical expenditure	Population aging rate	Ratio of the modern retail sales
Per-capita health food expenditure	1.00	0.89	0.86	0.79	0.85	0.70	0.39
Per-capita GDP		1.00	0.81	0.86	0.62	0.38	0.21
Average life-span			1.00	0.86	0.81	0.72	0.56
100 - Engel's coefficient				1.00	0.73	0.60	0.57
Per-capita medical expenditure					1.00	0.94	0.58
Population aging rate						1.00	0.74
Ratio of the modern retail sales							1.00

Table 2 Partial Correlation Matrix between Variables

	Per-capita health food expenditure	Per-capita GDP	Average life-span	100 - Engel's coefficient	Per-capita medical expenditure	Population aging rate	Ratio of the modern retail sales
Per-capita health food expenditure	1.00	0.91	-0.41	-0.73	-0.17	0.61	0.09
Per-capita GDP		1.00	0.61	0.83	0.41	-0.77	-0.14
Average life-span			1.00	-0.28	-0.34	0.57	0.06
100 - Engel's coefficient				1.00	-0.10	0.44	0.43
Per-capita medical expenditure					1.00	0.85	-0.46
Population aging rate						1.00	0.37
Ratio of the modern retail sales							1.00

In the end, the three variables, “per-capita medical expenditure,” “100 – Engel's coefficient” and “average life-span,” were removed from the candidates of explanatory variables. The remaining three variables, “per-capita GDP (= X₁),” “ratio of the modern retail sales (= X₂)” and “population aging rate (= X₃)” were used for the multiple regression analysis.

Finally, the best regression function was obtained by using the stepwise method of the multiple regression analysis. Only two explanatory variables X₁ and X₃ appeared in the best regression function, and the determination coefficient (adjusted R²) was 0.909. The value of the determination coefficient

shows how well the model fits, and this R^2 was sufficiently high to explain the “per-capita health food expenditure (Y).”

6 Conclusions

In this study, it turned out that the growth of the health food expenditure is explained by using only two indices, the per-capita GDP and the population aging rate. The former variable is an economic index, but the latter is a social index. Interestingly, this is a shared trend among Asian countries. In contrast, previous studies about health food have focused on not a shared trend but the individual food products. This could be because the kinds of functional food spread among people differ from one country to another due to their culture, religion and environment. The regression function obtained in this research enables us to quantitatively predict the future market size of health food, since the determination coefficient (adjusted R^2) was sufficiently high. This can greatly contribute to making a global marketing strategy of health food. However, the amount of data used for estimating the regression function was small because of the limitation of data source. We intend to undertake further verification of a conclusion using new data.

(E-mail: mwjia@whut.edu.cn, 1292263180@qq.com)

Abstract: This paper proposes the concept of environmental publicity by employing the method of literature research and descriptive research and making enquires to problems related to publicity. In addition, we discuss two typical forms of damage to environmental publicity, namely, the repetition of "tragedy of the commons" and the popularity of "free rider". We consider environmental publicity as an universally-linked and universally-shared comprehensive ecological system in which people should enjoy same rights while sharing responsibility. Three common public spiritual qualities, namely the no-harm spirit, the spirit of caring, the spirit of participation, are advocated to defend the environment publicity. We put forward conclusions to cultivate public spirit is the fundamental way to solve problems related to environmental publicity.

Key words: Environmental publicity; Public spirit; Public value

1 Introduction

In modern society, the public environment we live in is under various threats such as the aggravating energy crisis, ecological deterioration, especially the severe haze which has caused serious pollution in many parts of China, draws wide attention at home and abroad, even became a domestic political issue(Chen Zhu, et al,2013). It shows that the environmental publicity has been severely damaged. In recent years, some Chinese scholars introduced the concept of "publicity" into environmental science, which is a beneficial attempt and a new theoretical research paradigm in the field of environmental science from the perspective of philosophical and social sciences, extending the resolution of environmental problems from nature to people. Based on the environmental publicity, this paper proposes three common public spiritual qualities to solve public environmental issues: no-harm spirit, the spirit of caring, the spirit of participation.

2 Environmental Publicity and Typical Manifestation

Environmental issues are of publicity in essence. As the concept of publicity is complex and environmental issues are very urgent, it is necessary to briefly explain publicity.

2.1 Inquiries to environmental publicity

"Publicity" is a very complex concept. Kant, Arendt, Rawls, Frederickson and other western scholars gave abundant description to it. According to Habermas, "Publicity" is the concept of democracy which is characterized by specific social intention and specific political values, and which appeared quite late. "Although publicity appeared in Britain and France earlier and Germany later, Publicity, as a mature concept, was not popular in Europe in the 18th century." (Habermas,1999) Currently, the "public" is widely used in such fields as political science, philosophy, economics, law, literature. Although in different discourse systems, the definition of publicity varies due to different theoretical goals, publicity means "fairness, justice, rationality, service" and so on. (Zheng Hangsheng,2005)

Various theoretical interpretations of publicity given by different disciplines not only reflects the publicity of people's public life, of the national public administration, of global public awareness and public safety, but also demonstrates the publicity of natural environment shared among people. During the ever-going natural matter, energy and information exchange between human society and nature, multi-relations have been formed between man and man, man and society, man and nature, and thus there are different types of public property. As human live in the environment, and the environment provide resources for human life and production, the close relationship between human and environment constitutes the basic feature of environmental publicity.

2.2 Typical forms of environmental publicity damages

With the development of industrialization and urbanization, energy consumption continues to go up, hazy days is gradually increasing in number, especially regional air pollution becomes more and more severe with particulate matter (PM10) and inhalable particles (PM2.5) as the typical air pollutants.

Unlike such natural phenomenon such as wind, rain and lightning, fog and haze is "artificial natural phenomenon", the essence of which is environmental pollution, to be more specific, is air pollution. It not only affects the regional atmospheric environment, and destroys the environmental publicity, also does harm to people. This reflects not only the level and quality of national industrialization, but also people's public spirit and the level of ecological civilization

Therefore, how has environmental publicity been "threatened" step by step? Two typical forms are as follows:

First, the "tragedy of the commons" repeats. "Tragedy of the Commons" comes from the article Tragedy of the Commons written by the American scholar Harding in 1968 in the journal "Science". The article is about a land system in Britain which allows landlords to allocate a piece of uncultivated land in their own territory as public pasture open and free to all herdsmen. Of course, all the herdsmen wanted to raise as many sheep and cattle as possible. However, as the number of livestock is increasing out of control, the overloaded public pasture became a barren land. As a result, cattle and sheep starved to death. Harding specifically mentioned in the text the limited earth's resources as well as its effects on the so-called "quality of life". Although the article of Tragedy of the Commons focuses on such fields as economics, psychology and sociology, many scholars take its metaphorical meaning. Since the environment (such as the atmosphere with some environmental factors excluded) is for the public, not for someone or a group of people, and for humans have in common, when someone uses environment, he will affect others' environmental consumption. Driven by interest and competition, people cannot balance between the earth's limited resources and their "unlimited desires". when system and ethics cannot give full play to their due role, "tragedy" is inevitable. China is a country with a large population, limited resources. because of rapid industrial development and non-standard mechanism, a lack of public spirit, the conflicts between economic development and resources and environment are intertwined, forming a vicious cycle, public environmental pollution caused by industrialization such as air pollution have become more prominent, resulting in the repetition of "tragedy of the commons" in the environment.

Second, the "free-rider" phenomenon. Environmental publicity is beneficial to all. The beneficiaries of environmental protection are not only a local community, but also the society as a whole, even the future generations. It is the universal benefits that allow people who did nothing to protect the environment can also benefit from the environmental protection campaign. This phenomenon is termed as "free-rider" in economics. In accordance with economic reasoning, environment is shared among all the people. when a person consumes a public good, he will not affect others' consumption and he cannot exclude others from using such public goods. When people fully enjoy the benefits of good environment, few are willing to pay the price for this kind of public goods, because no matter whether he pays the price or not, he can consume this kind of public goods. At present, both for-profit organizations and individual citizens fail to abandon such a maternity as enjoying environmental benefit while doing nothing to protect the environment. "Free-rider" mentality exists in people' mind to various extents. It is very popular in some places and sectors. Consequently, resistance and the cost of environmental protection and management are growing.

3 Three Common Spiritual Qualities to Solve Public Environmental Issues

Objectivity of environmental publicity inherently requires people to defend "dignity" of the environment with reasoning, protect the environment by virtue of awe, thus highlighting the human public spirit qualities which include at least three common spiritual qualities, namely, no-harm spirit, humanism and the spirit of participation.

3.1 No-harm spirit

No-harm means is no damage to publicity. The principle of no-harm is the most basic ethical principle, reflecting the nature of public morality. No-harm spirit emphasizes avoiding intended damage and the risk of harm, intended or unintended as well as comforting to no-harm principle. No-harm spirit is particularly significant to the harmony between man and nature. In the social market economy, due to overemphasis on individual interest, acute conflicts exist between individual interest and public interest, between self-protection and moral obligations. In the private sector, individuals, as self-acclaimed subject in the economic activity, pursue the maximization of individual interests, thus doing harm to others or the public sectors. "In the public domain, individual should act as a member of a community, taking care of others and balancing their own likes and dislikes, probing the social and public interests, seeking mutual respect and common ground while putting aside differences." (Li Ping,2005) People

should enjoy public rights of the public domain while fulfilling obligations in the public sectors.

3.2 The spirit of caring

"The spirit of caring is embodied as consciously caring public interest, main public events, public order." (Jia Yingjian,2007) Communication of man always associated with its value orientation, value orientation from the ideological level affect people's attitude towards things, and through the direct influence on the behavior of the individual. People act according to their value orientation. Value orientation influences people's attitude which in turn affects people's deeds. Value orientation based on the publicity sometimes means consciously abandoning or even sacrificing individuals' own interests. Environmental protection volunteer action typically exemplifies the spirit of caring. Guided by this value, every subject always surpasses individual interest, treasuring consistence between themselves and the outside world. They consider such coexistence as an important condition to realize their value and personal interest, treating other as equal and free as them. In addition, they consciously care the social public order and the ecological environment, regarding protecting public interest as vital criteria to judge people's actions and pursuing the harmony between public order and ecological environment.

3.3 The Spirit of participation

In public life, only through participation can people be keenly aware of their rights and obligations, learn reasoning methods of theoretical significance and gradually form a rational sense of participation to achieve the maintenance of the community. In the open public area, it requires everyone to ensure the achievement of public value target through their active participation in public life as well as independent participation in public affairs management. Participation in public affairs, as practical social activities based on the citizen's free will and rational judgment, exemplifies society members' efforts to defend universally-shared value. Only citizens with a strong sense of participation in public affairs can voluntarily conduct social practical activities. In modern democratic life, citizen with strong participation spirit will be actively engaged in public and political life such as protecting the environment as an individual or a member of an organization through voluntary spontaneous behavior. "Participation does not mean that a predetermined target can be achieved immediately, nor a utilitarian result obtained. Participation is where the significance of civil activities lies." (Liu Xinmiao,2007)

4 The Cultivation of Public Spirits

In the early 1960's, the energy and ecological crises was studied by Club of Rome as a global public issue. The Club of Rome called for worldwide cooperation to address these global problems. Today, such problems have not been resolved, but intensified. In essence, energy and ecological crisis is a global crisis caused by contemporary people competing resources and plundering next generations' resource for survival and development. The ideological root of this behavior is the lack of public awareness and public spirit among individuals, group's even nations. To strengthen the public spirit and to develop publicity of universal and high-level significance are the fundamental way to resolve the ecological crisis and other public crises. (Guo Zhan,2009)

4.1 The cultivation of the government publicity

The government is of publicity by nature. The government plays the leading role in environmental protection and management. But due to the difference of national conditions, compared with developed countries, the environmental protection of China started relatively late with the laws and regulations to be improved. It is until 1979 when the first environmental protection laws promulgated - "People's Republic of China Environmental Protection law (trial)". Over the next 30 years, China successively formulated dozens of laws on environment and natural resources protection, on saving energy and promoting clean production and circular economy. However, because governments of various levels and enterprises has more desired rapid economic growth than environmental protection and administrative and legal system construction are lagging behind the real need for environmental protection, many environmental problems broke out in a very short period of time. The rampant "fog and haze in recent years is a typical example. In 2012, the Chinese government issued "twelfth five-year" plan for air prevention and control in heavily-polluted regions, making strict targets and measures for the first time to prevent and control the air pollution in 13 heavily-polluted areas. In order to further improve urban air quality, China released the first atmospheric pollution prevention plan (2013-2017) in September 2013, which requires, before 2017, a 10% fall or even more of PM2.5 concentrations in provincial capitals than in 2012, and increasing numbers of air-fresh days year by year. At a higher level, "the CPC Central Committee decision on deepening reform of the overall number of major issues" points out that accelerating construction of ecological civilization system should not divert from the direction of

constructing ecological civilization which must establish a comprehensive system of ecological civilization mechanism including the strictest source protection system and damage compensation system, responsibility system as well as improve the system of environmental management and ecological restoration.

4.2 The cultivation of the society's publicity

Environmental protection, as the obligation for both the government and civil society organizations as well as individuals, needs the joint efforts of the whole society, "compared with environmental protection campaigns abroad which was carried out from the bottom to the top or from the public and civil environmental organizations in China is basically "government-led" model, the environmental protection campaigns are in the led-by-government mode in which the government is policymaker, administrator, manager as well as supervisor of policies and regulations, almost assume full responsibility for environmental protection. "(Wang Litao,2011) Although it is essential to highlight government publicity and strengthen the administrative publicity, cultivating public awareness, fully carrying forward the public spirit and considering environmental protection as individual's responsibility are the ultimate goal and the fundamental way to address such environmental pollution as fog haze. Judging from the beneficiaries, the public is the beneficiary. As long as the public actively participate in environmental protection campaigns, they can be a strong driving force behind the environmental protection and management. At present, China's public participation is neither active nor effective. First, the social groups, especially non-governmental organizations are limited in number, scale, fund, and influence; Second, the public has few opportunities to participate in participation in environmental policy making. Prior participation is not sufficient, post-supervision is not effective and public participation didn't lead to good result; Third, the system to ensure the public's participation rights is to be perfected, and some system is only for show. Generally speaking, Chinese society is not highly civilized; the public spirit is not strong; the promise of "everybody is responsible for environmental protection" is not fulfilled by all. Only enlarging the size of "eco-citizens" groups, can fully demonstrate the men's leading position in environmental protection, realize the harmonious development between man and nature, achieve multi-win among economy environment and society proposed in "China Atmospheric Pollution Prevention Action Plan", and ultimately build a beautiful China.

5 Conclusions

Earth is the largest public area. No one is an outsider in the environmental protection game. Everyone should assume the responsibility of protecting the environment. Although the Chinese government has taken various effective measures, policies and laws related to environmental publicity is not perfect. So we must cultivate public spirit of the public to make up for imperfect system. Encourage the whole society to act in accordance with no-harm principle, to voluntarily defend the dignity of public environment, to rationalize the use of natural resources shared among all people and passed on generations by generations and to shape the public's rational thinking, social responsibility and public life. Only by doing so can effectively avoid repetition "tragedy of the commons" and "free rider" phenomenon, solve problems related to environmental publicity.

Study on the Integrated Care System for the Rural Elderly in the View of Sustainable Development

Hu Shiyong, Chen Mingwei

School of Politics and Administration, Wuhan University of Technology, Wuhan, P.R.China, 430070
(E-mail: hemming2000@163.com, cmw_chaney@163.com)

Abstract: The rural population aging produces profoundly effects to economy, environment resources and production methods and it causes huge impacts to the sustainable development. In the view of sustainable development, this paper integrates institutional endowment resources and non-institutional endowment resources, commercial endowment resources and non-commercial endowment resources in rural endowment system according to the sustainable principle and integrated care theory, and divides them into the primary endowment system and the secondary endowment system. It constitutes the integrated care system for the rural elderly and illustrates the function and operation mechanism of the integrated care system. This paper thinks that the integrated care system for the rural elderly should base on family endowment and government backstop, and pay attention to cultivate the rural home care system for the elderly and commercial endowment market, integrate and coordinate through community and social organization so as to play its function.

Key words: Sustainable theory; Integrated care system for the rural elderly; Endowment system; Work mechanism

1 Introduction

Under the effect of the trend of the constant ultra-low birth rate, China has entered the stage of rapid aging currently. It is predicted that until 2020, the aging population above 65 years old in China will be up to 167 million, which will be a quarter of the aging population in the whole world (Li Pan, 2014). The effects brought by the population aging are wide and deep, among which the expanding trend of rural aging and the aging problem are more prominent. At present, scholars at home and abroad usually tend to cope with the aging problem through isolated public policies. Including population policy, social endowment security system, basic medical insurance system, reeducation policy of the elderly etc. (Wang, 2006; Chen Sheying, 2010; Peng Xizhe, etc., 2011). But few of them treat the rural aging problem in China in a sustainable development way. In the development and research of the rural aging career, it only focuses on one certain resource. Such as the government supporting resources (Liu Zilan, 2003; Wang Yuan, etc., 2008), family endowment resource (Zhang Zhengjun, etc., 2012) and there are few researches about the comprehensive application of social resources, which lacks of the integrated theoretical analysis frame. Under such a background, in the view of sustainable development, this paper puts forward the integrated care system for rural elderly and its operation mechanism setting the integrated care theory as the frame, which has important significance to the perfection of the rural endowment system and the sustainable development of the rural society.

2 Rural Aging and the Sustainable Development

2.1 The development situation of the rural aging and the sustainable development theory

It shows in the data of the sixth nationwide population census that the aging degree of the rural population in China has reached 15.4%, which is 2.14% higher than the national average level of 13.26%. Due to the effect of urbanization and the migration flow of population, the rural aging degree in China will be more serious than urban area. It is predicted in the report of the development of aging career in China that the aged population in rural area in China will be up to 167 million until 2035 and the aging degree will reach 37.2%. The rapid development of rural aging has important effect to the sustainable development of the national economy and the environment resources.

The sustainable development involves the coordination and unification of three aspects including sustainable economy, sustainable ecology and sustainable society. This requires that human beings focus on economic efficiency, concern about ecological harmony and pursue the social fairness in the development so as to reach the comprehensive development of people finally. Thus it can be seen that the sustainable development has become a strategy about the development of society and economy, and it plays a significant role in the development of the human society. The sustainable development is trying to improve people's life quality under the condition of the containing capacity of the ecological

system. Liu Zhongyan, Ji Zhong, etc. (2005) thought that the sustainable development can optimize people's living space to supply foundation for the development of people. It can be better meet people's basic requirement to promote the comprehensive development of people. It can deepen people's recognition of the natural value and the self-value and let people get freedom in driving natural correctly. In Feb. 2015, the International Council for Science (ICSU) and the International Social and Science Council (ISSC) issued the report of *Review of Targets for the Sustainable Development Goals: The Science Perspective*, which implements independent evaluation to the 17 large targets as well as the 169 sub-targets of the sustainable development. It includes indexes such as ensuring the sustainability of economy and employment, building tolerant and sustainable developed industry and promoting industrial innovation, etc. It can be seen that with the development of the sustainable development theory, the research range of the educational circles has been expanded from the environment sustainability to the sustainability of economic development and production methods.

2.2 The contradiction between the rural population aging and the sustainable development

The rural population aging produces has a great impact on the sustainable development of China's economy and production. The rural population aging is one of the most urgent public problems faced by the industrial countries and the emerging marketing economy. Because the material basis in rural area is weak and the coverage of the social security system for the aged in rural area is relatively narrow, and the rural population aging occupies economic and social resources, the sustainable development of the rural society is facing severe problems.

In the layer of the economic resources, population aging increases the social and family burden gradually. The expenditure of social security and welfare will be increased greatly in order to cope with the population aging. The increasing of the population aging and the aging dependency ratio also increases the burden of the population of the labor age. Besides, the traditional family endowment is also facing severe challenges. The decreasing of the population of rural family and labor force also means the decreasing of the income of rural family and the declining of the ability of supporting old people, which can't sustain the impact of population aging and senility; In the layer of production method, the traditional industries need a large amount of labors of the right age. With the dual effect of the low birth rate and aging, the original high density labor intensity industries are facing severe challenges and the "period of demographic dividend" of the economic development in China is shortened greatly; In the layer of social resources, the aging group has special requirements in aspects such as clothing, catering, residence, traveling, medicine etc. So the infrastructural facilities should be adjusted according to the requirements of the elderly. The consumption field and service field of the society are sure to be changed and different service network will be built to meet the special requirements of the elderly to the maximum. The trend of the rapid development of aging distracts a mass of social resources.
